        test_cell on the 'libg157' cell is not specified correctly.
 (LIBG-157)
```

### What Next

Check the library description to ensure that each test_cell has correctly specified the *test_clock* signal type.

---

## LIBG-158

(error) Invalid nontest mode for test_cell on the '%s' cell.\n \tThere are more than 2 sequential elements.

### Description

The nontest mode for test_cells must be one of the following:

```
- A single flip-flop
        - A single latch
        - A single master-slave latch configuration using clocked_on and
                clocked_on_also
```

This warning informs you that the nontest mode of the test cell has more than 2 distinct sequential elements. Thus, it does not fit the previous requirements. The test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

Feedback

### What Next

Check the library description to ensure that each test_cell has properly specified the correct nontest mode. To determine the multiple sequential elements in this description,

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

---

## LIBG-159

(error) Invalid nontest mode for test_cell on the '%s' cell. \n \tThis describes a ganged cell.

### Description

The nontest mode for test_cells must be one of the following:

```
- A single flip-flop
        - A single latch
        - A single master-slave latch configuration using clocked_on and
                clocked_on_also
```

This warning informs you that the nontest mode of the test cell is a ganged cell. Thus, it does not fit the previous requirements. The test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

### What Next

Check the library description to ensure that each test_cell does not specify a ganged cell as its nontest mode. Ganged cells can be recognized by the keywords ff_bank or latch_bank.

---

## LIBG-160

(error) The nontest mode for test_cell on the '%s' cell is invalid.\n \tThe '%s' slave port does not directly feed the output.

### Description

The nontest mode for test_cells must be one of the following:

```
- A single flip-flop
        - A single latch
```

Feedback

```
        - A single master-slave latch configuration using clocked_on,
              clocked_on_also
```

This warning informs you that in nontest mode of the test cell, the slave does not directly feed the output. This means that this is not a master-slave latch configuration that DFT Compiler supports. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

The following example shows an instance where this message occurs:

```
cell(libg160) {
      area : 10;
      bundle (D) {
        members(D1, D2);
        direction : input;
        capacitance : 1;
      }
      pin(G) {
        direction : input;
        capacitance : 1;
      }
      latch_bank ("IQ","IQN", 2) {
        data_in : "D";
        enable : "G";
      }
      bundle (Q) {
        members(Q1, Q2);
        direction : output;
        function : "IQ";
        timing() {
          timing_sense : positive_unate;
          intrinsic_rise : 1.0;
          intrinsic_fall : 1.0;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "D";
        }
        timing() {
          intrinsic_rise : 1.0;
          intrinsic_fall : 1.0;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "G";
        }
      }
      test_cell() {
        pin(D1) {
          direction : input;
        }
        pin(G) {
          direction : input;
        }
```

Feedback

```
        pin(D2) {
          direction : input;
          signal_type : "test_scan_in";
        }
        pin(Q1 Q2 ) {
          direction : output;
          function : "G D2 D1";
          signal_type : "test_scan_out";
        }
      }
    }
```

The following is an example message:

```
Error: Line 193, The nontest mode for test_cell on the 'libg160' cell is
 invalid.
        The 'Q1' slave port does not directly feed the output. (LIBG-160)
```

### What Next

Check the library description to ensure that the nontest mode of the test_cell is correctly specified. If you are using a master-slave as the non test mode, the only accepted description is the state description using

```
clocked_on : <master clock>
        clocked_on_also : <slave clock>
```

---

## LIBG-161

(error) The nontest mode for test_cell on the '%s' cell is invalid\n \tThe '%s' state pin is not a latch for a master-slave configuration.

### Description

The nontest mode for test_cells must be one of the following:

```
- A single flip-flop
        - A single latch
        - A single master-slave latch configuration using clocked_on and
                clocked_on_also
```

This warning informs you that the nontest mode of the test cell is an incorrect master-slave description. This stage of the master-slave configuration is not a latch, thus, it does not fit the previous requirements. The test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg161) {
      area : 11;
      pin(D1 D2 D3) {
        direction : input;
```

Feedback

```
    capacitance : 1;
  }
  pin(CP) {

      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "CP SCK1";
    }
  }
  pin(Q3) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
```

Feedback

```
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "CP SCK1";
    }
  }
  test_cell() {
    pin(D1) {
      direction : input;
    }
    pin(D2) {
      direction : input;
    }
    pin(D3) {
      direction : input;
    }
    pin(CP) {
      direction : input;
    }
    pin(SCK1) {
      direction : input;
      signal_type : "test_scan_clock_b";
    }
    pin(SCK2) {
      direction : input;
      signal_type : "test_scan_clock_a";
    }
    pin(SI) {
      direction : input;
      signal_type : "test_scan_in";
    }
    statetable("C D ", "Q") {
      table :  "R  H/L : - : H/L,\
               ~R   -  : - :  N";
    }
    pin(Q) {
      direction : output;
      internal_node : "Q";
      input_map : "CP D1";
      signal_type : "test_scan_out";
    }
    pin(Q2) {
      direction : output;
      internal_node : "Q";
      input_map : "CP D2";
      signal_type : "test_scan_out";
    }
    pin(Q3) {
      direction : output;
      internal_node : "Q";
      input_map : "CP D3";
      signal_type : "test_scan_out";
    }
```

Feedback

```
      }
    }
```

The following is an example message:

```
Error: Line 218, The nontest mode for test_cell on the 'libg161' cell is
 invalid.
        The 'Q2' state pin is not a latch for a master-slave
 configuration. (LIBG-161)
```

### What Next

Check the library description to ensure that the nontest mode of the test_cell is correctly specified. If you are using a master-slave as the nontest mode, the only accepted description is the state description using

```
clocked_on : <master clock>
        clocked_on_also : <slave clock>
```

---

## LIBG-162

(error) The test_cell on the '%s' cell cannot have more than one\n \ttest_scan_in or test_scan_in_inverted signal type. This happens on the \n \t'%s' port.

### Description

Each test_cell must have only one test_scan_in or test_scan_in_inverted signal type. This signal type is specified on the pin that is used to take scan data into the cell.

This warning informs you that the test_cell pointed to has multiple test_scan_in or test_scan_in_inverted signal types. The message points to the second port that has this signal type. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg162) {
      area : 2;
      pin_opposite ( "Q", "NQ" );
      latch ( "QX" , "QY" ) {
        data_in   : " ((D*!SE) + (SI*SE)) ";
        enable  : " CK  ";
      }
      pin (D)    {
        direction : input;
        capacitance : 1;
      }
      pin (SI, SIN, SE) {
        direction : input;
        capacitance : 1;
      }
```

Feedback

```
      pin (CK)    {
        direction : input    ;
        capacitance :   2 ;
      }
      pin (Q)    {
        direction : output   ;
        function  : "QX" ;
      }
      pin (NQ)    {
        direction : output   ;
        function  : "QY" ;
      }
      test_cell() {
        latch ( "QX", "QY") {
          data_in : " D ";
          enable : " CK' ";
        }
        pin (D,CK) {
          direction : input;
        }
        pin (SI) {
          direction : input;
          signal_type : "test_scan_in";
        }
        pin (SIN) {
          direction : input ;
          signal_type : "test_scan_in_inverted";
        }
        pin (SE) {
          direction : input ;
          signal_type : "test_scan_enable";
        }
        pin (Q) {
          direction : output ;
          function : " QX ";
          signal_type : "test_scan_out";
        }
        pin (NQ) {
          direction : output ;
          function : " QY ";
          signal_type : "test_scan_out_inverted";
        }
      }
    }
```

The following is an example message:

```
Error: The test_cell on the 'libg162' cell cannot have more than one
       test_scan_in or test_scan_in_inverted signal type. This happens
 on
       the 'SIN' port. (LIBG-162)
```

Feedback

### What Next

Check the library description to ensure that each test_cell has only one test_scan_in or test_scan_in_inverted signal type.

---

## LIBG-163

(error) The '%s' port in test_cell on the '%s' cell has a\n \ttest_scan_out signal type on an inverted output.

### Description

The test_scan_out signal type can only be specified on a noninverted output. If the output is inverted, the proper signal type is test_scan_out_inverted. This signal type specifies the polarity of the port with respect to the state.

This warning informs you that the test_cell pointed to has the test_scan_out signal type specified on an inverted output. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg163) {
    area : 13;
    pin(D) {
      direction : input;
      capacitance : 1;
      timing() {
        timing_type : setup_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "C";
      }
      timing() {
        timing_type : hold_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "C";
      }
    }
    pin(C) {
      direction : input;
      capacitance : 2;
    }
    pin(SDI) {
      direction : input;

```

Feedback

```
      intrinsic_fall : 1.0;
      related_pin : "C";
    }
    timing() {
      timing_type : hold_rising;
      intrinsic_rise : 0.0;
      intrinsic_fall : 0.0;
      related_pin : "C";
    }
  }
  pin(SE) {
    direction : input;
    capacitance : 2;
  }
  pin(TQ) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "C";
    }
  }
  pin(SDO) {
    direction : output;
    timing() {
      timing_type : falling_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "C";
    }
  }
  test_cell() {
    pin(D) {
      direction : input;
    }
    pin(C) {
      direction : input;
    }
    pin(SDI) {
      direction : input;
      signal_type : "test_scan_in";
    }
    pin(SE) {
      direction : input;
      capacitance : 2;
      signal_type : "test_scan_enable";
    }
```

Feedback

```
      statetable("C D SDI", "Q") {

                  L -  -  : - : N";
      }

      pin(TQ) {
        direction : output;
        internal_node : "Q";
      }
      pin(SDO) {
        state_function : "TQ";
        direction : output;
        signal_type : "test_scan_out";
      }
    }
  }
```

The following is an example message:

```
Error: Line 176, The 'SDO' port in test_cell on the 'libg163' cell has a
        test_scan_out signal type on an inverted output. (LIBG-163)
```

**What Next**

The default behavior of selecting the function over the signal_type to determine the inversion of the output is correct in most cases.

Check the library description to ensure that the test_scan_out signal type is only placed on noninverted outputs. To determine if this is an inverted or noninverted output

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

---

## LIBG-164

(error) The '%s' port in test_cell on the '%s' cell has a\n \ttest_scan_out_inverted signal type on a noninverted output.

**Description**

The test_scan_out_inverted signal type can only be specified on an inverted output. If the output is noninverted, the proper signal type is test_scan_out. This signal type specifies the polarity of the port with respect to the state.

Feedback

This error informs you that the test_cell pointed to has the test_scan_out_inverted signal type specified on a noninverted output. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg164) {
            area : 11;
            pin(D0) {
              direction : input;
              capacitance : 1;

                        -  ~F : - : N";
            }

            pin(Q) {
              direction : output;
              inverted_output : FALSE;
              internal_node : "Q";
              signal_type : "test_scan_out";
            }

            pin(QN) {
              direction : output;
              inverted_output : TRUE;
              state_function : "Q";
              signal_type : "test_scan_out_inverted";
          }
          }
        }
```

The following is an example message:

```
Error: Line 220, The 'QN' port in test_cell on the 'libg164' cell has a
        test_scan_out_inverted signal type on a noninverted output.
 (LIBG-164)
```

**What Next**

Check the library description to ensure that the test_scan_out_inverted signal type is only placed on inverted outputs.

To determine if this is an inverted or noninverted output

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

            report_lib -table <library name> <cell name>
```

In the report_lib command's report, an inverted output is a state only if it has N. Instead the output contains an inversion of the state pin.

---

## LIBG-165

(error) The test cell on the '%s' cell cannot have more than one\n \ttest_scan_enable or test_scan_enable_inverted signal type.\n \tThis happens on the '%s' port.

Feedback

### Description

Each test_cell must have only one test_scan_enable or test_scan_enable_inverted signal type. This signal type is specified on the pin that is used to select between scan and mission mode operation of the cell. Using the state table format, Library Compiler expects a single test_scan_enable or test_scan_enable_inverted signal type. Otherwise, Library Compiler generates a black box cell.

This warning informs you that the test_cell pointed to has multiple test_scan_enable or test_scan_enable_inverted signal types. The message points to the second port that has this signal type. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg165) {
      area : 13;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(G) {
        direction : input;
        capacitance : 2;
      }
      pin(D2) {
        direction : input;
        capacitance : 1;
      }
      pin(C2) {
        direction : input;
        capacitance : 2;
      }
      pin(SE) {
        direction : input;
        capacitance : 2;
      }
      pin(SEB) {
        direction : input;
        capacitance : 2;
      }
      pin(Q) {
        direction : output;
        timing() {
          timing_type : rising_edge;
          intrinsic_rise : 1.0;
          intrinsic_fall : 1.0;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "G C2";
        }
      }
```

Feedback

```
    pin(QN) {
      direction : output;
      timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "G C2";
      }
    }
    test_cell() {
      pin(D) {
        direction : input;
      }

        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
      }
      pin(QN) {
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
      }
    }
  }
```

Feedback

The following is an example message:

```
Error: The test cell on the 'libg165' cell cannot have more than one
        test_scan_enable or test_scan_enable_inverted signal type.
        This happens on the 'SEB' port. (LIBG-165)
```

**What Next**

Check the library description to ensure that each test_cell has only one test_scan_enable or test_scan_enable_inverted signal type. Otherwise, provide a full functional description of the non test_cell cell to bypass the multuple scan enable check.

---

## LIBG-166

(error) The '%s' test_scan_clock port in test_cell on the '%s' cell\n \tdoes not have an active sense.

**Description**

The test_scan_clock must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock is the scan clock in the clocked scan type.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

**What Next**

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

```
* Create a cell with the non test mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

---

## LIBG-167

(error) The '%s' test_scan_clock_a port in test_cell on the '%s' cell\n \tdoes not have an active sense.

Feedback

### Description

The test_scan_clock_a must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock_a is the scan clock for the master stage of the LSSD scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

### What Next

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

---

## LIBG-168

(error) The '%s' test_scan_clock_b port in test_cell on the '%s' cell\n \tdoes not have an active sense.

### Description

The test_scan_clock_b must have an active sense in the full cell description. The active sense is determined by Library Compiler by checking the function of the full cell. The test_scan_clock_b is the scan clock for the slave stage of the LSSD scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

### What Next

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

Feedback

## LIBG-169

(error) The '%s' test_clock port in test_cell on the '%s' cell does \n \tnot have an active sense.

### Description

The test_clock must have an active sense in the full cell description. Library Compiler determines the active sense by checking the function of the full cell. The test_clock is the capture clock used by ATPG in the auxiliary clocked lssd scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

### What Next

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

## LIBG-170

(error) The '%s' port in test_cell for the '%s' cell has an invalid\n \tsignal type %s.

### Description

The valid signal_types in test_cells are

```
- test_scan_in
        - test_scan_in_inverted
        - test_scan_enable
        - test_scan_enable_inverted
        - test_scan_out
        - test_scan_out_inverted
        - test_scan_clock
        - test_scan_clock_a
        - test_scan_clock_b
        - test_clock
```

This warning informs you that the port in the test_cell pointed to has a signal_type other than the ones listed previously. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

Feedback

### What Next

Check the test_cell pointed to and change the invalid signal_type.

---

## LIBG-171

(error) The LSSD test_cell for the '%s' cell has neither\n \ta test_scan_clock_b signal type nor a master-slave as its nontest mode.

### Description

LSSD scan styles must have the following test_cell characteristics:

```
clocked lssd
        - signal types : test_scan_in/test_scan_in_inverted,
 test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
 test_scan_clock_b
        - nontest mode: flip_flop
   auxiliary clock lssd
        - signal types : test_scan_in/test_scan_in_inverted,
 test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
 test_scan_clock_b,
                test_clock
        - nontest mode : flip_flop
   single-latch lssd
        - signal types : test_scan_in/test_scan_in_inverted,
 test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
 test_scan_clock_b
        - nontest mode: latch
   single-latch lssd
        - signal types : test_scan_in/test_scan_in_inverted,
 test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
                test_scan_clock_b (optional)
        - nontest mode: master-slave (clocked_on & clocked_on_also)
```

This error informs you that this cell is an lssd scan style because it has test_scan_in/ test_scan_in_inverted, test_scan_out/test_scan_out_inverted, and test_scan_clock_a signal types. However, it is invalid because it has neither a test_scan_clock_b signal type nor a master-slave as its nontest mode. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg171) {
      area : 21;
             pin(D1) {
```

                signal_type : "test_scan_out";
              }
            }
          }
```

The following is an example message:

```
Error: Line 229, The LSSD test_cell for the 'libg171' cell has neither
        a test_scan_clock_b signal type nor a master-slave as its nontest
 mode. (LIBG-171)
```

### What Next

Check the library description to ensure that each test_cell has correctly specified the nontest modes and signal types in the test_cell pointed to. If you do not understand why the nontest function is not one of the previous types,

```
* Create a cell with the nontest mode as the functional part
         of the cell.
        * Compile this cell.
        * Issue the following command:

            report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

---

## LIBG-172

(error) The test_cell for the '%s' cell is not valid because\n \tit has missing or extra test signals.

### Description

The supported scan styles must have the following test_cell characteristics:

```
multiplexed flip-flop
        - signal types : test_scan_in/test_scan_in_inverted,
 test_scan_enable/
                test_scan_enable_inverted,
 test_scan_out/test_scan_out_inverted
        - nontest mode : flip-flop, master-slave latch pair, or latch
   clocked scan
        - signal types : test_scan_in/test_scan_in_inverted,
 test_scan_enable/
                test_scan_enable_inverted (optional), test_scan_clock,
                test_scan_out/test_scan_out_inverted
        - nontest modes : flip-flop or latch
```

Feedback

```
  clocked lssd
       - signal types : test_scan_in/test_scan_in_inverted,
test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
test_scan_clock_b
       - nontest mode: flip-flop
  auxiliary clock lssd
       - signal types : test_scan_in/test_scan_in_inverted,
test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
test_scan_clock_b,
                test_clock
       - nontest mode : flip-flop
  single-latch lssd
       - signal types : test_scan_in/test_scan_in_inverted,
test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
test_scan_clock_b
       - nontest mode: latch
  single-latch lssd
       - signal types : test_scan_in/test_scan_in_inverted,
test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
test_scan_clock_b
       - nontest mode: latch
  single-latch lssd
       - signal types : test_scan_in/test_scan_in_inverted,
test_scan_out/
                test_scan_out_inverted, test_scan_clock_a,
                test_scan_clock_b (optional)
       - nontest mode: master-slave (clocked_on & clocked_on_also)
```

This warning informs you that the other signal types do not correspond to one of the previously supported scan styles. Extra or missing signal types point to the fact that the test_cell is not valid, and the entire cell is a black box.

The following example shows an instance where this message occurs:

```
cell(libg172) {
      area : 13;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(C) {
        direction : input;
        capacitance : 2;
      }
      pin(SDI) {
        direction : input;
        capacitance : 1;
      }
      pin(SDOB) {
```

Feedback

```
        direction : output;
      }
      test_cell() {
        pin(D) {
          direction : input;
        }
        pin(C) {
          direction : input;
        }
        pin(SDI) {
          direction : input;
          signal_type : "test_scan_in";
        }
        statetable("D C", "QN") {
          table : "L/H H : - : H/L,\
                  -   L : - : N";
        }

        pin(SDOB) {
          direction : output;
          inverted_output : TRUE;
          internal_node : "QN";
          signal_type : "test_scan_out_inverted";
        }
      }
    }
  }
```

The following is an example message:

```
Error: Line 160, The test_cell for the 'libg172' cell is not valid
 because
        it has missing or extra test signals. (LIBG-172)
```

**What Next**

Check the library description to ensure that each test_cell has correctly specified the nontest modes and signal types in the test_cell pointed to. If you do not understand why the nontest function is not one of the previous types,

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

Feedback

## LIBG-173

(error) Cannot derive full function based on test_cell\n \ton the '%s' cell due to previous warnings or errors.

### Description

Library Compiler generates a functional description of the entire cell based on the information in the test_cell. However, if there are warnings or errors in the test_cell, a functional description of the entire cell cannot be generated.

This error informs you that the test_cell pointed to has previous errors or warnings. Thus, the test_cell is not valid, and the entire cell is a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg173) {
            area : 11;
            pin(D0) {
              direction : input;
              capacitance : 1;
              timing() {
                timing_type : setup_rising;
                intrinsic_rise : 1.0;
                intrinsic_fall : 1.0;
                related_pin : "CK1";
              }
              timing() {
                timing_type : hold_rising;
                intrinsic_rise : 1.0;
                intrinsic_fall : 1.0;
                related_pin : "CK1";
              }
            }

            pin(TI) {
              direction : input;
              capacitance : 1;
              timing() {
                timing_type : setup_rising;
                intrinsic_rise : 1.0;
                intrinsic_fall : 1.0;
                related_pin : "CK1";
              }
              timing() {
                timing_type : hold_rising;
                intrinsic_rise : 1.0;
                intrinsic_fall : 1.0;
                related_pin : "CK1";
              }
            }
```

Feedback

```
pin(TE) {
  direction : input;
  capacitance : 1;
  timing() {
    timing_type : setup_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "CK1";
  }
  timing() {
    timing_type : hold_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "CK1";
  }
}

pin(CK1) {
  direction : input;
  capacitance : 1;
}
pin(Q) {
  direction : output;
  inverted_output : FALSE;
  timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CK1";
  }
}

pin(QN) {
  direction : output;
  inverted_output : TRUE;
  timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CK1";
  }
}

test_cell() {
  pin(D0) {
    direction : input;
  }
  pin(TE) {
```

Feedback

```
        direction : input;
        signal_type : "test_scan_enable";
      }
      pin(TI) {
        direction : input;
        signal_type : "test_scan_in";
      }
      pin(CK1) {
        direction : input;
        capacitance : 1;
      }

      statetable("D0 CK1", "Q") {
        table : "L/H F : - : L/H,\
                 -  ~F : - : N";
      }

      pin(Q) {
        direction : output;
        inverted_output : FALSE;
        internal_node : "Q";
        signal_type : "test_scan_out";
      }

      pin(QN) {
        direction : output;
        inverted_output : TRUE;
        state_function : "Q";
        signal_type : "test_scan_out_inverted";
    }
    }
  }
```

In this case, the test_cell pointed to has the test_scan_out_inverted signal type specified on a noninverted output 'QN' (LIBG-164). Thus, the test_cell is not valid, and the entire cell is converted to a black box.

The following is an example message:

```
Error: Line 189, Cannot derive full function based on test_cell
        on the 'libg173' cell due to previous warnings or errors.
 (LIBG-173)
```

**What Next**

Fix the previous problems in order to recognize both the test_cell and full cell functionality. You might have to add a state table description of the entire cell.

Feedback

## LIBG-174

(error) The '%s' clocked test cell is not valid\n \tbecause it has a master-slave configuration as its nontest mode.

### Description

A clocked test_cell has the following characteristics:

```
- signal types : test_scan_in/test_scan_in_inverted, test_scan_enable/
                 test_scan_enable_inverted (optional), test_scan_clock,
                 test_scan_out/test_scan_out_inverted
        - nontest modes : flip-flop or latch
```

This warning informs you that the signal types point to this cell as being a clocked scan test_cell, but it does not have a flip-flop or latch as its nontest mode; it is currently specified as a master-slave cell. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg174) {
    area : 10;
    pin(D) {
      direction : input;
      capacitance : 1;
      timing() {
        timing_type : setup_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "G";
      }
      timing() {
        timing_type : hold_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "G";
      }
    }
    pin(G G2) {
      direction : input;
      capacitance : 1;
    }
    pin(D2) {
      direction : input;
      capacitance : 1;
      timing() {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "C2";
```

Feedback

```
    }
    timing() {
      timing_type : hold_rising;
      intrinsic_rise : 0.0;
      intrinsic_fall : 0.0;
      related_pin : "C2";
    }
  }
  pin(C2) {
    direction : input;
    capacitance : 2;
  }
  pin(Q) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "G C2";
    }
  }
  pin(QN) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : " G2 G C2";
    }
  }
  test_cell() {
    pin(D) {
      direction : input;
    }
    pin(G G2) {
      direction : input;
    }
    pin(D2) {
      direction : input;
      signal_type : "test_scan_in";
    }
    pin(C2) {
      direction : input;
      signal_type : "test_scan_clock";
    }
    latch ("IQ","IQN") {
      data_in : "D";
      enable : "G";
      enable_also : "G2";
```

Feedback

```
      }
      pin(Q) {
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
      }
      pin(QN) {
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
      }
    }
  }
```

In this case, the cell is a master-slave with an unknown test cell type.

The following is an example message:

```
Error: Line 208, The 'libg174' clocked test cell is not valid
        because it has a master-slave configuration as its nontest mode.
 (LIBG-174)
fi
```

**What Next**

Check the library description to ensure that nontest modes and signal types are correctly pointed to by the test_cell. To determine why the nontest function is not one of the previous types,

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

---

## LIBG-175

(error) The test cell for the '%s' auxiliary clocked lssd cell is not \n \tvalid because its nontest mode is not a flip-flop.

**Description**

An auxiliary clocked lssd test_cell has the following characteristics:

```
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
                 test_scan_out_inverted, test_scan_clock_a,
 test_scan_clock_b,
```

Feedback

```
                test_clock
        - nontest mode : flip-flop
```

This warning informs you that the signal types point to this cell as being a auxiliary clocked lssd test_cell, but it does not have a flip-flop as its nontest mode. This makes the test_cell invalid and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

The following example shows an instance where this message occurs:

```
cell(libg103) {
      area : 12;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(CK,IH, CK1) {
        direction : input;
        capacitance : 1;
      }
      pin(A,B) {
        direction : input;
        capacitance : 2;
      }
      pin(SI) {
        direction : input;
        capacitance : 1;
        timing() {
          timing_type : setup_falling;
          intrinsic_rise : 1.0;
          intrinsic_fall : 1.0;
          related_pin : "A";
        }
        timing() {
          timing_type : hold_falling;
          intrinsic_rise : 1.0;
          intrinsic_fall : 1.0;
          related_pin : "A";
        }
      }
      pin(Q) {
        direction : output;
        timing() {
          timing_type : rising_edge;
          intrinsic_rise : 1.0;
          intrinsic_fall : 1.0;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "CK IH CK1";
        }
        timing() {
          timing_type : falling_edge;
```

Feedback

```
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "B";
      }
    }
    pin(XQ) {
      direction : output;
    }
    test_cell(){
      pin(D,CK,CK1){
        direction : input;
      }
      pin(IH ){
        direction : input;
        signal_type : "test_clock";
      }
      pin(SI){
        direction : input;
        signal_type : "test_scan_in";
      }
      pin(A){
        direction : input;
        signal_type : "test_scan_clock_a";
      }
      pin(B){
        direction : input;
        signal_type : "test_scan_clock_b";
      }
      ff("IQ","IQN"){
        clocked_on : "CK";
        next_state : "D";
        clocked_on_also : "CK1";
      }

      pin(Q){
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
      }
      pin(XQ){
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
      }
    }
  }
```

Feedback

The following is an example message:

```
Error: Line 196, The test cell for the 'libg175' auxiliary clocked lssd
 cell is not
        valid because its nontest mode is not a flip-flop. (LIBG-175)
```

**What Next**

Check the library description to ensure that nontest modes and signal types are correctly pointed to by the test_cell. To determine why the nontest function is not one of the previous types,

```
* Create a cell with the nontest mode as the functional part
          of the cell.
        * Compile this cell.
        * Issue the following command:

             report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

---

## LIBG-176

(error) Neither the memory_read nor the memory write group\n \tis allowed on scalar ports.

**Description**

Either the memory_read group or the memory_write group is specified on a scalar port. These groups are only allowed on bus groups.

**What Next**

Remove the memory_read and memory_write group from all scalar ports.

---

## LIBG-177

(error) The '%s' cell is a ROM, and ROMs cannot have any\n \tmemory_write groups.

**Description**

The cell is defined as a ROM type in the memory group. ROM cells cannot have any memory_write groups because the memory block cannot be written to.

The following example shows an instance where this message occurs:

```
cell(libg177) {
            ...
            memory() {
              type : rom;
```

Feedback

```
            address_width : 10;
            word_width : 8;
          }
           ...
          bus (data_in) {
              bus_type   : "bus8"
              direction : input;
              capacitance : 1.46;
              fanout_load : 1.46;

              memory_write() {          /* Not allowed on ROM cells */
                address : ram_addr;
               enable : WR;
              }
          }
           ...
        }
```

The following is an example message:

```
Error: Line 22, The 'libg177' cell is a ROM, and ROMs cannot have any
       memory_write groups. (LIBG-177)
```

**What Next**

Either change the memory type to a ram type or remove the memory_write group.

---

## LIBG-178

(error) The '%s' cell is a RAM, and RAMs must have at\n \tleast one memory_read port and at least one memory_write port.

**Description**

The cell is defined as a RAM type in the cell memory group. RAM cells must have at least one memory_read port and at least one memory_write port.

The following example shows an instance where this message occurs:

```
cell (libg178) {

      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }

      bus (ram_addr) {
           bus_type  : "bus10"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
```

Feedback

```
      }
      bus (data_in) {
            bus_type   : "bus8";  /* defined in the library */
            direction : input;
            capacitance : 1.0;
            memory_write() {
              address : ram_addr;
              enable : WR;
            }
      }
      pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
      }

      bus(data_out){
        bus_type  : "bus8";
        direction : output;

     }
  }
```

In this case, the memory_read group is missing in the cell. Add the following group to the port 'data_out' :

```
memory_read() {
          address : ram_addr;
        }
```

The following is an example message:

```
Error: Line 22, The 'libg178' cell is a RAM, and RAMs must have at
        least one memory_read port and at least one memory_write port.
 (LIBG-178)
```

### What Next

You can implement either of the following suggestions:

```
(1) Change the memory type to rom and ensure only the memory_read
group is provided.
(2) If the model is for a RAM, make sure that both the memory_read and
memory_write groups are provided.
```

---

## LIBG-179

(error) The '%s' cell is a ROM, and ROMs must have at\n \tleast one memory_read group.

Feedback

### Description

The cell is defined as a ROM type in the cell memory group. ROM cells require at least one memory_read port.

The following example shows an instance where this message occurs:

```
cell (libg179) {

      area : 2300.0;
      memory() {
        type : rom;
        address_width : 10;
        word_width : 8;
       }

       bus (ram_addr) {
            bus_type  : "bus10"; /* defined in the library */
            direction : input;
            capacitance : 1.0;
     }
     bus (data_in) {
            bus_type   : "bus8"
            direction : input;
            capacitance : 1.0;
     }
     pin (WR) {
       direction : input;
       capacitance : 1.13;
       clock : true;
     }
     bus(data_out){
       bus_type  : "bus8";
       direction : output;
    }
 }
```

In this case, the memory_read group is missing in the cell. Add the following group to the port 'data_out' :

```
memory_read() {
         address : ram_addr;
       }
```

The following is an example message:

```
Error: Line 22, The 'libg179' cell is a ROM, and ROMs must have at
        least one memory_read group. (LIBG-179)
```

### What Next

Add the memory_read group to the data port.

Feedback

## LIBG-180

(error) The '%s' bus has a %s group, but the '%s' cell\n \thas no memory group.

### Description

The cell is missing a memory group. The bus has memory specific syntax, which is not allowed.

The following example shows an instance where this message occurs:

```
cell (libg179) {

      area : 2300.0;
      bus (ram_addr) {
           bus_type  : "bus10"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;
           memory_write() {
             address : ram_addr;
             enable : WR;
           }
     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }
     bus(data_out){
       bus_type  : "bus8";
       direction : output;

    }
 }
```

The following is an example message:

```
Error: Line 38, The 'data_in' bus has a memory_write group, but the
 'lib180' cell
        has no memory group. (LIBG-180)
```

### What Next

Either add the memory group to the cell or remove the memory_read/write groups from the ports.

Feedback

## LIBG-181

(error) In the '%s' cell, the '%s' data bus has a width of %d,\n \tbut the memory group has a word width of %d.

### Description

The size of the data bus does not match the size of the memory group specified in the cell memory group. They must be consistent.

The following example shows an instance where this message occurs:

```
cell (libg181) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 8;
        word_width : 6;
      }

      bus (ram_addr) {
           bus_type  : "bus8"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;

           memory_write() {
             address : ram_addr;
             enable : WR;
           }
     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }

     bus(data_out){
       bus_type  : "bus8";
       direction : output;
       memory_read() {
         address : ram_addr;
       }
    }
  }
```

Feedback

In this case, the width of the bus data_out is 8 and the word width in the memory group is 6. Change either the bus_data's width to 6 or the memory group's word width to 8 to make them consistent.

The following is an example message:

```
Error: Line 54, In the 'libg181' cell, the 'data_out' data bus has a
 width of 8,
        but the memory group has a word width of 6. (LIBG-181)
```

**What Next**

Change the library to make the data bus width and the memory group word's width consistent.

---

## LIBG-182

(error) The '%s' memory_write data bus can not be an output.

**Description**

The bus is an input to the memory block because it has the memory_write group specified. Inputs to the memory block can not be an output type.

**What Next**

The direction of the bus must be changed to either input, inout, or internal.

---

## LIBG-183

(error) In the '%s' cell, the '%s' address bus is not defined.

**Description**

The address bus specified in the group is not defined in the cell.

The following example shows an instance where this message occurs:

```
cell (libg183) {
      area : 2300.0;

      memory() {
        type : ram;
        address_width : 8;
        word_width : 8;
      }
     bus (data_in) {
           bus_type   : "bus8" /* defined in the library */
           direction : output;
           capacitance : 1.0;
           memory_write() {
```

Feedback

```
            address : ram_addr;
            enable : WR;
          }
      }
      pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
      }
      bus(data_out){
        bus_type  : "bus8";
        direction : output;
        memory_read() {
          address : ram_addr;
        }
     }
  }
```

In this case, define the ram_addr as a port in the cell as follows:

bus (ram_addr) { bus_type : "bus8"; /* defined in the library */ direction : input; capacitance : 1.0; }

The following is an example message:

```
Error: Line 58, In the 'libg183' cell, the 'ram_addr' address bus is not
 defined. (LIBG-183)
```

**What Next**

The address specification must refer to a bus defined in the cell.

---

## LIBG-184

(error) In the '%s' cell, the '%s' address bus has a width of %d,\n \tbut the memory group has an address width of %d.

**Description**

The size of the address bus does not match the address size of the memory group specified in the cell memory group. They must be consistent.

The following example shows an instance where this message occurs:

```
cell (libg184) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }
```

Feedback

```
      bus (ram_addr) {
           bus_type  : "bus8"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;

           memory_write() {
             address : ram_addr;
             enable : WR;
           }
     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }

     bus(data_out){
       bus_type  : "bus8";
       direction : output;
       memory_read() {
         address : ram_addr;
       }
    }
  }
```

In this case, the width of the bus data_out is 8 and the address width in the memory group is 10. Either change the width of the ram_addr to 10 or change the memory group's address width to 8 to make them consistent.

The following is an example message:

```
Error: Line 58, In the 'libg184' cell, the 'ram_addr' address bus has a
 width of 8,
        but the memory group has an address width of 10. (LIBG-184)
```

**What Next**

Change the library to make the address bus width and the memory group address width consistent.

---

## LIBG-185

(error) The '%s' memory address can not be an output.

Feedback

### Description

The address bus is an input to the memory block. Inputs to the memory block can not be an output type.

### What Next

The direction of the bus must be changed to either input, inout, or internal.

---

## LIBG-186

(error) In the '%s' cell, the '%s' memory_read data bus\n \tcannot be an input.

### Description

The data bus is an output of the memory block because it has the memory_read group specified.

The following example shows an instance where this message occurs:

```
cell (libg186) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 8;
        word_width : 8;
      }
      bus (ram_addr) {
           bus_type  : "bus8"; /* defined in the library */
           direction : output;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;
           memory_write() {
             address : ram_addr;
             enable : WR;
           }
     }
     pin (WR) {
       direction : input;
       capacitance : 1.13;
       clock : true;
     }
     bus(data_out){
       bus_type  : "bus8";
       direction : input; /* should be output */
       memory_read() {
         address : ram_addr;
       }
```

Feedback

```
    }
  }
```

The following is an example message:

```
Error: Line 54, In the 'libg186' cell, the 'data_out' memory_read data
 bus
        cannot be an input. (LIBG-186)
```

**What Next**

Change the direction of the bus that has the memory_write group to either output, inout, or internal.

---

## LIBG-187

(error) In the '%s' cell, The %s '%s' attribute is not\n \tthe name of a port or bus.

**Description**

The attribute specified in the group is not defined in the cell as either a port or a bus.

You cannot specify an expression here, only a port or a bus is valid. If you need to model an expression(logic), create a pin with a state_function attribute and use that internal pin.

The following example shows an instance where this message occurs:

```
cell (libg187) {
      area : 1380.0;
      interface_timing : TRUE;

      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }

      bus (RA) {
        bus_type  : "bus10";
        direction : input;
        capacitance : 1.0;
      }

      bus (DI) {
        bus_type   : "bus8";
        direction : input;
        capacitance : 1.0;

        memory_write() {
          address : RA;
          enable : "WRE";
        }
```

Feedback

```
      }

      pin (WE) {
        direction : input;
        capacitance : 1.0;
        clock : true;
      }

      pin (CE) {
        direction : input;
        capacitance : 1.0;
        clock : true;
      }

      bus(DO){
        bus_type  : "bus8";
        direction : output;
        capacitance : 1.0;

        memory_read() {
          address : RA;
        }
      }
    }
```

In this case, the port 'WRE' can be defined :

```
1. as an internal pin
        2. is state_function defines the writing occurence only when
           WE and CE are active.

      pin (WRE) {
        direction : internal;
        capacitance : 1.0;
        state_function : "!(WE' * CE')";
        clock : true;
      }
```

The following is an example message:

```
Error: Line 43, In the 'libg187' cell, the enable 'WRE' attribute is not
        the name of a port or bus. (LIBG-187)
```

**What Next**

Make sure the specification refers to a port or a bus defined in the cell.

---

## LIBG-188

(error) In the '%s' cell, the %s '%s' bus has a width of %d,\n \tbut the memory group has a word width of %d.

Feedback

### Description

The size of the bus does not match the word size of the memory block specified in the cell memory group. They must be consistent.

The following example shows an instance where this message occurs:

```
cell (libg188) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
       }

       bus (ram_addr) {
            bus_type  : "bus10"; /* defined in the library */
            direction : input;
            capacitance : 1.0;
     }
     bus (data_in) {
            bus_type   : "bus8"
            direction : input;
            capacitance : 1.0;

            memory_write() {
              address : ram_addr;
              enable : WR;
            }
     }
     bus (WR) {
       bus_type   : "bus10"
       direction : input;
       capacitance : 1.0;
       fanout_load : 1.0;
       clock : true;
     }
     bus(data_out){
       bus_type  : "bus8";
       direction : output;
       memory_read() {
         address : ram_addr;
       }
    }
 }
```

In this case, the bus type of the enable 'WR' is bus10. Change it to bus8.

The following is an example message:

```
Error: Line 42, In the 'libg188' cell, the enable 'WR' bus has a width of
 10,
        but the memory group has a word width of 8. (LIBG-188)
```

Feedback

### What Next

Change the library to make the bus width and the memory group word width consistent.

---

## LIBG-189

(error) In the '%s' cell, the memory_write group cannot\n \thave both the enable attribute and the clocked_on attribute.

### Description

The memory_write group has both the enable attribute and the clocked_on attribute specified. The Library Compiler does not allow it.

The following example shows an instance where this message occurs:

```
cell (libg189) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }

      bus (ram_addr) {
           bus_type  : "bus10"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8";
           direction : input;
           capacitance : 1.0;

           memory_write() {
             address : ram_addr;
             enable : WR;
             clocked_on : WR;
           }
     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }

     bus(data_out){
       bus_type  : "bus8";
       direction : output;
       memory_read() {
         address : ram_addr;
       }
```

Feedback

```
    }
 }
```

For the bus 'data_in', you can either have the enable attribute or the clocked_on attribute defined in the memory_write, but not both.

The following is an example message:

```
Error: Line 40, In the 'libg189' cell, the memory_write group cannot
        have both the enable attribute and the clocked_on attribute.
 (LIBG-189)
```

### What Next

If the memory write process is edge triggered, use the clocked_on attribute. If the memory write process is level-sensitive triggered, use the enable attribute. You cannot specify both at once.

---

## LIBG-190

(error) In the '%s' cell, the v3.1 sequential syntax is not\n \tsupported on memory cells.

### Description

The cell has both the memory syntax and the v3.1 sequential syntax defined by either the *function* attribute or the *ff* and *latch* groups. The two syntaxes are not compatible and cannot both be specified on the same cell.

The following example shows an instance where this message occurs:

```
cell (libg190) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }

      bus (ram_addr) {
           bus_type  : "bus10"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;

           memory_write() {
             address : ram_addr;
             enable : WR;
```

Feedback

```
        }
      }
      pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
      }

      bus(data_out){
        bus_type  : "bus8";
        direction : output;
        function : "WR + data_in";
        memory_read() {
          address : ram_addr;
        }
     }
  }
```

The function attribute is defined for the pin 'data_out'. This message is displayed for each element of the bus data_out that has the function attribute. To fix the problem, temove the function attribute from the pin.

The following is an example message:

```
Error: Line 60, In the 'libg190' cell, the v3.1 sequential syntax is not
        supported on memory cells. (LIBG-190)
```

**What Next**

Remove the v3.1 sequential syntax, and use the new state table syntax.

---

## LIBG-191

(error) The '%s' memory output cannot have a function.

**Description**

The memory output has an internal_node or a state_function attribute. A memory output has its function defined by the memory_read group and cannot also have an internal_node or a state_function attribute.

The following example shows an instance where this message occurs:

```
cell (libg191) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }

      bus (ram_addr) {
```

Feedback

```
            bus_type  : "bus10"; /* defined in the library */
            direction : input;
            capacitance : 1.46;
        }
        bus (data_in) {
            bus_type   : "bus8"
            direction : input;
            capacitance : 1.46;

            memory_write() {
              address : ram_addr;
              enable : WR;
            }
        }
        pin (WR) {
          direction : input;
          capacitance : 1.13;
          clock : true;
        }

        bus(data_out){
          bus_type  : "bus8";
          direction : output;
          state_function : "WR + data_in"; /* not allowed */
          memory_read() {
            address : ram_addr;
          }
       }
    }
```

This message is displayed for each element of the bus data_out that has the state_function attribute.

The following is an example message:

```
Error: Line 60, The 'data_out[0]' memory output cannot have a function.
 (LIBG-191)
```

**What Next**

Remove the internal_node or state_function attribute.

---

## LIBG-192

(error) The '%s' port that has both memory_read and memory_write\n \tmust have the inout direction.

**Description**

Buses with both memory_read and memory_write groups must have the direction inout.

Feedback

The following example shows an instance where this message occurs:

```
cell (libg192) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
      }

      bus (ram_addr) {
           bus_type  : "bus10"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;

     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }

     bus(data_out){
       bus_type  : "bus8";
       direction : output;      /* must be inout */
       memory_read() {
         address : ram_addr;
       }
       memory_write() {
          address : ram_addr;
          enable : WR;
       }
    }
 }
```

In this case, the direction of the bus 'data-out' is output. To fix the problem, set the direction to inout. This message is displayed for each element of the bus data_out.

The following is an example message:

```
Error: Line 62, The 'data_out[0]' port that has both memory_read and
 memory_write
        must have the inout direction. (LIBG-192)
```

**What Next**

Either change the direction of this bus to inout, or remove either the memory_read or memory_write group from this bus.

Feedback

## LIBG-193

(error) The '%s' port that has both memory_read and memory_write\n \tmust have a three_state expression.

### Description

Buses with both memory_read and memory_write groups must have the *three_state* attribute. During the memory write cycle, when the new data value is driven in from outside the cell, the port associated with the memory_read group must have a three_state attribute.

The following example shows an instance where this message occurs:

```
cell (libg193) {
      area : 2300.0;
      memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
       }

      bus (ram_addr) {
           bus_type  : "bus10"; /* defined in the library */
           direction : input;
           capacitance : 1.0;
     }
     bus (data_in) {
           bus_type   : "bus8"
           direction : input;
           capacitance : 1.0;

     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }

     bus(data_out){
       bus_type  : "bus8";
       direction : inout;       /* must have three_state */
       memory_read() {
         address : ram_addr;
       }
       memory_write() {
          address : ram_addr;
          enable : WR;
       }
    }
 }
```

Feedback

In this case, the bus 'data_out' has both memory_read and memory_write groups, but no three_state attribute. This message is displayed for each element of the bus data_out. To fix the problem, add the three_state attribute to the bus as follows:

```
pin (CE) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }
     bus(data_out){
       bus_type  : "bus8";
       direction : inout;
       three_state : "CE";       /* new statement */
       memory_read() {
         address : ram_addr;
       }
       memory_write() {
          address : ram_addr;
          enable : WR;
       }
    }
```

The following is an example message:

```
Error: Line 62, The 'data_out[0]' port that has both memory_read and
 memory_write
        must have a three_state expression. (LIBG-193)
```

**What Next**

Add a valid three_state expression to this bus, or remove either the memory_read or memory_write group from this bus.

---

## LIBG-194

(warning) The function attribute on the '%s' pin is ignored.

**Description**

This message indicates that the *function* attribute on the specified pin is ignored. If the pin is an internal pin, use *state_function* attribute. Internal pins are equal to internal nodes, which are single sequential elements. If the cell is a memory cell, it does not need a *function* attribute if the pin already has a *memory_read*, has a *state_function* attribute, or is an internal node.

The following example shows an instance where this message occurs:

```
cell(libg202) {
  area : 10;
  pin(D) {
    direction : input;
```

Feedback

```
    capacitance : 1;
  }
  pin(CP) {
    direction : input;
    capacitance : 1;
  }
  statetable ( "D CP", "Q QB") {
    table : "L/H R  : - - : L/H H/L,\
             -   ~R : - - : N   N";
  }

  pin(Q) {
    direction : output;
    inverted_output : FALSE;
    function : "Q";
    internal_node : "Q";
  }
  pin(QB) {
    direction : output;
    inverted_output : TRUE;
    internal_node : "QB";
  }
}
```

The following is an example message:

```
Warning: Line 127, the function attribute on the 'Q' pin is ignored.
 (LIBG-194)
```

**What Next**

Either change the internal pin to a output or inout port or remove the *function* attribute.

---

## LIBG-195

(warning) A bundle is not supported in the memory group.

**Description**

Currently, Library Compiler does not support memory cells with bundles.

The following example shows an instance where this message occurs:

```
cell (libg195) {
      area : 2300.0;
      memory() {
       type : ram;
       address_width : 10;
       word_width : 8;
      }

      bundle (ram_addr) {
```

Feedback

```
        members( D_1 D_2);
        direction : input;
        capacitance : 1.0;
      }
      bus (data_in) {
        bus_type   : "bus8"
        direction : input;
        capacitance : 1.0;
        memory_write() {
           address : ram_addr;
           enable : WR;
        }
      }
      pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
      }
      bus(data_out){
        bus_type  : "bus8";
        direction : output;
        memory_read() {
          address : ram_addr;
        }
     }
  }
```

The following is an example message:

```
Warning: Line 94, A bundle is not supported in the memory group.
 (LIBG-195)
```

**What Next**

Modify the bundle into a bus.

---

## LIBG-196

(warning) The inverted_output attribute is not defined in the '%s' output port.

**Description**

Library Compiler uses the *inverted_output* attribute value to determine whether a sequential output pin is inverting or noninverting.

If this attribute is not defined. LC will make following assumptions: - For the output with "internal_node" == first output node in statetable, it is assumed to be noninverting; - For the output with "internal_node" == second output node in statetable, it is assumed to be inverting.

Feedback

The following example shows an instance where this message occurs:

```
cell(libg202) {
  area : 10;
  pin(D) {
    direction : input;
    capacitance : 1;
  }
  pin(CP) {
    direction : input;
    capacitance : 1;
  }
  statetable ( "D CP", "Q QB") {
    table : "L/H R  : - - : L/H H/L,\
             -   ~R : - - : N   N";
  }

  pin(Q) {
    direction : output;
/*    inverted_output : FALSE; */
    internal_node : "Q";
  }
  pin(QB) {
    direction : output;
    inverted_output : TRUE;
    internal_node : "QB";
  }
}
```

In this case, set the inverted_output value to FALSE in the port 'Q' to construct the correct logic for the Design Compiler. Without it, LC will make assumption that the port 'Q' is noninverting.

The following is an example message:

```
Warning: Line 127, The inverted_output attribute is not defined in the
 'Q' output port. (LIBG-196)
```

### What Next

Make sure each inout and output pin has its "inverted_output" attribute set.

---

## LIBG-197

(warning) In the '%s' cell, the '%s' and '%s'\n \tmemory read or memory write ports have the same address attribute.

### Description

This message indicates that the same address attribute is used for both of the specified memory read or memory write ports. Each port must have a unique address attribute.

Feedback

The following example shows an instance where this message occurs:

```
cell (libg197) {
      area : 2300.0;
      memory() {
       type : ram;
       address_width : 10;
       word_width : 8;
      }

      bus (ram_addr) {
       bus_type  : "bus10"; /* defined in the library */
       direction : input;
       capacitance : 1.0;
     }
     bus (data_in) {
       bus_type   : "bus8"
       direction : input;
       capacitance : 1.0;
       memory_write() {
          address : ram_addr;
          enable : WR;
       }
     }
     pin (WR) {
       direction : input;
       capacitance : 1.0;
       clock : true;
     }
     pin (EN) {
       direction : input;
       capacitance : 1.0;
     }

     bus(data_out){
       bus_type  : "bus8";
       direction : inout;
       three_state : "EN";
       memory_read() {
         address : ram_addr;
       }
       memory_write() {
          address : ram_addr;
          enable : WR;
       }
    }
 }
```

In this case, the ports 'data_in' and 'data_out' have the same address attribute for the memory_write group. This message is displayed for each element of the bus data_in and the bus data_out.

Feedback

The following is an example message:

```
Warning: Line 38, In the 'libg197' cell, the 'data_in[0]' and
 'data_out[0]'
        memory read or memory write ports have the same address
 attribute. (LIBG-197)
```

**What Next**

Edit the cell description so that the specified ports have unique address attributes.

---

## LIBG-198

(error) The '%s' pin of the '%s' design must be an '%s'.

**Description**

By definition, a pin in the *related_pin* attribute for timing constraints must be a input pin.

The following is an example message:

```
Error: Line 153, The 'P' pin of the 'libg198' design must be an 'input'.
 (LIBG-198)
```

**What Next**

Check your library for a wrong pin in the *related_pin* attribute or for an incorrect *timing_type*.

---

## LIBG-199

(error) The '%s' input port in the '%s' cell cannot have timing arcs.

**Description**

Input ports cannot have timing arcs. There is a possible problem in the direction of the pin, which should be output or inout.

The following is an example message:

```
Error: Line 53, The 'D' input port in the 'libg199' cell cannot have
 timing arcs. (LIBG-198)
```

**What Next**

Check your library for a pin with a wrong direction. Change the direction to output or inout.

Feedback

## LIBG-201

(error) The min_period and min_pulse_width attributes are not allowed on the '%s' port in the '%s' cell.

### Description

This message indicates that the specified port has a *min_period*, *min_pulse_width_high*, or *min_period_width_low* attribute. These attributes are allowed only on clock enable ports.

### What Next

Update the technology library source to remove the offending attributes.

## LIBG-202

(information) In the '%s' cell, the '%s' internal pin is\n \treplaced with the inverted '%s' output pin.

### Description

This message indicates that the specified internal pin is an inversion of the output pin. The internal pin is replaced by the inverted output pin. This deletion is done without affecting the functionality of the cell. An internal pin that is never visible is functionally useless. Every internal pin must have a unique functional relationship with an output port.

The following example shows an instance where this message occurs:

```
cell(libg202) {
  area : 10;
  pin(D) {
    direction : input;
    capacitance : 1;
  }
  pin(CP) {
    direction : input;
    capacitance : 1;
  }
  statetable ( "D CP", "Q QB") {
    table : "L/H R  : - - : L/H H/L,\
             -   ~R : - - : N   N";
  }

  pin(Q2) {
    direction : internal ;
    internal_node : "QB" ;
  }
  pin(Q) {
    direction : output;
```

Feedback

```
    internal_node : "Q";
  }
  pin(QB) {
    direction : output;
    state_function : "Q2'";
  }
}
```

In this case the internal node 'Q2' is an inversion of the output 'Q'.

The following is an example message:

```
Information: Line 125, In the 'libg202' cell, the 'Q2' internal pin is
        replaced with the inverted 'Q' output pin. (LIBG-202)
```

**What Next**

Either delete the internal pin or give it a unique functional relationship with an output port.

---

## LIBG-203

(warning) The '%s' test cell has no function.

**Description**

One of the test_cells has no functional description. Each test cell needs a functional description (flip-flop or latch description). This is used to determine the full functionality of the cell and is also used for the command insert_test.

When reading a .db library, Library Compiler creates a full function if there is any test_cell with a functional description. If no test_cells have a functional description and there is no full cell functional description, the cell is converted to a black box.

**What Next**

Modify the library to specify a functional description within the test_cell group. If a full cell has the function description instead, the cell is no longer a black box, but the *insert_test* command will not be able to use the functional description.

---

## LIBG-204

(error) The '%s' test cell has no function and the cell is black box.

**Description**

One of the test_cells has no functional description. Each test cell needs a functional description (ff or latch description). This is used to determine the full function of the cell and is also used for the command insert_test.

Feedback

This cell becomes a black box and read_lib cannot proceed with reading the library if this error is found.

**What Next**

Specify a functional description within the test_cell. If you specify a full cell description instead, the cell is no longer a black box but insert_test cannot use the functional description.

---

## LIBG-205

(warning) Cell(%s): The function cannot be recognized \n\tduring functional optimization by Design Compiler.

**Description**

This warning message informs you that Library Compiler encountered one of the following problems:

1. Library Compiler failed to map the state table description of the cell to the flip-flop or latch group description due to the complexity of the function.
2. Library Compiler failed to degenerate a multiple flip-flop or latch group to a single flip-flop or latch group due to the complexity of the function.

The function cannot be recognized by Design Compiler. This cell becomes a black box cell during synthesis. However, it might not be a black box cell to DFT Compiler or other tools, depending on its test_cell description, if there is one.

In the following example, the cell cannot be modeled in v3.1 format, so the warning message should be ignored:

```
cell(libg205) {
  area : 16;
  pin(D) {
    direction : input;
    capacitance : 1;
  }
  pin(CP) {
    direction : input;
    capacitance : 2;
  }
  pin (Q0) {
    direction : output;
    internal_node : "Q";
    input_map : "D CP";
    ...
  }
  pin (Q1) {
    direction : output;
```

Feedback

```
    internal_node : "Q";
    input_map : "Q0 CP";
    ...
  }
  pin (Q2) {
    direction : output;
    internal_node : "Q";
    input_map : "Q1 CP";
    ...
  }
  pin (Q3) {
    direction : output;
    internal_node : "Q";
    input_map : "Q2 CP";
    ...
  }
  statetable( "D CP", "Q QN" ) {
    table : "- ~R : - - : N N,\
             H/L R : - - : H/L L/H";
  }
}
```

This example generates the following warning message:

```
Warning: Line 21, Cell(libg205): The function cannot be
         recognized by Design Compiler. The cell becomes a black box.
         (LIBG-205)
```

In the following example, the cell cannot be simplified into one flip-flop description by giving disable values (NRESTORE = 1 and SAVE = 0):

```
cell(libg205_1) {
  latch ("p1",IQ,IQN) {
     data_in : "((D !SE) + (SE SI))";
     enable : "!p1 + SAVE";
     clear : "!CDN";
  }
  latch ("p1, p2",IQ1,IQN1) {
     data_in : "p2";
     enable : "p1 + NRESTORE";
     clear : "!CDN";
  }
  pin (inQ) {
     function : "IQ";
     reference_input : "CP";
  }
  pin (NRESTORE) {
     retention_pin("restore",1);
  }
  pin (Q) {
    function : "IQ1";
    reference_input : "CP inQ";
  }
```

Feedback

```
  pin (SAVE) {
    retention_pin("save",0);
  }
}
```

This example results in the following warning message:

```
Warning: Line 21, Cell(libg205_1): The function cannot be
         recognized by Design Compiler. The cell becomes a black box.
         (LIBG-205)
```

### What Next

For item 1 above, ignore this message if the intended function cannot be described in v3.1 flip-flop or latch syntax. Otherwise, correct the state table function.

For item 2 above, correct the multiple sequential description if it cannot be simplified to a single sequential descriptor by tied up disable values. Otherwise, ignore the message.

---

## LIBG-206

(warning) The logic represented by the 'when' string (%s) in this %s group is equivalent to logic %s.

### Description

The logic represented by the 'when' string of state-dependent internal_power and leakage_power groups should not be logically equivalent to logic 0 or logic 1.

A power table with its 'when' condition equivalent to logic 0 is meaningless because it will always be ignored during power calculation.

A power table with its 'when' condition equivalent to logic 1 is valid all states and is therefore not state dependent. It should be represented by a power table without the 'when' condition.

### What Next

Check the 'when' conditions in the internal power or leakage power group and check that that are not equivalent to logic 0 or 1. Since such condition values are typically meaningless, the power tables may have been characterized incorrecly. 'when' strings with conditons equivalent to logic 1 should be removed. Power tables with conditions equivalent to logic 0 should be removed. This warning may be promoted to an error in future releases.

Feedback

## LIBG-207

(error) The logic represented by the 'when' string (%s) in this\n \t%s group is not mutually exclusive with the logic represented by\n \tthe 'when' string (%s) in the %s group on line %d.

### Description

The logic represented by the 'when' string of all state-dependent or path-dependent internal_power groups between a pair of pins should be mutually exclusive. If it is not, Library Compiler is not be able to determine which internal_power group to use when propagating a signal through the path, if the condition causes both of them to be evaluated 'TRUE'.

The logic represented by the 'when' string of all state-dependent leakage_power groups should be mutually exclusive. If it is not, Library Compiler is not be able to determine which leakage_power group to use if the condition cause more than one condition to be evaluated 'TRUE'.

The following example shows an instance where this message occurs:

```
cell(libg44) {
      area : 2;
      pin(D1 D0 S0) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "S0'D0 + S0 D1";
        timing() {
          timing_sense : non_unate;
          intrinsic_rise : 1.00;
          intrinsic_fall : 1.00;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : " D0 D1";
        }
        timing() {
          when : "S0'D0 + S0 D1'";
          when : "D1' S0 + S0'D0 ";
          sdf_cond : "(D1 == 1'b0 && S0 == 1'b1) || (S0 == 1'b0 && D0 ==
 1'b1)";
          timing_sense : positive_unate;
          intrinsic_rise : 1.00;
          intrinsic_fall : 1.00;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "S0";
        }
        timing() {
```

Feedback

```
          when : "D1 S0 + S0'D0";
          sdf_cond : "(D1 == 1'b1 && S0 == 1'b1) || (S0 == 1'b0 && D0 ==
 1'b0)";
          timing_sense : non_unate;
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "S0";
        }
        timing() { /* default */
          intrinsic_rise : 1.00;
          intrinsic_fall : 2.00;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "S0";
        }
      }
    }
```

In this case, the second when attribute's string has a typographical error. It should be "D1 S0 + S0'D0'"; where the pin D0 should be ticked according to the sdf_cond attribute's string.

The following is an example message:

```
Error: Line 258, The logic represented by the 'when' string (S0'D0 + S0
 D1') in this
        timing group is not mutually exclusive with the logic represented
 by
        the 'when' string (D1 S0 + S0'D0) in the timing group on line
 268. (LIBG-
44)
```

### What Next

Check the 'when' strings of both timing groups for wrong information and fix.

---

## LIBG-207w

(warning) The logic represented by the 'when' string (%s) in this\n \t%s group is not mutually exclusive with the logic represented by\n \tthe 'when' string (%s) in the %s group on line %d.

### Description

The logic represented by the 'when' string of all state-dependent or path-dependent internal_power groups between a pair of pins should be mutually exclusive. If it is not, Library Compiler is not be able to determine which internal_power group to use when

Feedback

propagating a signal through the path, if the condition causes both of them to be evaluated 'TRUE'.

The logic represented by the 'when' string of all state-dependent leakage_power groups should be mutually exclusive. If it is not, Library Compiler is not be able to determine which leakage_power group to use if the condition cause more than one condition to be evaluated 'TRUE'.

The following example shows an instance where this message occurs:

```
cell(libg44) {
      area : 2;
      pin(D1 D0 S0) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "S0'D0 + S0 D1";
        timing() {
          timing_sense : non_unate;
          intrinsic_rise : 1.00;
          intrinsic_fall : 1.00;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : " D0 D1";
        }
        timing() {
          when : "S0'D0 + S0 D1'";
          when : "D1' S0 + S0'D0 ";
          sdf_cond : "(D1 == 1'b0 && S0 == 1'b1) || (S0 == 1'b0 && D0 ==
 1'b1)";
          timing_sense : positive_unate;
          intrinsic_rise : 1.00;
          intrinsic_fall : 1.00;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "S0";
        }
        timing() {
          when : "D1 S0 + S0'D0";
          sdf_cond : "(D1 == 1'b1 && S0 == 1'b1) || (S0 == 1'b0 && D0 ==
 1'b0)";
          timing_sense : non_unate;
          intrinsic_rise : 0.1;
          intrinsic_fall : 0.1;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "S0";
        }
        timing() { /* default */
          intrinsic_rise : 1.00;
```

Feedback

```
          intrinsic_fall : 2.00;
          rise_resistance : 0.1;
          fall_resistance : 0.1;
          related_pin : "S0";
        }
      }
    }
```

In this case, the second when attribute's string has a typographical error. It should be "D1 S0 + S0'D0'"; where the pin D0 should be ticked according to the sdf_cond attribute's string.

The following is an example message:

```
Warning: Line 258, The logic represented by the 'when' string (S0'D0 + S0
 D1') in this
        timing group is not mutually exclusive with the logic represented
 by
        the 'when' string (D1 S0 + S0'D0) in the timing group on line
 268. (LIBG-
207w)
```

### What Next

Check the 'when' strings of both timing groups for wrong information and fix.

---

## LIBG-208

(warning) Different number of pins on the '%s' test_cell are found.\n \tThe test_cell is removed.

### Description

The cell and its associated test_cell must have the same number of pins.

This warning informs you that the test_cell pointed to has a different number of pins than its parent cell.

The following example shows an instance where this message occurs:

```
cell(lbdb128) {
      area : 13;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(G) {
        direction : input;
        capacitance : 2;
      }
      pin(D2) {
        direction : input;
```

Feedback

```
    capacitance : 1;
  }
  pin(C2) {
    direction : input;
    capacitance : 2;
  }
  pin(Q) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "G C2";
    }
  }
  pin(QN) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "G C2";
    }
  }
  test_cell() {
    pin(D) {
      direction : input;
    }
    pin(G) {
      direction : input;
    }
    pin(D2) {
      direction : input;
      signal_type : "test_scan_in";
    }
    pin(C2) {
      direction : input;
      signal_type : "test_scan_clock";
    }
    pin(SE) {
      direction : input;
      capacitance : 2;
      signal_type : "test_scan_enable";
    }
    state ("IQ","IQN") {
      force_01 : "G D'";
      force_10 : "G D";
    }
    pin(Q) {
```

Feedback

```
          direction : output;
          function : "IQ";
          signal_type : "test_scan_out";
        }
        pin(QN) {
          direction : output;
          function : "IQN";
          signal_type : "test_scan_out_inverted";
        }
      }
    }
```

In this case, the 'SE' pin is defined in the test_cell, but it is not defined in the parent cell. To fix the problem, add the definition,

```
pin(SE) {
        direction : input;
        capacitance : 2;
      }
```

The following is an example message:

```
Warning: Line 124, Different number of pins on the 'lbdb128' cell are
 found.
        The test_cell is removed. (LIBG-208)
```

### What Next

Check the library description to ensure that each test_cell has the same number of pins as the parent cell.

---

## LIBG-209

(warning) Unable to find the '%s' pin on the '%s' test_cell.\n \tThe test_cell is removed.

### Description

This message indicates that you specified a different pin name in the cell and its associated test_cell. This might be caused by a typo. The Library Compiler ignores the associated test_cell.

The following example shows an instance where this message occurs:

```
cell(lbdb129) {
      area : 13;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(G) {
        direction : input;
        capacitance : 2;
```

Feedback

```
}
pin(D2) {
  direction : input;
  capacitance : 1;
}
pin(C2) {
  direction : input;
  capacitance : 2;
}
pin(SE) {
  direction : input;
  capacitance : 2;
}
pin(Q) {
  direction : output;
  timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
  }
}
pin(QN) {
  direction : output;
  timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
  }
}
test_cell() {
  pin(D) {
    direction : input;
  }
  pin(G) {
    direction : input;
  }
  pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
  }
  pin(C2) {
    direction : input;
    signal_type : "test_scan_clock";
  }
  pin(SEB) {
    direction : input;
    capacitance : 2;
```

Feedback

```
          signal_type : "test_scan_enable";
        }
        latch ("IQ","IQN") {
          data_in : "D";
          enable : "G";
        }
        pin(Q) {
          direction : output;
          function : "IQ";
          signal_type : "test_scan_out";
        }
        pin(QN) {
          direction : output;
          function : "IQN";
          signal_type : "test_scan_out_inverted";
        }
      }
    }
```

In this case, a pin is named 'SE' at the cell level and 'SEB' at the test_cell level. To fix the problem, give the pin the same name.

The following is an example message:

```
Warning: Line 124, Unable to find the 'SE' pin on the 'lbdb129'
 test_cell.
        The test_cell is removed. (LIBG-209)
```

**What Next**

Check the library description to ensure that each test_cell has the same number of pins as the parent cell.

---

## LIBG-210

(error) The '%s' pin of the '%s' cell has conflicting signal_types\n \tbetween the cell and the test_cell.

**Description**

This message indicates that you specified conflicting signal_type attributes for the same pin on different test_cell groups.

The following example shows an instance where this message occurs:

```
cell(lbdb131) {
      area : 13;
      pin(D) {
        direction : input;
        capacitance : 1;
      }
      pin(G) {
```

Feedback

```
    direction : input;
    capacitance : 2;
  }
  pin(D2) {
    direction : input;
    capacitance : 1;
  }
  pin(C2) {
    direction : input;
    capacitance : 2;
  }
  pin(SE) {
    direction : input;
    capacitance : 2;
  }
  pin(Q) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "G C2";
    }
  }
  pin(QN) {
    direction : output;
    timing() {
      timing_type : rising_edge;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      rise_resistance : 0.1;
      fall_resistance : 0.1;
      related_pin : "G C2";
    }
  }
  test_cell() {
    pin(D) {
      direction : input;
    }
    pin(G) {
      direction : input;
    }
    pin(D2) {
      direction : input;
      signal_type : "test_scan_in";
    }
    pin(C2) {
      direction : input;
      signal_type : "test_scan_clock";
    }
    pin(SE) {
```

Feedback

```
      direction : input;
      capacitance : 2;
      signal_type : "test_scan_enable";
    }
    state ("IQ","IQN") {
      force_01 : "G D'";
      force_10 : "G D";
    }
    pin(Q) {
      direction : output;
      function : "IQ";
      signal_type : "test_scan_out";
    }
    pin(QN) {
      direction : output;
      function : "IQN";
      signal_type : "test_scan_out_inverted";
    }
  }
  test_cell() {
    pin(D) {
      direction : input;
    }
    pin(G) {
      direction : input;
    }
    pin(D2) {
      direction : input;
      signal_type : "test_scan_in";
    }
    pin(C2) {
      direction : input;
      signal_type : "test_scan_clock";
    }
    pin(SE) {
      direction : input;
      capacitance : 2;
      signal_type : "test_scan_enable_inverted";
    }
    state ("IQ","IQN") {
      force_01 : "G D'";
      force_10 : "G D";
    }
    pin(Q) {
      direction : output;
      function : "IQ";
      signal_type : "test_scan_out";
    }
    pin(QN) {
      direction : output;
      function : "IQN";
      signal_type : "test_scan_out_inverted";
    }
```

Feedback

```
      }
    }
```

In this case, The 'SE' pin has a test_scan_enable signal_type in the first test_cell group and a test_scan_enable_inverted signal_type in the second test_cell group. To fix the problem, make the signal_type consistent between the two test_cell groups.

The following is an example message:

```
Error: Line 94, The 'SE' pin of the 'lbdb131' cell has conflicting
 signal_types
       between the cell and the test_cell. (LIBG-210)
```

### What Next

Check the library description to ensure that each test_cell has no conflicting signal_type attributes on its pins.

---

## LIBG-211

(warning) Cell '%s' contains unused input pin(s).\n\tIt is labeled dont_use and dont_touch.

### Description

An input pin is unused if it does not appear in any functional statement, or state table input or input map, nor does it have any test signal_type description. Such cells may cause synthesis to generate errouneous logic because of incomplete modeling.

The following example shows an instance where this message occurs:

```
cell(acell) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
        }
        pin(Q) {
                direction : output;
                function : "IQ";
        }
        pin(QN) {
                direction : output;
                function : "IQN";
```

Feedback

```
                }
  }
```

The following is an example message:

```
Warning: Line 202, Cell 'acell' contains unused input pin(s).
        It is labeled dont_use and dont_touch. (LIBG-211)
```

**What Next**

Either delete the unused input pin or add it the functionality of the cell.

---

## LIBG-212

(warning) The logic represented by the '%s' when string in this %s group\n \tdoes not sensitize one or all pins in the '%s' related_pin attribute for the %s function attribute.

**Description**

This message indicates that the when attribute within an internal_power group does not make sense given the function associated with the output pin. Library Compiler warns you that allowing these extra tables in the library, you are unnecessarily increasing the size of the library and may be characterizing unnecessary data.

The following example shows an instance where this message occurs:

```
cell(libg212) {
      area : 2;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "A & B";
        internal_power() {
          related_pin : "B";
          when : "!A'";
           ...
        }
      }
    }
```

In this case, this internal power table will never be accessed. This is because in order for B to cause Z to change, pin A must be high.

The following is an example message:

```
Warning: Line 191, The logic represented by the '!A' when string in this
 internal_power group
        does not sensitize one or all pins in the 'B ' related_pin
 attribute for the (A & B) function attribute. (LIBG-212)
```

Feedback

### What Next

Check the 'when' string of internal_power group for wrong information and fix.

---

## LIBG-213

(warning) The default internal power is not needed for the %s pin.

### Description

This message indicates that the set of 'when' attributes is complete for the internal_power and there is no need for the default internal power table.

The following example shows an instance where this message occurs:

```
cell(libg213) {
      area : 2;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }

       pin ( Z ) {
         direction : output ;
         function : "A & B";
         internal_power () {
           when : "A";
           related_pin : "B";
           power(power_template) {
           values (" 1.000000, 1.000000, 1.000000, 1.000000");
           }
         }
         internal_power () {
           when : "B";
           related_pin : "A";
           power(power_template) {
           values (" 1.000000, 1.000000, 1.000000, 1.000000");
           }
         }
         internal_power () {
           related_pin : "A B";
           power(power_template) {
           values (" 1.000000, 1.000000, 1.000000, 1.000000");
           }
         }
      }
    }
```

In this case, the default internal power table is not needed. This is because in the when attribute contains all possible paths which will sensitize the related_pin B to the output. Therefore, no default internal power table is needed.

Feedback

The following is an example message:

```
Warning: Line 183, The default internal power is not needed for the A
 pin. (LIBG-213)
```

**What Next**

Check the 'when' string of internal_power groups for wrong information and fix or remove the default internal power group.

---

## LIBG-214

(warning) The default internal power is required for the '%s' pin.

**Description**

This message indicates that the set of 'when' attributes is not complete for the internal_power and there is a need for the default internal power table.

The following example shows an instance where this message occurs:

```
cell(libg214) {
      area : 2;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }

       pin ( Z ) {
         direction : output ;
         function : "A & B";
         internal_power () {
           when : "A";
           related_pin : "B";
           power(power_template) {
           values (" 1.000000, 1.000000, 1.000000, 1.000000");
           }
         }
      }
    }
```

In this case, the default internal power table is needed for the related_pin A. This is because the when attribute does not contain all possible paths which will sensitize the related_pin A to the output. Therefore, you either add the power table associated with the related pin A and a when or add the default internal power table as show below:

either internal_power () { when : "B"; related_pin : "A"; power(power_template) { values (" 1.000000, 1.000000, 1.000000, 1.000000"); } } or internal_power () { related_pin : "B"; power(power_template) { values (" 1.000000, 1.000000, 1.000000, 1.000000"); } }

Feedback

The following is an example message:

```
Warning: Line 183, The default internal power is required for the 'A'
 pin. (LIBG-214)
```

### What Next

Check the 'when' string of internal_power groups for wrong information and fix or add the default internal power group.

---

## LIBG-215

(error) The '%s' when condition includes the '%s' related pin.

### Description

This message indicates that the 'when' and 'related_pin' attributes contain the same pin. This condition does not make sense because the when attribute is a static state while the related_pin attribute is the transitioning pin.

Note that the 'related_pin' of a pin includes the pin itself.

The following example shows an instance where this message occurs:

```
cell(libg215) {
      area : 2;
      pin(A B) {
        direction : input;
        capacitance : 1;
      }

       pin ( Z ) {
         direction : output ;
         function : "A & B";
         internal_power () {
           when : "A";
           related_pin : " A B";
           power(power_template) {
           values (" 1.000000, 1.000000, 1.000000, 1.000000");
           }
         }
      }
    }
```

In this case, the internal power table contains the A pin in both the when and the related_pin attributes. Either remove the A pin from the related_pin or change the when statement.

The following is an example message:

```
Error: Line 183, The 'A' when condition includes the 'A' related pin.
 (LIBG-215)
```

Feedback

### What Next

Check the 'when' and the 'related_pin' strings of the internal_power group for wrong information and fix it.

---

## LIBG-220

(warning) The '%s' equation on the '%s' cell evaluates\n \tto a '%s' constant.

### Description

This message is generated when Library Compiler encounters a three-stated pin, whose three_state attribute always evaluates to 1.

The following example shows an instance where this message occurs:

```
cell(libg220) {
        area : 6.50;
        pin(A) {
                direction : input;
                capacitance : 1.5;
        }
        pin(Y) {
                direction : output;
                function : "A";
                three_state : "1";
        }
      }
```

The following is an example message:

```
Warning: Line 218, The 'three_state' equation on the 'libg220' cell
 evaluates
        to a '1' constant. (LIBG-220)
```

### What Next

Verify the cell and check the library description of the offending cell for correctness.

---

## LIBG-221

(warning) Cell %s, referred to by cell %s, does not exist.

### Description

The missing cell is referred to by the "single_bit_degenerate" attribute from a multibit cell. This attribute will be removed from the multibit cell.

Feedback

The following example shows an instance where this message occurs:

```
cell(FDBBX4) {
    area : 18;
    single_bit_degenerate : FDBB;
    bus(D) {
      ...
    }
    ...
  }
```

In this case, cell FDBB is not in the library.

The following is an example message:

```
Warning: Line 258, Cell FDBB, referred to by cell FDBBX4, does not exist.
 (LIBG-221)
```

The missing cell is referred to by the "retention_equivalent_cell" attribute from a non retention cell.

The following example shows an instance where this message occurs:

```
cell(non_retention) {
    area : 18;
    retention_equivalent_cell : my_retention;
    pin(D) {
      ...
    }
    ...
  }
```

In this case, cell my_retention is not in the library.

The following is an example message:

```
Warning: Line 188, Cell my_retention, referred to by cell non_retention,
 does not exist. (LIBG-221)
```

### What Next

Correct the attribute value or remove the attribute, or add the required cell in the library.

---

## LIBG-222

(warning) Cell %s, referred to by cell %s, is multibit.

### Description

The offending cell is referred to by the "single_bit_degenerate" attribute from a multibit cell. This cell must be a single-bit cell.

Feedback

The following example shows an instance where this message occurs:

```
cell(FDBBX4) {
    area : 18;
    single_bit_degenerate : FDBBX2;
    bus(D) {
      ...
    }
    ...
  }
```

In this case, cell FDBBX2 is a multibit cell.

The following is an example message:

```
Warning: Line 58, Cell FDBBX2, referred to by cell FDBBX4, is multibit.
 (LIBG-221)
```

### What Next

Correct the attribute value or remove the attribute, or add the required cell in the library.

---

## LIBG-223

(warning) Cells %s and %s have different interfaces.

### Description

The first cell is referred to by the "single_bit_degenerate" attribute from the second cell. These cells must have the same interfaces.

The following example shows an instance where this message occurs:

```
cell(FDBBX4) {
    area : 18;
    single_bit_degenerate : FDBB;
    bus(D) {
      ...
    }
    pin(CP) {
    }
    bus(Q) {
    }
  }
  cell(FDBB) {
    pin(D) {
    }
    pin(clk) {
    }
    pin(Q) {
    }
  }
```

Feedback

In this case, bus D and pin D, and bus Q and pin Q are matched. But pin CP and pin clk, are not. To correct, either change clk to CP, or change CP to clk.

The following is an example message:

```
Warning: Line 58, Cells FDBB  and FDBBX4 have different interfaces.
 (LIBG-223)
```

**What Next**

Correct the interfaces.

---

## LIBG-224

(warning) Cell %s has unequal bus or bundle widths.

**Description**

To be eligible for having the "single_bit_degerate" attribute, the cell must be a multibit black box, and all buses must have the same width.

The following example shows an instance where this message occurs:

```
type (downbus3) {
    base_type : array;
    data_type : bit;
    bit_width : 3;
    bit_from : 2;
    bit_to   : 0;
    downto   : true;
  }
  type (bus4) {
    base_type : array;
    data_type : bit;
    bit_width : 4;
    bit_from : 0;
    bit_to   : 3;
    downto   : true;
  }

  cell(FDBBX4) {
    area : 18;
    single_bit_degenerate : FDBB;
    bus(D) {
      bus_type : downbus3;
      ...
    }
    pin(CP) {
    }
    bus(Q) {
      bus_type : bus4;
```

Feedback

```
    }
  }
```

In this case, bus D has pin from 3 to 0, bus bus Q has range from 0 to 3.

The following is an example message:

```
Warning: Line 224, Cell FDBBX4 has unequal bus or bundle
 widths.(LIBG-224)
```

### What Next

Correct the bus range.

---

## LIBG-225

(warning) Errors have been detected. The single_bit_degenerate\n \tattribute is removed from cell %s.

### Description

The single_bit_degenerate attribute is removed from the cell because there is an error regarding the attribute specification on this cell or related cell.

The following example shows an instance where this message occurs:

```
cell(FDBBX2) {
  area : 18;
  single_bit_degenerate : FDBB;
  bundle(D) {
    members(D0, D1); ...
  }
  pin(CP) { ...  }

  bundle(Q) {
    members(Q0, Q1); ...
  }
  bundle(QN) {
    members(Q0N, Q1N); ...
  }
}

cell(FDBB) {
  area : 18;
  pin(Data)  { ...  }
  pin(CP) { ...  }
  pin(Q)  { ...  }
  pin(QN) { ...  }
}
```

The single_bit_denerate would be ok if pin "Data" is renamed to "D".

Feedback

The following is an example message:

```
Warning: Line 225, Errors have been detected. Attribute
 single_bit_degenerate
        is removed from cell %s. (LIBG-225)
```

### What Next

To specify "single_bit_degenerate" on a cell, the cell must satisfy:

```
It is a multibit black box with bus/bundle pin
        The bus member must range from 0 to N-1 or N-1 to 0 (N is the
 width)
        The single-bit cell referred to must be a single-bit cell.
        The two cells must have identical interface naming.
```

---

## LIBG-226

(warning) Only cell %s has geometry_print %s.

### Description

It is of no use to put a geometry_print on a single cell.

The following example shows an instance where this message occurs:

```
cell(FDBBX2) {
  area : 18;
  geometry_print : GP1;
  bundle(D) {
    members(D0, D1); ...
  }
  pin(CP) { ...  }

  bundle(Q) {
    members(Q0, Q1); ...
  }
  bundle(QN) {
    members(Q0N, Q1N); ...
  }
}
```

GP1 only appears on FDBBX2.

The following is an example message:

```
Warning: Line 226, Onle cell FDBBX2 has geometry_print GP1. (LIBG-226)
```

### What Next

Remove it or put it on other cells when appropriate.

Feedback

## LIBG-228

(warning) Failed to transform the function of cell '%s' to a netlist. The cell becomes a black box for Formality.

### Description

Library Compiler fails to synthesize a netlist structure representing functionality of this cell. Library Compiler does not accept a derived statetable description when performing this netlist transformation. That is, if the full-function description is not specified in the .lib file, this warning message will be issued. Other causes of failure should have been reported by other warning messages. This netlist structure is referenced by Formality. Without this netlist, Formality can only treat this cell as a black box.

### What Next

Check the statetable description and make sure it is specified correctly.

## LIBG-229

(warning) Cell '%s' has non-disjoint input.

### Description

One or more input pins used in the statetable are used in more than one sequential function, such as clock and enable. As a result, this function cannot be transformed by Library Compiler to a netlist structure referenced by Formality.

### What Next

Check the statetable description and correct all mistakes.

## LIBG-230

(warning) Internal pin '%s' is dangling. The pin is removed.

### Description

The internal pin is not associated with any statetable, it does not have a function or a state_function, it is not a memory port, nor is it part of any timing-arc specification. It is redundant and therefore being removed.

### What Next

You can add the required element if it is accidentally missing. Or a dummy timing arc will serve the purpose of keeping the internal pin interface.

Feedback

## LIBG-231

(information) Internal pin '%s' is for dcm timing.

### Description

The internal pin is labeled for dcm timing use only.

### What Next

Make sure the pin is used for dcm timing only, not for any other purpose.

## LIBG-232

(error) The 'function' attribute on the '%s' internal Pin/bus of the\n \t'%s' cell is not allowed.

### Description

This error is issued when any internal pin of a combinational cell defines a function attribute. In a combinational cell, a function attribute can only be defined on an output pin.

The following example shows an instance where this message occurs:

```
cell(libg232) {
  area : 1 ;
  pin (A) {
        direction : input ;
        capacitance : 0 ;
  }
  pin (A_INT) {
        direction : internal ;
        function : A;
        capacitance : 0 ;
        timing() {
                related_pin     : "A" ;
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
        }
  }
  pin ("Y") {
        direction : output ;
        function : "A'" ;
        timing() {
                related_pin     : "A_INT" ;
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
```

Feedback

```
        }
  }
```

The following is an example message:

```
Error: Line 10, The 'function' attribute on the 'A_INT' internal pin/bus
 of the
        'libg232' cell is not allowed. (LIBG-232)
```

### What Next

Check your library for wrong attributes.

---

## LIBG-233

(error) The 'clock_gate_enable_pin' attribute is defined on more than one\n \tpin in the '%s' cell.

### Description

This error is issued when the clock_gate_enable_pin attribute is defined on more than one pin in a cell. In a clock gating cell, there should only be at most one pin with the clock_gate_enable_pin attribute defined.

The following example shows an instance where this message occurs:

```
cell(libg233) {
  area : 1 ;
  is_clock_gating_cell : TRUE;
  pin (A) {
        direction : input ;
        capacitance : 0 ;
        clock_gate_enable_pin : TRUE;
  }
  pin (B) {
        direction : input ;
        capacitance : 0 ;
        clock_gate_enable_pin : TRUE;
  }
  pin ("Y") {
        direction : output ;
        function : "A' B'" ;
        timing() {
                related_pin     : "A B" ;
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
        }
  }
```

Feedback

The following is an example message:

```
Error: Line 10, The 'clock_gate_enable_pin' attribute is defined on more
 than one
       pin in the 'libg233' cell. (LIBG-233)
```

**What Next**

Check your library and remove extra clock_gate_enable_pin attribute.

---

## LIBG-234

(error) The '%s' cell cannot be used as a clock gating cell.

**Description**

This error is issued when the is_clock_gating_cell attribute is defined on a cell with disallowed function.

The is_clock_gating_cell attribute can be set on

- 2-input clock gates Examples of 2-input clock gates are AND, NAND, OR, and NOR library cells that are used to gate clocks.

- 1-input cells Examples of 1-input clock gates are buffer and inverter library cells that are used in the fanin and fanout of the 2-input clock gate.

- 2-input D latches These latches can be active high or low and must have a noninverting output.

The following example shows an instance where this message occurs:

```
cell(libg234) {
  area : 1 ;
  is_clock_gating_cell : TRUE;
  pin (A) {
        direction : input ;
        capacitance : 0 ;
        clock_gate_enable_pin : TRUE;
  }
  pin (B) {
        direction : input ;
        capacitance : 0 ;
  }
  pin (C) {
        direction : input ;
        capacitance : 0 ;
  }
  pin ("Y") {
        direction : output ;
        function : "A B C" ;
        timing() {
```

Feedback

```
                related_pin     : "A B C" ;
                intrinsic_rise  : 1.0 ;
                rise_resistance : 0.0 ;
                intrinsic_fall  : 1.0 ;
                fall_resistance : 0.0 ;
        }
  }
```

The following is an example message:

```
Error: Line 10, The 'libg234' cell cannot be used as a clock gating cell.
 (LIBG-234)
```

### What Next

Check your library and correct the error.

---

## LIBG-235

(error) The '%s' attribute is either not\n \tdefined on any pin in the integrated clock gated '%s' cell\n \tor it is defined on a wrong pin.

### Description

This error is issued when the clock_gate_enable_pin or clock_gate_clock_pin or clock_gate_outp_pin attribute is either not defined on any pin in a cell or it is defined on the wrong pin. In a clock gating cell, there should only be at most one pin with the clock_gate_enable_pin or clock_gate_out_pin or clock_gate_clock_pin attribute defined.

The following example shows an instance where this message occurs:

```
cell(libg235) {
  area : 1;
  clock_gating_integrated_cell : "latch_posedge";
  dont_use : true;
  dont_touch : true;
  statetable(" CP EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
  }
  pin(IQ) {
    direction : internal;
    internal_node : "IQ";
  }
  pin(EN) {
    direction : input;
    capacitance : 1.0;
  }
  pin(CP) {
    direction : input;
```

Feedback

```
    capacitance : 1.0;
    min_pulse_width_low  : 0.319;
    clock_gate_clock_pin : TRUE;
  }
  pin(Z) {
    direction : output;
    state_function : "CP * IQ";
    max_capacitance : 1.0;
    clock_gate_out_pin : TRUE;
  }
```

The following is an example message:

```
Error: Line 10, The 'clock_gate_enable_pin' attribute is either not
        defined on any pin in the integrated clock gated 'libg235' cell
        or it is defined on a wrong pin. (LIBG-235)
```

### What Next

Check your library and add the missing clock gate attribute.

---

## LIBG-236

(error) The '%s' clock gate cell has the wrong number of pins.

### Description

This error is issued when the clock_gating_integrated_cell attribute is defined on a cell with disallowed function.

The clock_gating_integrated_cell attribute must have at most two inputs pins and two output pins.

The following example shows an instance where this message occurs:

```
cell(libg236) {
  area : 1;
  clock_gating_integrated_cell : "latch_posedge";
  dont_use : true;
  dont_touch : true;
  statetable(" CP1 EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
  }
  pin(IQ) {
    direction : internal;
    internal_node : "IQ";
  }
  pin(EN) {
    direction : input;
    clock_gate_enable_pin : true;
```

Feedback

```
    capacitance : 1.0;
  }
  pin(CP1) {
    direction : input;
    capacitance : 1.0;
    min_pulse_width_low  : 0.319;
  }

  pin(CP2) {
    direction : input;
    capacitance : 1.0;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    state_function : "CP1 * IQ";
    max_capacitance : 1.0;
  }
```

The following is an example message:

```
Error: Line 10, The 'libg236' clock gate cell has the wrong number of
 pins. (LIBG-236)
```

### What Next

Check your library and correct the error.

---

## LIBG-237

(error) The '%s' clock gate cell has the wrong type of pins.

### Description

This error is issued when the clock_gating_integrated_cell attribute is defined on a cell with the wrong pin types

The clock_gating_integrated_cell attribute expects the following attributes on its pins: - clock_gate_enable_pin - clock_gate_obs_pin - clock_gate_test_pin

The following example shows an instance where this message occurs:

```
cell(libg237) {
  area : 1;
  clock_gating_integrated_cell : "latch_posedge_precontrol";
  dont_use : true;
  dont_touch : true;
  statetable(" CP EN CTL", "IQ ") {
     table : " L  L  L : - : L ,\
               L  L  H : - : H ,\
               L  H  L : - : H ,\
               L  H  H : - : H ,\
```

Feedback

```
                H  -  - : - : N ";
  }
  pin(IQ) {
    direction : internal;
    internal_node : "IQ";
  }
  pin(EN) {
    direction : input;
    capacitance : 0.017997;
    clock_gate_enable_pin : true;
  }
  pin(CTL) {
    direction : input;
    capacitance : 0.017997;
  }
  pin(CP) {
    direction : input;
    capacitance : 0.031419;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    state_function : "CP * IQ";
    max_capacitance : 0.500;
  }
}
```

The attribute clock_gate_test_pin is missing. You need to add it to the 'CTL' pin.

```
clock_gate_test_pin : true;
```

The following is an example message:

```
Error: Line 10, The 'libg237' clock gate cell has the wrong type of pins.
 (LIBG-237)
```

**What Next**

Check your library and correct the error.

---

## LIBG-238

(error) The '%s' clock gate cell is not of type '%s'.

**Description**

This error is issued when the clock_gating_integrated_cell attribute is defined on a cell with disallowed function.

Check the Library Compiler User Guide for the list of the clock gating integrated cell types.

Feedback

The following example shows an instance where this message occurs:

```
cell(libg238) {
  area : 1;
  clock_gating_integrated_cell : "latch_posedge";
  dont_use : true;
  dont_touch : true;
  statetable(" CP EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
  }
  pin(IQ) {
    direction : internal;
    internal_node : "IQ";
  }
  pin(EN) {
    direction : input;
    capacitance : 1.0;
  }
  pin(CP) {
    direction : input;
    capacitance : 1.0;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    state_function : "CP * IQ * EN";
    max_capacitance : 1.0;
  }
```

The following is an example message:

```
Error: Line 10, The 'libg238' clock gate cell is not of type 'latch_pos'.
 (LIBG-238)
```

### What Next

Check your library and correct the error.

---

## LIBG-238w

(warning) The '%s' clock gate cell is not of type '%s'.

### Description

This warning is issued when the clock_gating_integrated_cell attribute is defined on a cell with disallowed function.

Check the Library Compiler User Guide for the list of the clock gating integrated cell types.

Feedback

The following example shows an instance where this message occurs:

```
cell(libg238) {
  area : 1;
  clock_gating_integrated_cell : "latch_posedge";
  dont_use : true;
  dont_touch : true;
  statetable(" CP EN ", "IQ ") {
     table : " L  L  : - : L ,\
               L  H  : - : H ,\
               H  -  : - : N ";
  }
  pin(IQ) {
    direction : internal;
    internal_node : "IQ";
  }
  pin(EN) {
    direction : input;
    capacitance : 1.0;
  }
  pin(CP) {
    direction : input;
    capacitance : 1.0;
    min_pulse_width_low  : 0.319;
  }
  pin(Z) {
    direction : output;
    state_function : "CP * IQ * EN";
    max_capacitance : 1.0;
  }
```

The following is an example message:

```
Warning: Line 10, The 'libg238' clock gate cell is not of type
 'latch_pos'. (LIBG-238w)
```

### What Next

Check your library and correct the warning.

---

## LIBG-239

(information) The timing arc from '%s' to\n \t'%s' is resolved into the three_state_enable type.

### Description

The timing arc is entered as combitional/sequential. But the related pin is a fanin to the three_state function only.

Feedback

### What Next

Add "timing_type : three_state_enable;" to the timing group. Or check if this arc is intended for three_state_enable.

---

## LIBG-240

(warning) The phase relationship of the outputs of cell '%s'\n \tis different from that of its test cell at line %d.

### Description

The two outputs of the full cell are equal, but the outputs of the test cell are opposite; or vice versa.

The following example shows an instance where the message occurs:

```
cell (SCAN) {
    ff(IQ, IQN) {
      ...
    }
    pin (Q1) {
      direction : output;
      function  : IQ;
      ...
    }
    pin (Q2) {
      direction : output;
      function  : IQ;
      ...
    }
    ...
    test_cell() {
      ff(IQ, IQN) {
        ...
      }
      pin (Q1) {
        direction : output;
        function  : IQ;
        ...
      }
      pin (Q2) {
        direction : output;
        function  : IQN;
        ...
      }
      ...
    }
  }
```

Feedback

The following is an example message:

```
Warning: Line 200, The phase relationship of the outputs of cell 'SCAN'
is different from that of its test cell at line %300. (LIBG-240)
```

### What Next

If you intended that the outputs of the full cell differ from the outputs of the test cell, no action is required. Otherwise, change the specification of one of the cells so that they agree.

---

## LIBG-241

(warning) The '%s' cell has %d pins which exceeds the limit 16.\n \tThe state table is not generated.

### Description

The cell has over 16 pins. There is an exponential cose in performance and memory as the number of pins increases. This warning tells the user about the excessive size of the table that is being generated.

The following example shows an instance where this message occurs:

```
cell (libg241) {
latch(iq,iqn) {
    data_in : "((c1 *d1_b') +(c2 *d2_b') +(c3 *d3_b') +(c4 *d4_b')
 +(c5 *d5_b') +(c6 *d6_b') +(c7 *d7_b') +(c8 *d8_b') +(c9 *d9_b') +(c10
 *d10_b') +(c11 *d11_b') + (c12 * d12_b'))" ;
    enable : "(c1 +c2 +c3 +c4 +c5 +c6 +c7 +c8 +c9 +c10 +c11 +c12)" ;
    clear : "!rb";
    preset : "s";
    clear_preset_var1 : "L";
    clear_preset_var2 : "H";
}

      pin ( q ) {
         direction : output ;
         function : "iq";
        timing () {
            related_pin : "d1_b d2_b d3_b d4_b d5_b d6_b d7_b d8_b
d9_b d10_b d11_b d11_b " ;
            cell_rise ( prop1 ) {
               values ("0.102565, 0.092949, 0.117635, 0.129560");
            }
            rise_transition ( trans1 ) {
               values ("0.090691, 0.085401, 0.117467, 0.143013");
            }
            cell_fall ( prop1 ) {
               values ("0.099571, 0.101830, 0.122101, 0.129110");
            }
```

Feedback

```
            fall_transition ( trans1 ) {
               values ("0.100989, 0.083367, 0.104448, 0.185206");
            }
         }

         timing () {
            related_pin : "c1 c2 c3 c4 c5 c6 c7 c8 c9 c10 c11 c12" ;
            cell_rise ( prop1 ) {
               values ("0.101839, 0.105114, 0.140100, 0.165207");
            }
            rise_transition ( trans1 ) {

            }
            timing_type : clear ;
            timing_sense : positive_unate ;
         }
      }

      pin(d1_b d2_b d3_b d4_b d5_b d6_b d7_b d8_b d9_b d10_b d11_b d12_b
rb s){
         direction : input ;
         capacitance : 0.1 ;

      }
```

Feedback

```
        pin ( c1 c2 c3 c4 c5 c6 c7 c8 c9 c10 c11 c12) {
          direction : input ;
          capacitance : 0.1 ;
          clock : true ;
        }
    }
```

The following is an example message:

```
Warning: The 'libg241' cell has 26 pins which exceeds the limit of 16.\n
         The state table is not generated. (LIBG-241)
```

**What Next**

If possible, take advantage of the state table group and the input_map attribute to reduce the size of the table.

---

## LIBG-242

(warning) The '%s' cell has signal pins specified with 'x_function' attribute hence\n \tit is a black box for optimization tools.

For combinational cells or FF/LATCH sequential cells with x function, the function_id, function_class and cmog_class are set to "unknown".

**What Next**

Make sure the description is correct.

**Description**

The following example shows an instance where this message occurs:

```
cell(test) {
          area : 1;
          pin(A) {
            direction : input;
            capacitance : 0;
          }
          pin(B) {
            direction : input;
            capacitance : 0;
          }
          pin(O) {
            direction : output;
            function : "A'";
            x_function : "B";
          }
        }
```

Feedback

The following is an example message:

```
Warning: Line 57, Cell 'cell1', The 'cell1' cell has signal pins
 specified with 'x_function' attribute hence
 it is a black box for optimization tools. (LIBG-242)
```

## LIBG-243

(warning) The '%s' cell is missing the 'nextstate_type' attribute\n \tfor some input pin(s) specified in 'next_state' of its ff/ff_bank group.

### Description

This warning message occurs when the attribute *nextstate_type* is not defined in the input pin included in the *next_state* attribute from the cell's sequential state description. In a pin group, *nextstate_type* defines the type of a *next_state* attribute to be used in an *ff* group, a sequential group, or an *ff_bank* group.

The following example shows an instance where this message occurs:

```
cell(libg243) {
        area : 6.50;
        pin(D) {
           direction : input;
           capacitance : 3.0;
        }
        pin(CLK) {
           direction : input;
           capacitance : 1.5;
        }
        pin(SET) {
           direction : input;
           nextstate_type : scan_in;
           capacitance : 3.0;
        }

        ff("IQ","IQN") {
           next_state : "D CLK";
           clocked_on : "CLK";
           preset     : "SET'";
        }

        pin(Q) {
           direction : output;
           function : "IQ";
        }
        pin(QN) {
           direction : output;
           function : "IQN";
        }
   }
```

Feedback

The following is an example message:

```
Warning: Line 153, The 'libg243' cell is missing the 'nextstate_type'
 attribute
        for some input pin(s) specified in 'next_state" of its ff/ff_bank
 group. (LIBG-243)
```

### What Next

This is only a warning message. No action is required.

However, if the result is not what you intended, check the library for each input pin used in the *next_state* statement of a sequential group and add the *nextstate_type* attribute if necessary.

---

## LIBG-244

(warning) The values for clear_preset_var1 and \n \tclear_preset_var2 in the '%s' cell are opposite. \n \tThis may cause incorrect DC optimization.

### Description

The following example shows an instance where this message occurs:

```
cell(libg111) {
        area : 11;
        pin(D) {
                direction : input;
                capacitance : 1;
        }
        pin(CP) {
                direction : input;
                capacitance : 1;
        }
        pin(CLR) {
                direction : input;
                capacitance : 1;
        }
        pin(SET) {
                direction : input;
                capacitance : 1;
        }
        ff("IQ","IQN") {
                next_state : "D";
                clocked_on : "CP";
                clear   : "CLR'";
                preset   : "SET'";
                clear_preset_var1 : L;
                clear_preset_var2 : H;
        }
        pin(Q) {
                direction : output;
```

Feedback

```
                function : "IQ";
                timing() {
                        timing_type : rising_edge;
                        intrinsic_rise : 1.0;
                        intrinsic_fall : 1.0;
                        rise_resistance : 0.1;
                        fall_resistance : 0.1;
                        related_pin : "CP";
                }
                timing() {
                        timing_type : clear;
                        timing_sense : positive_unate;
                        intrinsic_fall : 1.0;
                        fall_resistance : 0.1;
                        related_pin : "CLR";
                }
                timing() {
                        timing_type : preset;
                        timing_sense : negative_unate;
                        intrinsic_fall : 1.0;
                        fall_resistance : 0.1;
                        related_pin : "SET";
                }
        }
        pin(QN) {
                direction : output;
                function : "IQN";
                timing() {
                        timing_type : rising_edge;
                        intrinsic_rise : 1.0;
                        intrinsic_fall : 1.0;
                        rise_resistance : 0.1;
                        fall_resistance : 0.1;
                        related_pin : "CP";
                }
                timing() {
                        timing_type : preset;
                        timing_sense : negative_unate;
                        intrinsic_fall : 1.0;
                        fall_resistance : 0.1;
                        related_pin : "CLR";
                }
                timing() {
                        timing_type : clear;
                        timing_sense : positive_unate;
                        intrinsic_fall : 1.0;
                        fall_resistance : 0.1;
                        related_pin : "SET";
                }
        }
}
```

Change the value of clear_preset_var1 to H or the value of clear_preset_var1 to L.

Feedback

The following example shows an instance where this message occurs:

```
Warning: Line 244, The values for clear_preset_var1 and clear_preset_var2
 in the 'libg111' cell are opposite.
This may cause incorrect DC optimization. (LIBG-244)
```

**What Next**

Change the value of clear_preset_var1 or clear_preset_var2.

---

## LIBG-245

(information) Cell(%s) test scan type is %s. DFT Compiler\n \tshould be able to infer this cell during compile -scan. \n \tIt is not a black box for DFT Compiler.

**Description**

Library Compilier recognizes test scan type for the scan cell according to its test_cell description.

**What Next**

report_lib also reports scan type for test scan cell.

---

## LIBG-246

(warning) Cell(%s) test scan type is not recognized by Library Compiler. It becomes a black box for DFT Compiler.

**Description**

Library Compiler fails to recognize test scan type of the scan cell according to its test_cell description.

**What Next**

Check the signal type of each pin in test_cell description and correct it if it is wrong.

---

## LIBG-247

(error) In test_cell of Cell(%s) clocked_on pin's polarity is opposite from the cell's definition.

**Description**

The test_cell's non-test mode behavior has to be consistent with what is defined in the cell section. Library Compiler detects that the clocked_on pin in test_cell has opposite polarity than the cell's defintion.

Feedback

The following example shows an instance where the message occurs:

```
cell (TNB) {
          ff ("IQ","IQZ")  {
             next_state : " (D SCAN') + (SD SCAN) ";
             clocked_on : "CLK'";
          }
          test_cell() {
            ff ("IQ","IQZ")  {
            next_state : "D";
            clocked_on : "CLK";
          }
          ...
        }
```

In this case the cell TNB is falling-edge triggered but its test_cell describes a rising-edge triggered flip-flop.

**What Next**

Correct test_cell's clocked_on pin's polarity to be consistent with the cell.

---

## LIBG-248

(warning) The '%s' cell's %s groups for %s '%s' \n \tdo not cover all the states represented by the 'when' string, and the default \n \t%s group is not defined for %s '%s', thus 0 will be used as \n \tthe %s value for the missing states of %s '%s'.

**Description**

This message indicates the leakage_power information defined in a cell does not cover all the states for the power_level(power_rail value). For the missing states of the power_level, 0 will be used as the leakage_power value.

It is also used to check for related_pg_pin-based leakage_power information.

The following example shows an instance where this message occurs:

```
cell(AN2) {
      leakage_power () {
        power_level : "VDD1";
        when : "A";
        value : 1.0;
      }
      leakage_power () {
        power_level : "VDD1";
        when : "!A";
        value : 1.5;
      }
      leakage_power () {
        power_level : "VDD2";
```

Feedback

```
        when : "A";
        value : 1.0;
      }
      ...
  }
```

In this case, the leakage_power for the state '!A' of power_level 'VDD2' is missing, . To fix the problem, add the leakage_power for the missing state in the cell group:

```
cell(AN2) {
      leakage_power () {
        power_level : "VDD1";
        when : "A";
        value : 1.0;
      }
      leakage_power () {
        power_level : "VDD1";
        when : "!A";
        value : 1.5;
      }
      leakage_power () {
        power_level : "VDD2";
        when : "A";
        value : 1.0;
      }
      leakage_power () {
        power_level : "VDD2";
        when : "!A";
        value : 1.2;
      }
      ...
  }
```

The following is an example message:

```
Warning: Line 12, The 'AN2' cell's leakage_power groups for power_level
 'VDD2'
        do not cover all the states represented by the 'when' string, and
 the default
        leakage_power group is not defined for power_level 'VDD2', thus 0
 will be used as
        the leakage_power value for the missing states of power_level
 'VDD2'. (LIBG-248)
```

**What Next**

Add the missing leakage_power information for the power_level.

Feedback

## LIBG-249

(error) The '%s' cell does not specify the %s group \n \twith the 'when' string (%s) for the power_level '%s'.

### Description

This message indicates the leakage_power information defined in a cell does not cover the state('when' string) for the power_level(power_rail value). For the power-level specific leakage power modeling, for each 'when' statement which appears in the leakage_power groups of a cell, there must exist a leakage_power group with that 'when' statement for every modeled power_level.

The same rule applies for the internal_power groups.

The following example shows an instance where this message occurs:

```
cell(AN2) {
      leakage_power () {
        power_level : "VDD1";
        when : "AB";
        value : 1.0;
      }
      leakage_power () {
        power_level : "VDD1";
        when : "!AB";
        value : 1.5;
      }
      leakage_power () {
        power_level : "VDD2";
        when : "AB";
        value : 1.0;
      }
      ...
  }
```

In this case, the leakage_power for the state '!AB' of power_level 'VDD2' is missing, . To fix the problem, add the leakage_power for the missing state in the cell group:

```
cell(AN2) {
      leakage_power () {
        power_level : "VDD1";
        when : "AB";
        value : 1.0;
      }
      leakage_power () {
        power_level : "VDD1";
        when : "!AB";
        value : 1.5;
      }
      leakage_power () {
        power_level : "VDD2";
```

Feedback

```
        when : "AB";
        value : 1.0;
      }
      leakage_power () {
        power_level : "VDD2";
        when : "!AB";
        value : 1.2;
      }
      ...
  }
```

The following is an example message:

```
Error: Line 12, The 'AN2' cell does not specify the leakage_power group
        with the 'when' string (!AB) for the power_level 'VDD2'.
 (LIBG-249)
```

### What Next

Add the missing leakage_power information for the power_level.

---

## LIBG-250

(error) The logic represented by the 'when' string (%s) in this\n \t%s group is not equal to or mutually exclusive with the logic represented by\n \tthe 'when' string (%s) in the %s group on line %d.

### Description

The logic represented by the 'when' string of all state-dependent or path-dependent internal_power groups between a pair of pins should be either equal or mutually exclusive for different power_levels. If it is not, Power Compiler will not be able to determine correctly which internal_power group to use when propagating a signal through the path.

The following example shows an instance where this message occurs:

```
cell(libg44) {
      area : 2;
      pin(D1 D0 S0) {
        direction : input;
        capacitance : 1;
      }
      pin(Z) {
        direction : output;
        function : "S0'D0 + S0 D1";
        ...
        internal_power() {
          power_level : VDD1;
          when : "S0'D0 + S0 D1'";
          when : "D1' S0 + S0'D0 ";
          related_pin : "S0";
```

Feedback

```
          power(scalar) { values ( "1.0" ); }
        }
        internal_power() {
          power_level : VDD2;
          when : "D1 S0 + S0'D0";
          related_pin : "S0";
          power(scalar) { values ( "2.0" ); }
        }
      }
    }
```

In this case, the second when attribute's string has a typographical error. It should be "D1 S0 + S0'D0"'; where the pin D0 should be ticked according to the sdf_cond attribute's string.

The following is an example message:

```
Error: Line 258, The logic represented by the 'when' string (S0'D0 + S0
 D1') in this
        internal_power group is not equal to or mutually exclusive with
 the logic represented by
        the 'when' string (D1 S0 + S0'D0) in the internal_power group on
 line 268. (LIBG-250)
```

**What Next**

Check the 'when' strings of both internal_power groups for wrong information and fix.

---

## LIBG-251

(error) The '%s' group has conflicting 'related_pin' with the \n \t'%s' group on line %d.

**Description**

The "related_pin" in different internal_power groups with the same power_level of the same pin must not share pins. Similarly, the related_pin in different internal_power groups without power_level definition of the same pin must not share pins.

One exception is that, for the above 2 cases, if the pins specified in the "related_pin" of the first internal_power are all included in the "related_pin" of the second internal_power, then Library Compiler will issue LBDB-107 warning and the second internal_power will overwrite the first one.

The following example shows an instance where this message occurs:

```
cell(libg44) {
      area : 2;
      pin(D1 D0 S0) {
        direction : input;
        capacitance : 1;
```

Feedback

```
    }
    pin(Z) {
      direction : output;
      function : "S0'D0 + S0 D1";
      ...
      internal_power() {
        power_level : VDD1;
        related_pin : "S0";

        power(scalar) { values ( "1.0" ); }
      }
      internal_power() {
        power_level : VDD1;
        related_pin : "S0 S1";
        power(scalar) { values ( "2.0" ); }
      }
    }
  }
```

In this case, the second internal_power group's 'related_pin' conlficts with that of the first internal_power group. One fix can be that replacing the 'related_pin' of the second internal_power group from "S0 S1" to "S1".

The following is an example message:

```
Error: Line 251, The 'internal_power' group has conflicting 'related_pin'
 with the
        'internal_power' group on line 268. (LIBG-251)
```

**What Next**

Correct the 'related_pin' strings of both internal_power groups.

---

## LIBG-252

(error) The 'function' of the '%s' pin/bus on the '%s' cell\n \tis not correctly defined.

**Description**

This error is issued when the function is not correctly defined. A valid function statement in the sequential model must satisfy the following 2 conditions:

For a ff/latch, the noninverted is called teh first variable and the inverted output is called the second variable. A function statement of each primary output must include either the first variable or the second variable.

1. It must include and can only include the the first variable or the second variable or a the valid input pins defined for the cell in addition to the boolean operators.
2. All the component insider the function statement should be separated by a space or spaces.

Feedback

The following example shows an instance where this message occurs:

```
cell(libg17) {
        area : 6.50;
        pin(CLK) {
                direction : input;
                capacitance : 1.5;
        }
        pin(SET) {
                direction : input;
                capacitance : 3.0;
        }
        ff("IQ","IQN") {
                next_state : "IQ'";
                clocked_on : "CLK";
                preset     : "SET'";
        }
        pin(Q) {
                direction : output;
                function : "IQ1";       /* wrong, should be IQ */
        }
        pin(QN) {
                direction : output;
                function : "IQN";
        }
      }
```

The following is an example message:

```
Error: Line 23, The 'function' of the 'Q'  in/bus on the 'libg17' cell
        is not correctly defined. (LIBG-252)
```

**What Next**

Make the appropriate correction in your library, as indicated in the error message. For more information on sequential models, refer to the *Library Compiler Reference* and *User Guide Manuals*.

---

## LIBG-253

(error) Cell(%s): The '%s' pin is a duplicate of '%s' internal pin.

**Description**

This message indicates that the specified internal pin is a duplicate of the other relative pin. For statetable-based sequential cells, the "IQ" function can only be defined in an internal pin with internal_node : "IQ".

The following example shows an instance where this message occurs:

```
cell(libg253) {
```

Feedback

```
                ...
                statetable(" CEN CLK ", " IQ  "){
                        table : "\
                        L L : - : L , \
                        H L : - : H , \
                        - H : - : N " ;
                }
                ...
                pin(IQ){
                        direction : internal;
                        internal_node : "IQ";
                        ...
                }
                pin(Y){
                        direction : output;
                        state_function : "IQ";
                        ...
                }
                ...
        }
```

In this case, internal pin IQ and pin Y are duplicate. The correct model should be:

cell(libg253) {

... statetable(" CEN CLK ", " IQ "){ table : "\ L L : - : L , \ H L : - : H , \ - H : - : N " ; } ... pin(IQ){ direction : output; internal_node : "IQ"; ... } ... }

The following is an example message:

```
Warning: Line 139, Cell(libg253): The pin 'SOSV' is a duplicate of the
 'IQ' internal pin. (LIBG-253)
```

**What Next**

Combine the information of the two pins into the internal pin and remove the other pin.

---

## LIBG-254

(error) An invalid '%s' %s string in the '%s' cell.

**Description**

The string given is not valid for representing a boolean logic defined in Synopsys format.

The following example shows an instance where this message occurs:

```
cell(sample) {
  switch_cell_type : coarse_grain;
  area : 1 ;
  pg_pin ("VVDD") {
        pg_type : internal_power;
```

Feedback

```
        pg_function : "(IO" ;
  }
  ...
```

In this simple case, the closing parenthesis is missing in the function string.

The following is an example message:

```
Error: Line 400, An invalid '(IO' pg_function string in the 'sample'
 cell. (LIBG-254)
```

**What Next**

Refer to your Library Compiler Reference Manual to find out the valid format of the string. It is described in the "function simple attribute" under the "Cell Group Description and Syntax".

---

## LIBG-255

(error) A bad '%s' pg_pin name in the '%s' cell.

**Description**

The error gets detected during the *read_lib* and *check_library* commands. This error occurs when either the pg_pin name is not found or an incorrect pin name in one or more attributes of the pin group is detected. The pg_pin group is not recognized and the pin name is labeled as bad.

The following example shows an instance where this message occurs:

```
cell (libg3) {
    pg_pin(VSS) {
        pg_type : primary_power;
        voltage_name : VSS;
    }
    pg_pin(VDD) {
        pg_type : primary_power;
        voltage_name : VDD;
    }
    pg_pin(VVDD) {
        pg_type : internal_power;
        voltage_name : VDD1;
        pg_function : "E";       /* <-- This is wrong */
    }
 }
```

The following is an example message:

```
Error: Line 426, A bad 'E' pg_pin name in the 'libg3' cell. (LIBG-255)
```

Feedback

### What Next

Check your library for an incorrect pin name in a related attribute or for an incorrect pin group.

---

## LIBG-256

(error) The '%s' group is overlapping with the '%s' group on line %d.

### Description

This message indicates that two *dynamic_current* groups in ccs power are overlapping with each other.

If following three conditions is true, then two groups are considered to be overlapped :

1. Two groups have at least one pin specified in *related_inputs* attribtue is identical.
2. Both have same list of pins specified in *related_outputs* or both have no *related_outputs* attribtue.
3. *When* atrributes specified in both groups are not mutually exclusive, or both groups have no *when* attribute.

The following example shows an instance where this message occurs:

```
cell(libg256) {
  ...
  pin(A1) {
    direction : input;
    ...
  }
  pin(A2) {
    direction : input;
    ...
  }
  pin(A3) {
    direction : input;
    ...
  }
  pin(A4) {
    direction : input;
    ...
  }
  pin(A5) {
    direction : input;
    ...
  }
  pin(ZN1) {
    direction : output;
    ...
```

Feedback

```
}
pin(ZN2) {
  direction : output;
  ...
}
...
dynamic_current() {
  when : "A2";
  related_inputs : "A5 A4";
  related_outputs : "ZN2 ZN1";
  switching_group() {
    pg_current(V2) {
    ...
    }
    ...
  }
}
dynamic_current() {
  when : "!A1";
  related_inputs : "A4 A3";
  related_outputs : "ZN1 ZN2";
  switching_group() {
    pg_current(V2) {
    ...
    }
    ...
  }
}
...
```

In this case, "A2" and "!A1" specified in two when attributes respectively are not mutually exclusive, pin "A4" is specified in both related_inputs groups, and same list of pins ("ZN1" and "ZN2") is specified in both related_outputs groups. Two dynamic_current are overlapping. You can modify any of these attributes to fix the problem. For example : change "A4 A3" to "A2 A3".

The following is an example message:

```
Error: Line 79, The 'dynamic_current' group is overlapping with the
 'dynamic_current' group on line 88. (LIBG-256)
```

**What Next**

Check *related_inputs*, *related_outputs*, and *When* attributes for all *dynamic_current* groups to see if any of them breaks above rules, and make the necessary correction.

---

## LIBG-257

(error) The %s must be set to 0.0 or omitted.

Feedback

### Description

There are two attributes, input_high_value and input_low_value, within a gate_leakage group. The input_high_value is to specify gate leakage current on a pin when this pin is set to high. The input_low_value is to specify gate leakage current on a pin when this pin is set to low. If the 'when' statement inside leakage_current or va_leakage_current implies that the pin high never occurs, then input_high_value shall be set to 0.0 or ignored. If the 'when' statement implies that the pin low shall never occur, then input_low_value must be set to 0.0 or ignored.

The following example shows an instance where this message occurs:

```
leakage_current() {
     when : "A1 & A2 & !ZN";
     ...
     gate_leakage(A2) {
       input_high_value : 2.1;
       input_low_value : -1.7;
     }
     gate_leakage(A1) {
       input_high_value : 7.1;
       input_low_value : -8.7;
     }
  }
```

In this case, we have when condition "A1 & A2 & !ZN", which means pins A1 and A2 shall never set to low because they will never occur within this leakage_current. So, input_low_value is meaningless for both pins. We shall set both to 0.0 or comment them out.

The following is an example message:

```
Error: Line 210, The input_low_value must be set to 0.0 or omitted.
 (LIBG-257)
```

### What Next

Check *input_low_value* and *input_high_value*, and make the necessary correction.

---

## LIBG-258

(error) No %s is allowed within an intrinsic_parasitic\n \tif power_cell_type is %s.

### Description

If the power_cell_type is macro, then followings groups can't be specified within an intrinsic_parasitic : state-dependent condition, intrinsic_resistance and intrinsic_capacitance.

Feedback

If the power_cell_type is standard cell or there is no power_cell_type specified, then total_capacitance can't be specified within an intrinsic_parasitic.

The following example shows an instance where this message occurs:

```
cell (test) {
  intrinsic_parasitic() {
    when : "!A1 & A2 & !ZN";
    total_capacitance(V2) {
       value : 9.0;
    }
  }
 ...
}
```

In this case, there is no power_cell_type specified under cell "test", meaning power_cell_type is defaulted to standard cell. The total_capacitance is not allowed within an intrinsic_parasitic group.

```
cell (test) {
  power_cell_type : macro;
  intrinsic_parasitic() {
    when : "!A1 & A2 & !ZN";
    intrinsic_resistance(G1) {
       related_output : "ZN";
       value : 9.0;
    }
    intrinsic_capacitance(G1) {
       value : 8.2;
    }
  }
 ...
}
```

In this case, 'when' attribute, 'intrinsic_resistance' and 'intrinsic_capacitance' are not allowed in an 'intrinsic_parasitic' group because the 'power_cell_type' is 'macro'.

The following is an example message:

```
Error Line 272, No intrinsic_resistance is allowed within an
 intrinsic_parasitic
        if power_cell_type is macro. (LIBG-258)
```

**What Next**

Check the library source file, and make the necessary correction.

---

## LIBG-259

(error) The power_cell_type must be macro if\n \tmin_input_switching_count and max_input_switching_count are defined.

Feedback

### Description

If min_input_switching_count and max_input_switching_count are defined within switching_group, then power_cell_type defined in cell must be macro.

The following example shows an instance where this message occurs:

```
cell (test) {
 ...
 power_cell_type : stdcell;
 dynamic_current() {
   ...
   switching_group() {
      min_input_switching_count : 1;
      max_input_switching_count : 9;
      ...
   }
   ...
 }
 ...
}
```

In this case, min_input_switching_count and max_input_switching_count both are defined under one of switching_group groups within a dynamic_current, and power_cell_type is standard cell, which is wrong. We shall change "stdcell" to "macro" to avoid the error.

The following is an example message:

```
Error Line 272, The power_cell_type must be macro if
        min_input_switching_count and max_input_switching_count are
 defined. (LIBG-259)
```

### What Next

Check the library source file, and make the necessary correction.

---

## LIBG-260

(error) The logic represented by the %s string is not equal\n \tto or mutually exclusive with the logic represented by the %s string.

### Description

The logic represented by one programmable driver type string must be not equal to or mutually exclusive with the logic represented by other programmable driver types under the same pin.

The following example shows an instance where this message occurs:

```
cell(libg260) {
     pad_cell : true;
```

Feedback

```
...
 pin(A1) {
  direction : input;
  is_pad : true;
 ...}
 pin(A2) {
  direction : input;
  ...}
 pin(A3) {
   direction : input;
  ...}
 pin(ZN1) {
  direction : inout;
  max_capacitance : 0.1;
  pull_up_function : "!A1 * !A2 * !A3";
  pull_down_function : "A1 * A2 * !A3";
  bus_hold_function : "A1 * !A2 * !A3";
  open_drain_function : "!A1 * A2 * !A3";
  open_source_function : "!A1 * !A2 * A3";
  resistive_function : "A1 * A2 * A3";
  resistive_0_function : "A1 * A2";
  resistive_1_function : "!A1 * A2 * A3";
 ...}
}
```

The following are example messages:

```
Error: Line 102, The logic represented by the resistive_0_function string
 is not equal
        to or mutually exclusive with the logic represented by the
 pull_down_function string. (LIBG-260)

Error: Line 102, The logic represented by the resistive_0_function string
 is not equal
        to or mutually exclusive with the logic represented by the
 resistive_function string. (LIBG-260)
```

### What Next

```
In this case, the resistive_0_function is not mutually exclusive with
pull_down_functioni and resistive_function.  To fix the problem, you
might want to change it as following :

       resistive_0_function : "A1 * !A2 * A3";
```

---

## LIBG-261

(error) The programmable driver type can only be defined on a pad cell.

Feedback

### Description

The programmable driver type can only be defined a pad cell, which has either pad_cell or auxiliary_pad_cell attribute.

The following example shows an instance where this message occurs:

```
cell (libg261) {
    ...
    pin (A) {
      direction : input;
      pull_up_function : "p1 * p2";
      ...
    }
   ...}
```

In this case, a programmable driver type, pull_up_function, is defined on pin A, which is under a cell, ligb261. The cell is not a pad cell, which is wrong. To fix the problem, please either add pad_cell attribute under cell level or remove pull_up_function attribute from the pin.

The following is an example message:

```
Error: Line 94, The programmable driver type can only be defined on a pad
 cell. (LIBG-261)
```

### What Next

Check the library source file, and make the necessary correction.

---

## LIBG-262

(information) Cell(%s) is recognized as one-hot mux cell.

### Description

This message is issued when a cell is recognized as one-hot mux cell.

One-hot mux cells have following characteristic: 1. Two equal sized, disjoint sets of input pins, one is select pins(e.g. "S0,S1"), another set is data input pins(e.g. "D0,D1"). 2. Have cell attribute "contention_condition", e.g. Fc = S0'*S1 + S0*S1. That is there could be one and ONLY one select pin can be logic 1, others are logic 0. 3. There is only one output pin defined and its function is defined with respect to all of its inputs, e.g. Fo = S0*D0 + S1*D1;

The following example shows an instance where this message occurs:

```
cell(OHMUX2) {

  ...
  contention_condition : "( S0 S1 + S0' S1' )";
```

Feedback

```
  pin(D0) {
    direction : input;
    capacitance : 1;
  }
  pin(D1) {
    direction : input;
    capacitance : 1;
  }
  pin(S0) {
    direction : input;
    capacitance : 1;
  }
  pin(S1) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "(S0 D0 + S1 D1)";
    ...
  }
}
```

The following is an example message:

```
Warning: Line 139, Cell(OHMUX2) is recognized as one-hot mux
 cell.(LIBG-262)
```

### What Next

The one-hot mux cell will be used in DC logical synthesis.

---

## LIBG-263

(warning) Cell(%s) is not recognized as one-hot mux cell.

### Description

This message is issued when there is cell level attribute "contention_condition" defined, but it does not match with output pin function as a one-hot mux cell.

One-hot mux cells have following characteristic: 1. Two equal sized, disjoint sets of input pins, one is select pins(e.g. "S0,S1"), another set is data input pins(e.g. "D0,D1"). 2. Have cell attribute "contention_condition", e.g. Fc = S0'*S1 + S0*S1. That is there could be one and ONLY one select pin can be logic 1, others are logic 0. 3. There is only one output pin defined and its function is defined with respect to all of its inputs, e.g. Fo = S0*D0 + S1*D1;

This warning message is reported in step 3, when it find the output function with restiction of contention function does not match with the function of one-hot mux cell.

Feedback

The following example shows an instance where this message occurs:

```
cell(OHMUX2) {

  ...
  contention_condition : "( S0 S1 + S0' S1' )";
  pin(D0) {
    direction : input;
    capacitance : 1;
  }
  pin(D1) {
    direction : input;
    capacitance : 1;
  }
  pin(S0) {
    direction : input;
    capacitance : 1;
  }
  pin(S1) {
    direction : input;
    capacitance : 1;
  }
  pin(Z) {
    direction : output;
    function : "(S0 D0 + S1 D1 + D0' D1)";
    ...
  }
}
```

In this case, the contention function matches with one-hut mux cell select pin restriction, but the output pin function is not a function of one-hot mux cell.

The following is an example message:

```
Warning: Line 139, Cell(OHMUX2) is not recognized as one-hot mux
 cell.(LIBG-263)
```

**What Next**

If users intend to define the cell as one-hot mux cell, and use it later on in logical synthesis, check the cell contention_condition definition and output pin function, modify to make them match the definition of one-hot mux cell.

If users won't use the cell as one-hot mux cell, just ignore this warning.

---

## LIBG-264

(warning) ICG cell '%s' function can not be recognized during functional optimization by Power Compiler.

Feedback

### Description

A cell with attribute "clock_gating_integrated_cell" defined as "generic" is called a generic ICG cell.

Library Compiler will try to resolve ICG type of a generic ICG cell. Valid resolved types are,

latch_(posedge | negedge | posedgeactivelow | negedgeactivelow )_ (precontrol | postcontrol| *)_(obs | *)_(invgclk | *) or none | (posedge | negedge | posedgeactivelow | negedgeactivelow )_ (control | *)_(invgclk | *).

Please refer to Library Compiler User Guide for the corresponding schematics of these types.

If a generic ICG cell can't be resolved as any exact type, Library Compiler will resolve them as blackbox. It means this generic ICG will not be auto inferred by Power Compiler and understood by Formality and other client tools that need to understand the function of such cells.

FF-based ICG cell won't be supported by Power Compiler, either.

The following example shows an instance where this message occurs:

The following is an example message:

```
Warning: ICG cell 'cell1' function can not be recognized during
 functional optimization by Power Compiler. (LIBG-264)
```

### What Next

Change the cell to be one of the valid ICG types.

---

## LIBG-265

(information) Derived ICG type for cell '%s' is '%s'.

### Description

A cell with attribute "clock_gating_integrated_cell" defined as "generic" is called a generic ICG cell.

Library Compiler will try to resolve ICG type of a generic ICG cell. If successful, the value of attribute "clock_gating_integrated_cell" will be updated.

The following is an example message:

```
Information: Derived ICG type for cell 'cell1' is 'latch_posedge'.
 (LIBG-265)
```

Feedback

## LIBG-266

(warning) The 'data_in_type' attribute on the '%s' pin/bus in\n \tthe '%s' cell is inconsistent with its function. The attribute is ignored.

### Description

This warning message occurs when the *data_in_type* attribute does not match the functional information specified in the cell's sequential state description.

In a pin group, *data_in_type* defines the type of *data_in* attribute to be used in an ff group, a seq group, or a ff_bank group. Any pin with the *data_in_type* attribute must be in the *data_in* function. The tool performs a consistency check between the pin's *data_in_type* attribute and the *data_in* function and generates this warning when inconsistencies are found.

The following is an example message:

```
Warning: Line 153, The 'data_in_type' attribute on the 'SET' pin/bus in
        the 'libg35' cell is inconsistent with its function. The
 attribute is ignored. (LIBG-266)
```

### What Next

This is only a warning message. No action is required.

However, to avoid this warning, check your library for a pin that has a *data_in_type* attribute but is not used in the *data_in* statement of a sequential group. After making your changes, run the command again.

## LIBG-267

(error) The power_down_function attribute should not be specified inside the test_cell's ff/latch/statetable group.

### Description

This error message occurs because the *power_down_function* attribute must be specified in a cell's ff/latch/statetable group, not specified inside the test_cell.

The following example shows an instance where this message occurs: The following example results in this error message:

```
test_cell () {
         pin (Q) {
            direction : output;
            function : "IQ";
            signal_type : test_scan_out;
         }
         pin (CK) {
```

Feedback

```
            direction : input;
         }
         pin (D) {
            direction : input;
         }
         pin (SI) {
            direction : input;
            signal_type : test_scan_in;
         }
         pin (SE) {
            direction : input;
            signal_type : test_scan_enable;
         }
         ff (IQ,IQN) {
            clocked_on : "!(CK)";
            next_state : "D";
            power_down_function : "!VDD + VSS"; /* <-- This is wrong */
         }
      }
```

The following is an example message:

Error: Line 426, Cell 'test', The power_down_function attribute should not be specified inside the test_cell's ff/latch/statetable group. (LIBG-267)

**What Next**

Check your library to delete the *power_down_function* attribute in test_cell.

---

## LIBG-268

(error) A function cannot point to two different flip-flop or latch groups.

**Description**

This error message occurs when the Boolean expression in the *function* attribute of this pin contains more than one internal node of flip-flop or latch. Only one internal node is allowed.

**What Next**

Specify individual internal nodes separately as shown in the following example:

```
pin(temp) {
   direction :internal;
   function : "Q1";
   reference_input : "RET CK q1";
   ...
pin(Q) {
   direction : output;
   function : "Q2 + temp";
   reference_input : "RET CK q1";
```

Feedback

```
    ...
}
```

## LIBG-269

(error) The '%s' has a count of %d, which does not match\n \tthe size %d specified.

### Description

This error message occurs when the specification of the total number of reference_input is not matched to total number of internal nodes specified in ff/latch/ff_bank/latch_banck group.

### What Next

Check the library source file and correct the problem by grouping the values together in the required format.

## LIBG-270

(error) The variable in the Boolean expression is not allowed.

### Description

This error message occurs because some variables, such as IQ or IQN, in flip-flop or latch groups cannot be specified in a functional expression if the group is referred by reference_input defined in the pin.

The following example shows an instance where this message occurs: In the following example, latch 1 is referred by 2 pins, internal_1 and internal_2. That means the variables IQ_0 and IQN_0 can be referred by either the internal_1 or internal_2 pin. In latch 2, data_in is connected to IQ_0, which is not allowed because it could be either the internal_1 or internal_2 pin.

```
pin(output_1) {
    direction : "output";
    function : "IQ_1";
    reference_input : "IQ_0";
  }
  pin(internal_1) {
    direction : "internal";
    function : "IQ_0";
    reference_input : "D CP";
  }
  pin(internal_2) {
    direction : "internal";
    function : "IQ_0";
    reference_input : "D1 CP1";
  }
```

Feedback

```
  latch ("p1 p2","IQ_0","IQN_0") {    /* latch 1 */
     data_in : "p1";
     enable : "p2";
  }
  latch ("p1", "IQ_1","IQN_1") {      /* latch 2 */
     data_in : "p1";
     enable : "CP";
  }
```

The following is an example message:

```
Error: Line 160, The variable in boolean expression is not allowed.
 (LIBG-270)
```

### What Next

Check the library source file, and correct the problem by grouping the values together in the required format.

---

## LIBG-271

(warning) The disable value of the retention pin might not be valid.

### Description

This warning message occurs because the disable value that you provided might be incorrect. The tool ties up the disable values from all logic expression functions to see if the results are reasonable.

The following example shows an instance where this message occurs: The following example shows that data_in becomes logic "0" when the RESTORE pin is tied up to disable value "0". The 2 valid pins in data_in are "D" and "RESTORE". The expected data_in after tie up to the disable value is "D", not logic "0". So, in this case, the tool issues the warning message because it is possible that the disable value might be invalid.

```
pin (RESTORE) {
    direction : "input";
    retention_pin("restore",0);
    ...
  }
  pin (D) {
    direction : "input";
    ...
  }
  latch ("IQ","IQN") {
     data_in : "D * RESTORE";
     ...
  }
```

Feedback

The following is an example message:

```
Warning: Line 160, The disable value of retention pin might not be valid.
(LIBG-271)
```

**What Next**

Check the library source file to see if the disable value is valid.

---

## LIBG-272

(information) Library '%s' is being compiled with pin_number recomputation enabled.

**Description**

The pin number of the cells in this library will be assigned by a consistent rule, so the pin number can be assigned consistently when the cells are logically equal but have different function expression or pin orders in .lib are different.

The following is an example message:

```
Information:  Library 'lib_example' is being compiled with pin_number
 recomputation enabled.(LIBG-272)
```

---

## LIBG-273

(error) the logic represented by the %s string \n \t(%s) is not mutually exclusive with the logic represented by\n \tthe %s string (%s) on line %d.

**Description**

The logic represented by the clamp_*_function and illegal_clamp_condition string should be mutually exclusive. If it is not, Library Compiler is not be able to determine which value the cell will clamp to.

The following example shows an instance where this message occurs:

```
cell(libg273) {
      area : 2;
      ...
      pin(Z) {
        direction : output;
        function : "S0'D0 + S0 D1";
        clamp_0_function : "D0";
        clamp_1_function : "D0";
        clamp_latch_function : "!D0";
        ...
      }
    }
```

Feedback

In this case, the clamp_0_function string is not exclusive with clamp_1_function string.

The following is an example message:

```
Error: Line 258, Cell 'libg273', pin 'Z', the logic represented by the
clamp_0_function string (D0) is notmutually exclusive with the logic
 represented
by the clamp_1_function string (D0) on line 268. (LIBG-273)
```

**What Next**

Check the clamp_*_function and illegal_clamp_condition strings of both timing groups for wrong information and fix.

---

## LIBG-274

(error) You are not allowed to specify the function attribute on the single-bit output pin of the test_cell group of a parallel sequential cell.

**Description**

In parallel sequential cells, the single-bit output pin is only a test output pin. Therefore, do not specify the *function* attribute on this pin, in the *test_cell* group.

This message identifies a parallel sequential cell that has a single-bit output pin with the *function* attribute.

The following example shows an instance where this message occurs:

```
cell (LSFDS) {

  ...

  test_cell() {
    bus (D) {
      bus_type : BUS4;
      direction : input ;
      capacitance : 2.000000 ;
    }
    pin (CK) {
      direction : input ;
      capacitance : 1.000000 ;
    }
    ff_bank (IQ,IQN,4) {
      next_state : "D" ;
      clocked_on : "CK" ;
    }
    bus (Q) {
      bus_type : BUS4;
      direction : output ;
      function : "IQ" ;
    }
```

Feedback

```
    pin (SO) {
      direction : output ;
      signal_type : "test_scan_out";
      function : "IQ[3]" ;
    }
  }
}
```

In this example, the *function* attribute should not be defined on the pin 'SO'.

The following is an example message:

```
Error: Line 302, Cell 'test', You are not allowed to specify the function
 attribute on the
single-bit output pin of the test_cell group of a parallel sequential
 cell. (LIBG-274)
```

### What Next

Check your library, and delete the *function* attribute specified on the single-bit output pin.

---

## LIBG-275

(information) Complex function sequential cell will skip\n sequential cell timing consistency check.

### Description

This message is to infer user that a complex function seuqential cell which contains mux/xor/maj with Boolean logic will skip sequential cell timing consistency check.

The following example shows an instance where this message occurs:

```
cell (test) {

    ...

    ff(IQ,IQN) {
      clocked_on : "CK" ;
      next_state : "RETN & ((SE SI) + (!SE D))" ;
    }
}
```

The following is an example message:

```
Information: Line 118, Cell 'SDRFFQ_X1M_A12TR', Complex function
 sequential cell will skip sequential cell timing consistency check.
 (LIBG-275)
```

### What Next

The cell timing consistency need to be checked by user.

Feedback

## LIBG-276

(error) Port '%s', only one %s can be the synchronized load enable pin in the cell.

### Description

The synchronized load enable pin is the pin with attribute *nextstate_type : load*. A synchronized load enable register cell should have only one load enable pin. So only one pin/bus/bundle should be specified with this attribute.

This message identifies a sequential cell that has more than one pin/bus/bundle being specified with attribute *nextstate_type : load*.

The following example shows an instance where this message occurs:

```
cell (test) {

  ...

  ff (IQ,IQN) {
      next_state : "E*D + !E*IQ" ;
      clocked_on : "CK" ;
  }
  pin (D) {
      direction : input ;
      nextstate_type : load ;
  }
  pin (E) {
      direction : input ;
      nextstate_type : load ;
  }
  pin (CK) {
      direction : input ;
      capacitance : 1.000000 ;
  }
  bus (Q) {
      direction : output ;
      function : "IQ" ;
  }
}
```

In this example, the *nextstate_type : load* attribute should not be defined on the pin 'D', only pin 'E' should have this attribute.

The following is an example message:

```
Error: Line 302, Cell 'test', Only one pin/bus/bundle can be the
 synchronized load enable pin in the cell. (LIBG-276)
```

Feedback

### What Next

Check your library, and correct the *nextstate_type : load* attribute specified on the wrong pin.

---

## LIBG-277

(warning) The port '%s' is not working as a synchronized load enable pin,\n \tthe cell can not be degenerated into non-synchronized load enable register cell.

### Description

The synchronized load enable(SLE) pin is the pin with attribute *nextstate_type : load*. When SLE pin is active, the register allows new values to load at the data input. When SLE pin is inactive, the register output is holding unchanged.

So when the load enable pin is at inactive level, the simplified next_state should be a Boolean expression with IQ; when the load enable pin is at active level, the simplified next_state should be a Boolean expreassion without IQ, but not tie to "1" or "0".

This message identifies the SLE pin doesn't satisfy the above conditions.

The following example shows an instance where this message occurs:

```
cell (test) {

  ...

  ff (IQ,IQN) {
      next_state : "E*D + IQ" ;
      clocked_on : "CK" ;
  }
  pin (D) {
      direction : input ;
      nextstate_type : data ;
  }
  pin (E) {
      direction : input ;
      nextstate_type : load ;
  }
  pin (CK) {
      direction : input ;
      capacitance : 1.000000 ;
  }
  bus (Q) {
      direction : output ;
      function : "IQ" ;
  }
}
```

In this example, the *next_state* attribute should be correct to "E*D + !E*IQ"

Feedback

The following is an example message:

```
Warning: Line 302, Cell 'test', The port 'E' is not working as a
 synchronized load enable pin, the corresponding non-SLER degenerated
 model can't be generated. (LIBG-277)
```

### What Next

Check your library, and correct the "next_state" attribute or the SLE pin.

---

## LIBG-278

(warning) The sequential element %s variable '%s' is unused in the cell function,\n \tthe '%s' attribute should not be specified and will be removed.

### Description

This message indicates the sequential cell has both clear_preset_var1 and clear_preset_var2, but one of them is unused and will be removed from the library.

If the sequential element second var (e.g. IQN) is unused in cell function, then we don't need clear_preset_var2 to be specified. If the sequential element first var (e.g. IQ) is unused in cell function, then we don't need clear_preset_var1 to be specified.

You will get this message if you specify the unused clear_preset_var, and it will be removed in the process.

The following example shows an instance where this message occurs:

```
cell(libg278) {
        area : 11;
        pin(D) {
                direction : input;
                capacitance : 1;
        }
        pin(CP) {
                direction : input;
                capacitance : 1;
        }
        pin(CLR) {
                direction : input;
                capacitance : 1;
        }
        pin(SET) {
                direction : input;
                capacitance : 1;
        }
        ff("IQ","IQN") {
                next_state : "D";
                clocked_on : "CP";
                clear   : "CLR'";
```

Feedback

```
                preset   : "SET'";
                clear_preset_var1 : L;
                clear_preset_var2 : L;  /* this is unsed as IQN is unused
 */
        }
        pin(Q) {
                direction : output;
                function : "IQ";
                timing() {
                        timing_type : rising_edge;
                        intrinsic_rise : 1.0;
                        intrinsic_fall : 1.0;
                        rise_resistance : 0.1;
                        fall_resistance : 0.1;
                        related_pin : "CP";
                }
                timing() {
                        timing_type : clear;
                        timing_sense : positive_unate;
                        intrinsic_fall : 1.0;
                        fall_resistance : 0.1;
                        related_pin : "CLR";
                }
                timing() {
                        timing_type : preset;
                        timing_sense : negative_unate;
                        intrinsic_fall : 1.0;
                        fall_resistance : 0.1;
                        related_pin : "SET";
                }
        }
}
```

The following is an example message:

```
Warning: Line 111, The sequential element second variable 'IQN' is unused
 in the cell function,\n
\tthe 'clear_preset_var2' attribute should not be specified and will be
 removed. (LIBG-278)
```

**What Next**

Edit the .lib and remove the unused clear_preset_var1/var2

---

## LIBG-280

(information) The cell '%s' contiains memory/memory_read/memory_write groups which are deprecated, use the is_memory_cell attribute instead.

Feedback

### Description

The groups are now obsolete and are no longer used by Synopsys tools. Use is_memory_cell attribute for memory cell. For example: cell (my_memory_cell) { is_memory_cell : true ; }

By default, bypass the checking for the groups(memory/memory_read/memory_write) for the same reason. Set the gvar lc_enable_memory_group_check to true to bring back the checking.

### What Next

Remove the deprecated groups(memory/memory_read/memory_write) and add is_memory_cell attribute for the cell.

---

## LIBG-281

(warning) The when condition of '%s' has been changed to '%s', by removing output pin(s) from the Boolean expression.

### Description

The string associated with a *when* attributes for receiver_capacitance includes pins of *output* directions . Tool will remove all the output pins from when attribute and copy original when to char_when if there is no char_when attribute.

The following example shows an instance where this message occurs:

```
cell (libg281) {
  area : 4
  pin(A2) {
    direction : input
    receiver_capacitance() {
     when : "A2&!B&ZN" ;
    }
  }
  pin(B) {
    direction : input
  }
  pin (ZN) {
    direction : output
  }
  }
```

The following is an example message:

```
Error: Line 431, The when condition of 'A2&!B&ZN' has been changed to 'A2
 B'', by removing output pin(s) from the Boolean expression. (LIBG-281)
```

Feedback

**What Next**

Check your library and remove output pins from when condition

# LIBMAP

## LIBMAP-1

(error) %s Only 1 file match in libmap is allowed for RTL file '%s', but %d were found.

**Description**

More than 1 file was matched by libmap following the specified patterns. Make sure each RTL matches are unique to avoid ambiguities.

**What Next**

Re-specify the libmap so that each rule only univocally matches one RTL file.

## LIBMAP-2

(error) %s Only 1 directory match in libmap is allowed for RTL file '%s', but %d were found.

**Description**

More than 1 directory was matched by libmap following the specified patterns. Make sure each RTL matches are unique to avoid ambiguities.

**What Next**

Re-specify the libmap so that each rule only univocally matches one directory for the specified RTL file.

## LIBMAP-3

(error) %s Only 1 wildcard match in libmap is allowed for RTL file '%s', but %d were found.

**Description**

More than 1 wildcard was matched by libmap following the specified patterns. Make sure each RTL matches are unique to avoid ambiguities.

**What Next**

Re-specify the libmap so that each rule only univocally matches one wildcard.

Feedback

## LIBMAP-4

(error) %s Configuration declaration is not supported in libmap file '%s' at line %d.

**Description**

Libmap configuration is not supported.

**What Next**

Remove or comment any config/endconfig block from the provided libmap.

## LIBMAP-5

(Warning) %s Only spice library is supported in libmap file '%s' at line %d, but '%s' was given.

**Description**

Only spice libraries are supported.

**What Next**

Remove any other library types than 'spice'.

## LIBMAP-6

(error) Libmap files are not supported for VHDL.

**Description**

Libmap support is not enabled for using VHDL.

**What Next**

Remove -libmap flag.

## LIBMAP-7

(warning) Libmap file is ignored if -library option is used in analyze command.

**Description**

If both -libmap option and -library option is specified to the analyze command, -library option takes precedence and -libmap is ignored.

**What Next**

Use only one of -library or -libmap option.

Feedback

## LIBMAP-8

(error) %s Directory for library '%s' recognized in libmap file has not been declared.

**Description**

Libmap file was matched to a library that has not been declared.

**What Next**

Declare the library and its path using *define_design_lib*.

## LIBMAP-9

(error) %s Invalid import in libmap file '%s' at line %d, a semicolon is required.

**Description**

A semicolon is required after library import.

**What Next**

Add a semicolon after library import, for example, 'include libmap.map;', and try again.

## LIBMAP-10

(error) %s Corrupt libmap include chain.

**Description**

Libmap include failed because of invalid library definition.

**What Next**

Add a semicolon after each library import, and make sure each imported libmap file exists and is readable.

## LIBMAP-11

(error) Libmap provided file for -libmap argument in analyze command cannot be empty.

**Description**

The -libmap argument requires the definition of *libmap_file* in order to work. Declare the file first.

**What Next**

Remove -libmap flag, or provide a file for libmap to process.

Feedback

## LIBMAP-12

(error) %s Provided libmap file '%s' cannot be loaded. It does not exist or is not a regular file.

**Description**

Provided libmap file from -libmap argument is not a regular file, thus it cannot be processed.

**What Next**

Make sure the provided libmap file exists or it path is correctly defined.

## LIBMAP-13

(error) %s Invalid libmap library definition '%s' at line %d, a semicolon is required.

**Description**

A semicolon is required after library definition.

**What Next**

Add a semicolon after library definition, for example, 'library lib1 rtl/sub1.sv;', and try again.

## LIBMAP-14

(error) %s Missing ',' as path separator between '%s' and '%s' of file '%s' at line %d.

**Description**

Path separator for libmap definition is missing.

**What Next**

Add a comma to separate each path when describing libraries in libmap file.

# LLE

## LLE-001

(Warning) Overlay file has duplicated definition at file %s line %d for the corner, this line will be ignored.

Feedback

**Description**

LLE overlay side file definition is based on cell namd and TR number, this warning means the same definition(same cell name and same TR number) has already been defined for the same corner. This line's duplicated definition will be ignored.

**What Next**

Check and correct the lle overlay side files.

# LM

## LM-001

(warning) %d missing %s%s across all libraries.

**Description**

The *check_workspace* command found some missing arcs or checks. This is usually due to inconsistent use of arc sense (like clear_low versus clear2_low), modes (multiple arcs with separate modes versus one arc with multiple modes), or sometimes true missing arcs.

**What Next**

The *check_workspace* command used with the *-allow_missing* option can auto-correct many of these situations. There is a modes solver, a sense2 solver, and true missing arcs can sometimes be duplicated in the base library. For true missing arcs/checks (and library cells), you can also choose to ignore them. See the documentation for the *check_workspace* command.

If after *check_workspace -allow_missing* there are still errors, your library source files may need to be revisited.

## LM-002

(information) Fixed all missing %ss.

**Description**

The missing objects of the given type were all resolved.

**What Next**

No action is needed.

Feedback

## LM-003

(information) Verifying missing arcs/checks fix...

**Description**

After missing arcs/checks have been resolved, we re-verify that the libraries are all aligned. This is just an informational message to tell you that this verification has begun.

**What Next**

No action needed.

## LM-004

(error) Timing/power object verification across libs failed.

**Description**

Verification of objects used for timing (arc, check, receiver capacitance, etc.) or power (leakage, dynamic) failed. Previous messages would give you an indication of the problems encountered.

**What Next**

You may need to make some changes to your setup in order to get *check_workspace* to succeed. Passing additional arguments to *check_workspace* to allow missing objects or missing library cells might help. Changing (or removing) scaling groups is a possible fix because you cannot have missing objects in the context of scaling groups. Removing some problem library cells or libraries might also work as a last resort.

## LM-005

(information) Only one logical library loaded - internal checks only

**Description**

You entered the *check_workspace* command with only one DB library in memory. This message is just telling you that there will be no checks between logical libraries because there are no logical libraries to compare. Comparisons between logical and physical libraries will still occur.

**What Next**

No action needed.

Feedback

## LM-006

(warning) Library %s has %d duplicate %s(s).

### Description

The *check_workspace* command found duplicate DB objects such as arcs, leakage/dynamic power records, cell em records, receiver capacitance records, or ccsn records. Duplicates are defined as objects that share the same signature, which means that there is no way to tell them apart. The *check_workspace* command will try to make the objects unambiguous and match objects of this type across libraries.

### What Next

Sometimes, duplicates are allowed. Therefore, the tool will try to make the duplicates unambiguous. If this succeeds and all duplicates are resolved, no action is needed. If there are still duplicates, the check will fail. In that case, use the *check_workspace -details* with the appropriate detail value to report the specific objects that are duplicates.

## LM-007

(information) Duplicate %s: %s

### Description

The checker found a duplicate object, and *check_workspace* was call with the *-details* option to provide more verbose information. This message is emitted to show the specific object which was ambiguous.

### What Next

This is a companion message for LM-006. See the description there.

## LM-008

(information) %d libraries need their breakpoints repaired.

### Description

While comparing NLDM between related attributes in the same library, breakpoints were found that either have the same variables but different dimensions, an extra variable, or a split pair (for example, one attribute has a table which is function of Tclk and the other has Tdat). These can be automatically repaired. The message tells you that *check_workspace* will correct these issues for some number of libraries.

### What Next

No action needed.

Feedback

## LM-009

(error) Unfixable %s '%s' because\n \t%s.

### Description

While comparing two arcs/checks across libraries, a serious difference was found between the delay data for the two objects being compared. The message will detail the irreparable problem. For example, the data might exist in one library and be missing from the one being compared. This will cause check_workspace to fail, and some action (usually by changing the source library) is needed to fix it.

### What Next

Using the information from the message, you can try to adjust the .lib source. It is also possible that you have created a scaling group which tightens the restrictions on missing data across libs. You might be able to get a library created without scaling groups.

## LM-010

(error) No libraries to %s

### Description

You tried to do some operation which requires that there are some libraries in memory, and you have not yet loaded any. For example, you tried to save the library to disk and no logical or physical library files have been loaded. Or, you tried to *check_workspace* without having a base logical library to which other logical and physical libraries would be compared.

## LM-011

(error) You must check your workspace before committing

### Description

You will get this message from *commit_workspace if the workspace needs to be checked. It could be that you have not run check_workspace yet. Or, it could be that you had a successful check, then either changed the PVT configuration, or added or removed files from the workspace. Anything that changes the state of the workspace will require a check before committing.*

### What Next

The workspace must be checked and clean before committing it to disk.

Feedback

## LM-012

(error) The checker found problems which must be resolved before committing

### Description

You tried to save the library without first resolving the issues found by the checker using additional options for *check_workspace*.

### What Next

Libraries must be checked and clean before saving to disk.

## LM-013

(error) %s thresholds do not match

### Description

While creating a scaling group, some thresholds from one of the libraries did not match the first library in the group. These could be the thresholds defined at the library level or pin-specific thresholds. Each library in the group must agree for the threshold values input_threshold_pct_fall, input_threshold_pct_rise, output_threshold_pct_fall, output_threshold_pct_rise, slew_lower_threshold_pct_fall, slew_lower_threshold_pct_rise, slew_upper_threshold_pct_fall, slew_upper_threshold_pct_rise, and slew_derate_from_library, as defined in Liberty.

This will cause *create_scaling_group* to fail.

### What Next

You can use *set_thresholds* to change the thresholds for libraries and lib cell pins so that they match. However, you should to go back to the source of the DB libraries and ensure that these libraries are compatible.

### See Also

- create_scaling_group
- set_thresholds
- report_thresholds

## LM-014

(information) Library %s:%s is missing %d design(s)

Feedback

### Description

In comparison to the superset of all designs found in all logical libraries, the given library is missing some designs. This is a summary which was preceded by specific warnings (for designs missing in a downstream library) or errors (for designs missing in the base library). For example, if the base library contains the design AN2:

```
Base:     lib 1
Comparing lib 2 /u/me/libs/or2.db:or2...

Error: Design OR2 is missing in base library /u/me/libs/an2.db:an2
 (LM-091)
Information: Library /u/me/libs/an2.db:an2 has 1 missing lib cell(s)
 (LM-014)

Warning: Design AN2 is missing in library /u/me/libs/or2.db:or2 (LM-090)
Information: Library /u/me/libs/or2.db:or2 has 1 missing lib cell(s)
 (LM-014)
```

### What Next

A missing design in a downstream library is less of an issue than a missing design in the base library, but both indicate inconsistent libraries which is something you should address. Missing designs can be resolved by using the *-allow_missing* option to *check_workspace*.

---

## LM-015

(error) Check FAILED

### Description

This is just a summary message that the *check_workspace* command failed. It should be the last thing written by the command before returning to the command line.

### What Next

Examine the errors and warnings issued by *check_workspace* and determine if additional command options can correct the issues.

Feedback

## LM-016

(error) Incompatible graph found for design %s: %s.

### Description

This is a serious error. It means that two logic libraries that have the same cell and ports (by name) but they do not have the same arcs. More importantly, the graph has different nodes. This could indicate cells with a different function. The *check_workspace* command will remove the cell from the non-base library.

### What Next

To use these libraries to create a reference library, you must ensure that you read the logic library that has the superset of the graph first. To do this, remove the current library workspace, reread the logic libraries in a different order, and then use the *check_workspace -ignore_missing* command to combine the libraries without trying to create a superset of missing arcs.

Note that the library is still incorrect, and you should go back to the library source files to determine why they have two cells with substantially different arcs.

## LM-017

(error) %s '%s' has invalid thresholds.

### Description

This message indicates that invalid threshold values were specified for a library or library cell pin. This message is issued either when reading a logic library that contains invalid threshold values or when invalid values are specified in the *set_thresholds* command.

Thresholds other than the slew derating factors must be in the range of 5 percent to 95 percent, and the high and low slew thresholds must differ by at least 1 percent. In addition, the low threshold must be less than the high threshold.

You cannot write a library until you correct the values. To show the thresholds for a specific library or library cell pin, use the *report_thresholds* command.

### What Next

Check with your library vendor and correct the values before proceeding. To modify the threshold values, use the *set_thresholds* command.

## LM-018

(error) Must have at least 2 libraries for a scaling group

Feedback

### Description

A scaling group requires at least 2 libraries, and you passed in only 1 library to the command *create_scaling_group*.

### What Next

Make sure the specification of libraries to *create_scaling_group* is correct.

---

## LM-019

(error) Library %s is blocked from inclusion in scaling groups%s

### Description

There are two possible problems: either the source library is already in use in a different scaling group, or the checker found some problem earlier and marked the listed library such that it cannot be included in any scaling groups. One example problem which causes this is when duplicate arcs or checks were found in the library.

### What Next

In cases where there was an error which prevented the source library from being in a group, the libraries in question can be included in the library you write, but only as a single pane (that is, a specific unscaled characterization point). See the specific errors or warnings which occurred previously.

### See Also

- LM-006

---

## LM-020

(error) Scaling library group %u is no longer valid

### Description

You removed a library which was part of a scaling library group. By doing so, the SLG became invalid because a v,t point is missing.

### What Next

You might need to recreate other scaling library groups.

---

## LM-021

(information) Removed scaling library group %u

Feedback

**Description**

The scaling library group was removed because it became empty due to the its last library being removed.

**What Next**

No action required.

---

## LM-022

(warning) Scaling group already exists with these libraries

**Description**

You tried to create a scaling group but have already done so with the same set of libraries.

**What Next**

Check for a typo in your command.

---

## LM-023

(error) For rail requirement%s, %s characterization point %s

**Description**

While creating a scaling group, one of two things is wrong. In one case, there is a missing characterization point. For each voltage required for an arc (there might be an output voltage, an input and output voltage, or either of those along with a bias voltage), you must have each temperature, and vice-versa. So if you had 2 temperatures, two voltages for the main rail, and two voltage values for an input rail on level shifters, you would typically need eight libraries to cover those points.

In the other case, more than one library has the same characterization point. Each point can occur only once.

**What Next**

Try using a different set of libraries for your scaling group.

---

## LM-024

(information) For rail requirement%s, found%s

**Description**

While creating a scaling group, the application found missing or duplicate characterization points (PVTs). This message tells you which temperatures, output voltages (on the To pin

Feedback

of an arc), and input voltages (on the from pin of an arc, if a different rail than the to pin) were found. To get complete coverage, each combination of these values would usually have to be found in a library to allow a valid scaling group. In some cases, missing PVTs are allowed, for example, if you have multi-voltage arcs but in all cases, Vout = Vinp.

This informational message is paired with other messages, which will indicate if this is allowed or if it is an error which will prevent creating of the scaling group.

*LM-023 (n) LM-138 (n)*

---

## LM-025

(error) Could not fix all missing %s

### Description

There were missing objects of the given type, and not all could be resolved. The likely cause is more objects in one library than another, for example, an extra timing arc.

To view the missing objects, you could use *check_workspace -details* and pass in the proper value according to the information you need. For example, use *arcs_progress* for missing arcs, *leakage_progress* for leakage power records, and so on. Note that this can produce large output.

### What Next

You could try using *check_workspace -allow_missing* to allow missing objects to be passed through to the merged library. There would be no data for that object in any pane that includes the source library. Note that this will not work if you have created scaling groups, as there cannot be any missing objects. If the command option succeeds, a warning version of this message (LM-125) is output.

### See Also

- LM-125

---

## LM-026

(warning) Lib cell %s is defined in more than one physical library

### Description

Duplicate physical definitions are found for the lib cell. The application will use the first one that was loaded into the workspace, and ignore the duplicates. The lib cell's physical definitions are from LEF file or GDSII file.

You can use *get_lib_cells* command to find all of the library cells with this name.

Feedback

### What Next

Check your LEF or GDSII file and remove the duplicate, then restart the library creation with updated files.

---

## LM-027

(Information) Identified potential valid scaling groups.

### Description

The *group_libs* command analyzes the logic libraries loaded in the library workspace to check for potential scaling groups. If the command identifies one or more potential scaling groups, it issues this message.

### What Next

If you want the *group_libs* command to create the identified scaling groups, set the *lib.workspace.group_libs_create_slg* application option to *true*, and then run the *group_libs* command again.

### See Also

- group_libs

---

## LM-028

(warning) Some port differences found with %s versus base design %s as follows:

### Description

Each logical source library (from DB, for example) other than the first (known as the base) is compared to the base. Each design (library cell) is compared. Here, some differences were found with one or more ports for a specific design. This is an introductory message to show the two designs being compared. Subsequent messages will show the individual problems, and whether they were errors or were repaired (warnings and information only). Problems include missing ports, different port directions, ports out of order, and so on.

### What Next

When reading multiple logical source libraries, the library cell function, port names, port directions and many other port attributes must match those of the same cell in the base library. Libraries with this sort of error are probably out of date and should not be used. However, you can choose to remove the design from one or more libraries with *remove_lib_cell*, or in some cases, you can change port attributes. You can also have incompatible library cells removed automatically using the application option *lib.logic_model.auto_remove_incompatible_timing_designs*.

Feedback

**See Also**

- LM-029
- LM-056
- LM-123
- LM-124
- LM-129
- lib.logic_model.auto_remove_incompatible_timing_designs
- remove_lib_cell

## LM-029

(information) Successfully reordered out of position ports on design %s

**Description**

Previous messages (LM-028, LM-124) indicated that there were some ports out of position with the given design in comparison to the base DB library. The application was able to correct the problem.

## LM-030

(error) '%s' is not a valid DB/Liberty library file.

**Description**

The tool could not read the specified library file.

**What Next**

In the case of a DB file, ensure the file is a valid logic library file created with the Synopsys Library Compiler tool. In the case of a Liberty .lib file, ensure that the file conforms to the Liberty syntax.

## LM-031

(error) File '%s' is protected by a license code

**Description**

The .db file is protected by a license code. This product does not currently support reading of licensed .db files.

Feedback

### What Next

Obtain a non-licensed version of the library.

---

## LM-032

(error) Design %s is incompatible between these libraries:\n \t%s:%s\n \t%s:%s

### Description

During *check_workspace*, the first occurrence of each timing design (library cell) is compared to occurrences in all downstream libraries. If there are differences with function id, missing ports, or different port directions, the design is incompatible. Earlier messages showed the specific results of the comparison.

### What Next

When reading multiple DB or Liberty libraries, the library cell function, port names, and port directions must match those of the same cell in the base library. Libraries with this sort of error are probably out of date and should not be used. By default, the design remains. You can remove it using the *remove_lib_cell* command, then rerun the check. If you want offending library cells to be automatically removed from the offending library, you can set the application option *lib.logic_model.auto_remove_incompatible_timing_designs* to true and the designs will be automatically removed. Note that there are some cases where the design is always removed, for example, incompatible graphs.

- remove_lib_cell
- lib.logic_model.auto_remove_incompatible_timing_designs

---

## LM-033

(warning) Mismatched PG pins between the logic library and %s for block %s: %s.

### Description

The PG pins for the specified block differ between the logic and physical library source files. The tool cannot fix this mismatch.

This can happen when the logic library and physical library have more than two PG pins for a block, but the names do not match.

Feedback

### What Next

This is a warning, and it does not prevent the library from being written. However, the specified block will have all of the PG ports from both the logic and physical library source files, which might not be desirable.

Although the tool allows this mismatch, your library source files should match. You should alert the provider of your library source files about this discrepancy.

---

## LM-034

(information) Combined %d physical design%s:%s

### Description

This message, along with LM-052, summarizes the results of combining physical libraries into the workspace. In this case, there were designs from logical sources (DB), so the physical designs are combined with the logical source in the workspace. A count of unique design names is listed, followed by a line for each type of view (design, frame, layout) which had any content combined. For each view type, if any ports were reordered because they did not match the logical design, that is also listed. For example:

```
Information: Combined 20 physical designs:
      20 with a design view (14 had ports reordered);
      20 with a frame view (14 had ports reordered) (LM-034)
```

---

## LM-035

(error) Design %s does not exist in physical libraries

### Description

During *check_workspace*, when combining physical views into the workspace, neither a frame view nor a design view exists for the named library cell in any physical source library read into the application. Since the library cell does have a timing view, this means it can be timed, but not placed. This is an error and could be serious. This issue can be fixed automatically by setting the application option *lib.logic_model.auto_remove_timing_only_designs* to true, in which case you will see a similar message with the warning severity (LM-135). However, we recommend that you investigate why your DB or LIB files have designs that do not exist in any physical source.

Note that in the physical-only flow, there is a similar message which is always a warning. See LM-063.

### What Next

Verify that you are using the most up to date LEF or GDS and DB or LIB files. To continue, you would need to remove the library cell from the all DB or LIB files that contain it.

Feedback

## LM-036

(error) %s/%s was not copied from physical library

**Description**

The design was not combined into the base library. The likely cause is an attempt to associate different designs to one another (by name) that have significantly different footprints. This is an error and could be serious, but it will not block writing of the library.

**What Next**

Verify that you are using the most up to date LEF or GDS file.

## LM-037

(information) Combined physical block %s/%s (with %s port reordering).

**Description**

A verbose information message that indicates that a physical block was combined into the base library.

## LM-038

(warning) Port %s for block %s is out of order.

**Description**

When adding a physical design into the base library, the tool found a port on the specified block whose location differs from that in the logic library.

This message is issued only in verbose mode.

**What Next**

No action is required. The tool will reorder the ports using the order from the base library.

## LM-039

(error) Port %s missing on %s design %s

**Description**

When combining a physical design into the base library, a port was found to be missing on either the physical or base logical design.

Feedback

## LM-040

(error) Port %s/%s has related %s pin %s in lib %s, %s in lib %s

### Description

This is an incompatibility between the PG pin configuration between two DB files. The same cell in all DB files must have the same PG pins, and the signal pins must have the same related PG pins. In this case, a port refers to different related PG pins across libraries. This is related to LM-041, as pins with different related power pins will often have a different signal level.

### What Next

There are a few ways to correct this. Starting from a .lib file, ensure that every signal pin has related power/ground pins. It's better not to rely on Library Compiler to use a default value. If you can't modify the .lib files, then from this application, you can use attributes to fix the problem. Given that you have a cell A with signal pin X with related power pin VDD and in another library lib2 it has related power pin VDDX, and both power pins are available on cell A:

```
set_attribute [get_lib_pins {lib2/A/X}] related_power_pin_name VDD
```

Then, rerun the *check_workspace* command.

## LM-041

(error) Port %s has signal level %s in lib %s, %s in lib %s

### Description

This is an incompatibility between the PG pin configuration between two DB files. The same port in all DB files must have the same signal level.

### What Next

This is related to LM-040. See the comments there. Usually, fixing the related_power_pin_name attribute should also correct the signal_level mismatch.

## LM-042

(warning) Different number of rails between libs %s (%d) and %s (%d)

### Description

This is an incompatibility between the PG configuration between two DB files. Each DB file must have the same number of rails, and the rail names must align. This may be followed by some LM-043 messages about rail alignment. If the rails are just extra power rails and

Feedback

they are not used, you might be able to write a library. If there are different signal levels or the rail alignment is different for power rails, you will not be able to write a library.

## LM-043

(error) Different rail %s between the %s (%s) and %s (%s) libraries.

### Description

The PG configuration differs between the specified logic libraries. Each logic library must have the same number of rails, with the same names, in the same order. This message indicates that the alignment of the rails is wrong, either because one library has extra rails, or the rail names or types are simply different.

### What Next

In some cases, such as rail type differences, this error prevents the tool from writing the library and you must fix the logic library source file. If the rail names and positions differ, you can use the *rename_rail* command to make the rail names match. For example, if library A has a rail named VDD1.0 and library B has a rail named VDD1.1, use the following command to fix the mismatch:

```
rename_rail -library A -from VDD1.0 -to VDD
rename_rail -library B -from VDD1.1 -to VDD
```

When you rerun the *check_workspace* command, it issues this message again; however, it can correct the mismatch because the names now match.

Note that within a logic library, the voltage rail name is essentially a constant that is replaced with a voltage value. However, the tool uses the voltage rail names to match rails across libraries. If the rail names are inconsistent, the tool must trace back from the PG pins in the two libraries being compared to determine which rail is which, and whether they can be matched, which increases runtime.

### See Also

- LM-048
- LM-049
- rename_rail

## LM-044

(warning) Extra rail %s in lib %s

Feedback

**Description**

This is an incompatibility between the PG configuration between two DB files. Each DB file must have the same number of rails, and the rail names must align. In this case, one lib has an extra, unused rail.

---

## LM-045

(information) Fixed PG mismatch: %s name %s overrides %s.

**Description**

The PG pin names in the logic and physical library source files do not match. In this case, each design has exactly one PG pin of a type (power or ground) that does not match, so the tool will use the name in the physical library source file. Note that power and ground pins are considered separately.

**What Next**

Although the tool allows this mismatch, your library source files should match. You should alert the provider of your library source files about this discrepancy.

---

## LM-046

(information) Allowed extra internal PG pin %s from the logic library that is missing in %s.

**Description**

The PG pin names in the logic and physical library source files do not match. In this case, the block has an extra PG pin of type internal power or ground in the logic library. This might be due to an old method to emulate bias pins, or it could indicate that the logic library and physical library are out of sync.

**What Next**

Although the tool allows this mismatch, your library source files should match. You should alert the provider of your library source files about this discrepancy.

---

## LM-047

(warning) Port %s/%s changed from %s to %s.\n \tDeleting all arcs and checks at this port.

**Description**

The PG pin types in DB and LEF do not match. The most likely case is that the type is a power type in LEF and signal in DB. The default behavior is to take the type from LEF.

Feedback

Since power pins cannot have any arcs, any that exist are removed. You will also get this message if you change the port_type attribute of a pin from signal to power or ground.

**What Next**

Currently, there is no method to override this behavior.

---

## LM-048

(information) For the rail mismatches shown above, find common names, then use rename_rail commands to make them match. Then rerun check_workspace.

**Description**

When rail names don't match across DB libraries, you need to use *rename_rail* to make them match. For example, if you have library A with a rail named VDD1.0 and library B with a rail named VDD1.1:

```
rename_rail -library A -from VDD1.0 -to VDD
rename_rail -library B -from VDD1.1 -to VDD
```

That is one of many ways to get the rail names to match. During the repeat of *check_workspace*, you may see LM-043 messages again if the rails are still in different orders across libraries, but this should be followed with an indication that the problem was corrected.

**See Also**

- LM-043
- LM-049

---

## LM-049

(information) All rail names match, reordering rails...

**Description**

After the *check_workspace* command detected mismatched rail names, you used the *rename_rail* command to correct the problem. This message indicates that the names now match but the rails are still in a different order. The tool should be able to correct this problem.

**See Also**

- LM-043
- LM-048

Feedback

## LM-050

(information) Copied %d physical design%s

**Description**

A message summarizing the results of combining physical libraries into the workspace. In this case, there were no logical designs, so the physical designs are just transferred to the workspace.

## LM-051

(information) Copied %d physical-only design%s

**Description**

A message summarizing the results of combining physical libraries into the workspace. In this case, there were designs from logical sources (DB or LIB) and you are in a *keep_all_physical_cells* flow, so designs known to be physical-only were copied as well.

**What Next**

Note that this path may not be supported. In the future, it may only be possible to include physical-only cells in a workspace that only has designs from physical sources like LEF or GDS.

## LM-052

(information) Skipped %d physical design%s

**Description**

This message, along with LM-034, summarizes the results of combining physical libraries into the workspace. Some designs were not combined into the workspace. Reasons for this include a duplicate design (exists in more than one physical library), a design in physical library source that does not exist in DB, or physical-only designs without the appropriate option to *check_workspace*.

## LM-053

(error) Could not remove library cell %s/%s

**Description**

The *remove_lib_cell* command could not remove the specified library cell. This can happen if the library is in read-only mode.

Feedback

## LM-054

(information) Fixed direction mismatches for block %s.

### Description

The tool found ports on the specified block that did not match the directions in the timing view. These mismatches were detailed with NDM-032 errors. You enabled the setting that allows timing view directions to be applied to the design view to make them match.

### What Next

Although the tool allows this mismatch, your library source files should match. You should alert the provider of your library source files about this discrepancy.

## LM-055

(warning) Direction for port %s on %s is changed from unknown to %s.

### Description

The port on the specified physical design has an unknown direction. This typically indicates that the library source file for this physical design does not specify a direction for the port. If the design also has logical data, the library manager gets the port direction from the corresponding logical design. However, for physical-only designs, the library manager changes port direction to in if the *check_workspace* command did not find any problem. This message reports this change.

### What Next

Although the library manager allows an unknown port direction and changes it to the in direction, you should verify that this is desired. You should notify the provider of your library source files about this missing direction issue.

## LM-056

(error) Port %s/%s has %s '%s' in lib %s, '%s' in lib %s.

### Description

There is an incompatibility of port attributes between two logical libraries. Certain attributes must be the same for a given design port in all DB or Liberty source files. For example, port_type (signal, power, ground, etc.), direction, and various other attributes . *check_workspace* will fail if there is a mismatch for these attributes. In most cases, the user will need to fix the mismatch in the source, reload it and run *check_workspace* again. There may be some cases where the attribute can be changed in the library manager, or where an application option can change the error to a warning.

Feedback

### What Next

Starting from a Liberty source file, modify the attribute on the port, load the updated DB or Liberty source file, and rerun the *check_workspace* command.

---

## LM-057

(error) Your scaling group is very large (%1.2f %s). This is\n \t%1.1f times the size of the representation as %u unscaled panes.\n \tScaling group not created due to excessive runtime required to\n \tcreate it, and the large projected memory overhead to use it.

### Description

You are using *create_scaling_group*, and the group is going to be very large in memory and disk space, and it will also take a very long time to create. Scaling is not for everyone. You need a complete grid of logical libraries to cover the range of voltages and temperature, but that alone does not mean you will get an efficient representation. If the breakpoints (table indices) do not match across the PVTs, tables get expanded to cover the complete range of breakpoints in order to guarantee that all values from the contributing logical libraries can be retrieved exactly. That expansion costs memory, and because all of the extra points need to be filled in, the time to create the group (during *check_workspace*) can be extensive.

For example, say you have 7x7 tables and 6 contributing libraries over 2 voltages and 3 temperatures. As unscaled panes, you could assign a cost of 7x7x6, or 194, for one table. Scaling groups always have a small incremental cost over unscaled panes due to optimizations for delay calculation. So with the same breakpoints across all 6 libraries, you could assign a cost of about 250 to the scaling group. Now, in the worst case, if you have no overlap at all in the breakpoints, the final tables would be 49x49x2x3, or a cost of 14406, 75x the unscaled size rather than 1.3x. If you have more contributing libraries, the factor could be even higher.

This message is telling you that you have fallen into this situation and you should reconsider the use of scaling groups. You can force the application to create the group for you using the *-force* option to *create_scaling_group*, but this is not recommended.

### What Next

Scaling is a powerful feature which allows you to interpolate in the voltage and temperature dimensions, but your source libraries need to be designed with that in mind. Check with the provider of your logical libraries and request libraries where the breakpoints match across all PVTs.

### See Also

- create_scaling_group

Feedback

## LM-058

(warning) Duplicate physical block %s accepted only from library file '%s'.

**Description**

The *check_workspace* command found blocks with the same name in two or more physical library source files, such as LEF files. When the physical library source files contain duplicate block names, the tool uses the block from the first physical library source file read.

## LM-059

(error) There are no physical-only blocks.

**Description**

You created a physical-only library workspace with the *create_workspace -flow physical_only* command. However, the *check_workspace* command found all blocks defined in the physical libraries in one or more logic libraries; therefore, there are no physical-only blocks to include in the reference library.

**What Next**

If you want to create a library that contains only physical information for the blocks, read only the physical library source files and not the logic library source files.

## LM-060

(error) Equal/opposite relationships between %s/%s and %s are different:\n \t%s in %s, %s in %s

**Description**

Equal/opposite information, loaded from DB, is different for a design in the base library in comparison to another library.

**What Next**

In general, these libraries are incompatible, and you should go back to the source of the library and make sure these libraries were intended to be used together.

An app option lib.logic_model.relax_pin_equal_opposite_attr_check is provided to relax the consistencies check for equal/opposite attributes. It is a boolean option, default is false. When the app option set as true, the error will be treated as a warning. In that case, the LM-160 message is output.

SEE ALSO

Feedback

**LM-160(n)**
**lib.logic_model.relax_pin_equal_opposite_attr_check(3)**

---

## LM-061

(error) Switch cell %s has incorrect number of primary power/ground pins

### Description

A switch cell requires at least one primary power and one primary ground pin, and then at least one internal power and/or one internal ground pin.

### What Next

You can correct this in the library manager by changing the *pg_type* attribute on a lib pin. However, it is probably best to review the Liberty source of the library and correct it there.

---

## LM-062

(error) %s %s refers to a %s '%s' that is not on the parent library cell '%s'.

### Description

An object in a .db library file refers to a power or ground pin that does not exist on the library cell that owns the object. The .db file is corrupt.

### What Next

Recompile the library source file (.lib) into a new .db file.

---

## LM-063

(warning) DB design %s does not exist in physical libraries

### Description

During *check_workspace -flow physical_only*, neither a frame view nor a design view exists for the named library cell in any physical library read into the application. Since we are creating a physical-only library (that is, designs which exist only from physical library source), this is a warning in this flow. It would be an error in the normal flow (see LM-035).

---

## LM-064

(warning) Cell %s has more than one physical %s pin and none in DB.\n \tSome related %s pins cannot be derived.

Feedback

### Description

In the case where DB has no PG pins and the physical design has more than one power and/or ground pin, the application cannot derive the related pg pin on signal pins.

### What Next

You can use the *related_power_pin_hint* and *related_ground_pin_hint* attributes on pins in the DB file(s) to help steer the application towards a solution. In the case that you have multiple DB files, the attributes only need to be set on one instance of the pin. If you continue to get this error, use *get_attribute* or *report_lib_pins* to determine which pins are missing related pins, provide hints, and rerun *check_workspace*.

Although this is an error, it will not prevent the user from writing a library at this time; the library will simply be missing related power/ground pins for the problem cell(s). However, there may be some modes when such errors will prevent writing the file.

---

## LM-065

(error) Rail %s on port %s is defined as %s;\n \tpreviously defined as %s (on %s)

### Description

There's an inconsistency with a voltage rail within a DB file. On different cells, each has a PG port that refers to the same rail using the *voltage_name* attribute (which refers to an entry in the *voltage_map*). In one case, the pg_type of the port is power; in another, it is ground. It was likely a typo in the .lib file. Although you can have mixed types for an entry in a voltage_map, power and ground is the one combination that is not allowed.

### What Next

Someone really should follow up with the provider of the DB because this is a very serious error. There is no automatic recovery for this error. The PG ports in question will have no rail associated with them. You can use *set_attribute* to set the *rail_name* attribute to something appropriate.

---

## LM-065w

(warning) Rail %s on port %s is defined as %s;\n \tpreviously defined as %s (on %s),will add extra rail for it to continue

### Description

There's an inconsistency with a voltage rail within a DB file. On different cells, each has a PG port that refers to the same rail using the *voltage_name* attribute (which refers to an entry in the *voltage_map*). In one case, the pg_type of the port is power; in another, it is ground. It was likely a typo in the .lib file. Although you can have mixed types for an entry

Feedback

in a voltage_map, power and ground is the one combination that will be handled by adding an extra rail.

**What Next**

Someone really should follow up with the provider of the DB because this is a very serious warning. There is automatic recovery for this warning. The PG ports in question will have an extra rail associated with them.

---

## LM-066

(error) PG port %s has voltage_name %s which does not exist in the voltage_map

**Description**

Logic libraries define PG pin connections by using library-level *voltage_map* attributes and cell-level *pg_pin* groups. The *voltage_map* attributes define the power rail names. The *pg_pin* groups define the PG pin connections for a cell; they use the *voltage_name* attribute to assign one of the defined power rails to each PG pin.

The tool issues this error when the power rail specified for the *voltage_name* attribute is not defined in a library-level *voltage_map* attribute.

**What Next**

If you have access to the logic library source, you can update the library to correct this issue. Otherwise, you can use the *set_attribute* command to modify the *rail_name* attribute of the PG pin in the reference library (the *voltage_name* attribute in the logic library is stored as the *rail_name* attribute in the reference library).

To determine the power rail names defined for the library, use the *report_workspace -panes* command. If the tool deleted a power rail because it appeared to be unused, use the *create_rail* command to re-create the power rail.

---

## LM-067

(error) Attribute %s on similar %ss %s (%s) and %s (%s) must match

**Description**

There's an inconsistency with an attribute between two objects. They must match. For example, if this is a *related_power_pin_hint* attribute, if it is applied to similar lib pins in different libraries, the value must be the same, because the final library will only have one representation of the lib pin.

**What Next**

Use the *set_attribute* command to change one of the attributes.

Feedback

## LM-068

(warning) Unknown pin '%s' for attribute '%s' on '%s/%s'

### Description

You provided a hint for the checker to select the correct related power, ground, or bias pin when the DB has no PG pins and the LEF has more than one of a particular type. The hint pin name did not exist in the LEF so it does not exist on the cell in the workspace. For example, if the LEF power pins are VDD and VDDx, and you used *vdd* as the value for the *related_power_pin_hint* attribute, you would see this warning. Even though this is a warning, it will cause *check_workspace* to fail in some modes.

### What Next

Use the *set_attribute* command to change one of the attributes.

## LM-069

(error) Table template %s was not loaded from DB or .lib

### Description

There's a table in the DB or Liberty source file that refers to a template of an unsupported type. Since the template was not loaded, the table cannot be loaded either. One current example is an internal power table with a reference to a poly_power_template.

### What Next

The result is that this internal power record is ignored. It does not prevent the library from being written.

## LM-070

(error) %s is not a single cell library

### Description

You created a workspace with the ETM flow or the organize_by_pvt flow. Currently, these flows only allow single cell libraries, and the named library has more than one cell.

## LM-071

(error) Design %s already exists for PVT '%s'\n \tfrom lib %s;\n \tcannot add it from lib %s

Feedback

### Description

You created a workspace to reorganize logical DB libraries according to PVT. There can be only one combination of design name and PVT, and the application found a duplicate of a combination.

---

## LM-072

(error) Cannot reorganize by PVT

### Description

This is a summary message. See previous messages, for example, LM-070 and LM-071 for specific problems trying to reorganize the workspace by PVT.

---

## LM-073

(error) %s have the same PVT:\n \t%s

### Description

At the conclusion of *check_workspace*, the application verifies that you don't have multiple contributing libs using the same PVT. This causes ambiguity in the NDM created; the timer will be unable to distinguish panes using these libraries. Only one pane will be used. There can be several causes of a duplicate PVT, but in general, this occurs when multiple DB libraries were intended to have a different process, but the values in the libraries are the same. Prior to *check_workspace*, either use the *-process_label* option for *read_db*, or use *set_process* to adjust the process number or label in the initial libraries after reading.

The message will list each conflicting contributing DB library and the pane (in the final NDM) it is in.

### What Next

This is an error. You should be able to make adjustments to your script and rebuild the library to remove the situation.

---

## LM-074

(warning) Units for lib %s do not match the base

### Description

Libraries that come from DB files don't need to have the same units - all values are scaled appropriately when the file is read. However, there is a legacy idea of a "main" library and the units for various quantities in it. This establishes units for commands that deal with values, like timing, capacitance, and so on. This is just an advisory message to tell you

Feedback

that the units the main application will use are not necessarily all the same as the units from this particular library.

## LM-075

(warning) DB/Liberty file %s has invalid nominal voltage %g.

### Description

The nominal voltage in DB is based on the *nom_voltage* library attribute, or the voltage value in the default operating conditions. For this application, if the Liberty source has a *voltage_map*, then the nominal voltage must match a value from the map. If there is no match found, this warning message is issued. A library with an invalid nominal voltage cannot be included in any scaling group. You will get an LM-076 error message in the *create_scaling_group* command if your try to use the library with invalid nominal voltage in a scaling group.

Why is there a DB or Liberty file with an invalid nominal voltage? One possibility is that the voltage from the default operating conditions overrides the attribute, and that voltage is not in the voltage map. In general, this seems to be a typo when creating the default operating conditions in the .lib file. Why is it a problem? Capacitance and DRC values in the library are characterized to the nominal voltage. This voltage value needs to be in the voltage map because scaling is based on the nominal voltage and the values in the voltage map.

### What Next

You can modify the .lib to fix the issue listed above and regenerate the DB file. Or, you can use the *set_attribute* command in this application to change the *nom_voltage* attribute to an valid value for the loaded library. The following example shows changing nom_voltage to 0.65 for lib A.

```
set_attribute [get_libs A] nom_voltage 0.65
```

### See Also

- LM-076

## LM-076

(error) Library %s has invalid nominal voltage.

### Description

To be included in a scaling group, a library must have a valid nominal voltage. If you are getting this message, it means that the library had a voltage map, and the nominal voltage was not in it.

Feedback

Prior to this message, you should have seen an LM-075 message during *read_db*. LM-075 provides more detailed information about why the library's nominal voltage is invalid.

**What Next**

You can use the *set_attribute* command to change the nominal voltage to an valid value for the loaded library. The attribute name is "nom_voltage". The following example shows how to change the nominal voltage to 0.65 for lib A.

```
set_attribute [get_libs A] nom_voltage 0.65
```

**See Also**

- LM-075

---

## LM-077

(error) The value specified for nominal voltage (%g) is not valid; it must match a voltage rail.

**Description**

You tried to change the nominal voltage using *set_attribute*. The value specified is not a valid rail voltage, that is it was not in the voltage map in the DB. You can see the rails using *report_workspace*.

**What Next**

Use one of the voltages from the existing rails as the nominal voltage attribute value.

**See Also**

- LM-076
- LM-075

---

## LM-078

(warning) All designs were filtered out of library '%s'

**Description**

You were reading a source file into the library manager, and the combination of filtering application options lib.workspace.include_design_filters and lib.workspace.exclude_design_filters, or other command options, caused all cells to be filtered out, yielding an empty library. As an example of command options, if you use the *-views* options for the *read_ndm* command, and ask for only layout views and the file has only frame views, that would be considered filtering out all designs.

Feedback

### What Next

This is only a warning to call your attention to a possible typo in one of your filters. If it was an error, you can remove the library with *remove_lib*, adjust your filters, then re-read the file.

*read_db (2), read_lib (2), read_lef (2), read_gds (2), read_ndm (2), lib.workspace.include_design_filters (3), lib.workspace.exclude_design_filters (3).*

---

## LM-079

(error) Library %s is not compatible with the %s flow:%s

### Description

Some flows restrict the content of a Liberty/DB library. The named library has a problem construct which is not allowed in the flow, or is missing a required construct or attribute.

### What Next

Either change flows, or modify the library source.

---

## LM-080

(warning) Attribute '%s' for %s/%s does not match the base DB %s

### Description

During *check_workspace*, attributes are compared between the base logical (DB) library and each other contributing logical libraries. For certain attributes, they are checked for consistency across the DBs, and in cases where they do not match, this warning is issued. For example, if the dont_touch *attribute is true on a design in the base library but false in another library, we would report it. This alone does not cause check_workspace to fail, and if it succeeds, then for boolean attributes, the value from the base DB library is used. For string attributes, the value is removed from all libraries.*

You can use *get_attribute* to see the specific values for the given objects across different source libraries.

Depending on the particular attribute and various other settings, this message may be accompanied by the LM-081 error which will cause *check_workspace* to fail. For more information, consult the man page for LM-081.

*LM-081(n)*

Feedback

## LM-081

(error) Attribute '%s' mismatches considered as error

### Description

An attribute or construct in the base DB library did not match another DB. A warning was issued, but due to application option settings, some were upgraded to error. Examples:

- The app option *lib.logic_model.require_same_opt_attrs* is true and there were mismatches for *dont_touch*, *dont_use*, or *use_for_size_only* attributes.
- The app option *lib.logic_model.require_same_voltage_range* is true and there were mismatches for *input_voltage_range* or *output_voltage_range* constructs.

In some cases, the *set_attribute* command can be used to correct the problem. Or, you can change the value of the app option to allow *check_workspace* to succeed, in which case the value from the base DB library is used by default. In some cases, there are other choices to control how the value is computed.

*LM-080(n) LM-115(n) lib.logic_model.require_same_opt_attrs(3) lib.logic_model.require_same_voltage_range(3) set_attribute(2)*

## LM-082

(information) Some objects are missing in some logic libraries

### Description

Compared to the base logic library, some objects (arcs, leakage power records, dynamic power records, and so on) in the same relative position are missing in some logic libraries. Previous LM-001, LM-025 and other messages would be an indicator that this workspace has missing objects. Note that missing objects cannot be allowed in the presence of scaling groups, so if you are using scaling groups, you will not be able to use -allow_missing to fix this problem.

### What Next

There should not be missing objects across logic library source files. Either correct the source, or remove the cells which are causing objects to show as missing, or if using scaling groups, remove the scaling group(s). Then rerun *check_workspace*, potentially with -allow_missing if you are not removing cells or correcting the source.

## LM-083

(information) Breakpoints comparison failed

Feedback

### Description

Within a library, complimentary attributes (for example, rise delay and rise transition) for some arcs did not have identical breakpoints.

### See Also

- NLDM-003
- NLDM-004

---

## LM-084

(warning) Invalid leakage_power record for design %s: \t%s. Record ignored.

### Description

There's an inconsistency with a leakage_power record in your source file. It could be that it has a when condition which refers to a port that does not exist on the design. In another case, the record is missing a value, which probably means it was negative in the Liberty source (which is illegal, but not an error). The content of the message will tell you want the exact issue it. We disregard the record.

### What Next

This is a warning. But you should really investigate the history of the Liberty source file.

---

## LM-085

(error) Current workspace is not in exploration mode

### Description

Commands *group_libs report_lib_groups write_lib_groups* are only supported in exploration mode. Command *create_workspace* with exploration flow will create workspace in exploration mode.

---

## LM-086

(error) Lib groups are not created yet, use command group_libs to create lib groups.

### Description

Command *group_libs* will create lib groups based on the logical and physical libraries in current workspace. Then you can *report_lib_groups write_lib_groups* and *rename_lib_group* to query and edit lib groups.

Feedback

## LM-087

(error) cannot find lib group %s.

### Description

Failed to find lib group with user specified name.

### What Next

Use *report_workspace* to list all the lib groups, check whether your lib group name is valid.

## LM-088

(error) The related power or ground pin information is missing for one or more signal pins.

### Description

This is a summary message that indicates that one or more signal pins are missing information about the related power or ground pin. Previous LM-098 information messages listed the names of the signal pins that are missing the *related_power_pin* or *related_ground_pin* attribute in the logic library and the names of their owning cells.

### What Next

If the library cell has PG pins in the logic library, you can set the *related_power_pin_name* or *related_ground_pin_name* attribute directly.

If the library cell does not have PG pins in the logic library but does in the physical library, you can help the tool derive the missing related PG pins by setting the *related_power_pin_hint* and *related_ground_pin_hint* attributes of the problematic pins. If you have more than one logic library source file, you need to set the attributes only on one instance of each pin.

You can allow missing related power and ground pins by setting the *lib.workspace.allow_missing_related_pg_pins* application option to *true*. However, this is not recommended because without related PG pins, the tool that reads the library cannot determine the supply connectivity for the signal pin. This can cause issues with multivoltage constraints, especially when using alternative (non-primary) power supplies.

For example,

```
prompt> check_workspace
 ...
Information: Signal pin A in cell OR2 does not have related power pin.
 (LM-098)
Error: The related power or ground pin information is missing for one or
 more signal pins. (LM-088)
```

Feedback

```
prompt> set_attribute [get_lib_pins ao1.0/OR2/A] related_power_pin_hint
 VDD
prompt> check_workspace
 ...
Workspace check succeeded!
```

### See Also

- LM-064
- LM-098
- lib.workspace.allow_missing_related_pg_pins

---

## LM-089

(warning) Unable to find PG port %s - %s

### Description

The *check_workspace* command found a dangling reference to a PG port. This can happen in a few cases when DB or .lib files do not have PG pins.

When a DB or .lib source file has a power record (leakage_power or internal_power) which uses a power_level attribute to specify a forward reference to a PG pin (expected to be declared in a physical source file), and this PG pin cannot be found, you would get this warning, and the power record will be removed.

When a DB or .lib source file uses the rail_connection group to connect an existing power rail to a forward reference to a PG pin (expected to be declared in a physical source file), and this PG pin cannot be found, you would get this warning.

### What Next

In the case of leakage_power, this is just a warning to alert you to the situation. This could indicate an inconsistency between the DB and the physical source (LEF, GDS). In the case of rail_connection, it's a warning here, but will likely become an error because the design will probably have missing related power pins.

*lib.workspace.allow_missing_related_pg_pins(3)*

---

## LM-090

(warning) Design %s is missing in%s library %s:%s

### Description

In comparison to the union of all designs in all logical libraries, the given library is missing a design. All logical libraries in a workspace should contain the same designs. This is a

Feedback

warning because you used the *-allow_missing* option to *check_workspace* so that the union will be created in the workspace.

**What Next**

A missing design in a downstream library is less of an issue than a missing design in the base library, but both indicate inconsistent libraries which is something you should address.

**See Also**

- check_workspace
- LM-014
- LM-091

---

## LM-091

(error) Design %s is missing in%s library %s:%s

**Description**

In comparison to the union of all designs in all logical libraries, the given library is missing a design. All logical libraries in a workspace should contain the same designs. This is an error because you did not tell *check_workspace* how to resolve the problem.

**What Next**

A missing design in a downstream library is less of an issue than a missing design in the base library, but both indicate inconsistent libraries which is something you should address. Missing designs can be resolved by using the *-allow_missing* option to *check_workspace*.

**See Also**

- check_workspace
- LM-014
- LM-090

---

## LM-092

(information) Removing all timing-only designs

Feedback

### Description

You got one or more LM-035 messages because designs in DB that did not have a contribution from a physical source like LEF or GDS. The application option auto_remove_timing_only_designs has been set to true, so the tool removed these designs from the workspace.

### See Also

- LM-035

---

## LM-093

(information) Some power data was not loaded for %s/%s

### Description

Something was wrong with the internal power data from DB or .lib. Earlier messages would have indicated the problem. This just informs you that the data was ignored.

### What Next

The result is that this internal power record is ignored. It does not prevent the library from being written.

### See Also

- LM-069

---

## LM-094

(warning) One or more suspicious values found in base_curves, curve_y=%d: (%s )

### Description

A very small value (which will eventually be quantized to zero) was found in the given compact CCS base curves record from DB (or .lib). This is not expected. This will result in the failure to create a delay table, leaving a hole in the data. If this library is part of a scaling group, check_workspace will fail.

### What Next

If you are not using scaling groups, this will not cause library creation to fail, but there may be missing data for any arcs which use this base curve. If you are using scaling groups, you will not be able to get a library created unless you modify the .lib data.

Feedback

## LM-095

(warning) Bus property only exist in frame view %s/%s.

### Description

A port is defined as a bus port in frame view while in timing view, it is not a bus port. *check_workspace* will remove such bus properties automatically, when the application option *lib.workspace.remove_frame_bus_properties* is *true*.

### See Also

- lib.workspace.remove_frame_bus_properties
- LM-096

## LM-095e

(error) Bus property only exist in frame view %s/%s.

### Description

A port is defined as a bus port in frame view while in timing view, it is not a bus port. This inconsistency will bring bad result in *link_block* and *write_verilog*, which must be fixed.

Users should add the bus information into timing view through updated db file, or remove the bus property from frame view. *check_workspace* can remove such bus properties automatically, when the application option *lib.workspace.remove_frame_bus_properties* is *true*.

Users can also enable the Design Mismatch Manager (DMM) by command *set_current_mismatch_config* to repair the mismatch.

### See Also

- lib.workspace.remove_frame_bus_properties
- LM-096

## LM-096

(information) Remove bus property from %s/%s.

### Description

Remove the bus properties which only exist in frame view.

Feedback

**See Also**

- LM-095
- lib.workspace.remove_frame_bus_properties

---

## LM-097

(error) For design %s, PG pin '%s' is also used as a signal pin%s

**Description**

A cell in a DB file has a PG pin and a signal pin with the same name. Modern versions of Library Compiler do not allow this.

**What Next**

Currently, the program deletes the signal pin and continues. But someone really should follow up with the provider of the DB because this is a very serious error.

---

## LM-098

(information) Signal pin %s in cell %s does not have a related %s pin.

**Description**

This message indicates that the relationship between a signal pin and a related power or ground pin is missing.

**What Next**

In the case that the library cell in question does have PG pins, you can set the *related_power_pin_name* or *related_ground_pin_name* on pins in the library which came from DB directly. If the library cell does not have PG pins, but the physical contribution (from LEF, GDS, etc) does, then you can set the *related_power_pin_hint* or *related_ground_pin_hint* attribute on the signal pin to help the application derive the missing related power or ground pin. In the case that you have multiple DB files, the attribute only needs to be set on one instance of the pin.

These messages will be followed up with a single LM-088 error to summarize all of these informational messages. If allowing missing related power and ground pins is desirable, you can set the *lib.workspace.allow_missing_related_pg_pins* application option to true to allow signal pins to have no related power and ground pins.

Feedback

**See Also**

- lib.workspace.allow_missing_related_pg_pins
- LM-064
- LM-088

## LM-099

(information) Previous '%s' %s message(s) are considered as %s\n \tdue to '%s'

**Description**

The severity level of a message is considered to a different level. The reason will be given in the message. The reason can be application option setting, command line option, etc.

## LM-100

(error) Table size mismatch for %s attribute %s on library cell %s on an arc %s->%s: expected %u, found %u.

**Description**

The tool found an inconsistent attribute represented as a table while reading a logic library source file. The expected size of the table did not match what was actually found.

**What Next**

This is a serious error. If you see this error, it should give enough information so that you can find the problem in the .lib file.

## LM-101

(error) More than one instance of cell %s, mode %s, PVT '%s'

**Description**

For the ETM flow, in the early stages of *check_workspace*, each logical design with the same name is compared using the mode label and the PVT information from *read_db* or *read_lib*. There can be only one unique combination of logical design name, mode, and PVT. You get this message if there is a duplicate.

**What Next**

Make sure you have applied the correct mode label to each logical library read into the ETM flow workspace. Once you know which library has the wrong label, remove it, then re-read it with the correct label.

Feedback

**See Also**

- check_workspace
- read_db
- read_lib

---

## LM-102

(warning) Invalid rail_connection for %s/%s ignored: rail %s does not exist

**Description**

While reading a DB or .lib file, an invalid rail_connection was found. A rail_connection specifies a forward reference connecting an existing rail to a PG pin that will be supplied by a physical source file. If the rail is not defined in the source file, this is invalid, and the rail_connection is ignored.

**What Next**

Ensure that the logical source files that you are supplying use a consistent and complete specification for PG pins and rails. Note that rail_connection and power_supply have been superseded by the pg_pin and voltage_map constructs, and the latter is the preferred method for specifying PG pins and rails.

---

## LM-103

(error) Inconsistent rail_connection for %s/%s: %s

**Description**

The *check_workspace* command found an inconsistent reference based on a rail_connection from Liberty. A rail_connection specifies a forward reference connecting an existing rail to a PG pin that will be supplied by a physical source file. The rail_connection group was superseded by the pg_pin construct, but Library Compiler still allows use of the rail_connection. Each design in each contributing DB or .lib file for different PVTs must have the same connections, or none at all. You may also see other messages regarding problem voltage rails in the same context.

You get this message when we are comparing a downstream library to the base (first) library. If a PG pin name is found in a rail_connection in both, but the rail names different, you would see that we found a rail name that was not expected. In another case, if a PG pin name is missing in the downstream library, you would see something like PG pin missing.

Feedback

### What Next

Ensure that the logical source files that you are supplying use a consistent specification for PG pins and rails. All such files should use either pg_pin, or rail_connection plus the power_supply groups. When using rail_connection, the definitions must be the same across source files. It is possible that *rename_rail* might be able to fix the problem when the PG pin reference is the same in all libraries but the rail names are different.

---

## LM-104

(error) With mode %s, design %s has incompatible port function setup between libraries %s:%s and %s:%s

### Description

For the ETM flow, for a given mode (applied with the -mode_label option to *read_db* or *read_lib*) across all PVTs, it is required that the function information for ports match. The *function* attribute will be 0 or 1 for various ports. For each port, the attribute must be the same: either both 0, both 1, or both missing. In this case, one or more ports were missing, and *check_workspace* detected it.

### What Next

Verify that you have applied the correct mode to each library. If you have, at this time, you would need to go back to the .lib file or the creator of it and verify that the function information for the ports is consistent.

### See Also

- check_workspace
- read_db
- read_lib

---

## LM-105

(error) With mode %s, function for port %s/%s does not match: \tValue %d in library %s: %s \tValue %d in library %s:%s

### Description

For the ETM flow, for a given mode (applied with the -mode_label option to *read_db* or *read_lib*) across all PVTs, it is required that the function information for ports match. The *function* attribute will be 0 or 1 for various ports. For each port, the attribute must be the same: either both 0, both 1, or both missing. In this case, the listed port was 0 in one library and 1 in the other.

Feedback

### What Next

Verify that you have applied the correct mode to each library. If you have, at this time, you would need to go back to the .lib file or the creator of it and verify that the function information for the ports is consistent.

### See Also

- check_workspace
- read_db
- read_lib

---

## LM-106

(warning) There's no power pin or ground pin of the antenna diode for design %s

### Description

There are three types of diode cells: power, ground and power_ground which depend on the connections from diodes to VDD/VSS. Check the physical library and the logical library source.

---

## LM-107

(warning) More than one power pin or ground pin of the antenna diode for design %s

### Description

There is at most one power pin and one ground pin for the antenna diode cell. Check the physical library and the logical library source.

---

## LM-108

(information) For PG pin '%s', replaced rail '%s' with '%s'

### Description

While reading a Liberty(.lib or DB) file, an entry in the *voltage_map* is being used for multiple purposes. In this application, rails have a single type (power, ground, etc.). So, the rail is duplicated, with the new one renamed to include the type. For example, if the entry was VDD, and there are power and nwell PG pins in the file using it, you would see this message for the first PG pin which detected the need for VDD-nwell. You can see rails using *report_workspace -panes* or use *get_attribute* to see the *rail_name* attribute on your PG pins.

Feedback

### What Next

Rail names are not widely used, so there is nothing you need to do. You do have the option to create dedicated entries in the voltage_map for each type.

---

## LM-109

(warning) Copied PG pin '%s' from physical source (was missing in logical source)

### Description

In *check_workspace*, a PG pin was found in the physical source files which was not in the logical source. The application created a pin in the timing view to cover the difference.

### What Next

This could because of old DB files without pg_pin's, or something is out of sync between the physical and logical sources. If you want issues like this to force an error, you can use set_message_info to make scripts stop sometime after the issue occurs.

---

## LM-110

(warning) '%s' and '%s' is incompatible, '%s' ignored.

### Description

If the port in physical design is not consistent with timing view, the physical design will be ignored in edit flow.

---

## LM-111

(warning) Missing physical library cell, create placeholder physical library cell '%s'.

### Description

You got one or more LM-035 messages because designs in DB that did not have a contribution from a physical source like LEF or GDS. when the application option auto_remove_timing_only_designs has not been set to true, the tool will create placeholder physical cell for the missing cell. Following are basic information for a placeholder physical lib cell. Lib cell width and height (default: unit site width and height) Lib cell original (default: 0, 0) LEF site associated with the cell (default: unit site) Pin location (default: 0,0) Pin terminal layer (default: metal1 (layer maskName)) Pin terminal geometry (default: metal1 min width x min width)

Feedback

**See Also**

---

## LM-112

(warning) Missing physical library port, create placeholder physical library port '%s' for library cell '%s'.

**Description**

The tool found missing ports on the specified block compare to the ports in the timing view. These mismatches were detailed with NDM-031 errors. Following are basic information for a placeholder physical lib port. Pin location (default: 0,0) Pin terminal layer (default: metal1 (layer maskName)) Pin terminal geometry (default: metal1 min width x min width)

**See Also**

- NDM-031
- LM-111

---

## LM-113

(warning) Port '%s' on library cell '%s' has been created as a placeholder for a missing logical port.

**Description**

The tool found a missing logical port on the specified logical cell compared to the ports in the design view. The mismatch has also been reported with an NDM-031 error message. A placeholder port in the logical library has been created with the following characteristics: 1. Physical port direction and type were used for the placeholder port. 2. No timing information was created.

**See Also**

- NDM-031

---

## LM-114

(information) Changing port type from '%s' to '%s' on port '%s/%s'.

Feedback

### Description

Ports can roughly be divided into two primary classes: signal and PG. PG ports are further subdivided into power, ground, pwell, and nwell. Some physical source formats, like LEF, might classify ports with a "use" like signal and power, but also provides additional sub-types for signals, such as "clock". As the application does not have a primary port type of "clock", it converts that port type on the physical view to "signal". This message is used to convey that. The information about a port's sub-type, like clock, is carried as a dedicated attribute on the port, and that information is normally taken from the logical source (DB or .lib).

### What Next

This is just an informational message; no action is necessary.

---

## LM-115

(warning) %s %s/%s has voltage range %s in lib %s versus %s in the base lib.

### Description

Voltage range is imported from the Liberty input_voltage_range and output_voltage_range constructs. The values differ between the given library and the base. In general, these should be the same. The application option *lib.logic_model.require_same_voltage_range* controls whether you get this warning or an error, and whether the final values come from the base library (default) or from the widest range of values (the min of the lows of the range, the max of the highs).

### What Next

This is just a warning, so no action is needed unless you want it to be an error. See the man page for lib.logic_model.require_same_voltage_range for details.

### See Also

- LM-081

---

## LM-116

(Error) Cannot use read_ndm with '%s': %s

### Description

The *read_ndm* command is used to load NDM files into a workspace. This is subject to a number of rules based on the current flow and the type of NDM file. In this case, you tried to read a library which is not valid in the current context. For example, you tried to read an

Feedback

aggregate library, which is never allowed. Or, you tried to load frame views from a design library in a flow other than the etm_moded flow.

**What Next**

Check the type of the library in comparison to the flow you are using. See the man page for *read_ndm* for complete details.

---

## LM-117

(Error) Technology data in %s and workspace technology data is not compatible

**Description**

Technology data in the library which is reading and workspace technology data must be compatible, otherwise *read_ndm* will fail.

**What Next**

Try another library with compatible technology data.

---

## LM-118

(warning) Workspace technology data replaced by the technology data from '%s'

**Description**

*read_ndm* will replace the workspace technology data with technology data from the library which is reading. The replacement occurs when the two technology data are compatible or the workspace technology data is not referred by other physical libraries.

---

## LM-120

(information) List of cells with rectilinear boundaries in current workspace library: %s

**Description**

This message is for reporting cells with rectilinear boundaries in the current workspace library. All cells with rectilinear boundaries will be reported in the message's cell name list.

**What Next**

This is information only. No further action is required.

---

## LM-121

(information) Cell misaligned logical libraries are detected, and cell shadowing fixing is %s.

Feedback

### Description

*group_libs* groups logical libraries based on cell name signatures, if a set of libraries with exact same lib cells, those libraries will be in one group. Sometimes, instead having exact matching or well aligned cells among libraries, cells are partially overlapping in a set of libraries, the cell misaligned case is frequently seen in low power libraries. If use pure cell signature based algorithm for cell misaligned libraries, some cells may be created in multiple reference ndm libraries, each library only contains partial of pvt panes, this will cause cell shadowing during link designs. So special handling is needed to achieve good partition result, we call it cell shadowing fix.

You get this message because cell misaligned logical libraries are detected, and also telling whether the cell shadowing fix is turned on, it is on by default, user can set app option *lib.workspace.group_libs_fix_cell_shadowing* to turn it off.

### Examples

Library pvt1_2_cell has cell LVLH and ISO, library pvt2_1_cell has cell LVLH.

With pure signature based grouping strategy, 2 ndm ref lib will be created: ndm1: libs: pvt1_2_cell cells: 2 cells LVLH and ISO panes: 1 pvt pane pvt1

ndm2: libs: pvt2_1_cell cells: 1 cell LVLH panes: 1 pvt pane pvt2

Cell LVLH is in both ndm1 and ndm2, ndm1 only with pvt pane pvt1, ndm2 only with pvt pane pvt2. ndm1 and ndm2 will shadow each other if both are in linking path.

With cell shadowing fix on grouping strategy, 2 ndm ref lib will be created: ndm1: libs: pvt1_2_cell and pvt2_1_cell cells: 1 cell LVLH panes: 2 pvt panes, pvt1 and pvt2

ndm2: libs: pvt1_2_cell cells: 1 cell ISO panes: 1 pvt pane pvt1

Cell LVLH is in ndm1 with 2 pvt panes.

---

## LM-122

(Error) Multiple designs are detected in etm flow.

### Description

ETM flow will build a library from Extracted Timing Models (ETMs), it will merge multiple PVTs and modes for one design into a single library cell. For each session, will do the merge for only one design. You get this error message because multiple designs are detected in current session.

Feedback

### What Next

Only read DB or LIB files that contain the specific design you want to do the merge and create nlib. You can start again by reading only related DB or LIB files, or you can use *remove_lib* to remove redundant library.

---

## LM-123

(error) Port(s) out of position ports also used in the logic function: %s/%s, %s

### Description

The checker is comparing ports for a particular design to the same design from the base library. A port was found in a different position, that is, the ports are in a different order. In this case, either the port from the comparison design or the base (or both) is also used in the logic function. This is an error, and it cannot be repaired. This is an indication of two libraries are out of sync with one another.

---

## LM-124

(information) Port out of position: %s/%s aligned with %s

### Description

The checker is comparing ports for a particular design to the same design from the base library. A port was found in a different position, that is, the ports are in a different order. Often, this is reparable. If it can be repaired, and no other serious port related errors are found, an LM-029 message will be output indicating the ports were reordered. If not, other error messages will be output.

---

## LM-125

(warning) Could not fix all missing %s

### Description

There were missing objects of the given type, and not all could be resolved. The likely cause is more objects in one library than another, for example, an extra timing arc.

To view the missing objects, you could use *check_workspace -details* and pass in the proper value according to the information you need. For example, use *arcs_progress* for missing arcs, *leakage_progress* for leakage power records, and so on. Note that this can produce large output.

This message is the warning version of LM-025, which is used when the *-allow_missing* option is passed to *check_workspace* and there are no scaling groups. Consult the manpage for *check_workspace* for details on the impact of allowing missing objects.

Feedback

SEE ALSO

**LM-025(n)**

## LM-126

(Error) Some %ss failed to compare.

### Description

The *compare_db* command issues this error message to indicate that some objects, such as timing arcs or leakage power records, did not match between the base library and the comparison library. This message indicates only that errors occurred; previous messages provide the detailed information about the mismatches.

### What Next

Review the previous messages to determine the mismatched objects.

### See Also

- compare_db

## LM-127

(Error) The base library does not contain any logic library information.

### Description

The *compare_db* command issues this error message when it cannot perform the verification because the base library does not contain any logic library information.

### What Next

Ensure that you loaded the correct reference library into the verification workspace.

### See Also

- compare_db
- create_workspace

## LM-128

(Error) Could not find a matching pane in the base library.

Feedback

### Description

The *compare_db* command issues this error message when it cannot find a pane in the base library that matches the voltage, temperature, process number, and process label data of the comparison library.

### What Next

Review the voltage, temperature, process number, and process label data of the comparison library. You can determine this information either from the message issued by the *compare_db* command just prior to this message, or by using the *report_workspace -panes* command.

It is likely that the comparison library did not contribute to the building of the base library. It is also possible you either did not use the *-process_label* option with the *compare_db* command or you used it but specified an incorrect value.

### See Also

- compare_db
- report_workspace

---

## LM-129

(error) Could not correct all port differences with design %s

### Description

Previous messages, starting with LM-028, indicated that there was an issue with some ports on the given design, for example, a port had a different direction in the comparison library and the base library. The application was not able to repair the problems. This is a summary message. Consult the man page for the specific error messages above for the given design.

---

## LM-130

(warning) Shadowed design %s is %s visible from source library %s

### Description

In the library manager, you used *check_workspace* in an aggregate workspace. The check found a cell which appears in more than one library in the workspace. This is called shadowing. Only the cell in the first library in the order will be visible to the user of the aggregate. You will get this message for each library which contains the shadowed cell, indicating whether it will or won't be visible.

Feedback

Sometimes, shadowing is intentional. For example, if you have a complete library then receive an update for a single cell, you can create an aggregate with the update followed by the original. It can also be an error, for example, if you have not created a physical-only library correctly you could potentially have a library with only physical data shadowing a library that has physical and logical data.

**What Next**

If the shadowing is intentional, no action is needed. If it was not intentional, you need to remove one or more libraries and/or adjust their order to make sure the correct version of a cell is found.

---

## LM-131

(Information) Base library does not have a contributing logic library with the exact path '%s'%s.

**Description**

The *compare_db* command issues this informational message to indicate that the comparison library does not have an exact match in the base library based on the file path.

If the command finds a contributing logic library with the same file name, but a different path, the message indicates this. For example, if the comparison library path is /path/to/my.db and the base library contains a contributing library with the path /different/path/to/my.db, the end of the message indicates that the leaf file name was found.

**What Next**

This is only an informational message. If the command does not find the contributing logic library by path name, it searches for a matching pane in the base library by using the PVT information from the comparison library.

**See Also**

- compare_db

---

## LM-132

(information) Configuration change %s file %s

**Description**

In the library manager, you used *set_pvt_configuration* and the change in configuration caused one or more files to be de-activated, or re-activated. In the case of re-activation, it's possible the file was re-read.

Feedback

**What Next**

This is an informational message. No action is needed.

---

## LM-133

(warning) Did not load %s because its PVT (label='%s', P=%.7g, V=%.7g, T=%.7g) does not match the current configuration

**Description**

In the library manager, you used *read_db* or *read_lib* to read a logical library source file. The PVT of the file does not match the current PVT configuration, which you set with *set_pvt_configuration*.

Generally, when using PVT configuration, it is expected that you would attempt to load many more DB or .lib files than you need and let the application filter out the files which don't match your configuration. For example, you might select all DB files in a directory using the *glob* command to match the files. In this user model, this warning is expected.

**What Next**

If you believe that the file should have been loaded, verify that your PVT configuration is set correctly. You can use *report_workspace* to show the current configuration.

---

## LM-134

(warning) Process label '%s' from command line overrides value '%s' from Liberty source

**Description**

In the library manager, you used *read_db* or *read_lib* to read a logical library source file with the *-process_label* option. The source file already had a process label specified on the default operating conditions, and the value you specified on the command line differs from the source file.

**What Next**

Ensure that the process label you are using is correct.

---

## LM-135

(warning) Design %s does not exist in physical libraries

**Description**

During *check_workspace*, when combining physical views into the workspace, neither a frame view nor a design view exists for the named library cell in any physical

Feedback

source library read into the application. Since the library cell does have a timing view, this means it can be timed, but not placed. Because you set the application option *lib.logic_model.auto_remove_timing_only_designs* to true, the application automatically removed the timing-only designs. Without that option, the LM-035 error would have been output. However, we recommend that you investigate why your DB or LIB files have designs that do not exist in any physical source.

---

## LM-136

(information) Must-join port %s missing on %s, will copy from %s

### Description

This message indicates that a must-join port was found on physical view only. It will be copied to logical view later to keep consistency between all views of a design. A must-join port can be defined in LEF by MUSTJOIN statement in PIN section.

### What Next

This is an informational message. No action needed.

---

## LM-137

(Error) Design '%s' does not have a %s view in the base library.

### Description

The tool issues this error message when you are running a library verification command, such as *compare_db*, and the base library does not contain the requested view for a specific design.

For example, if you are using the *compare_db* command, this means that the base library does not have a timing view for the given design.

### What Next

It is rare for a design to exist in the reference library with missing views. This would mean that the design had contributions from some source libraries but not others. Some possible causes of this error are misuse of the design filter application options when building the base library or changes to the comparison library since the base library was built.

### See Also

- compare_db

Feedback

## LM-138

(Information) Allowed missing characterization points since all provided points have %s = %s

### Description

While creating a scaling group, there is a missing characterization point. For example, there is an arc which has a different voltage rail connection on the input and output, and not all combinations of Vout and Vinp have been read. However, if in all provided libraries, the Vinp and Vout values are the same, then the scaling group is allowed, and this informational message is provided in case it is not what the user expected.

## LM-139

(error) Lib %s pin %s %s %s.

### Description

This message indicates there is frequency max_cap or max_trans attribute mismatch on the specified pin between the checking lib and base lib.

The mismatches can be one of following: - attribute missing in one lib. - table index dimensions are different. - table with different index variables. - related_pin attributes on max_cap or max_trans are different.

### What Next

You have to fix the mismatches in the liberty files to pass the *check_workspace*.

## LM-141

(error) %s '%s' has inconsistent receiver capacitance thresholds comparing with base library.

### Description

This message indicates that the library has different receiver capacitance threshold values comparing with base library. All logical libraries should have exact the same number and the same value for both rise and fall of receiver capacitance thresholds.

You cannot write a library until you correct the values.

### What Next

Check with your library vendor and correct the values before proceeding.

Feedback

## LM-142

(warning) Cell %s has width of '%d' tile, not equals to size %lu in vertical_abutment_labels_top/bottom.

**Description**

This message indicates that the cell needs to occupy specified tiles in horizontal row, but the vertical_abutment_labels_top/bottom has different number of labels assigned to the cell.

You should assign exact the same number of labels to the cell as its width in tile.

**What Next**

Check the placement rule file and the cell, correct the setting before proceeding.

## LM-143

(warning) length_precision %u is not identical to target library scaling factor %u. Use target library scaling factor.

**Description**

This message indicates that the length_precision defined in the PRF is not equal to the library scaling factor, which may introduce data inconsistency. By default, library scaling factor is 10000.

**What Next**

Change the length_precision in PRF to same value as the scaling factor in target library.

## LM-144

(warning) %s(%g,%g,%g,%g) is out side of cell boundary of %s, ignored.

**Description**

This message indicates that the rectangle defined by the attribute is not within cell boundary, which will be ignored.

**What Next**

Check the rule and the cell, correct the setting before proceeding.

## LM-145

(warning) Layer %s specified in %s does not exist.

Feedback

### Description

This message indicates that the specified layer defined in ignored_pnet_layers or must_join_group does not exist in current library, it will be ignored.

### What Next

Check the layer setting, correct the setting before proceeding.

---

## LM-146

(warning) tap_rule %s specified in %s under %s group does not exist.

### Description

This message indicates that the tap_rule specified in tap_distance under one tap_boundary_wall_cell_properties group does not exist in current library, this tap_boundary_wall_cell_properties group will be ignored.

### What Next

Define the tap_rule before using it.

---

## LM-152

(Warning) The base library and comparison library have different schema versions.

### Description

The tool issues this warning message when you try to use the verification flow to compare libraries with different schema versions.

### What Next

In general, you should not compare libraries with different schema versions, as this can be very error prone.

### See Also

- compare_db

---

## LM-153

(Error) Differences found for %s '%s'.

Feedback

### Description

The *compare_db* command issues this error message when it finds mismatches between objects, such as timing arcs or leakage power records, in the base library and the comparison library.

For example, the timing arcs could have tables with different data in the two libraries or could be missing tables in one of the libraries.

### What Next

Review the messages issued by the tool following this message; these messages provide information about the objects with mismatches. Note that detailed information about the specific data that is different is not available.

### See Also

- compare_db

---

## LM-154

(Warning) %s has no %ss for %s; %s has %u-> Was this design removed?

### Description

The *compare_db* command issues this warning message when it finds objects, such as timing arcs or leakage power records, that exist in either the base library or the comparison library, but not in both.

### What Next

In many cases, this warning occurs because a design was removed for a particular pane when the reference library was built. This can be due to using the *-allow_missing* option with the *check_workspace* command when the reference library was created or due to the application option settings used when the reference library was created. If this is intended, no action is required.

This warning can also occur if changes occurred to the logic library source file after generating the reference library. In this case, you might need to regenerate the reference library.

### See Also

- compare_db
- check_workspace

Feedback

## LM-155

(Error) %s missing in the base library: '%s'.

### Description

The *compare_db* command issues this error message when an object, such as a timing arc or leakage power record, is missing in the base library.

### What Next

A missing object could be due to one of the following causes: use of the *-allow_missing* option with the *check_workspace* command, changes to the comparison library after building the base library, or other changes that were used to work around out-of-date source files.

### See Also

- compare_db

## LM-156

(Error) Comparison port %s/%s has differences.

### Description

The tool issues this error message when a library verification command, such as *compare_db*, detects a design port that has different attributes in the base library and the comparison library.

### See Also

- compare_db

## LM-157

(Error) Comparison design %s %s port '%s'.

### Description

The tool issues this error message when a library verification command, such as *compare_db*, detects a design that has a different number of ports in the base library and the comparison library.

Note that a design in a logic library might be missing PG ports that exist in the base library; this is valid and is not reported as an error.

Feedback

### See Also

- compare_db

---

## LM-158

(Warning) Comparison library is missing design '%s'.

### Description

The tool issues this warning message when a library verification command, such as *compare_db*, detects a design that exists in the base library but not in the comparison library.

### What Next

There are several reasons why the base library might contain a superset of the designs in the comparison library. For example, if the *-allow_missing* option was used with the *check_workspace* command when the base library was built.

### See Also

- compare_db

---

## LM-159

(Warning) Comparison library has extra design '%s'.

### Description

The tool issues this warning message when a library verification command, such as *compare_db*, detects a design that exists in the comparison library but not in the base library.

### What Next

This warning is likely caused by an application option setting when the base library was built, such as a design filter or the removal of timing-only designs. You should investigate the cause of the warning to determine if you should regenerate the reference library.

This warning is also likely because the base library is one of the outputs of an exploration flow. So it's possible that some designs in the comparison library are existing in other outputs of that exploration flow. But it doesn't exist in the base library.

### See Also

- compare_db

Feedback

## LM-160

(warning) Equal/opposite relationships between %s/%s and %s are different:\n \t%s in %s, %s in %s

### Description

Equal/opposite information, loaded from DB, is different for a design in the base library in comparison to another library.

### What Next

In general, these libraries are incompatible, and you should go back to the source of the library and make sure these libraries were intended to be used together. In some cases, this can be treated as an error. In that case, the LM-060 message is output.

## LM-161

(error) Layer %s (%d) in the source technology file %s does not match the layer of the same name in the destination library.

### Description

You get this error message when you try to apply a new technology file that is incompatible with the current technology in the library. The existing technology is not replaced with the new technology file due to incompatible layer that does not match to the one that already exists in the existing library.

### What Next

Update the technology file so that the layer number and layer name matches the destination library.

### See Also

- read_ndm
- create_workspace

## LM-162

(error) Layer %s (%d) is in the destination library but not in the source technology file %s.

### Description

You get this error message when you try to apply a new technology file that is missing layers that are currently used in the current technology library. The existing technology is

Feedback

not replaced with the new technology file due to missing layer that already exists in the existing library.

**What Next**

Update the technology file so that the layer number and layer name matches the destination library.

**See Also**

- read_ndm
- create_workspace

---

## LM-163

(error) Via definition %s in the source technology file %s does not match the via definition of the same name in the destination library.

**Description**

You get this error message when you try to apply a new technology file that has incompatible via definition that are currently used in the current technology library. The existing technology is not replaced with the new technology file due to incompatible via definition that does not match to the one that already exists in the existing library. Look at the via definition and compare the layer definition to that of source to ensure that they match on layer numbers and layer names before applying to the new technology file with the destination library.

**What Next**

Update the technology file so that the via defintion for layer number and layer name matches the destination library.

**See Also**

- read_ndm
- create_workspace

---

## LM-164

(error) Via definition %s is in the destination library but not in the source technology file %s.

Feedback

### Description

You get this error message when you try to apply a new technology file that has missing via definition that are currently used in the current technology library. The existing technology is not replaced with the new technology file due to missing via definition that already exists in the existing library.

### What Next

Update the technology file so that the via defintion for layer number and layer name matches the destination library.

### See Also

- read_ndm
- create_workspace

---

## LM-165

(error) Site definition %s in the source technology file %s does not match the site definition of the same name in the destination library.

### Description

You get this error message when you try to apply a new technology file that has different site width and height compared to the one in the source library. The existing technology is not replaced with the new technology file due to incompatible site definition that does not match to the one that already exists in the existing library.

### What Next

Update the technology file so that the site definition matches the destination library.

### See Also

- read_ndm
- create_workspace

---

## LM-166

(error) Site definition %s is in the destination library but not in the source technology file %s.

Feedback

### Description

You get this error message when you try to apply a new technology file that has missing sites compared to the one in the destination library. The existing technology is not replaced with the new technology file due to missing site definition that already exists in the existing library.

### What Next

Update the technology file so that the missing site definition are added to the technology file before applying the technology file to the destination library.

### See Also

- read_ndm
- create_workspace

## LM-170

(information) create timing view for variant cell %s

### Description

This message indicates that the tool create timing view for the variant cell of a cell group. The new timing view of the variant cell is just the same as its master's timing view. For example: Users specified the below comamnd before check_workspace: create_cell_group -share_timing_view -name A [get_lib_cells "phyLib/A phyLib/A_1 phyLib/A_2 phyLib/A_3"] The command means A_1, A_2, A_3 share the same timing view as the master A's timing view. When we use A_1, A_2, A_3 in normal flow, if we can find the timing view of the master A, we will create timing view for the variant cells(A_1, A_2, A_3).

### What Next

This is an informational message. No action needed.

---

## LM-171

(information) no timing view for master cell %s in target lib %s

### Description

This message indicates that the tool cannot find the master's timing view in the target library. For example: Users specified the below command before check_workspace: create_cell_group -share_timing_view -name A [get_lib_cells "phyLib/A phyLib/A_1

Feedback

phyLib/A_2 phyLib/A_3"] The command means A_1, A_2, A_3 share the same timing view as the master A's timing view. When we use A_1, A_2, A_3 in normal flow, if we cannot find the timing view of the master A in the target library, the tool will issue LM-171.

**What Next**

This is an informational message. No action needed.

---

## LM-172

(warning) cell %s has its own timing view and it does not share timing view with the master %s

**Description**

This message indicates that the variant cell has its own timing view and it does not share its master's timing view. For example: Users specified the below comamnd before check_workspace: create_cell_group -share_timing_view -name A [get_lib_cells "phyLib/A phyLib/A_1 phyLib/A_2 phyLib/A_3"] The command means A_1, A_2, A_3 share the same timing view as the master A's timing view. If users provide .db/.lib which contains timing data for A_1, then the tool will issue LM-172 for A_1. And A_1 has its own timing view which will not share the timing view of its master A.

**What Next**

Please check the create_cell_group command for the cell of the message, if you want the variant cell share the same timing view as its master, please do not provide timing data for the cell.

---

## LM-173

(Warning) Could not find a matching pane in the base library.

**Description**

The *compare_db* command issues this warning message when it can find the a logic library contributed by a db whose name is the same as the comparison library but it cannot find a pane in the base library that matches the voltage, temperature, process number, and process label data of the comparison library. The comparison will continue using the logical library in the base lib.

The voltage name can be renamed when setting lib.logic_model.use_db_rail_names to false. The voltage values may not matched in this case when finding the matched pane. So no exactly matched pane will be found.

Feedback

### What Next

Review the voltage, temperature, process number, and process label data of the comparison library. You can determine this information either from the message issued by the *compare_db* command just prior to this message, or by using the *report_workspace -panes* command.

It is likely that the comparison library did not contribute to the building of the base library. It is also possible you either did not use the *-process_label* option with the *compare_db* command or you used it but specified an incorrect value.

### See Also

- compare_db
- report_workspace

---

## LM-174

(warning) Bus property only exist in timing view %s/%s.

### Description

A port is defined as a bus port in timing view while in frame view, it is not a bus port. The physical data need to be checked to ensure the missing is expected. *LM-095(n)*

---

## LM-175

(information) Deriving %s pin for cell %s.

### Description

Some signal pins in the cell does not connected to power and/or ground rail, the tool will try to associate the signal pin to the rail if only one exist.

The association won’t be performed on pad/memory/macro cells in PG-pin based libraries, neither for pins that are feedthrough(shorted) or unconnected.

---

## LM-176

(Warning) Failed to update non-existing site definition '%s'!

### Description

The site definition should be found in current technology library. otherwise, cannot update successfully. If you want to create site, please insure width and height should be specified. when width or height is not defined, only update existing site.

Feedback

site ("site_def_1") { width : 2; height : 3; type : pad; symmetry ("Y"); is_default : false; }

---

## LM-177

(Warning) Cell '%s' Port '%s' : The attribute '%s' value '%s' is inconsistent with its value '%s' in logical library!

**Description**

When the attribute is set in logical library and logical library has high priority, no update happens.

---

## LM-178

(Warning) Cell '%s' Port '%s' : Cannot set '%s' to '%s' on non power/ground/bias pin!

**Description**

is_secondary_pg can only be set on power/ground/bias pin!

---

## LM-179

(Warning) Failed to set attribute '%s' value to '%s' on %s.%s!

**Description**

For attribute mask_shift_layers, mask_shift_layers cannot be set when is_mask_shiftable is 'false' in the frame cell.

---

## LM-180

(Warning) Cell group '%s' ignored due to more than one cells are in the group with site id.

**Description**

For cell group with site id, only one cell can be in a cell group. Otherwise, the warning will be issued. For example: library(normal) { distance_unit : 1um; length_precision : 10000; cell(TNBUFFX2_HVT) { cell_group : "group1"; start_site_id(2, 3); } cell(TNBUFFX32_HVT) { cell_group : "group1"; start_site_id(4, 3); } }

Both cell 'TNBUFFX2_HVT' and 'TNBUFFX32_HVT' are in the same group 'group1'. You can change one of the cell_group name to another name.

Feedback

## LM-181

(Warning) The number of routing_blockage with following layer and geometry in %s.%s is inconsistent with PRF file. Ignored!

**Description**

The warning indicates the number of routing_blockage with same layer and geometry doesn't match between input PRF file and FRAME/DESIGN view in clib.

## LM-182

(Warning) Failed to set density %s on layer %s for design %s.%s!

**Description**

Following are possible reason: 1) The layer is neither a base layer which can be found in technology file nor a derived layer. 2) There is no geometry on the layer.

## LM-183

(Warning) Both C1CN and C1C2 data models exist!

**Description**

The warning indicates both C1CN and C1C2 data models exist in this library.

## LM-184

(warning) The routing direction '%s' of layer '%s' is different from the existing routing direction '%s' of the layer. Updating existing to new one.

**Description**

The specified direction is different from the existing routing direction of the layer. The tool will update with the input routing direction.

**What Next**

Please check the routing direction specified is correct.

## LM-185

(warning) Default site definition is missing in the library.

Feedback

### Description

You get this warning message when you update site definition into the library. Tool will check whether there is default site definition after updating site definition through command read_physical_rules. As there will be an error in downstream flow if there is no default site definition.

### What Next

Update physical rule file (PRF) so that the default site definition is set. site(site_def_1) { width: 2; height: 3; type: pad; symmetry (x, y, r90); is_default: true; }

### See Also

- read_physical_rules
- write_physical_rules

---

## LM-186

(warning) Overwrite existing value '%s' for attribute '%s' with new value '%s'!

### Description

You get this warning message when you update user-define attribute into the library. Tool will check whether there is existing attribute before updating.

### What Next

Please make sure you want to overwrite the value in NDM.

### See Also

- read_physical_rules
- write_physical_rules

---

## LM-187

(Error) Library cell %s has incompatible tlatch record across db files.

### Description

The tool issues this error message when check_library detects a library cell has different tlatch record across the db files. If having superset of tlatch record is desired, specify -allow_missing in check_library.

Feedback

**What Next**

Check tlatch consistency across db files. Specify -allow_missing in check_library if want to take union of the record.

---

## LM-188

(warning) Ignore invalid %s with %s.

**Description**

This message indicates that the antenna_rule or antenna_layer_rule has syntax error, which will be ignored. Please check the detail error before the message.

**What Next**

Check the rule and correct the setting before proceeding.

---

## LM-189

(information) Setting terminal class to bump on port '%s'.

**Description**

Pad pins in a macro cell must be of class bump. Sets pin class to bump for pins which are not of class bump.

**What Next**

This is just an informational message; no action is necessary.

---

## LM-190

(warning) Cannot find port '%s'/'%s'.

**Description**

The pin in the attribute does not exist.

**What Next**

Check the attribute, such as via_ladder_pin_order, make sure that each pin actually exsits in cell.

---

## LM-191

(warning) Failed to create track_pattern '%s' for %s '%s'.

Feedback

**Description**

This message indicates the track_pattern is not create successfully for the row_pattern or site.

**What Next**

Check the track_pattern and correct the track_pattern

# LMUI

## LMUI-001

(error) %s cannot be the empty string

**Description**

The given option must have at least one character.

**What Next**

Re-enter the command with a non-empty string passed to the given option.

## LMUI-002

(error) All libraries in a scaling group must have the same process information

**Description**

You passed a set of libraries to *create_scaling_group* and there's more than one process id and/or process label between them.

**What Next**

Either remove some of the libraries from the collection passed to *create_scaling_group*, or if you believe the process information is wrong in one or more libraries, use *set_process* to correct them. You can also rerun the application and pass a more consistent set of process labels to *read_db*. Or

## LMUI-003

(error) Library %s has no timing view; cannot %s

Feedback

### Description

Certain operations in the application require that the library used has a timing view. For example, the libraries passed to *create_scaling_group* or *rename_rail* must have a timing view.

---

## LMUI-004

(error) Library %s is already merged.

### Description

The libraries passed to the *create_scaling_group* command have already been merged. This means that you previously created scaling groups and wrote out a reference library, and then tried to create more scaling groups. You must create all of your scaling groups before writing the reference library.

---

## LMUI-005

(error) Cannot %s because there is no library workspace.

### Description

The first step in the library preparation flow is to create a library workspace by using the *create_workspace* command. You must have an open library workspace to perform library preparation tasks.

### What Next

Create a library workspace, and then reenter the command you used.

### See Also

- create_workspace

---

## LMUI-006

(error) You can have only one library workspace.

### Description

The first step in the library preparation flow is to create a library workspace by using the *create_workspace* command. You can have only one library workspace open at a time. The tool issues this message when you try to create a library workspace when another workspace is already open.

Feedback

### What Next

Before creating a new library workspace, either complete the library preparation flow for the current workspace and commit it to a saved reference library, which removes the workspace from memory, or remove the current workspace from memory without committing it by using the *remove_workspace* command.

---

## LMUI-007

(error) Invalid library name

### Description

The library name specified to must be compatible with the filesystem. The name specified cannot be used as a file name because it contains invalid characters, like space or slash. Further restrictions disallow certain characters that are used in the specification of a library name. For example, vertical bar is used in the full name of an aggregate member library.

### What Next

Use a different name.

---

## LMUI-008

(error) Cannot %s %s the library workspace.

### Description

You attempted an invalid action using objects in the library workspace. For example, you cannot apply the *remove_lib_cell* command to library cells in the workspace.

### What Next

Use a different object.

---

## LMUI-009

(warning) Cannot specify the %s %s in the %s flow. It is ignored.

### Description

In the library manager, you attempted to specify a command or command option that is incompatible with the current flow, so it was ignored.

For example, if you specify the option *-allow_missing* to *check_workspace* in the *physical_only* flow, you will see this message, because the option does not apply to the *physical_only* flow.

Another example is using *process_workspaces -output* in the exploration flow and more than one sub-workspace is being processed, and you are not creating an aggregate (with the application option *lib.workspace.explore_create_aggregate*).

---

## LMUI-010

(error) Cannot %s after a successful check_workspace

**Description**

In the library manager, you attempted an operation after a successful *check_workspace* which is not allowed at that point. For example, you cannot change the process label or number for a library with *set_process* after a successful check.

---

## LMUI-011

(error) Must specify %s

**Description**

In the library manager, a command requires that something is specified. For example, if a command has options -a and -b and one or more of them is required but none is specified, some commands will issue this message.

---

## LMUI-012

(warning) Cannot use %s on %s %s:\n \t%s

**Description**

In the library manager, a command was used on an invalid object. For example, if you try to use *set_process* on a physical library, it will be rejected because that library does not have a timing view where process information is stored.

---

## LMUI-013

(information) %s %s already has these settings

**Description**

In the library manager, you used a command to change settings on one or more objects, and the objects already have those settings. For example, if you used *set_process* and the library already has the process label and number that you are trying to set, you would get this informational message in case your entry was a typo.

Feedback

## LMUI-014

(error) Could not %s for library %s

**Description**

In the library manager, a problem occurred in a command which prevented it from completing. Previous messages should indicate the specific problem. This is a summary message.

## LMUI-015

(error) %s '%s' does not exist%s

**Description**

An object specified to a command does not exist, and it must for the command to function.

## LMUI-016

(error) %s '%s' already exists%s

**Description**

An object specified to a command already exists, and it must not for the command to function.

## LMUI-017

(error) Library file '%s'\n \tis already registered.

**Description**

You tried to read a file into the library manager which has already been loaded into memory.

**What Next**

If the file has changed and you want to reread it, you can remove the library using the *remove_lib* command, then reread the file.

## LMUI-018

(error) %s failed: %s.

Feedback

**Description**

Some commands require auxiliary files either in the installation root or set in application options. Something is missing, and the message will tell you which it is.

**What Next**

Ensure that the software is installed correctly and all required files in the installation and elsewhere are present.

---

## LMUI-019

(error) Read of Liberty file failed: %s

**Description**

This is a summary message at the end of *read_lib* if one or more of the files you provided failed to load.

**What Next**

The text in this message and/or other error messages from the reader should guide you to the problem in the .lib file(s) that need to be corrected.

---

## LMUI-020

(error) The %s command is not supported in fast exploration mode.

**Description**

In the fast version of the exploration flow, you create library groups and write scripts for them using *group_libs* and *write_workspace*. You cannot process (check and commit) the workspaces. The fast version (enabled with the application option *lib.workspace.fast_exploration* set to true) can be more than 50 times faster than the original version. It is functionally equivalent to process a workspace versus writing a workspace creation script and sourcing it back.

---

## LMUI-021

(error) Cannot include library '%s' in a scaling group:\n \t%s

**Description**

You used *create_scaling_group* and a library that you passed to it was disqualified from being included in a scaling group. The reason is given in the message. One reason is that the library does not have any pins. It might have cells, but they are pinless, and therefore there are no arcs, checks, or capacitances to scale.

Feedback

### What Next

Verify that you are using the correct libraries for scaling, or remove the command from your script.

---

## LMUI-022

(error) Cannot specify %s library as the seed for the edit or verification flows.

### Description

When you create a workspace with the *create_workspace* command using the edit or verification flows, you can only supply a fully committed library as the library argument. You might have specified a frame-only NDM library, or some other type of NDM library which is not allowed.

### What Next

If you want to edit a frame library, use the frame flow, and *read_ndm* to load the file into the workspace.

### See Also

- create_workspace
- read_ndm

---

## LMUI-023

(error) Command %s requires the %s flow workspace.

### Description

The command that you just used was used in a flow that does not support the command.

### What Next

Create a flow workspace that supports the command before you use the command.

### See Also

- create_workspace
- remove_workspace

---

## LMUI-024

(information) %s is ignored in the aggregate flow.

Feedback

**Description**

An aggregate library is an NDM library that contains a group of individual NDM lib-cell libraries. The command or command option you entered is invalid while creating an aggregate library in the aggregate flow.

---

## LMUI-025

(error) Cannot specify %s library as the seed for the aggregate flow.

**Description**

When creating a workspace with the aggregate flow, you can pass in a new library name to create a new aggregate, or an existing aggregate library to modify it (add new libraries, remove libraries, reorder libraries). The existing library must be an aggregate library. It cannot be any other type of NDM library.

**What Next**

Make sure you are using the correct library.

---

## LMUI-026

(error) Cannot use '%s' when there are open libraries

**Description**

You tried to use a command which requires no open libraries. For example, you cannot create a workspace while there are open libraries.

**What Next**

Close all of the open libraries.

---

## LMUI-027

(information) Library is effectively read-only.

**Description**

The *open_lib* command in the library manager shell is used to query a reference library. It is not used to open a library for the purpose of editing and saving. If you want to change the library, create a workspace with the appropriate flow to edit the type of library you are planning to change.

Feedback

## LMUI-028

(error) Cannot read logic library source file in edit flow.

**Description**

In edit flow, Library Manager cannot read logic library files.

## LMUI-029

(error) Cannot %sworkspace %s

**Description**

In the library manager, you attempted an operation on a workspace which is invalid. For example, you tried to remove a sub-workspace (a workspace created by *group_libs*). Or, you tried to use *commit_workspace*, *check_workspace*,

## LMUI-030

(warning) Without -mode_label, the library will be modeless

**Description**

In the ETM flow, you specify the mode for the Liberty library with the *-mode_label* option to *read_db* or *read_lib*. The option is not required, so we warn you just in case you wanted to specify a mode and forgot.

**What Next**

There is no way to apply a mode to the logical source library, so if that was your intention, you will need to remove the library with *remove_lib*, and re-read it, specify the *-mode_label* option.

## LMUI-031

(warning) Ignored technology file '%s' in edit flow .

**Description**

The technology file specified to *create_workspace* will be ignored in edit flow.

## LMUI-032

(warning) Can not remove lib '%s', it is associated with current workspace.

Feedback

### Description

The lib which associated with current workspace is loaded during *create_workspace* in edit flow, this lib can not be removed, otherwise the current workspace will be invalid. You can use command *remove_workspace* to remove workspace and it's associated lib.

---

## LMUI-033

(error) Option -mode_label is not consistent with previous read_db or read_lib command.

### Description

In the ETM flow, if you want to create a multiple modes library, use option -mode_label for every *read_db* and *read_lib* command. In the ETM flow, if you want to create a single mode library, you should not use option -mode_label in any *read_db* or *read_lib* command. If you specify -mode_label option in one *read_db* or *read_lib* command, you have to specify -mode_label option for every *read_db* or *read_lib* command. Otherwise, you will get this *LMUI-033* error message.

---

## LMUI-034

(warning) Without -mode_label, the library will be modeless

### Description

In the ETM flow, you specify the mode for the Liberty library with the *-mode_label* option to *read_db* or *read_lib*. The option is not required, so we warn you just in case you wanted to specify a mode and forgot. If you specify the mode for any Liberty library, you have to specify mode for all Liberty libraries in current session. You cannot have mixed moded and non-moded logical libraray in one workspace in ETM flow, LMUI-033 will be issued for such case.

### What Next

There is no way to apply mode to the logical source library, so if that was your intention, you will need to remove the library with *remove_lib*, and re-read it, specify the *-mode_label* option.

---

## LMUI-035

(error) Cannot read %s views with read_ndm in the %s flow

### Description

In some flows, *read_ndm* can only read certain views. You requested a view/flow combination that is not supported.

Feedback

## LMUI-036

(warning) Option %s is applicable to the %s command only if the flow type of the current workspace is %s. The option was ignored.

### Description

In the library manager, you attempted to specify a command option that is not applicable in the current flow; therefore, the option was ignored. For example, if you specify option *-allow_missing* to the *check_workspace* command in the *physical_only* flow, since the option does not apply to the *physical_only* flow it will be ignored.

### What Next

You can use the "get_attribute [get_workspace [current_workspace]] flow" command to show the flow type of the current workspace.

### See Also

- current_workspace

## LMUI-037

(warning) Multiple antenna layer rules defined in layer '%s' with name '%s' and mode '%d'. The latter one will overwrite the former one.

### Description

This warning is issued when multiple antenna layer rules defined in a layer with same name and same mode with command "define_antenna_layer_rule". Only the last rule will take effect.

### What Next

Remove redundant antenna layer rules or rename them.

## LMUI-038

(error) Antenna layer rule defined in layer '%s' with name '%s' and mode '%d' associates with an undefined antenna rule.

### Description

This error is issued when an antenna layer rule defined in a layer with command "define_antenna_layer_rule", But there is no antenna rule defined with the name and the mode with command "define_antenna_rule".

Feedback

**What Next**

Add antenna rule before the antenna layer rule.

---

## LMUI-039

(error) Cannot %s when app option lib.workspace.read_mw_frame is true.

**Description**

When app option lib.workspace.read_mw_frame is true, that means you want to create a library from Milkyway FRAM view directly. In this case, only a packed file for Milkyway FRAM view data can be read by read_lef. All other data cannot be read into the workspace. Moreover, only one packed file can be read by read_lef.

**What Next**

Commit or remove the current workspace and start a new library preparation flow.

---

## LMUI-040

(Error) Technology data in %s and workspace technology data is not compatible

**Description**

Technology data in the library which is reading and workspace technology data must be compatible, otherwise *create_workspace* will fail.

**What Next**

Try another libary with compatible technology data.

---

## LMUI-041

(error) Cannot invoke the %s command because %s file has already been loaded.

**Description**

The read_lef, read_gds, read_ndm, read_db, and read_lib commands cannot be invoked if the import_icc_fram command has already been invoked to successfully read an icc fram tar file, which was created by the export_icc2_frame command in the icc shell, into the current workspace, and vice versa.

**What Next**

Commit or remove the current workspace and start a new library preparation flow.

Feedback

### See Also

- import_icc_fram

---

## LMUI-042

(Warning) No workspace to %s.

### Description

There is no workspace for the specified operation. Either there is no sub-workspaces at all, or the workspace specified is an exploration mode workspace.

### What Next

Please read some logical and physical libraries, and use *group_libs* command to generate some sub-workspaces, then try this command again.

### See Also

- process_workspaces
- write_workspace

---

## LMUI-043

(warning) PVT configuration is not used in the %s flow

### Description

This is just a reminder that PVT configuration is not used by the library manager workspace flow you are in. Either you have an existing PVT configuration and you created a workspace in a flow that does not use it, or you made a change to the PVT configuration using *set_pvt_configuration* while in one of those flows.

---

## LMUI-044

(information) %d/%d workspaces %s successfully

### Description

In the library manager, while processing workspaces in the exploration flow, a step completed, and this is an informational message to tell you the results of that step.

---

## LMUI-045

(warning) Cannot use the %sworkspace as an argument to %s. It is ignored.

Feedback

**Description**

In the library manager, you attempted an operation on a workspace which is invalid. For example, you passed the root workspace in the exploration flow to *write_workspace* or *process_workspaces*. The application ignored this argument.

---

## LMUI-046

(warning) Option '%s' is ignored %s

**Description**

In the library manager, you used an invalid option which is ignored. For example, your current workspace is a sub-workspace, and you tried to pass a list of workspaces to *process_workspace* or *write_workspace*. In these cases, only the current workspace will be processed or written.

---

## LMUI-047

(warning) Must_join_group '%s' on terminal '%s' of block '%s' will be mapped to 1.

**Description**

When convert must_join_group information of a library from IC Compiler II to IC Compiler, all defined values will be mapped to 1. If the value is not 1, then it will lose information.

**What Next**

This is a warning message and tool will continue. There is no action needed if the lose of information is expected.

---

## LMUI-048

(warning) Ignored must_join_group '%s' on terminal '%s' of block '%s'.

**Description**

When convert must_join_group information of a library from IC Compiler II to IC Compiler, only terminals with rect and polygon shapes will be converted. The specified terminal is not with rect and polygon shapes so the must_join_group information of it will not be converted.

**What Next**

This is a warning message and tool will continue. There is no action needed if the lose of information is expected.

Feedback

## LMUI-049

(information) Use mode label '%s' to read db as there is %s match in the base lib.

**Description**

The *compare_db* command found the specified db file matches one in the base lib, and the one in the base lib was read using the reported mode label. So the *compare_db* command will use this mode label to read specified db file.

The match could be either a full file name match or a leaf file name match.

**What Next**

This is a informational message and no action is required.

## LMUI-050

(Warning) The %s %s is deprecated. %s

**Description**

Some aspect of the user interface (a command, an option, a value for an option, an application option, and so on) has become deprecated and will be removed in a subsequent release.

**What Next**

This is a warning. Your action will work as planned. The message text will indicate what the correct action or replacement is for the deprecated feature.

## LMUI-051

(Error) The %s %s is obsolete. %s

**Description**

Some aspect of the user interface (a command, an option, a value for an option, an application option, and so on), which was deprecated in a previous release, is now obsolete. It will be completely removed in a subsequent release.

**What Next**

The message text will indicate what the correct action or replacement is for the deprecated feature. As this is an error, you will need to change your usage to continue.

Feedback

## LMUI-052

(information) Can reuse library %s for workspace %s.

### Description

This message indicates that an existing library can be reused for the specified workspace. The processing of the workspace will be skipped.

## LMUI-053

(information) Cannot reuse library %s for workspace %s: %s.

### Description

This message indicates that no existing library can be reused for the specified workspace. The reason was given with the message. It will continue to process the workspace.

## LMUI-054

(information) The default value of %s will be '%s' in %s release.

### Description

This message indicates the default value of the specified application option will be changed in specified release. No action required in this release, but you need pay attention to the flow that will be impacted.

## LMUI-055

(warning) The size of the %s library cell does not match the site_def %s.

### Description

The *set_cell_site* command issues this warning message when the height or width of the specified library cell is not an integer multiple of the specified site_def, the command will not change the site_def of this cell.

### Example Message

```
Warning: The size of the AND library cell does not match site_def CORE.
 (LMUI-055)
```

### What Next

Change the site_def definition by using the *set_attribute* command.

Feedback

### See Also

- read_lef
- set_attribute

---

## LMUI-056

(information) The '%s' library cell is ignored.

### Description

The *set_cell_site* command issues this message because the type of the library cell is one of macro, black_box, module, pad, pad_spacer, flip_chip_driver, corner_pad. The command will not change the site_def of this cell.

### What Next

No action requried.

### See Also

- read_lef
- set_attribute

---

## LMUI-057

(error) : Failed to create cell group '%s' for cell list (%s)!

### Description

This message indicates that the cell group is not created successfully from EEQ in input LEF file, or from physcial_variant_cells in input db/lib file.

### What Next

Please check the error message printed by create_cell_group and correct them. For example, if the cell group already exists, please use command remove_cell_group to remove the cell group and redo check_workspace.

### See Also

- read_lef

---

## LMUI-058

(information) : Cell group '%s' is created successfully for cell list (%s)!

Feedback

### Description

This message indicates that the cell group is created successfully from EEQ in in input LEF file, or from physcial_variant_cells in input db/lib file.

### What Next

No action required

### See Also

- read_lef

---

## LMUI-059

(warning) Reading new physical rules, unsaved data in previous execution will be lost.

### Description

The command read_physical_rules is executed more than once, the cell level attributes in previous file will be lost if have not been applied by check_workspace.

### What Next

Check the physical rules by write_physical_rules.

---

## LMUI-060

(information) %s is only avaiable in the %s flow.

### Description

The command or command option you entered is invalid while current workspace is not in the specified flow.

---

## LMUI-061

(warning) Application option '%s' will be ignored in the %s flow.

### Description

The reported application option will be ignored in the specified flow. Please refer to the man page of the application option for details.

---

## LMUI-062

(error) Cannot rename %s to an existing library cell %s.

Feedback

**Description**

The message indicates you are trying to rename a library cell to an existing library cell in the same library, which is not allowed.

**What Next**

Correct the command line option or remove the library cell.

---

## LMUI-063

(information) Trim leading and trailing whitespaces for %s value: changed '%s' to '%s'.

**Description**

This message indicates the tool removes the leading and trailing whitespaces of the specified value.

---

## LMUI-064

(error) Invalid %s value '%s' is not used since it contains '\\n'.

**Description**

The value specified is invalid since it contains invalid characters ('\\n').

**What Next**

Remove the invalid charaters

---

## LMUI-065

(warning) The '-scale_factor' option is ignored.

**Description**

The "-scale_factor" option is ignored when the *design.allow_multiple_scale_factors* app option is set to true. If used, the specified *-scale_factor* must be same as the *scale_factor* specified with the app option *design.session_scale_factor* .

**What Next**

Nothing, it is an informational message. Please do not specify the "-scale_factor" if *design.allow_multiple_scale_factors* is set

---

## LMUI-066

(error) The specified scale factor '%d' is not usable.

Feedback

**Description**

The specified scale_factor is not usable for scale factor conversion. The scale factor specified must be larger than current scale factor of the library and must be an integral multiple of scale factor of the library being opened for edit. For example, if the library has a scale factor of 10000, then a new scale factor of 20000 is okay to use. However, a scale factor of 4000 or 8000 will result in an error.

**What Next**

Please specify a usable scale factor.

# LNK

## LNK-003

(error) Block '%s' was not successfully linked.

**Description**

A *link_block* message indicating that the link process failed for your design.

The link process will fail if there are port mismatches between modules within a design, or to lib cells. The link process will also fail if there are circular or recursive references in the module hierarchy.

**What Next**

See previous error messages for more details. Either update your Verilog source, correct the ref_libs, view switch list, or *search_path* used for this design.

**See Also**

- link_block
- read_verilog
- remove_blocks
- set_ref_libs
- set_view_switch_list
- search_path

## LNK-005

(warning) Unable to resolve reference to '%s' first referenced from module '%s'.

Feedback

### Description

The reference was not resolved to a module, block or library cell.

This warning is issued once for the first module containing a cell making this reference. Additional cells making this reference (in this module or in other modules within this block) are included in the unbound instance count at the end of *link_block*.

### What Next

Look further back in the error log to see if a previous error caused this reference to be unresolved.

If the reference is the name of a module in your Verilog source, see if the module was loaded with *get_modules module_name*. Also, check the Verilog source to verify that that module was read with the same *read_verilog* command as the module reference.

Use *get_blocks* *:*block_name*.* to see if there is a block with that name in any open library.

Check the view switch list with *get_view_switch_list* to see if the views selected by the switch list match any available views of that block. Lib cell references automatically select the timing, frame, or design views regardless of the view switch list setting.

Run *list_blocks -ref_libs -lib_cells > file* and examine the file to see if the desired view of the block is shadowed by another block with the same name in an earlier reference library.

### See Also

- get_blocks
- get_modules
- set_ref_libs

---

## LNK-008

(warning) Cannot find port '%s' on reference '%s', referenced by instance '%s'.

### Description

During the link process, an instance in the design could not be resolved because a port on the instance was not found in the design. This indicates a mismatch between the pinout of the instance and the design to which it should have resolved.

For example, if you have only these three instances of an FD1 in a design:

```
FD1 u1 ( .Q(n1), .CP(clock1), .D(data1));
  FD1 u2 ( .Q(n2), .CP(clock2), .D(data2));
  FD1 u3 ( .Q(n3), .CK(clock3), .D(data3));
```

Feedback

There is a typo in the third instance, listing "CK" instead of "CP". By default, you will get the LNK-008 message for the first instance only.

```
Warning: Cannot find port 'CK' on design 'FD1',
       referenced by instance 'u1'. (LNK-008)
```

This might seem confusing, since that instance does not have a CK port. But for a name-based reference, each instance expects at least the total of all listed ports. To see all instances which cannot be resolved, use the -verbose option to *link_block*:

```
Warning: Unable to resolve reference to 'FD1' in 'top'. (LNK-005)
Warning: Unable to resolve reference to 'FD1' in 'alu'. (LNK-005)
```

The LNK-005 messages are generated in addition to LNK-008.

**What Next**

Examine the library's ref_lib list, log messages, and use the *which* command to find out which files were loaded. This could also be due to a typo in the netlist source.

**See Also**

- link_block
- set_ref_libs
- LNK-005

---

## LNK-010

(error) In module '%s', too few ports on instance '%s' referencing '%s'.

**Description**

The specified reference to a module, block or library cell does not have enough ports. This indicates a mismatch between the library and the netlist.

**What Next**

Make sure the library is correct. Then, verify that the netlist is referencing the correct cell.

---

## LNK-011

(error) In module '%s', too many ports on instance '%s' referencing '%s'.

**Description**

The specified reference to a module, block or library cell has too many ports. This usually indicates a mismatch between the library and the netlist. It can also indicate that there are

Feedback

multiple conflicting references to the same library cell or black box. One such conflict is two references with different pin counts.

**What Next**

This error causes the link to fail. Make sure the library is correct. Then, verify that the netlist is referencing the correct cell.

---

## LNK-012

(error) In module '%s', width mismatch on port '%s' on instance '%s' referencing '%s'.

**Description**

The linker matched a bused port on an instance with a bused port on a library cell, but bus width is different between the two. This could indicate an incorrect library or a netlist which is out of date with the library.

**What Next**

Verify that your source is in sync with the library.

---

## LNK-017

(error) In module '%s', port mismatch on instance '%s' referencing '%s'.

**Description**

The reference to the module has an interface that is incompatible with the ports that are defined on that module. This indicates an inconsistency between modules within the Verilog netlist.

**What Next**

Correct the inconsistency within the Verilog netlist. Then re-read the Verilog.

---

## LNK-023

(error) Recursive hierarchy detected in block '%s': %s.

**Description**

The linker detected recursive hierarchy in the block that is being linked. This is a design error. The message will list the modules that create the recursion.

For example, if module A has an instance of B and module B has an instance of A, that is a recursive loop.

Feedback

### What Next

Remove the recursion, reread the blocks, and relink.

---

## LNK-024

(error) Cannot link flat library cell %s.

### Description

The current block is a flat library cell. Flat library cells have no hierarchy, so they cannot be linked.

### What Next

Change the current block to a design block, then link the design from there.

### See Also

- current_block
- link_block

---

## LNK-025

(error) Cannot rebind block %s before it has been linked.

### Description

The current block has been newly read in, but it has not yet been linked. A block cannot be rebound before initial link.

### What Next

Change the current block to the block that should be rebound. Then rebind that block.

### See Also

- current_block
- link_block
- rebind_block

---

## LNK-026

(warning) Block %s has conflicting link contexts: library %s and library %s.

Feedback

### Description

This multiply instantiated block is referenced by parent blocks that are linked with different hierarchical reference library lists.

When the entire block hierarchy is linked with the same reference library list, it is straight forward to decide how to resolve references within each block.

But when hierarchical reference library lists are used, a multiply instantiated block can be referenced from different libraries each with different reference library lists. In this case it is not clear which reference library list should be used to resolve references within the block. The first library's reference library list is used, but that may not be the designer's intent.

### What Next

Review the block hierarchy. Determine which blocks should be linked with which reference library lists.

If a library has the *use_hier_ref_libs* attribute incorrectly set, the setting can be removed with:

```
prompt> set_attribute [get_libs library-name] false
```

If a library is missing the *use_hier_ref_libs* attribute, the setting can be removed with:

```
prompt> set_attribute [get_libs library-name] true
```

If a multiply instantiated block really should be linked with different reference library lists, the block should be copied so that instances that are to be linked different reference library lists reside in different libraries.

```
prompt> copy_block -from_block my-block -to_block new-lib:my-block
```

### See Also

- copy_block
- link_block
- set_ref_libs

---

## LNK-031

(information) Skipping module '%s', using frozen block '%s'.

### Description

This message tells you that a stub module in the Verilog source is being skipped and the 'frozen' version of the block is being used from the reference library list. A block is

Feedback

considered frozen if it has a FRAME view. This action only occurs during the initial link of newly read Verilog.

If the app option *link.prefer_frame* is set to true, then 'frozen' blocks (that is, blocks with a FRAME view) are preferred over Verilog modules. If the app option is set to false, then Verilog modules are preferred over 'frozen' blocks.

When a 'frozen' block is used, the linker uses the view switch list to decide which view of that block to link to. This can be changed with the *set_view_switch_list* command. Individual instances can be changed to reference a different view with the *change_abstract*, *change_view* or *set_reference* commands.

The number of skipped module messages displayed for each block is controlled by the app option *link.reference_limit*. Additional messages are suppressed. When a block has skipped modules, a message is displayed giving the number of modules skipped for each block.

**What Next**

No action is required. This is just information only.

To see more skipped module messages, set the app option *link.reference_limit* to a larger number, re-read the verilog and relink the block.

```
prompt> set_app_options -global { link.reference_limit 99999 }
prompt> read_verilog ...
prompt> link_block
```

To see the names of all the modules being suppressed, set the app option *link.reference_limit* to -1, re-read the verilog and relink the block.

```
prompt> set_app_options -global { link.reference_limit -1 }
prompt> read_verilog ...
prompt> link_block
```

To not prefer a specific block over the Verilog module, remove the library containing that block from the reference library list.

```
prompt> set_ref_libs -remove frozen_blocks.nlib
```

To remove the 'frozen' state from a specific block, remove the FRAME view of that block.

```
prompt> remove_blocks -force myLib:myBlock.frame
```

To always prefer Verilog modules over 'frozen' blocks, set the *link.prefer_frame* app option to false.

```
prompt> set_app_options -global { link.prefer_frame false }
```

Feedback

## LNK-032

(information) Skipped %d modules from block '%s'.

### Description

This message tells you that stub modules in the Verilog source have been skipped and the 'frozen' versions of those blocks are being used from the reference library list. A block is considered frozen if it has a FRAME view. This action only occurs during the initial link of newly read Verilog.

If the app option *link.prefer_frame* is set to true, then 'frozen' blocks (that is, blocks with a FRAME view) are preferred over Verilog modules. If the app option is set to false, then Verilog modules are preferred over 'frozen' blocks.

When a 'frozen' block is used, the linker uses the view switch list to decide which view of that block to link to. This can be changed with the *set_view_switch_list* command. Individual instances can be changed to reference a different view with the *change_abstract*, *change_view* or *set_reference* commands.

The number of skipped module messages displayed for each block is controlled by the app option *link.reference_limit*. Additional messages are suppressed. When a block has skipped modules, a message is displayed giving the number of modules skipped for each block.

### What Next

No action is required. This is just information only.

Feedback

To see more skipped module messages, set the app option *link.reference_limit* to a larger number, re-read the verilog and relink the block.

```
prompt> set_app_options -global { link.reference_limit 99999 }
prompt> read_verilog ...
prompt> link_block
```

To see the names of all the modules being suppressed, set the app option *link.reference_limit* to -1, re-read the verilog and relink the block.

```
prompt> set_app_options -global { link.reference_limit -1 }
prompt> read_verilog ...
prompt> link_block
```

See the manual page for LNK-031 for information on how to control which blocks are considered 'frozen'.

```
prompt> man LNK-031
```

To always prefer Verilog modules over 'frozen' blocks, set the *link.prefer_frame* app option to false.

```
prompt> set_app_options -global { link.prefer_frame false }
```

---

## LNK-040

(information) User %sunits loaded from library '%s'

Feedback

### Description

This message appears when you have not explicitly set your design units (time, capacitance, etc.) with the *set_user_units* command. The units used in your shell session will be taken from the default units in the given library.

### What Next

You can use *report_user_units* to see what units have been selected. You can use the *set_user_units* to force different units of your choice.

### See Also

- set_user_units
- report_user_units

---

## LNK-041

(warning) Cannot connect net to internal pin '%s'

### Description

Net cannot be connected to internal pins of a lib_cell. Such connections will be ignored by *link_block*.

### What Next

Please check the verilog file to correct references to internal pins.

### See Also

- link_block

---

## LNK-042

(warning) Cannot link scalar net to bus port '%s' on reference '%s', referenced by instance '%s'.

### Description

During the link process, an instance in the design could not be resolved because a bus port on the instance was being connected to a scalar net. This indicates a mismatch between the pinout of the instance and the design to which it should have resolved.

The LNK-005 messages are generated in addition to LNK-042.

Feedback

### What Next

Review your source rtl.

### See Also

- link_block
- LNK-005

---

## LNK-043

(information) Message limit (link.reference_limit %d) reached for this block, remaining reference messages will be suppressed.

### Description

The number of unresolved references in this block has exceeded the limit set in the app option *link.reference_limit*. Additional error messages about unresolved references will be suppressed.

### What Next

To see more unresolved reference messages, set the app option to a larger number and relink the block.

```
prompt> set_app_options -global { link.reference_limit 99999 }
prompt> link_block
```

To see all unresolved reference messages, set the app option to -1 and relink the block.

```
prompt> set_app_options -global { link.reference_limit -1 }
prompt> link_block
```

## LNK-044

(info) Changed reference of instance '%s' from '%s' to '%s'.

### Description

An exact match for the reference could not be found but a match was found using case insensitive search. Based on design repair settings, the reference was changed.

Feedback

### What Next

The design has been repaired as based on the repair settings set by the user.

If the repair is not acceptable, please change the repair settings and start again.

### See Also

- get_blocks
- get_modules
- set_ref_libs

---

## LNK-045

(info) Disconnected pin '%s' of instance '%s', in module '%s'.

### Description

The pin of instance is being disconnected from its net

The design is being repaired based on the repair settings set by the user. The pin of the instance does not have a corresponding port on the reference the instance is being bound to, so the pin is being disconnected and will be deleted.

### What Next

The design has been repaired as based on the repair settings set by the user.

If the repair is not acceptable, please change the repair settings and start again.

### See Also

- get_blocks
- get_modules
- set_ref_libs

---

## LNK-046

(info) Removed pin '%s' of instance '%s', in module '%s'.

### Description

The pin of instance is being deleted.

Feedback

The design is being repaired based on the repair settings set by the user. The pin of the instance does not have a corresponding port on the reference the instance is being bound to, so the pin is being deleted.

**What Next**

The design has been repaired as based on the repair settings set by the user.

If the repair is not acceptable, please change the repair settings and start again.

**See Also**

- get_blocks
- get_modules
- set_ref_libs

---

## LNK-047

(info) Renamed pin '%s' of instance '%s', to '%s', in module '%s'.

**Description**

The pin of instance is being renamed.

The design is being repaired based on the repair settings set by the user. The pin of the instance is being mapped to a port with different name on the reference the instance is being bound to.

**What Next**

The design has been repaired as based on the repair settings set by the user. Some possibilities are that the name is being mapped by a case insensitive match or the names are declared as synonyms

If the repair is not acceptable, please change the repair settings and start again.

**See Also**

- get_blocks

---

## LNK-050

(error) Unable to link design. Design exceeds the database capacity.

Feedback

### Description

The tool is not able to link this design, because the number of objects in the design exceeds the database capacity.

### What Next

Please contact Synopsys for technical help in resolving this issue.

### See Also

- link_block

---

## LNK-053

(information) Linking instances in module '%s':

### Description

The *link_block* command prints the name of each module as it links when run with the *-verbose* flag.

### What Next

Run the *link_block* command without the *-verbose* flag.

### See Also

- read_verilog
- link_block

---

## LNK-055

(warning) Referenced block '%s' does not have a physical view.

### Description

The linked block references another block that does not have a physical description defined. Without a physical definition of sub-blocks, the physical hierarchy cannot be created.

If the sub-block is a lib cell, (most likely a timing view) it is missing its frame view definition. Without a frame view, there is no physical information for that cell.

To see what views are available for what lib cells or blocks, use the *list_blocks* command.

If the sub-block is a logic-only block from the Design Planning budgeting flow, it can only be referenced by other logic-only blocks.

Feedback

### What Next

If the sub-block is a lib cell, there was a problem in creating that library. Go back and recreate that library. During library preparation, make sure that LEF exists for each of the lib cells in that library.

If the sub-block is a logic-only block, then a physical version of that sub-block is required. If needed, re-read the sub-block from Verilog, without setting the logic_only attribute on it.

Generally commands cannot handle sub-blocks without physical information. In rare cases blocks without physical sub-blocks may be processed by *link_block* by setting the *link.require_physical* app option to false. Subsequent commands may give unexpected results with these blocks.

### See Also

---

## LNK-056

(info) Block '%s' reference '%s' needs to be rebound.

### Description

This is a verbose message indicating which reference within the named block is causing that block to be rebound. There may be several references in the block that require updating, this message reports the first such reference discovered.

There are several reasons why a block reference would need to be rebound. A change in a reference library or the ref lib list could change which block the reference should be bound to. A change in the view switch list could change which block view is used for default view references. Or a change in the referenced block's port interface could require updating the pins on each cell referencing that block.

This message can be enabled with the *link_block -verbose* options, or by setting the *link.verbose* app option to true.

Feedback

### What Next

To disable this message, either set the *link.verbose* app option to false, or remove the *-verbose* option from the *link_block* command.

### See Also

- get_view_switch_list
- link_block
- set_app_options
- set_view_switch_list

---

## LNK-062

(warning) Library %s reference library '%s' is not bound.

### Description

This library has reference libraries that have not been bound to the actual library named. The *link_block* command cannot resolve references to blocks or lib cells in the unbound library. Those references will be unresolved.

The specified block is in a library that has not had its reference library list set. The reference library list is used to resolve references to lib_cells and other blocks in the block hierarchy.

### What Next

Verify that the reference library list on this library is set correctly. Correct the setting with the *set_ref_libs* command. Check to see if the TCL search_path variable is set to locate that library. Verify that the library is on disk and readable. Try to explicitly open the library with the *open_lib* command.

---

## LNK-063

(warning) Library %s has no reference libraries.

### Description

The specified block is in a library that has not had its reference library list set. The reference library list is used to resolve references to lib_cells and other blocks in the block hierarchy.

Feedback

**What Next**

Set the reference library list for this library with the *set_ref_libs* command.

---

## LNK-064

(warning) In library %s, no block views exist for block %s.

**Description**

The library contained a library catalog entry for the block, but no actual design data. If the block should exist in that library, the library may be in an inconsistent state.

**What Next**

Recreate the missing block from the Verilog source, or copy the block from another library.

**See Also**

- copy_block
- read_verilog

---

## LNK-065

(warning) In library %s, block %s.%s has no top module.

**Description**

The library contains a block that does not have a top module specified. Without a top module, the block has no port interface and cannot be used to resolve block references.

**What Next**

Re-read the block Verilog specifying the top module for this block.

**See Also**

- read_verilog

---

## LNK-066

(warning) Linking block %s.%s with an empty view switch list.

Feedback

### Description

The block, library, or perhaps global view switch list is empty. If the switch list is empty no block views will be used to resolve references in this block. So the block will have no physical hierarchy.

### What Next

Set the view switch list to some of the views desired for this physical block hierarchy, and re-link the block.

### See Also

- get_view_switch_list
- link_block
- set_view_switch_list

---

## LNK-067

(Warning) Block '%s' is already linked.

### Description

The specified block has already been linked.

### What Next

Most often this means the extraneous link command may be removed from a script.

---

## LNK-068

(warning) Could not open block %s.

### Description

There was a reference to the block, but *link_block* was unable to open the block to read it from the library. References to that block will not be resolved.

### What Next

Verify that the block is in the library and not locked from use by another user. Re-build the block from Verilog, or recreate the abstract or frame view as needed.

Feedback

**See Also**

- create_abstract
- create_frame
- link_block
- read_verilog_outline
- read_verilog

---

## LNK-069

(information) Binding to reference library %s.

**Description**

This library had a reference library that was not bound to the actual library named. The library binding has been restored.

**What Next**

If the binding is now correct, there is nothing further to do. If the binding was incorrect, update the *search_path* variable and rebind the reference libraries with the *set_ref_libs* command.

**See Also**

- link_block
- set_ref_libs
- search_path

---

## LNK-070

(information) Block '%s' was not successfully auto-linked.

**Description**

A summary message indicating that the auto link process failed for your block.

**What Next**

See previous error messages for more details.

Feedback

## LNK-071

(error) Block '%s' has %d inconsistent port references.

### Description

A summary message indicating that the link process failed for your block.

Mismatched port references to a lib cell or to a module in the same block will cause *link_block* to fail. In this case, the block must be removed, the Verilog corrected, and re-read.

### What Next

See previous error messages for more details. Remove the block, fix the failed port references listed in previous error messages, then re-read the Verilog and re-link the block.

### See Also

- link_block
- read_verilog
- remove_blocks
- set_ref_libs
- set_view_switch_list
- search_path

## LNK-072

(information) Block '%s' has %d failed port references.

### Description

A *link_block* summary message indicating the number of references that failed due to port reference mismatches between blocks. These mismatches caused the link process to fail for your block.

### What Next

See previous error messages for more details. Either update your Verilog source, correct the ref_libs, view switch list, or *search_path* used for this block.

Feedback

### See Also

- link_block
- read_verilog
- remove_blocks
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-073

(information) Block '%s' has %d unbound instances.

### Description

A *link_block* summary message indicating the number of instances that could not be bound to other blocks or library cells. These unbound instances caused the link process to fail for your block.

### What Next

See previous error messages for more details. Either update your Verilog source, correct the ref_libs, view switch list, or *search_path* used for this block.

### See Also

- link_block
- read_verilog
- remove_blocks
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-074

(information) Block '%s' has %d unresolved references.

Feedback

### Description

A *link_block* summary message indicating the number of unresolved block references for this block. These unresolved references caused the link process to fail for your block.

### What Next

See previous error messages for more details. Either update your Verilog source, correct the ref_libs, view switch list, or *search_path* used for this block.

### See Also

- link_block
- read_verilog
- remove_blocks
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-075

(error) In block '%s', cannot remap instance %s to block %s because pin %s would have to be deleted and it is connected to net %s.

### Description

The specified instance is now being mapped to a block with different port interface than used previously and one of the ports removed from the block corresponds to a pin which is connected to a net. So the instance cannot be remapped, leaving the instance unbound. The command *link_block* is unable to link the block.

### What Next

The instance needs to be mapped to a block with the port available. Either correct the ref_libs, view switch list, or *search_path* used for this block.

### See Also

- link_block
- remove_blocks
- set_ref_libs

Feedback

- set_view_switch_list
- search_path

---

## LNK-076

(error) Reference %s is bound to both %s and %s.

**Description**

An instance within the block is bound to two different views of two different blocks. An instance may be bound to two different views of the same block, but not different blocks.

**What Next**

The *link_block* command will attempt to repair the reference to use views from the first block, and discard references to the second block.

Verify that the block referenced is the desired block. If not, update the view switch list, or the library's ref_lib list to select the desired block.

**See Also**

- link_block
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-077

(error) In block %s, cannot resolve references to %s and %s. Target blocks have incompatible port interfaces.

**Description**

The block is referencing two different views of a child block. But the two views of the child block have different port interfaces.

A block may not simultaneously reference two views of a child block unless the views have identical port interfaces.

**What Next**

Use the *change_view* command on those instances that reference the undesired block view. Then re-link the block.

Feedback

### See Also

- change_view
- link_block

---

## LNK-078

(error) In block %s, could not resolve reference to %s.

### Description

The block reference could not be resolved to a block because the reference expected a port that did not exist on the targeted block.

### What Next

Check the verilog source to see if the port interface on the block reference is correct.

Check the block selected by the ref_lib lib and view switch list to see if they have the expected port interface.

Correct any issues, then relink the block.

### See Also

- change_view
- link_block
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-079

(information) Reference to '%s' has %d pin removal failures.

### Description

For this reference, some instances had net connections on pins that do not exist on the new block. Because those pins are being used, they could not be removed to make the pin interface of the instance match the port interface of the new block.

This message tells you how many cell instance pin removals were attempted but failed while rebinding that reference.

Feedback

### What Next

Verify that the instances should be bound to this view of the new block. Verify whether the pins on the instances should be connected to a net.

To see more pin removal failures for this reference use the *link_block -verbose* command.

### See Also

- link_block
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-080

(error) Error while rebinding reference to '%s'.

### Description

Errors occurred while rebinding this reference.

### What Next

Look at the preceding error messages and resolve those issue. Then relink the block with the *link_block* command.

### See Also

- link_block

---

## LNK-081

(error) Unable to resolve reference to '%s'.

### Description

No block or lib cell was found in the ref_lib list for this library to resolve this reference.

### What Next

Check the ref_lib list for this library to see if the desired target block exists. Update the ref_lib list to include the missing library, then relink the block.

Feedback

### See Also

- link_block
- set_ref_libs

---

## LNK-082

(error) Unable to resolve reference to '%s'.

### Description

No block view was found in the view switch list to resolve this reference.

### What Next

See if you are using the global, library, or block view switch_list. See which views are selected in that list. See which views of that block are available in that library.

Update the view switch_list to include the desired view.

See which library is being used to resolve the block reference. If multiple libraries have a block with the same name, a block in an earlier library may be over-shadowing a desired block in a later library.

Update the ref_lib list so that the desired library is earlier.

### See Also

- get_view_switch_list
- link_block
- set_ref_libs
- set_view_switch_list

---

## LNK-083

(error) Unable to resolve reference to '%s.%s'.

### Description

An instance requested a specific view of this block, but the reference could not be bound to that block view.

### What Next

Verify that the instance is requesting the desired block view. If not, use the *change_view* command to cause the instance to use the desired block view.

Feedback

Verify that you're using the block from the desired library. If not, move that library earlier in the ref_lib list.

**See Also**

- change_view
- link_block
- set_ref_libs

---

## LNK-084

(error) Block '%s' has %d references with pins that could not be removed.

**Description**

This block has references that have pins that could not be removed because those pins are connected to nets. Those references could not be resolved.

**What Next**

See previous error messages for more details. Either update the pin net connections, or update the libraries or views being referenced by *link_block*.

**See Also**

- link_block
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-085

(error) Block '%s' has %d mismatched view port interfaces.

**Description**

This block is referencing two views of a block that have different port interfaces. All views referenced by a block must have the same port interface.

**What Next**

See previous error messages for more details. Decide which view is desired for this block. Use the *change_view* command to cause instances that are requesting the incompatible block view to use the desired block view. Then run *link_block* again.

Feedback

### See Also

- change_view
- link_block
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-086

(information) Block '%s' was not successfully rebound.

### Description

There were failures in some references when trying to rebind this block.

### What Next

See previous error messages for more details. Resolve the issues described in those error messages. Then run *link_block* again.

### See Also

- change_view
- link_block
- set_ref_libs
- set_view_switch_list
- search_path

---

## LNK-090

(warning) The 'link_path' variable is obsolete, it is no longer used.

### Description

The *link_path* application variable is obsolete. It is no longer used by the *link_block* command to resolve block or lib cell references. You may set and use this variable in your scripts, but it will not affect linking.

The *link_library* variable is an alias to the *link_path* variable. It is also obsolete.

Feedback

### What Next

Use the *set_ref_libs* command to tell the linker which libraries to use to locate blocks to resolve references and bind sub-blocks.

Use the *search_path* variable to specify which directories to search for files and libraries.

Use the *suppress_message* command to suppress this message.

### Examples

```
prompt> set_app_var link_path
 "$link_path /usr/libs/commonLib /usr/libs/leafCells"
Warning:  The 'link_path' variable is obsolete, it is no longer used.
 (LNK-090)
myLib /usr/libs/commonLib /usr/libs/leafCells

prompt> suppress_message LNK-090

prompt> set_app_var search_path "$search_path /usr/libs"
/global/libs . /usr/verilog /usr/libs
prompt> set_ref_libs {commonLib leafCells}
commonLib leafCells

prompt> link_block
Using libraries: myLib commonLib leafCells
Linking block myLib:TOP.design
Information: units loaded from library 'leafCells' (LNK-040)
Design 'TOP' was successfully linked.
1
```

### See Also

- get_app_var
- link_block
- report_app_var
- set_app_var
- set_ref_libs
- suppress_message
- search_path

---

## LNK-091

(error) The cell array instance name, %s, already exists.

Feedback

### Description

The linker cannot create a cell array instance with a name that is already used by another instance.

### What Next

Revise the verilog to make sure that the name of each cell array instance is unique.

### Examples

```
module top ( SET, A, CLOCK, Z );

  input  SET, CLOCK;
  input A;
  output Z;

  bot  \\U1[3] (.set(SET), .z(Z), .a(A), .clock(CLOCK));
  bot  U1 [3:0] (.set(SET), .z(Z), .a(A), .clock(CLOCK));
endmodule

The U1[3] name in the cell array U1[3:0] has already been used.
```

### See Also

- get_cells

---

## LNK-092

(error) Instantiated synthetic module '%s' has mismatched parameter specification.

### Description

The parameter spefication in the instantiation does not match the corresponding synthetic module. It can be due to the following reasons:

- A required parameter is missing.
- An incorrect parameter name is provided.
- The instantiation has more parameters than the syntheic module.

### What Next

Check the parameters for the synthetic module in the corresponding .sl file and make correction accordingly. If you are using DesignWare developer, you can modify the module/implementation definition in your *.sl file as appropriate.

Feedback

## LNK-093

(info) Ignoring parameters in reference to '%s' in '%s'.

### Description

The down design has no parameter information and we can't verify parameter equivalence (this can occur in an ascii read flow).

### What Next

Check the design hierarchy for correctness.

## LNK-094

(error) '%s' is an empty RTL module without an associated physical blackbox design.

### Description

This soft error denotes that an empty RTL module has been read. Presence of this error doesn't denote a link failure, but denotes that the empty logic module will be optimized away in synthesis. A physical blackbox representation for this modules is needed to preserve the module through synthesis. In absence of a physical representation or synthesis restrictions on this module it will get optimized away in compile_fusion. Users can ignore this error if a physical representation is going to be added to this cell before proceesing with the flow.

### What Next

Use report_mismatch_config output to check which action types are allowed for empty_logic_module mismatch. Use set_current_mismatch_config or set_attribute command to enable the correct mitigation.

The following will enable the repair strategy for predefined default configuration set_attribute -objects [get_mismatch_types empty_logic_module] -name action(default) -value *repair*

Repairing empty logic modules will create macro blackboxes in place of these standard cell instances. These macros will be equivalent to user defined macros and will be placed in synthesis by macro placer.

If the physical representation will be added after linking the design, change empty_logic_module's mitigation strategy to ignore. This will prevent this error from being issued by the tool. set_attribute -objects [get_mismatch_types empty_logic_module] -name action(default) -value *ignore*

Feedback

**See Also**

- report_mismatch_configs
- set_current_mismatch_config
- set_attribute
- create_blackbox

---

## LNK-095

(information) Physical representation was created for empty module '%s'.

**Description**

A physical representation for empty module was created to allow optimization to complete.

**What Next**

Use report_design_mismatch and get_mismatch_objects to identify the mismatches

**See Also**

- report_design_mismatch
- get_mismatch_objects

---

## LNK-526

(Information) Design name shortened to '%s'.

**Description**

Down stream tools have limitation for the length of design name. The design name generated by HDL compiler is shortened, then the design can be accepted by down stream tools.

**What Next**

To avoid this message, ensure that your design names do not exceed the limit.

---

## LNK-527

(error) The Width '%u' of the Net is less than the width '%u' of port '%s' of reference '%s'.

**Description**

Width mismatch of the net with the port of the the reference.

Feedback

**What Next**

Please correct the error and rerun again.

# LPFM

## LPFM-1

(information) %s

**Description**

This is a general informational message.

**What Next**

No action required.

## LPFM-2

(warning) Clib library '%s' registry file error at line %d. %s

**Description**

The registry.dat file inside a Clib library (directory) is created and updated by Library Compiler. Note that in the early phase of testing, there may be frequent incompatibility between versions. The following descriptions should help in diagnosing issues.

*Bad symbolink link.* Most likely the symbolic link points to a file no longer exists.

*First line not recognizable.* The first line is of a fixed "key" format that users must not modify.

*File type not supported.* Clib only supports a limited number of file.

*Bad data format.* Each line consists of 2 or 3 tokens (fie_type file_name checksum). This line is invalid.

*File name already registered.* This is most likely a bug as two files cannot have the same name in a given (clib2020) directory.

*File missing or not readable.* The file has been removed or is not readable.

*Bad checksum in registry.* The registry checksum in the first line no longer agrees with the checksum generated from the rest of the file. This means a user may have modified the registry.

Feedback

### What Next

If the problem is a bad symbolic link because of a moved file, update the symbolic link. In general, the clib2020 library needs to be re-checked and saved in order to update the registry. R&D.

---

## LPFM-3

(error) Clib library '%s' not qualified.

### Description

This error message occurs after the Clib checks failed either by check_clib command or internally called in create_clib or save_clib command (equivalent to check_library -logic_vs_physical). The default check is -logic_vs_physical. When it is not qualified by the default check, save_clib cannot save it as qualified clib on disk. When there is no frame file, it will print out: No physical library found.

The Clib passing criteria depend on the policy specified by set_early_data_check_policy command:

1) error policy, default mode No Error/Warning issues reported in LIBCHK-xxx.

2) tolerate policy Library data as is, and no severe errors below reported LIBCHK-212, 213 LIBCHK-300, 301, 320, 321, 322, 323, 330, 331 LIBCHK-124, 125

3) repair policy: Use the same criteria as tolerate policy, and apply check_library -auto_fix

### What Next

Check the reported issues in LIBCHK-xxx tables for detail and correct the library accordingly or apply auto fix.

---

## LPFM-4

(error) Failed to save cell library '%s': %s.

### Description

This message indicates that an operation of saving the specified cell library failed. The reason is given with the message.

### What Next

This is just a summary message. Usually there will be other error message(s) before this one to indicate the actual problem. Please refer to those error messages for how to correct the issue.

Feedback

## LPFM-5

(error) Failed to create cell library '%s': %s.

**Description**

This message indicates that an operation of creating a cell library failed. The reason is given with the message.

**What Next**

Correct the problem and try again.

## LPFM-6

(error) Failed to %s ECO file '%s': %s.

**Description**

This message indicates that an operation of specified ECO file failed. The reason is given with the message.

**What Next**

Correct the problem and try again.

## LPFM-7

(error) Failed to save frame '%s' for cell library '%s'.

**Description**

This message indicates that saving specified frame of cell library failed. The reason is given with the message.

**What Next**

Correct the problem and try again.

## LPFM-8

(error) Failed to open cell library '%s': %s.

**Description**

This message indicates that an operation of open the specified cell library failed. The reason is given with the message.

Feedback

**What Next**

Correct the problem and try again.

---

## LPFM-9

(information) ECO file '%s' was changed: %s.

**Description**

This message indicates that the specified ECO file had been changed outside Library Compiler. The actual change and tool's re-action are given with the message.

**What Next**

Verify whether the change is expected.

---

## LPFM-9w

(warning) ECO file '%s' was changed: %s.

**Description**

This message indicates that the specified ECO file had been changed outside Library Compiler. The actual change and tool's re-action are given with the message.

**What Next**

Verify whether the change is expected.

---

## LPFM-10

(error) Unable to create a temporary work directory

**Description**

Library Compiler is unable to create a temporary work directory to store data. If the environment variable TMPDIR is present, please make sure it points to a writable disk location which is not full. If TMPDIR is missing, Library Compiler uses /usr/tmp, please make sure /usr/tmp is writable and not full.

**What Next**

Fix the problem and run again.

---

## LPFM-11

(information) Clib2020 %s requires %d number of refresh check(s)

Feedback

**Description**

Refresh checks are triggered because the Clib2020 has been copied or moved imappropriately. Although totally harmless, they introduce unnecessary performance overheads. The underlying cause is that some modification time stamps are changed.

When copying using "cp", be sure to specify "-a" (for archive), rather than "-R":

cp -a clib_dir /destination

When copying using "tar", preserve high-resolution time stamps using posix format.

tar --posix -cf output.tar clib_dir

Alternatively, you may wish to refresh it using open_clib & save_clib commands in Library Compiler

---

## LPFM-12

(error) Cannot open cell library '%s' as it had been changed since last save. Please save it again using Library Compiler first.

**Description**

This message indicates that the specified cell library had been changed since last save and cannot be opened. Here, the change means any content or time stamp change of any relavent files in the cell library.

**What Next**

Save the cell library using Library Compiler and try again.

---

# LPP

---

## LPP-001

(error) No valid scenario with dynamic power found with switching power consumption.

**Description**

This message occurs when low-power placement is enabled but no dynamic power enabled scenario is found. This message indicates that low-power placement will not be used.

**What Next**

Make sure at least one scenario is active with dynamic power, so that low-power placement can work on optimizing the dynamic power consumption.

Feedback

**See Also**

- set_scenario_status
- place.coarse.low_power_placement

## LPP-002

(warning) Mismatched switching activities found for the physically equivalent nets: (1) net %s with toggle rate (r+f) = %f vs. (2) net %s with toggle rate (r+f) = %f. The toggle rate of (1) will be consistently used for low-power placement.

**Description**

This message indicates a mismatch in switching activities between physically equivalent nets during low-power placement preparation. This is likely an erroneous condition for power analysis.

**What Next**

Check the SAIF file or activities on those nets.

# LRA

## LRA-1000

(Information) Created libset %s from: %s.

**Description**

Libset was created with all the libraries provided to create_libset command.

**What Next**

No action is needed if the list of libraries is as expected.

## LRA-1001

(Error) Unable to %s DB files. Cannot continue with create_suggestion_libs command

**Description**

The db files corresponding to the reference libraries are missing. The existence of db files is needed for create_suggestion_libs command.

Feedback

**What Next**

If the location of the .db files has changed since creation, update search_path to include the new path. Or use the set_db_file_mapping command to specify the new path.

---

## LRA-1002

(Information) Successfully created the suggestion library "%s" in libset "%s", referenced from library "%s"

**Description**

The suggestion library creation needed for new lib cell creation is successful.

**What Next**

No action is needed.

---

## LRA-1003

(Error) Library set %s requires to have at least an inverter, and one of {NAND2 NOR2 AND2 OR2}

**Description**

The libraries that are passed to create_libset does not satisfy the minimum gates needed for analysis.

**What Next**

Check the arguments to create_libset command.

---

## LRA-1004

(Error) The reference library

**Description**

There can be only be on suggestion library for a given reference library in a given libset.

**What Next**

Check the arguments to create_suggestion_libs command.

---

## LRA-1005

(Error) problem in create_libset: no valid libraries were specified

Feedback

**Description**

There is no valid library passed to create_libset command.

**What Next**

Check the arguments and make sure you pass atleast one valid library name to create_libset.

---

## LRA-1006

(Error) Cannot create the suggestion library

**Description**

There is a already suggestion library with the name in this libset.

**What Next**

Check the -name_prefix argument to create_suggestion_libs command.

---

## LRA-1010

(Information) The libcell %s is marked as available for analysis

**Description**

The lib cell is marked as available for library analysis. By default all library cells except some special cells like UPF cells are available for library analysis. This message is printed if the user has changed this for certain lib cells using set_use_for_library_analysis and then reversing it by issuing set_use_for_library_analysis again with argument true.

**What Next**

No action is needed if this is the intention.

---

## LRA-1011

(Information) The libcell %s is marked as unavailable for analysis

**Description**

The given lib cell is marked as not available for library analysis. By default all library cells except some special cells like UPF cells are available for library analysis. This message is printed if the user is issuing the command set_use_for_library_analysis to change this.

**What Next**

No action is needed if this is the intention.

Feedback

## LRA-1012

(Information) The libcell %s is marked as unavailable for this session and cannot be changed

**Description**

The given lib cell is marked as not available for library analysis permanently. By default all library cells except some special cells like UPF cells are available for library analysis. This message is printed if the user is issuing the command set_use_for_library_analysis with -force option to skip analysis.

**What Next**

No action is needed if this is the intention.

## LRA-1020

(Warning) The libcell %s is ignored since it is a synthetic library cell

**Description**

When a synthetic library cell is passed to set_use_for_library_analysis command, it will be ignored. The reason is the synthetic library cell is not part of library analysis.

**What Next**

Review the arguments to set_use_for_library_analysis command.

## LRA-1021

(Warning) The libcell %s cannot be marked for analysis because it is a %s lib_cell

**Description**

Some of the lib cells like UPF lib cells and MACRO lib cells are considered during library analysis. Hence passing those lib cells to set_library_analysis will receive this warning.

**What Next**

Review the arguments to set_use_for_library_analysis command.

## LRA-1022

(Warning) Cannot use -force option with value true

Feedback

**Description**

The -force option to set_use_for_library_analysis can only be used with value false. By default all library cells are part of analysis except UPF and macro lib cells. And invoking -force with value false will cause the analysis to be skipped for those lib cells permanently.

**What Next**

Review the arguments to set_use_for_library_analysis command.

---

## LRA-1051

(Warning) Library %s is not added to libset %s since it does not have timing view.

**Description**

The library passed to create_libset command does not have the timing view. To be able to perform library analysis, you will need the timing view

**What Next**

Review the library creation step and make sure that your library has timing view.

---

## LRA-1052

(Information) Using the mapped DB file %s instead of the original DB file %s for library %s

**Description**

The original DB file used during the library creation step is not accessible during create_suggestion_lib. Hence the mapped DB file path is used. The mapped DB file path can come from search_path or from set_db_file_mapping command.

**What Next**

No action is needed if this is intentional

---

## LRA-1054

(Error) The provided input should be a library object or the library name of an opened library. Please check the specified input %s. If this is the path to a library not yet opened, please read in this library first then properly specify it.

**Description**

The provided input should be a library object or the library name of an opened library. Please check the specified input %s. If this is the path to a library not yet opened, please read in this library first then properly specify it.

Feedback

**What Next**

Use the correct library name

---

## LRA-1055

(Error) Unable to add library %s to libset %s

**Description**

The library cannot be added to libset.

**What Next**

Check the arguments to create_libset

---

## LRA-1056

(Warning) Library set has inconsistent pvt pane counts Maximum found: %u panes (eg: %s), Minimum found: %u panes (eg: %s)

**Description**

The libraries used in the libset should have same number of pvt panes.

**What Next**

Review the library preparation step

---

## LRA-1057

(Error) Db file %s is not available

**Description**

The .db file corresponding to the reference library is not available. To be able to successully run create_suggestion_lib command, the .db file should exist.

**What Next**

If the location of the .db files has changed since creation, update search_path to include the new path. Or use the set_db_file_mapping command to specify the new path.

---

## LRA-1058

(Error) Library %s is not a suggestion library

Feedback

**Description**

User reference library is used in place of libra suggestion library during create_libset

**What Next**

Check the arguments to create_libset

---

## LRA-1059

(Error) Unable to find a corresponded reference library for the given existing suggestion library %s

**Description**

The reference library is not read in before executing create_libset command.

**What Next**

Check your library setup

---

## LRA-1060

(Information) Attaching the existing %s suggestion library %s to the reference library %s.

**Description**

The association between the reference and suggestion library has been successuflly made during create_libset command.

**What Next**

No action is needed.

---

## LRA-1400

(warning) logic function %s is not canonical %s

**Description**

The specified logic function string was not able to be represented canonically. This can happen for a number of reasons. For instance, perhaps the function string is badly formed, or perhaps the function can be minimized in a way that eliminates one or more of the variables so they do not influence the output. You will see this message when that happens. This message can also happen for a more subtle reason: Library Compiler must be able to understand the function being created. For some large/complex functions, the existing Library Compiler code that recognizes and canonicalizes functions may 'give up', and this message will result.

Feedback

**What Next**

Change your function description to be correct, or less complex.

---

## LRA-1401

(warning) %s %s already exists

**Description**

You will get this message when you are creating a duplicate object in the Libra data manager, ie, one that already exists. This is usually due to a naming conflict

**What Next**

Rename the object you are creating and try again.

---

## LRA-1402

(warning) %s %s does not exist

**Description**

You will get this message when you have given an object or an object name as a command argument that doesn't exist.

**What Next**

Check the name or object that you are passing in, and make sure it is valid.

---

## LRA-1601

(Info) Successfully created library cell family %s using %s.

**Description**

A library cell family is successfully created using either library cells or sub-families.

**What Next**

Review the definition of the newly created library cell family.

---

## LRA-1602

(Error) Failed to create library cell family %s.

**Description**

Failed to create the library cell family.

Feedback

**What Next**

Check the specified library cells or sub-families, makes sure they satisfy grouping conditions (e.g. consistent functional properties)

---

## LRA-1603

(Info) Successfully created initial library cell families for library %s.

**Description**

Successfully identified and created initial library cell families for the specified library.

**What Next**

Review the newly created initial library cell families.

---

## LRA-1604

(Error) Failed to create initial library cell families for library %s.

**Description**

Failed to identify initial library cell families for the specified library.

**What Next**

Check the library content and grouping conditions.

---

## LRA-1605

(Info) %s library cell

**Description**

Successfully added a library cell to an existing library cell family.

**What Next**

Review the content of the updated library cell family.

---

## LRA-1606

(Info) %s library cell

**Description**

Successfully removed a library cell from an existing library cell family.

Feedback

**What Next**

Review the content of the updated library cell family.

---

## LRA-1607

(Info) %s library cell

**Description**

The specified library cell is not included in the target library cell family, ignored for further process.

**What Next**

Check the specified library cell and the target library cell family's content.

---

## LRA-1608

(Info) Ignoring expression

**Description**

Ignoring the family rule expression.

**What Next**

Check and correct the indicated missing portion.

---

## LRA-1609

(Info) Ignoring expression

**Description**

Ignoring the family rule expression due to syntax problem.

**What Next**

Check expression syntax.

---

## LRA-1610

(Info) Ignoring expression

**Description**

Ignoring the family rule expression, wild card is not supported.

Feedback

**What Next**

Remove wildcard expressions.

---

## LRA-1611

(Warning) The specified sub-family named %s does not exist, please provide a correct library cell family name.

**Description**

The specified sub-family name is not correct.

**What Next**

Check and provide a valid library cell family name.

---

## LRA-1612

(Info) The family rules does not apply to family creation using sub-families, the rules are ignored.

**Description**

Family rules can not be applied to a library cell family creation by grouping sub-families.

**What Next**

Don't provide a family rule.

---

## LRA-1613

(Warning) The given family

**Description**

Manually modifying an initial family's content can cause conformity problem of the initial library cell set of a library.

**What Next**

Check if the outcome of this manipulation is as needed.

---

## LRA-1614

(Warning) The given family

Feedback

**Description**

Arbitrarily manipulating initial library cell families is not allowed.

**What Next**

Avoid such manipulations.

---

## LRA-1615

(Warning) The given family

**Description**

This library cell family is created by grouping sub-families. Adding or removing library cells is not allowed.

**What Next**

Avoid such operaiton.

---

## LRA-1616

(Error) The given library cell family rule name %s does not exist.

**Description**

The specified library cell family rule is not valid.

**What Next**

Check the specified rule name.

---

## LRA-1617

(Error) The given library cell family name %s does not exist.

**Description**

The specified library cell family name is not valid.

**What Next**

Check the specified family name.

---

## LRA-1618

(Warning) The given library cell

Feedback

**Description**

The specified library cell has different logical function to the target library cell family. Ignored for further process.

**What Next**

Check the specified library cell is correct.

---

## LRA-1619

(Warning) The given library cell

**Description**

The specified library cell is a Libra suggestion library cell, ignored for further process.

**What Next**

Check the specified library cell is correct.

---

## LRA-1620

(Error) The input libset '%s' does not exist.

**Description**

The specified libset does not exist, stop further processes.

**What Next**

Check the specified libset is correct.

---

## LRA-1621

(Error) There is no library defined in the input libset '%s'.

**Description**

The specified libset is empty, it does not have any library.

**What Next**

Check the specified libset is correct.

---

## LRA-1633

(Info) Family rule name %s does not exist, please provide a correct name.

Feedback

**Description**

This family rule does not exist, skipped for further process.

**What Next**

Use an existing family rule.

---

## LRA-1634

(Warning) Family name '%s' already exists, please use another name.

**Description**

Duplicated family names are not allowed.

**What Next**

Use a different family name.

---

## LRA-1635

(Warning) No %s is provided, unable to create a family.

**Description**

Missing inputs to create a library cell family.

**What Next**

Provide valid library cells or existing families to be grouped as a new library cell family.

---

## LRA-1636

(Warning) A sub-family of a family must be defined by libcells; however, the specified sub-family %s is defined by sub-fmailies.

**Description**

A family can be defined by grouping a set of sub-families. A sub-family must be defined by grouping a set of library cells; it can not be defined by grouping sub-families.

**What Next**

Provide valid sub-families.

Feedback

## LRA-1637

(Warning) All the sub-families in a family must have same functional properties; however some of the provided sub-families (e.g. %s) are different.

**Description**

All the sub-families to be grouped as a new family must be with same functional properties.

**What Next**

Check the functional properties of the specified sub-families, make sure they are consistent.

## LRA-1638

(Warning) All the library cells in a family must have same functional properties; however some of the provided library cells (e.g. %s) are different. %s

**Description**

All the library cells to be grouped as a new family must be with same functional properties.

**What Next**

Check the functional properties of the specified library cells, make sure they are consistent.

## LRA-1639

(Warning) No library cell matches the given family rule %s.

**Description**

No library cell matches the conditions defined in the specified family rule.

**What Next**

Check the family rule definition or the input library cell set.

## LRA-1640

(Warning) Deleting library's initial families are not allowed. Only user-defined families can be deleted. Ignoring %s.

Feedback

**Description**

Library's initial families are not allowed to be arbitrarily deleted.

**What Next**

If initial families need to be updated, use the proper UIs to create initial families again.

---

## LRA-1641

(Warning) Unable to move library cells between families (Source: %s, Target: %s): %s.

**Description**

Unable to move library cells between two library cell families. Check the reason that causes this failed move.

**What Next**

Check the reason and fix it.

---

## LRA-1642

(Warning) Some library cells are not in the source family %s, ignored (%s).

**Description**

Some library cells are not in the source library cell family, ignored.

**What Next**

Check the correctness of the selected input cells.

---

## LRA-1650

(Warning) The sub-family '%s' has already included in this family.

**Description**

The target family already includes this sub-family, it will not be included twice.

**What Next**

Don't add this sub-family to the target family.

---

## LRA-1655

(Info) Deleting sub-rule %s from family rule %s

Feedback

**Description**

Deleting a sub-family from a family rule.

**What Next**

Review the family rule definition

---

## LRA-1661

(error) Target libcell %s has a non-supported height. Currently we only support single height target libcells

**Description**

The physical model for new libcell creation today only supports single-height libcells as target cells. You will see this message when you have given a non-single-height libcell as a target libcell.

**What Next**

Use a single height target libcell instead.

---

## LRA-1662

(info) Height check %s for target libcell %s

**Description**

Tells if a target libcell's height check was not able to be done, or if it succeeded.

**What Next**

If the check was not able to be done, check your physical library set up to make sure physical data are available.

---

## LRA-1671

(info) Created %lu new libcells from %s

**Description**

Library cell creation was successful, and new libcells were created.

**What Next**

Save the suggestion library containing the new libcells, and use them in optimization with FC, etc.

Feedback

## LRA-1672

(Error) Unable to create new function %s

### Description

The new libcell(s) that were requested were not created. This can be for a variety of reasons. It may be that the supplied function or design was incorrect, or it may be that the target libcell(s) were not valid, or didn't align with the supplied names, or it might be that there are new desired libcell names which conflict with existing ones.

### What Next

Review the messages that came ahead of this one and see if there are problems. Review the supplied function equation, or design, and the target libcells.

## LRA-1673

(Error) Unable to build a netlist for function %s

### Description

The new libcell(s) that were requested were not created. This can be for a variety of reasons. It may be that the supplied function or design was incorrect, or it may be that the target libcell(s) were not valid, or didn't align with the supplied names, or it might be that there are new desired libcell names which conflict with existing ones.

### What Next

Review the messages that came ahead of this one and see if there are problems. Review the supplied function equation, or design, and the target libcells.

## LRA-1674

(Info) A base name is required for each function. Please specify %d base name(s)

### Description

The name for a new libcell includes a 'base name' which is supplied by the user, in a list. This message occurs if that list is not the same size as the set of new libcells which will be created.

### What Next

Make sure that your list of target libcells is the same size as the list of names.

Feedback

## LRA-1675

(Info) An exact name is required for each lib cell. Please specify %d exact name(s)

**Description**

Users can optionally supply a set of 'exact' new libcell names for created new libcells, in a list. This message occurs if that list is not the same size as the set of new libcells which will be created.

**What Next**

Make sure that your list of target libcells is the same size as the list of names.

## LRA-1676

(Error) Found duplicate exact name '%s'

**Description**

Users can optionally supply a set of 'exact' new libcell names for created new libcells, in a list. This message occurs if that list is not unique, or not the same size as the set of new libcells that will be created.

**What Next**

Make sure that your list of target libcells is the same size as the list of names.

## LRA-1677

(Info) Model effort value %s is being ignored

**Description**

This message means that an invalid model effort value was given. "none", "low" and "high" are the valid values.

**What Next**

Revise your model effort argument and rerun.

## LRA-1678

(Error) Libcell %s is not in analysis named %s

Feedback

**Description**

The target libcell supplied has not been analyzed in the analysis set which was supplied. This means that we cannot get the data we need from the target libcell in order to create a new libcell.

**What Next**

Run library analysis on the library(ies) containing target libcells supplied to this command.

---

## LRA-1679

(Info) Found an analysis set matching libset name %s

**Description**

We were able to find an analysis set matching the libset name supplied.

**What Next**

Nothing -- this is an informational message.

---

## LRA-1680

(Error) Use static_analyze to create the analysis name %s first

**Description**

In order to use a reference libcell for new libcell creation, library analysis has to have been run on it (and its library) first. This message occurs when we cannot find a valid analysis with that libcell.

**What Next**

Run library analysis on the reference libcells that you supply to this command.

---

## LRA-1681

(Info) Analysis set name %s does not exist. Searching with libset name %s

**Description**

Reference libcells have to have been analyzed first, with library analysis. So, if a specified analysis can't be found, we also search to see if there is an analysis whose name matches that of the libset that you supplied.

Feedback

**What Next**

Nothing, unless this search fails. In that case, make sure you have analyzed a library before creating new libcells using its members as references.

---

## LRA-1682

(Info) -cost_check and -cost_percent lists need to have the same number of entries, so ignoring -cost_check and -cost_percent

**Description**

This message occurs when cost check and cost percentage arguments are different. If they are, they will be ignored, and this message will be printed.

**What Next**

Review and revise your arguments to this command.

---

## LRA-1683

(Info) Invalid weights found so setting cost weights equally

**Description**

Cost values must be numerically valid -- if they aren't you get this message (when they are all zero).

**What Next**

Revise your weights to be nonzero.

---

## LRA-1684

(Error) Target family %s %s

**Description**

The family named in the option was not found. Without it, the command will fail.

**What Next**

Either create the family, or revise your arguments to the command.

---

## LRA-1685

(Error) Libset %s does not have a new function suggestion library %s. Use create_suggestion_lib to create one first

Feedback

**Description**

This message occurs if there is a difference between the suggestion library for the given libset and the suggestion library from the command.

**What Next**

Insure that you are using the correct suggestion library.

---

## LRA-1686

(Error) Can only specify one suggestion library at a time

**Description**

Currently the command will only allow one suggestion library to be supplied. We may extend this in the future.

**What Next**

Only use one suggestion library at a time.

---

## LRA-1687

(Error) No target library found

**Description**

This command has to have at least one valid target libcell. If none is given, you get this message.

**What Next**

Review and revise your arguments to the command, so that you give at least one valid target libcell.

---

## LRA-1688

(Error) All target libcells must come from the same library

**Description**

This is a necessary limitation for now -- we don't allow you to give a set of target libcells that spans separate libraries. That may change in the future, but for now this keeps things consistent.

Feedback

**What Next**

Split your command invocation into multiple pieces, one for each reference suggestion library.

---

## LRA-1689

(Error) New function %s is invalid

**Description**

This is a 'canonicalization' error -- the idea is that we must be able to find a unique canonical form for each new libcell function. That's not always possible, which is unfortunate. But if you get this message, it also means that Library Compiler would fail as well -- in other words, even if this command *were* able to generate a new libcell using the function you have given, Library Compiler would not recognize it. So that's why this is an error.

Another possibility is that the is a functional error in your function description, or design.

**What Next**

Revise your function / design input to be correct, or smaller.

---

## LRA-1690

(Error) Failed to get the target suggestion library

**Description**

Currently this command needs 'target' libcells, which are examples to follow when building new libcells. If no target libcell was found, you get this error.

**What Next**

Add a target libcell to the command.

---

## LRA-1691

(Error) Failed to get the libset %s

**Description**

The named libset was not found, and that is an error.

**What Next**

Either create the libset you've named in this command, or change the libset name to be one that is already created.

Feedback

## LRA-1692

(Error) Libset %s does not include this target library

**Description**

The libset used must include the target library. A target library contains the example libcells that will be used to create new function libcells.

**What Next**

Use a valid libset which contains the target library, or create it prior to this command.

## LRA-1693

(Error) Problem in create_scaled_lib_cell: no valid lib_cell specified for option -ref_lib_cell_%s. This lib_cell must be in the referenced library of the specified target suggestion library

**Description**

The low or high reference libcell must be valid. If not, you will get this error.

**What Next**

Supply a valid low or high reference libcell.

## LRA-1694

(Error) Problem in create_scaled_lib_cell: only one valid lib_cell can be specified for option -ref_lib_cell_%s

**Description**

This message occurs when an invalid number of low or high reference libcells are found.

**What Next**

Supply only one libcell at a time.

## LRA-1695

(Error) Problem in create_scaled_lib_cell: unable to create a new lib_cell

**Description**

An error occurred when attempting to create the new libcell. This may be because the weightings were invalid, or because of a problem with the supplied low or high reference libcells.

Feedback

**What Next**

Review your command options, and make sure the reference libcells and weights are correct.

---

## LRA-1696

(Info) Successfully created a new lib_cell

**Description**

A new libcell was created.

**What Next**

Save the suggestion library and use the libcell in your optimization flow.

---

## LRA-1697

(Info) Equation parse %s for output %s and equation %s

**Description**

You get this message to describe what happened when parsing your supplied equation.

**What Next**

If the parsing failed, review your equation to make sure it is in correct infix format.

---

## LRA-1698

(Error) Equation string %s %s

**Description**

There was a problem in your equation specification. Here is an example of a valid equation argument:

-function "Y = (A B) + (C D)"

**What Next**

Make sure your equation string has a correct form.

---

## LRA-1699

(Error) %s for the -design option

Feedback

**Description**

There was an invalid *-design* argument used. The design needs to be a valid combinational (for now) logic design.

**What Next**

Review and revise your call to the command.

---

## LRA-1700

(Error) Design %s has an error: %s

**Description**

There is a problem with the supplied design -- it either contains a sequential element (not supported yet), or there is another problem with the functionality it describes. There are limits to the size and complexity of functions that can be made into libcells, and this message might indicate that you've hit one of them.

**What Next**

Revise the design you are supplying, and rerun.

---

## LRA-2180

(error) No target libcells were specified

**Description**

No target libcells were specified, so no new libcell can be created.

**What Next**

One or more target libcells must be supplied to *create_new_function_lib_cells*.

---

## LRA-2181

(error) Mismatch between target libcells and supplied names

**Description**

The names that are in the exact names list must match one-for-one for the new libcells to be created. If that list doesn't match, then you will see this error.

**What Next**

Inspect your use of the command and insure that the list of target libcells matches up with the list of exact names that you provided.

Feedback

## LRA-2182

(error) Libcell %s already exists, please try another name

**Description**

Exact names given by the user for new libcells must be unique.

**What Next**

Inspect your use of the command and insure that the list of exact names that you provided are unique amongst themselves and among the existing libcells.

## LRA-2183

(info) Unable to lexically classify target libcell %s, using ad-hoc name

**Description**

We try to name the new libcell intelligently, which requires that lexical classification has been run on the target library so that we know how drive variants are named. If your target library has not been lexically classified, then the name generated for the new libcells is less descriptive.

**What Next**

See if you can run lexical classification on the target library, if you want the new libcell names to be more descriptive.

## LRA-2184

(info) Cost-Based Filter for libcell %s -- %s

**Description**

This is a cost comparison message that is used when costing new potential implementations for new libcells. It explains how your cost comparisons happened, based on your input to the command.

**What Next**

This is an informational message -- make sure the cost filtering is occuring as you wish, based on these messages.

## LRA-2185

(info) %s does not have a specified naming conventioin for lexical classification. No lexical attributes could be referenced for the cell naming.

Feedback

**Description**

We try to name the new libcell intelligently, which requires that lexical classification has been run on the target library so that we know how the target library cell is named. If your target library has not been lexically classified, then the name generated for the new libcells is less descriptive.

**What Next**

See if you can run lexical classification on the target library, if you want the new libcell names to be more descriptive.

---

## LRA-2186

(info) %s has not been lexically classified. No lexical attributes could be referenced for the cell naming.

**Description**

The given object was not lexically classified. We try to name the new libcell intelligently, which requires that lexical classification has been run on the target library so that we know how the target library cell is named. If your target library has not been lexically classified, then the name generated for the new libcells is less descriptive.

**What Next**

See if you can run lexical classification on the target library, if you want the new libcell names to be more descriptive.

---

## LRA-2187

(info) Unable to supply a family for new libcell %s

**Description**

This message indicates that it was not possible to find a family of libcells to which this new libcell could be added, or it was not possible to install this libcell into that family.

**What Next**

This is an informational message -- this condition can occur when your initial or user-defined family setup is incomplete.

---

## LRA-3001

(Error) The input libset '%s' is does not exist.

Feedback

**Description**

The specified libset does not exist, unable to continue the flow.

**What Next**

Provide a valid libset.

---

## LRA-3002

(Error) There is no library defined in the input libset '%s'.

**Description**

The specified libset does not include any library.

**What Next**

Review the libset definition, provide a valid libset.

---

## LRA-3003

(Error) The input column for naming convention definition must be a positive integer.

**Description**

The column in the naming convention definition must be positive integer equal or larger than 1.

**What Next**

Review and correct the naming convention.

---

## LRA-3004

(Error) The input attribute is not valid. It must be a predefined attribute name, or an user-defined attribute name with '-is_userdef_attr' specified.

**Description**

The input attribute for naming convention definition is not correct. It must be a predefined lexical attribute name or an user-defined attribute name. If this is an user-defined attribute, specify with '-is_userdef_attr' option.

**What Next**

Review and correct the naming convention.

Feedback

## LRA-3005

(Error) The input regular expression pattern '%s' has syntax error.

**Description**

The regular expression pattern is not correct, a syntax error is detected.

**What Next**

Review and correct the regular expression specified to naming convention.

## LRA-3006

(Error) The input value for attribute '%s' must be one of {TRUE, true, True, 1, FALSE, false, False, 0}

**Description**

This attribute is with boolean type, need to specify a correct value.

**What Next**

Specify the value with correct data format.

## LRA-3007

(Error) Full library name or cell name can not be set for classification.

**Description**

The lexical attribute for the library or cell name can not be specified for classification. They are directly derived from the library cell information.

**What Next**

Do not specify these attributes for lexical classifications.

## LRA-3008

(Error) The given naming convention is empty, please provide a valid name.

**Description**

A valid name needs to be specified for this naming convention.

**What Next**

Provide a name for this naming convention.

Feedback

## LRA-3009

(Info) Added or modified column %d definition for the naming convention named '%s' %s.

**Description**

One of the column of this naming convention has been added or modified.

**What Next**

Review and check if this change is correct.

## LRA-3010

(Info) An reserved attribute keyword '%s' is detected, option '-is_userdef_attr' is ignored.

**Description**

A reserved attribute keyword is detected, it can not be used as an user-defined attribute name.

**What Next**

Review the correctness of the definition.

## LRA-3011

(Warning) Unable to find the keyword mapping set '%s'.

**Description**

The specified keyword mapping set does not exist.

**What Next**

Check if the specified keyword mapping set name is valid.

## LRA-3012

(Warning) Unable to find the keyword mapping set '%s' for deletion.

**Description**

The specified keyword mapping set does not exist, it can not be deleted.

**What Next**

Check if the specified keyword mapping set name is valid.

Feedback

## LRA-3013

(Warning) Unable to find the keyword mapping set '%s' to report, ignored.

**Description**

The specified keyword mapping set does not exist, unable to report the content.

**What Next**

Check if the specified keyword mapping set name is valid.

## LRA-3014

(Warning) Unable to remove the keyword '%s' from the keyword mapping set '%s', ignored.

**Description**

A keyword can not be removed from a keyword mapping set.

**What Next**

Check if the specified keyword is included in the keyword mapping set.

## LRA-3015

(Warning) Unable to add the mapping of keyword '%s' and predefined attribute '%s', check if the given attribute is a valid predefined attribute.

**Description**

A mapping relationship of a keyword and a specified lexical attribute can not be added.

**What Next**

Check if the given attribute is a valid predefined lexical attribute.

## LRA-3016

(Info) Classified library %s.

**Description**

The library has been successfully processed by lexical classification.

**What Next**

Review the classification results.

Feedback

## LRA-3017

(Warning) Unable to classify library %s, please check the corresponded library cell naming convention.

**Description**

The library could not be successfully processed by lexical classification.

**What Next**

Check the correctless of the specified naming convention.

## LRA-3018

(Info) Cleared naming convention of library %s.

**Description**

The library's naming convention is cleared.

**What Next**

Nothing if this is an expected process.

## LRA-3019

(Info) Cleared naming convention %s.

**Description**

The specified naming convention is cleared.

**What Next**

Nothing if this is an expected process.

## LRA-3020

(Warning) The naming convention %s does not exist.

**Description**

The specified naming convention does not exist, unable to do further process.

**What Next**

Check the correctness of the given naming convention.

Feedback

## LRA-3100

(Warning) The input attribute name '%s' is not a pre-defined name, please check the correctness

**Description**

The specified attribute name is not a pre-defined name

**What Next**

Check the correctness of the specified attribute name

## LRA-3101

(Warning) The user-defined attribute name can only be set through library cell naming convention rules.

**Description**

The user-defined attribute name can not arbitrarily changed. They are derived from cell naming conventions.

**What Next**

Change the user-defined attribute name by configuring naming conventions.

## LRA-3102

(Warning) The corresponded user-defined attribute name did not set, which has to be firstly set through library cell naming convention rules and run classifier.

**Description**

The corresponded user-defined lexical attribute name did not set.

**What Next**

Set the user-defined attribute through library cell naming convention. Then, run lexical classification.

## LRA-3103

(Warning) The lexical attribute '%s' does not exist.

**Description**

The specified lexical attribute does not exist.

Feedback

**What Next**

Check the correctness of the specified attribute name

---

## LRA-3200

(Warning) The naming convention for column '%d' in library '%s' is not properly defined.

**Description**

The naming convention for this column is not properly defined.

**What Next**

Check the correctness of the definition on the column indicated in the message.

---

## LRA-3301

(Warning) Unable to generate a valid regular expression pattern based on the input library naming convention. Please check the naming convention definitions.

**Description**

The tool reads the specified library naming convention to create a regular expression pattern for further processes. Based on the input library naming convention, a valid regular expression pattern could not be generated.

**What Next**

Check the correctness of the naming convention definitions.

---

## LRA-3302

(Warning) Library cell '%s' can not be successfully classified by the given lexical naming convention.

**Description**

This library cell can not be classified by the given lexical naming convention.

**What Next**

Check the correctness of the naming convention definitions. If the library has multiple naming conventions for different cells, try to define multiple naming convention rules and perform incremental classification.

Feedback

## LRA-3303

(Warning) The lexical classification results of library cell '%s' may not be entirely correct.

**Description**

The tool trys to perform a sanity check after the classification. This message indicates the results may not be entirely correct.

**What Next**

Review the results of this libray cell and adjust the naming convention in need.

## LRA-3304

(Warning) The keywords defined in set '%s' may not be sufficient for the library cell '%s'.

**Description**

This cell's name includes certain information that is not covered by the defined keyword set.

**What Next**

Check this cell's name and add additional keywords in need to cover it.

## LRA-4103

(error) Removing analysis set %s.

**Description**

An existing library analysis set is being removed due to modification to libraries.

**What Next**

This is an informational message, no action is required.

## LRA-4801

(warning) Argument -plot has been specified, which requires a GUI session to be initialized, please run

**Description**

A GUI session was not initialized.

Feedback

**What Next**

Start a GUI session.

---

## LRA-4802

(information) Could not find analysis set named %s.

**Description**

The analysis set of the given name could not be found, need to provide a correct name to proceed.

**What Next**

Provide a correct analysis name.

---

## LRA-4803

(warning) The specified Op Cond

**Description**

The specified Op Cond name is not coverered by the given library analysis, unable to read the analysis results for comparison.

**What Next**

Check the correctness of the Op Cond name, or provide an analysis that covers this Op Cond.

---

## LRA-4804

(warning) The specified PPVT process corner

**Description**

The specified PPVT process corner is not coverered by the given library analysis, unable to read the analysis results for comparison.

**What Next**

Check the correctness of the PPVT process corner information, or provide an analysis that covers this Op Cond.

---

## LRA-4805

(warning) The PPVT format of

Feedback

**Description**

The specified PPVT process corner format is not correct. The format is {Process Label, Process, Voltage, Temperature}, as specified for analysis environment creation. For some libraries without Process Labels, use the reserved keyword "(none)" to specify it.

**What Next**

Provide a correct format for PPVT process corner information.

---

## LRA-4806

(warning) The specified input slew point

**Description**

The specified input slew point is not coverered by the given library analysis, unable to read the analysis results for comparison.

**What Next**

Check the correctness of the input slew point.

---

## LRA-4807

(warning) The specified input slew index

**Description**

The specified input slew index is not coverered by the given library analysis, unable to read the analysis results for comparison.

**What Next**

Check the correctness of the input slew index.

---

## LRA-4808

(warning) The specified input slew index

**Description**

The input slew index is an integer equal or larger than zero, a negative value is not valid.

**What Next**

Check the correctness of the input slew index.

Feedback

## LRA-4809

(warning) The specified output load point

**Description**

The specified output load point is not coverered by the given library analysis, unable to read the analysis results for comparison.

**What Next**

Check the correctness of the output load point.

## LRA-4810

(warning) The specified output load index

**Description**

The specified output load index is not coverered by the given library analysis, unable to read the analysis results for comparison.

**What Next**

Check the correctness of the output load index.

## LRA-4811

(warning) The specified output load index

**Description**

The output load index is an integer equal or larger than zero, a negative value is not valid.

**What Next**

Check the correctness of the output load index.

## LRA-4812

(info) Op Cond / PPVT setting is not provided, default setting in the %s analysis is used (Library: %s)

**Description**

The interested Op Cond or PPVT process corner information is not provided, the tool will use the default process corner defined in the analysis to compare.

Feedback

**What Next**

Check the compared process corner, if it is not the interested process corner, specify it directly to the command.

---

## LRA-4813

(info) Input slew setting is not provided, default setting in the analysis is used. Reference library: Slew Value = %f (Index = %d), Target library: Skew Value = %f (Index = %d)

**Description**

An input slew setting is not provided, the tool uses the default setting defined in the analysis.

**What Next**

Check the compared input slew setting, if it is not the interested setting, specify it directly to the command.

---

## LRA-4814

(info) Output load setting is not provided, default setting in the analysis is used. Reference library: Load Value = %f (Index = %d), Target library: Load Value = %f (Index = %d)

**Description**

An output load setting is not provided, the tool uses the default setting defined in the analysis.

**What Next**

Check the compared output load setting, if it is not the interested setting, specify it directly to the command.

---

## LRA-4815

(warning) The input slew settings of analysis environments do not match. Environment

**Description**

The input slew settings of the analysis environments for reference and target libraries do not match.

**What Next**

Check and align the input slew settings of the anlaysis environments.

Feedback

## LRA-4816

(warning) The output load settings of analysis environments do not match. Environment

**Description**

The output load settings of the analysis environments for reference and target libraries do not match.

**What Next**

Check and align the output load settings of the anlaysis environments.

## LRA-4817

(warning) The input slew settings to be compared are not matched. Reference library: %.8f, Target library: %.8f

**Description**

The input slew settings do not match between the reference and target libraries' analysis environment. This could be caused by input slew points are different under the same input slew index.

**What Next**

Check and align the input slew settings.

## LRA-4818

(warning) The output load settings to be compared are not matched. Reference library: %.8f, Target library: %.8f

**Description**

The output load settings do not match between the reference and target libraries' analysis environment. This could be caused by output load points are different under the same output load index.

**What Next**

Check and align the output load settings.

## LRA-4819

(warning) The comparison conditions given to the reference and the target libraries are not matched, please align them.

Feedback

**Description**

The comparison conditions do not match between the reference and the target libraries. They need to be aligned for a valid comparison.

**What Next**

Check and align the comparison conditions.

---

## LRA-4820

(info) The given attribute

**Description**

The given attribute is not valid, it is ignored.

**What Next**

Check the attribute name and provide the correct name.

---

## LRA-4821

(info) No valid attribute is give, all valid attributes will be reported.

**Description**

This message informs the user that all valid attributes will be compared and reported, since no valid attribute was provided.

**What Next**

Review the comparison report.

---

## LRA-4822

(info) The given family named %s is not found.

**Description**

The provided family name is not valid.

**What Next**

Check and correct the family name.

Feedback

## LRA-4823

(info) The given family named %s is an initial family, but it does not belong to the reference library %s.

**Description**

The provided family should include a set of library cells belong to the reference library. However, the given family is an initial family defined for some other library.

**What Next**

Check and correct the family name.

## LRA-4824

(warning) The specified %s file does not exist.

**Description**

The specified file for this command does not exist.

**What Next**

Provide a valid file.

## LRA-4825

(warning) Unable to read the specified input file

**Description**

The specified input file can not be successfully read in.

**What Next**

Provide a valid file.

## LRA-4826

(info) The timing units of the reference library and the target library are not matched, auto-scaling will be applied if it is applicable.

**Description**

The timing units are not consistent between the reference and the target libraries. The tool will try to do auto-scaling for a valid comparison.

Feedback

**What Next**

Review the comparison results.

---

## LRA-4827

(info) The power units of the reference library and the target library are not matched, auto-scaling will be applied if it is applicable.

**Description**

The power units are not consistent between the reference and the target libraries. The tool will try to do auto-scaling for a valid comparison.

**What Next**

Review the comparison results.

---

## LRA-4828

(info) The capacitance units of the reference library and the target library are not matched, auto-scaling will be applied if it is applicable.

**Description**

The capacitance units are not consistent between the reference and the target libraries. The tool will try to do auto-scaling for a valid comparison.

**What Next**

Review the comparison results.

---

## LRA-4829

(info) A line must be with the format

**Description**

The information specified on the indicated line in the given custom cell pair mapping file is not correct. This line will be ignored. The correct format is "A_Cell_in_Ref_Lib A_Cell_in_Target_Lib" (e.g. INV_ABC INV_XYZ).

**What Next**

Check the correctness of the line indicated in this message.

Feedback

## LRA-4830

(info) The reference library cell %s defined in this line

**Description**

A duplicated reference cell definition is detected in the given custom cell pair mapping file. This line will be ignored.

**What Next**

Check the correctness of the line indicated in this message.

## LRA-4831

(info) A line must be with the format

**Description**

The information specified on the indicated line in the given lexical attribute values mapping file is not correct. This line will be ignored. The correct format is "A_Lexical_Attribute Value_in_Ref_Lib Valie_in_Target_Lib

**What Next**

Check the correctness of the line indicated in this message.

## LRA-4832

(info) The attribute value of the reference library %s defined in this line

**Description**

A duplicated lexical attribute value is detected in the given lexical attribute values mapping file. This line will be ignored.

**What Next**

Check the correctness of the line indicated in this message.

## LRA-4833

(warning) Unable to write to the specified output file

**Description**

The tool is not able to write to the specified output file.

Feedback

**What Next**

Check the write permission of the specified file.

---

## LRA-4834

(info) %s library cell %s does not exist.

**Description**

The message indicates the specified reference or target library cell does not exist.

**What Next**

Check and provide a valid cell name.

---

## LRA-4835

(warning) Detected different library vendors, stop comparison.

**Description**

The tool detects the given reference and target libraries are created by different library vendors. The comparison will be stopped.

**What Next**

Provide libraries from the same vendor.

---

## LRA-4836

(info) The given family named %s is an user-defined family. The library cells included in this family but not belong to the reference library %s will be ignored.

**Description**

The given family is an user-defined family. ly may include library cells from different libraries. The library cells not belong to the reference library will be ignored.

**What Next**

Review the compared library cells.

---

## LRA-4837

(info) The given lexical attribute mapping definition will be ignored since a custom comparison pair definition file is specified.

Feedback

**Description**

The custom comparison pair mapping definition has higher priority. The given lexical attribute mapping definitions will be ignored.

**What Next**

Review the compared library cells.

---

## LRA-4838

(warning) Unable to find an exactly matched input slew point

**Description**

The tool is not able to find an exactly matched input slew point from the library analysis by the specified value. A closest available input slew point will be used as the comparison condition.

**What Next**

Review the input slew comparison condition.

---

## LRA-4839

(warning) Unable to find an exactly matched output load point

**Description**

The tool is not able to find an exactly matched output load point from the library analysis by the specified value. A closest available output load point will be used as the comparison condition.

**What Next**

Review the output load comparison condition.

---

## LRA-4840

(info) Set the number of significant digits to 5, the default value

**Description**

The tool will report the absolute values with the number of significant digits equals to 5. This is the default settings of the tool.

**What Next**

Adjust the number of significant digits if there is a need.

Feedback

## LRA-5701

(information) Creating lib cell %s ...

**Description**

Libra command *create_new_function_lib_cells* is creating the lib cell.

**What Next**

This is an informational message, no action is required.

## LRA-5702

(error) %s executable is missing. %s

**Description**

Libra command *create_new_function_lib_cells* needs supports from PrimeTime and Library Compiler. This error message indicates the tool is not able to find the executable of PT or LC.

**What Next**

Try to set the app option and environment variable according to the error message.

## LRA-5703

(error) Libra create_new_function_lib_cells encounters an internal error. %s

**Description**

Libra command *create_new_function_lib_cells* encounters an internal error and not able to resolve by itself. The lib cell is not able to be created.

**What Next**

Set the app option to decrypt log file and search for the error.

## LRA-5704

(error) Lib cell %s cannot be created. %s

**Description**

Libra command *create_new_function_lib_cells* cannot create the lib cell. Currently Libra can only create the new function lib cell which has only one output pin with at least one input pin.

Feedback

**What Next**

Please check the design meet the limitation and try again.

---

## LRA-5705

(error) Library Compiler executable is missing.

**Description**

Libra command *save_suggestion_libs* needs supports from Library Compiler. This error message indicates the tool is not able to find the executable of LC.

**What Next**

Try to set the environment variable SYNOPSYS_LC_ROOT to a proper location.

---

## LRA-5706

(error) Can not find the original DB file of %s

**Description**

Libra command *save_suggestion_libs* needs original DB file of the reference library. This error message indicates the tool is not able to find the original DB file.

**What Next**

Put the original DB file back to the location. User might be able to use *report_lib* to find out the location.

---

## LRA-5707

(error) Library Compiler encounters an error when writing out the library '%s'

**Description**

Libra command *save_suggestion_libs* needs support from LC. This error message indicates the LC encoutners an error while writing out the library.

**What Next**

Check if LC can be launched successfully outside Libra session. Check if the environment variable SYNOPSYS_LC_ROOT is set properly.

---

## LRA-5708

(error) Tool doesn't have write permission.

Feedback

**Description**

Libra command *save_suggestion_libs* does not have the permission to write out suggestion library.

**What Next**

Grant user the permission to write file into output location.

---

## LRA-5709

(error) save_suggestion_libs is not able to write the library '%s'. %s

**Description**

The format or the flow that reference library of the library user wants to write out is not supported by *save_suggestion_libs*.

**What Next**

If there is any library refer to a non-pg-pin-based library, filter out that library and issue the command again. If the reference library is read in thru CLIB flow, close it, and use DB + FRAME (*create_ref_lib*) flow to read in again.

---

## LRA-5710

(warning) *save_suggestion_libs*: There is no library be specified to write out

**Description**

*save_suggestion_libs* doesn't recognize any input of library that user wants to save out.

**What Next**

Check the input argument of *save_suggestion_libs* again. Make sure the library could be queried by *get_libs* command.

---

## LRA-5711

(error) *save_suggestion_libs*: %s libset does not exist

**Description**

*save_suggestion_libs* doesn't recognize the input of libset.

**What Next**

Check if the input libset exists in the session.

Feedback

## LRA-5712

(error) *save_suggestion_libs*: Pane ID %d invalid. Library %s has max Pane ID of %d

**Description**

*save_suggestion_libs* doesn't recognize the input of pane ID.

**What Next**

Specify a correct pane ID. User can use *report_libs* to look for the pane ID.

## LRA-5713

(warning) *save_suggestion_libs*: Missing frame for lib_cell %s.

**Description**

lib_cell doesn't have frame view in memory. The frame view of the lib cell would not be written out.

**What Next**

When *create_ref_libs*, make sure to include the frame file which contains all lib_cells frame view. After that, user has to *create_suggestion_libs* again if user wants to have lib cell frame view be written out.

## LRA-6000

(error) No current design supplied, exiting.

**Description**

The *run_design_driven_analysis* command needs a current design for analysis, and no current design was found.

**What Next**

Read in a design, link it, and rerun the command.

## LRA-6001

(error) Library error for design-driven analysis on design %s, exiting.

Feedback

**Description**

In addition to a design, the *run_design_driven_analysis* command needs a collection of library cells supplied within a libset in order to generate suggestions for new libcells. There was an error in getting that library information.

**What Next**

Supply a libset for the command to use when invoking the command.

---

## LRA-6002

(error) Invalid -num_suggest value of %d (must be a positive integer). Exiting

**Description**

The limit on the number of new libcell functions to suggest must be a positive integer.

**What Next**

Supply a positive integer value for *-num_suggest* and rerun.

---

## LRA-6003

(error) No suggested libcells were found for design %s.

**Description**

There were no potential new cell functions identified for this design.

**What Next**

Make sure that you have supplied a valid design and library as input for the command.

---

## LRA-6004

(error) Cannot locate libset %s

**Description**

The given libset was not available.

**What Next**

Make sure that you have supplied a valid libset as input for the command.

---

## LRA-7001

(Error) Library cell family '%s' not found.

Feedback

**Description**

The specified library cell family name could not be found.

**What Next**

Check the specified family name.

---

## LRA-7002

(Error) Please specify a valid %s attribute name.

**Description**

The specified attribute name is invalide.

**What Next**

Check the specified attribute name.

---

## LRA-7003

(Error) Please specify a valid library analysis name.

**Description**

The specified analysis name could not be found.

**What Next**

Check the specified analysis name.

---

## LRA-7004

(Error) Please run library analysis.

**Description**

Library analysis could not be run.

**What Next**

Check the analysis name or a current analysis has been specified.

---

## LRA-7005

(Info) x attribute for bar chart plot is library cell name.

Feedback

**Description**

Using library cell name for x attribute.

**What Next**

Review the content of the updated x attribute name.

---

## LRA-7006

(Error) Library set '%s' not found.

**Description**

The specified libset could not be found.

**What Next**

Check the specified libset name.

---

## LRA-7007

(Info) No '%s' attribute value for library cell '%s'.

**Description**

Attribute value does not exist for the library cell.

**What Next**

Review the attribute values for the library cell.

---

## LRA-7008

(Error) Please run start_gui.

**Description**

GUI has not been started, please run start_gui.

**What Next**

Run start_gui.

---

## LRA-7009

(Error) Please specify value in range (0 to %u) for '%s'.

Feedback

**Description**

The specified value was not within a valid range.

**What Next**

Specify a value withing the valid range.

---

## LRA-7010

(Info) No '%s' attribute value for timing arc object.

**Description**

Attribute value does not exist for the timing arc object.

**What Next**

Review the attribute values for the timing arc object.

---

## LRA-7011

(Info) No '%s' attribute value for all library cells.

**Description**

Attribute value does not exist for any of the library cells.

**What Next**

Review the attribute values for the library cells.

---

## LRA-7012

(Info) No %s to plot.

**Description**

There are no library cells or timing arcs to plot.

**What Next**

Review your library cells or timing arcs.

Feedback

# LRO

## LRO-0005

(warning) Could not find the name %s

**Description**

This message indicates that the name could not be found.

**What Next**

Provide a correct name for removal

## LRO-0006

(error) Gap name %s not found

**Description**

Provided gap name could not be found, need to provide a correct name to proceed.

**What Next**

Provide the correct gap name in gap_names option

## LRO-0007

(error) Skipping creation of gap '%s' because it is missing one or more lib cell names

**Description**

This message indicates that the creation of the gap is skipped due to missing some names in the lib cell names option. The number of the lib cell names must match with the number of the gaps. For example, you can have g0 with gap size of 2 and g1 with gap size of 1. In this case, the command options must be used as *"-gap_names {g0 g1} -lib_cell_names { {name1 name2} {name3} }"*. The first new gap lib cell in g0 will be named as "name1", and the second new gap lib cell in g0 will be named as "name2". The new gap lib cell in g1 will be named as "name3".

**What Next**

Provide a correct list of lib cell names or gap names to be able to create this gap

Feedback

## LRO-0008

(warning) Skipping gap %s because it is already implemented

**Description**

This message indicates that the gap was already implemented and will not be created again

**What Next**

Remove this gap from the gap names list to avoid this warning

## LRO-0009

(error) Could not create gap lib cell '%s'

**Description**

This message indicates that the gap cell creation is not successful

**What Next**

Please check for previous errors that cause the gap cell creation to fail

## LRO-0010

(error) Please use a percentage coefficient between 0 and 1

**Description**

This message indicates that provided percentage coefficient value is not within the acceptable range.

**What Next**

Provide a valid percentage coefficient value to proceed.

## LRO-0011

(warning) No analysis data can be found for lib cell '%s'

**Description**

This message indicates that the library analysis data could not be found for the lib cell, and it will be skipped.

Feedback

**What Next**

Please check to see for possible errors during run_library_analysis for this lib cell

---

## LRO-0012

(warning) Skipping gap %s because no suggestion library found for reference library '%s'

**Description**

This message indicates that the gap is skipped due to missing a suggestion library for the reference library

**What Next**

Use create_suggestion_libs command to create a suggestion library for the reference library to be able to create this gap

---

## LRO-0014

(error) Could not find the libset named %s

**Description**

The libset of the given name could not be found, need to provide a correct name to proceed.

**What Next**

Provide a correct libset name.

---

## LRO-0015

(error) Found a mismatch between gap names and lib cell names

**Description**

The number of the lib cell names must match with the number of the gaps. For example, you can have g0 with gap size of 2 and g1 with gap size of 1. In this case, the command options must be used as *"-gap_names {g0 g1} -lib_cell_names { {name1 name2} {name3} }"*. The first new gap lib cell in g0 will be named as "name1", and the second new gap lib cell in g0 will be named as "name2". The new gap lib cell in g1 will be named as "name3".

**What Next**

Provide a correct list of lib cell names or gap names to proceed.

Feedback

## LRO-0016

(warning) Less than two active costs. No tradeoff to perform

**Description**

This message indicates that there is less than two active costs enabled. Therefore there is no tradeoff to perform.

**What Next**

Active more than two costs to proceed.

## LRO-1000

(error) Could not find analysis set named %s

**Description**

The analysis set of the given name could not be found, need to provide a correct name to proceed.

**What Next**

Provide a correct analysis name or run "run_library_analysis" command to generate an analysis set.

## LRO-1002

(warning) Libcell %s is a redundant variant of %s. Redundant variants will not be listed as dont_use in the present flow

**Description**

This message indicates that the libcell is a redundant physical variant of a libcell. This libcell will not be listed in the dont_use list.

## LRO-1003

(information) Generated %d library cells from gap information

**Description**

This message shows the total number of generated library cells from gap information

**What Next**

This is an informational message, no action is required.

Feedback

## LRO-1005

(information) Removed %d redundancies, outliers, and equivalences

**Description**

This message shows the total number of removed redundancies, outliers, and equivalences.

**What Next**

This is an informational message, no action is required.

## LRO-1006

(warning) Could not find library cell family named %s

**Description**

The given library cell family name could not be found, need to provide a correct name to proceed.

**What Next**

Provide a correct library cell family name.

## LRO-1007

(error) Could not find any library cell families

**Description**

This message indicates that no library cell families can be found from the provided family list.

**What Next**

Provide valid library cell family names.

## LRO-1008

(warning) Family %s was not provided in the family list and will be ignored for keeping it separate

**Description**

This message indicates that the library cell family is not provided in the family list and will be ignored for keeping it seperate.

Feedback

**What Next**

Provide the library cell family name in the family list.

---

## LRO-1009

(information) Removed %d gaps

**Description**

This message shows the total number of removed gaps.

**What Next**

This is an informational message, no action is required.

---

## LRO-2000

(information) Created %d gap cells from gap %s

**Description**

This message shows the total number of implemented gap cells from the gap information

**What Next**

This is an informational message, no action is required.

---

## LRO-4000

(information) Found %d libcells equivalent to other libcells across all PVTs

**Description**

This message shows the total number of equivalent lib cells that are found during analysis across all PVT indices.

**What Next**

This is an informational message, no action is required.

---

## LRO-4001

(information) Found %d libcells equivalent to other libcells at some PVTs

**Description**

This message shows the total number of equivalent lib cells that are found during analysis at some PVT indices.

Feedback

**What Next**

This is an informational message, no action is required.

---

## LRO-4100

(information) Found %d libcells redundant across all PVTs

**Description**

This message shows the total number of redundant lib cells that are found during analysis across all PVT indices.

**What Next**

This is an informational message, no action is required.

---

## LRO-4101

(information) Found %d libcells redundant at some PVTs

**Description**

This message shows the total number of redundant lib cells that are found during analysis at some PVT indices.

**What Next**

This is an informational message, no action is required.

---

## LRO-4200

(information) Found %d libcells outlier across all PVTs

**Description**

This message shows the total number of outlier lib cells that are found during analysis across all PVT indices.

**What Next**

This is an informational message, no action is required.

---

## LRO-4201

(information) Found %d libcells outlier at some PVTs

Feedback

**Description**

This message shows the total number of outlier lib cells that are found during analysis at some PVT indices.

**What Next**

This is an informational message, no action is required.

---

## LRO-4300

(information) In analysis %s :

**Description**

This message shows the analysis name that is used for gap, redundancy, outlier, and equivalent lib cell analysis

**What Next**

This is an informational message, no action is required.

---

## LRO-4301

(information) In families %s :

**Description**

This message shows the family names that are used for gap, redundancy, outlier, and equivalent lib cell analysis

**What Next**

This is an informational message, no action is required.

---

# MBIT

---

## MBIT-001

(Error) %s. Banking/Debanking aborted.

**Description**

This message indicates that either banking or debanking is aborted due to some reason.

**What Next**

Users need to fix the reason.

Feedback

**See Also**

- create_multibit
- split_multibit
- identify_multibit

---

## MBIT-003

(Error) The specified cell (%s) is invalid because the cell is locked.

**Description**

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell is locked.

**What Next**

Users need to check the specified cell.

**See Also**

- create_multibit
- split_multibit

---

## MBIT-004

(Info) The specified cell (%s) is invalid because of dont_touch attribute.

**Description**

This message indicates that the specified register cell is invalid during banking or debanking, because the cell has dont_touch attribute.

**What Next**

Users need to check the specified cell.

**See Also**

- identify_multibit
- create_multibit
- split_multibit
- place_opt

Feedback

## MBIT-005

(Error) Invalid specified cell (%s). The cell must be sequential cell.

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell is not sequential cell.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

## MBIT-006

(Error) The specified cell (%s) is invalid because its location is invalid.

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell's location is invalid.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

## MBIT-007

(Error) The specified cell (%s) is invalid because its reference library cell is different with other candidate cells.

### Description

This message indicates that the specified register cell is invalid for create_multibit, because the cell's reference library cell is different with other candidate cells.

Feedback

### What Next

Users need to remove the specified register from the candidate registers list.

### See Also

- create_multibit
- split_multibit

---

## MBIT-008

(Error) The specified cell (%s) is invalid because its hierarchy is different with other candidate cells.

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell's hierarchy is different with other candidate cells.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

---

## MBIT-009

(Error) The specified cell (%s) is invalid because of inconsistent size_only attribute.

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell's size_only attribute is inconsistent with other candidate cells.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

Feedback

## MBIT-010

(Error) The specified cell (%s) is invalid because timing constraint is not removable.

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because cell has un-removable timing constraints.

### What Next

Users need to check the timing constraints on specified cell.

### See Also

- create_multibit
- split_multibit

## MBIT-011

(Error) Failed to create multibit cell.

### Description

This message indicates that tool failed to create a multibit cell.

### What Next

Users need to double check design setup.

### See Also

- create_multibit
- split_multibit

## MBIT-012

(Error) Failed to set location on cell (%s).

### Description

This message indicates that tool failed to set location on cell.

### What Next

Users need to double check the design setup.

Feedback

**See Also**

- create_multibit
- split_multibit

---

## MBIT-013

(Warning) Failed to find %s pins on cell %s .

**Description**

This message indicates that tool failed to find related pins on cell.

**What Next**

Users need to double check the reference library cell.

**See Also**

- create_multibit
- split_multibit

---

## MBIT-014

(Error) Inconsistent control pin connections on candidate flops (%s and %s)

**Description**

This message indicates that the control pin connection on specified candidate flops are not electronically equivalent.

**What Next**

Users need to check the specified cells' connection.

**See Also**

- create_multibit
- split_multibit

---

## MBIT-015

(Warning) SCANDEF update fails because %s.

Feedback

**Description**

This message occurs when SCANDEF update failes due to the described reason.

**What Next**

Call check_scan_chain beforehand to ensure all the scan chains are valid.

**See Also**

- check_scan_chain
- create_multibit
- split_multibit

---

## MBIT-016

(Error) %s at or near line number %d.

**Description**

Syntax error at or near the reported line number.

**What Next**

Correct the syntax error and rerun the command.

---

## MBIT-017

(Error) Insufficient bit width for banking or splitting.

**Description**

This message indicates that specified candidates has insufficient bit width for banking or splitting. For create_multibit, the candidate flops' count should be less than or equal to bank's bit width. For split_multibit, the sub-bank's width should be equal to original bank's width.

**What Next**

Users need to double check the specified banking or splitting candidates.

**See Also**

- create_multibit
- split_multibit

Feedback

## MBIT-018

(Info) create_multibit cannot continue because %s.

### Description

This message occurs when the single-bit flops to be banked are failed due to printed reason.

### What Next

Use write_def to dump out the SCANDEF file to check the issue, and specify the single-bit flops to meet the scan chain constraints. All the single-bit scan flops to be banked are either ORDERED list or from FLOATING list of scanchain or not present in scan chain.

### See Also

- write_def
- create_multibit

## MBIT-019

(Error) Inconsistent data input / output pin connection.

### Description

This message indicates that tool found the connected input data pin count is not equal to connected output pin count. Since the connection count is inconsistent, tool skipped the splitting.

### What Next

Users need to double check the specified banking or splitting candidates.

### See Also

- create_multibit
- split_multibit

## MBIT-020

(Error) The specified cell (%s) is invalid because of legalize_only attribute.

Feedback

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell has legalize_only attribute.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

---

## MBIT-021

(Warning) Could not find the lib cell %s.

### Description

Reported library cell could not be found.

### What Next

Users need to check the specified library cell.

### See Also

- identify_multibit

---

## MBIT-022

(Warning) Bit width of library cell %s will be treated as 1.

### Description

Could not determine the bit_width of the reported library cell; bit_width will be treated as 1.

### What Next

Users need to check the specified library cell.

### See Also

- identify_multibit

Feedback

## MBIT-023

(Warning) Number of register should be greater than 0.

**Description**

Number of register should be greater than 0.

**What Next**

Correct the number and rerun the command.

**See Also**

- identify_multibit

## MBIT-024

(Warning) Input bit %d cannot be less than 2.

**Description**

Input bit cannot be less than 2. Specific entry will be ignored.

**What Next**

Correct the mapping entry and rerun the command; otherwise specific entry will be ignored.

**See Also**

- identify_multibit

## MBIT-025

(Warning) Entry for %d bits is not proper, calculated bit is %d

**Description**

Calculated total number of bits is more than its entry bit. Entry will be ignored.

**See Also**

- identify_multibit

## MBIT-026

(Warning) Found duplicate entry for %d bit in functional group %s.

Feedback

### Description

Duplicate entry found. The entry will be ignored.

### See Also

- identify_multibit

---

## MBIT-027

(Warning) Functional group with name %s already exists.

### Description

Reported functional group already exists. You can continue but this group will be ignored. Alternatively rename the group and rerun the command.

### See Also

- identify_multibit

---

## MBIT-028

(Error) The specified cell (%s) is invalid because its bound is different with other candidate cells.

### Description

This message indicates that the specified register cell is invalid for create_multibit, because the cell's bound is different with other candidate cells.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

---

## MBIT-029

(Error) The specified cell (%s) is invalid because its voltage area is different with other candidate cells.

Feedback

### Description

This message indicates that the specified register cell is invalid for create_multibit, because the cell's voltage area is different with other candidate cells.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

---

## MBIT-030

(Warning) Single-bit lib cell %s has already been added.

### Description

Reported single-bit lib cell was already added to some functional group. It cannot be added again. Present occurrence of lib cell will be ignored.

### See Also

- identify_multibit

---

## MBIT-031

(Error) The specified cell (%s) is invalid because it belongs to RP group.

### Description

This message indicates that the specified register cell is invalid for create_multibit or split_multibit, because the cell belongs to RP group.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

Feedback

## MBIT-032

(Warning) WNS threshold for %s has already been set. Value specified at line number %d is ignored.

### Description

WNS threshold value for the reported group is already set. You are trying to set it once more and hence the warning.

### See Also

- identify_multibit

## MBIT-033

(Warning) No mapping entry found for functional group %s.

### Description

For the reported functional group there is no mapping entry. This group will be ignored during banking.

### See Also

- identify_multibit

## MBIT-034

(Warning) Mapping entry for bit %d not found for functional group %s.

### Description

Reported bit entry for the group is not found. This may result in lower banking ratio.

### See Also

- identify_multibit

## MBIT-035

(Error) The specified reference lib cell is dont-use: %s.

### Description

Tool could not create or split cell because the specified reference library cell is marked as dont-use.

Feedback

### What Next

Users need to check the specified library cell.

### See Also

- identify_multibit

---

## MBIT-036

(Warning) The reference lib cell %s is dont-use.

### Description

The reported reference lib cell is ignored.

### What Next

Users need to check the specified library cell.

---

## MBIT-037

(Error) No proper functional group defined in input file %s.

### Description

You are getting this message as the tool didn't find a single valid functional group in input_map_file.

### What Next

Provide proper functional group information through input_map_file. If input_map_file contains functional group information, check for error warning to know why they are ignored.

### See Also

- identify_multibit

---

## MBIT-038

(Warning) There is no scandef info in current design

### Description

No scandef info is in current design

Feedback

### What Next

Users need to check whether the missing scandef is intended

### See Also

- check_scan_chain

---

## MBIT-039

(Error) Inconsistent timing constraints on candidate flops (%s and %s)

### Description

This message indicates that the timing constraints on specified candidate flops are not consistent.

### What Next

Users need to check the specified cells' timing constraints.

### See Also

- create_multibit
- split_multibit

---

## MBIT-040

(Error) Failed to deduce library-cells from specified multi-bit cell.

### Description

Tool failed to deduce library-cells from specified multi-bit cell. User needs to manually specify '-lib_cells' option.

### What Next

User needs to manually specify '-lib_cells' option.

### See Also

- identify_multibit

---

## MBIT-041

(Warning) No mbit lib cell found for strategy %s to replace %lu cells.

Feedback

### Description

No mbit lib cell is mapped to the strategy mentioned.

### What Next

Map level_shifter_cell or isolation_cell as required and re run the command.

### See Also

- map_isolation_cell
- map_level_shifter_cell

---

## MBIT-042

(Error) The specified reference lib cell is invalid: %s.

### Description

Tool could not create or split cell because the specified reference library cell is invalid.

### What Next

Users need to check the specified library cell.

### See Also

- identify_multibit

---

## MBIT-043

(Error) The app option required for banking of multibit cell '%s' has not been specified.

### Description

This error message occurs when the tool detects that you have specified a multibit cell for banking during create_multibit/identify_multibit command without using the app option for banking multibit cells.

### What Next

Please specify the following app option: mbit.enable_banking_of_multibit_cell and run the command again.

Feedback

**See Also**

- identify_multibit
- create_multibit

---

## MBIT-045

(Error) %s cell specified for the command option '-cells'.

**Description**

This error message occurs when the tool detects that you have specified invalid list of cells for banking/de-banking during identify_multibit/split_multibit command with cells option.

**What Next**

Please specify valid list of cells and run the command again.

**See Also**

- identify_multibit
- split_multibit

---

## MBIT-046

(Error) The specified cell (%s) is non considered as it has size_only attribute.

**Description**

This message indicates that the specified cell is invalid for create_multibit or split_multibit or identify_multibit, because size_only attribute is set on it.

**What Next**

Users need to check the specified cell.

**See Also**

- create_multibit
- split_multibit
- identify_multibit

---

## MBIT-047

(Error) SDC constraint is set on the cell (%s)

Feedback

### Description

This message indicates that the SDC constraints is specified on candidate flops because of which it is ignored.

### What Next

Users need to check the SDC constraint applied.

---

## MBIT-048

(Error) %s Lib cell does not belong to strategy %s.

### Description

The specified reference library cell does not belong to proper strategy.

### What Next

Please use the lib-cell from proper power strategy.

### See Also

- identify_multibit

---

## MBIT-049

(Error) The specified cell (%s) is invalid because of retention cell criteria.

### Description

This message indicates that the specified register cell is either not a retention cell or it retention strategy is not matching with other cells.

### What Next

Users need to check the specified cell.

### See Also

- create_multibit
- split_multibit

---

## MBIT-050

(Warning) The specified cell (%s) is invalid because %s.

Feedback

**Description**

This message indicates that the specified register cell is invalid for create_multibit or split_multibit.

**What Next**

Users need to check the specified cell.

**See Also**

- create_multibit
- split_multibit

---

## MBIT-051

(Info) No multibit banking performed as no valid multibit lib-cell found in the library.

**Description**

This message indicates that no valid multibit lib-cell found in the library for multibit banking.

**What Next**

Users need to check library for valid multibit lib-cells.

**See Also**

- create_multibit
- split_multibit

---

## MBIT-052

(Error) Cells %s and %s does not having matching constraints.

**Description**

This message indicates that cells which are expected to be banked are ignored as they don't having matching constraints on them.

**What Next**

cells are expected to have matching constraint

Feedback

## MBIT-053

(Error) Cells to be banked does not having matching restrictions.

### Description

This message indicates that cells which are expected to be banked are ignored as they are not allowed by restriction manager.

### What Next

cells are expected to have matching restriction

## MBIT-054

(Error) Cell %s to be debanked does not passes restrictions check.

### Description

This message indicates that cell %s which is expected to be debanked is ignored as it does not passes restriction manager check.

### What Next

cell is expected to pass restriction check.

## MBIT-055

(Warning) Design has scan stitched cells but no scandef found.

### Description

This message indicates that scandef is not provided but cells have valid scan connection. During multibit banking such cells will be banked if they are found consecutive and that may reduce banking ratio.

### What Next

Read scandef before multibit banking.

### See Also

- identify_multibit
- split_multibit

Feedback

## MBIT-056

(Warning) The multibit cell %s may not be used during banking becuase the delay of arc from clock pin to output pin could not be computed.

### Description

The multibit cell %s may not be used during banking becuase the delay of arc from clock pin to output pin could not be computed and Please check if libcell is not corrupted.

### What Next

Please check if libcell is corrupted or not.

### See Also

- identify_multibit

## MBIT-057

(Warning) Lib cell %s does not match cell %s.

### Description

The specified reference library cell cannot be used to replace specified cell.

### What Next

Please use the lib-cell match with cell.

### See Also

- identify_multibit
- split_multibit
- create_multibit

## MBIT-058

(Warning) Bus based banking is not supported for MV cells

### Description

Physical aware multibit engine does not support bus based banking for MV cells. As of now bus based banking is only supported for register cells.

Feedback

### What Next

Use register cells for bus based banking.

### See Also

- identify_multibit
- split_multibit
- create_multibit

---

## MBIT-059

(Warning) Cell %s is not debanked as its ref lib cell has dont_use attribute true.

### Description

Multibit cell instance having its ref lib cell has dont_use attribute true cannot be debanked.

### What Next

Remove dont_use attribute on lib cell and then debank the cells.

### See Also

- identify_multibit
- split_multibit
- create_multibit

---

## MBIT-060

(Warning) set_target_library_subset will not be honored.

### Description

Set_target_library_subset in split_multibit will not be honored if we don't use either -cells or -lib_cells option with split_multibit.

### What Next

Use -cells or -lib_cells option with split_multibit to honor set_target_library_subset.

### See Also

- split_multibit

Feedback

## MBIT-061

(Error) Invalid cell list specified for the command option '-exclude_instance'.

### Description

This error message occurs when the tool detects that you have specified invalid list of cells for banking/de-banking during identify_multibit/split_multibit command with exclude_instance option.

### What Next

Please specify valid list of cells and run the command again.

### See Also

- identify_multibit
- split_multibit

## MBIT-062

(Warning) Invalid specified cell (%s). The cell specified by the command option '-exclude_instance' must be a sequential cell.

### Description

This message indicates that the specified register cell is invalid for identify_multibit/ split_multibit, because the cell specified by the command option '-exclude_instance' is not a sequential cell.

### What Next

Users need to check the specified cell for the command option '-exclude_instance'.

### See Also

- identify_multibit
- split_multibit

## MBIT-063

(Error) Please specify more than one lib cell for the command option '-lib_cells' in debanking.

Feedback

### Description

This message indicates that the number of specified lib cells is not sufficient.

### What Next

Users should make sure to specify more than one lib cell and the sum of the bit width of all lib cells should be equal to bit width of multibit cell be debanked.

### See Also

- split_multibit

---

## MBIT-064

(Error) The width of specified lib cells for debanking is higher than the width of multlibit cell.

### Description

This message indicates that the width of specified lib cells for debanking is higher than the width of multlibit cell. The sub-bank's width should be equal to original bank's width.

### What Next

Users should make sure to specify more than one lib cell and the sum of the bit width of all lib cells should be equal to bit width of multibit cell be debanked.

### See Also

- split_multibit

---

## MBIT-065

(Error) No -lib_cell is expected with the provided list of unmapped cells.

### Description

The list of provided unmapped cells will be added to a bus instance and will be candidates for banking by the sequential RTL mapping and banking engine. Therefore, no -lib_cell is expected.

### What Next

Please remove the -lib_cell option from the create_multibit command and try again.

### See Also

- create_multibit

Feedback

## MBIT-066

(Error) cell_list does not support a mix of mapped and unmapped cells.

**Description**

create_multibit does not support a list of mapped and unmapped cells.

**What Next**

Please check the list of provided cells and try the create_multibit command again.

**See Also**

- create_multibit

## MBIT-067

(Error) Provided list of cells has a mix of sequential and non-sequential cells.

**Description**

Non-sequential cells are not supported in the list of provided cells for create_multibit.

**What Next**

Please check the list of cells provided to the create_multibit command.

**See Also**

- create_multibit

## MBIT-068

(Error) create_multibit command failed: multibit flow is disabled.

**Description**

create_multibit could not create the bus instance because of multibit flow is disabled.

**What Next**

Please check the app-option setting for enabling the multibit flow.

**See Also**

- create_multibit

Feedback

## MBIT-069

(Error) create_multibit command failed: provided list of cells do not all belong to the same hierarchy.

### Description

create_multibit could not create the bus instance because the provided list of cells do not belong to the same hierarchy.

### What Next

Please check the list of cells provided to the create_multibit command.

### See Also

- create_multibit

## MBIT-070

(Error) create_multibit command failed: one or more cells already belong to a bus instance.

### Description

create_multibit did not create the bus instance because one or more cells already belong to a bus instance and are candidates for banking for the sequential mapping engine.

### What Next

Please check the list of cells provided to the create_multibit command.

### See Also

- create_multibit

## MBIT-071

(Error) Failed to create bus instance because single-bit cells do not share control signals or are functionally not equivalent.

### Description

create_multibit expects the single-bit cells to be functionally equivalent for them to be added to a bus instance.

Feedback

### What Next

Please check the list of cells provided to the create_multibit command.

### See Also

- create_multibit

---

## MBIT-072

(Error) Banking step is skipped because of no setup scenario.

### Description

This message indicates that the banking step is skipped because of no setup scenario.

### What Next

Users should specify at least one setup scenario.

### See Also

- identify_multibit
- place_opt

---

## MBIT-073

(Warning) Cannot identify the correct multibit_width of lib cell (%s). The number of input data pins (%u) and output data pins (%u) are mismatched.

### Description

This message indicates that the report_multibit command may not get the correct multibit_width attribute of the lib cell. The multibit_width is used to identify the bit width of the lib cell, and if this attribute is missing, the command uses the number of data pins to identify the bit width.

### What Next

Users need to check the multibit_width and pin attribute of the lib cell.

### See Also

- report_multibit

Feedback

# MDXF

## MDXF-001

(error) Could not parse '%s' with value string '%s' inside '%s'

**Description**

This message indicates either the given rule name or value string is syntactically wrong.

**What Next**

Please refer to the MDXF Reference Manual and provide correct rule name/value string.

## MDXF-002

(error) Multiple '%s' provided

**Description**

Multiple section(s)/attribute(s) provided whose occurrence number one or at most one.

**What Next**

Please refer to the MDXF Reference Manual and remove repetitive occurrences.

## MDXF-003

(error) Wrong %s provided

**Description**

If file version is mentioned in the error, the given MDXF file version number is greater than reader's version number or non-numeric characters have been mentioned.

If the unit is mentioned in the error, not supported distance unit has been provided.

**What Next**

Please refer to the MDXF Reference Manual and provide correct distance unit or file version.

## MDXF-004

(error) Encountered while converting the data to %s

Feedback

**Description**

This message indicates an internal data model error.

**What Next**

Send the log to Synopsys.

---

## MDXF-005

(error) Required %s not provided

**Description**

If file version is mentioned in the error, the required mdxf file version number is not provided in the mdxf file.

If the unit is mentioned in the error, the required attribute distance unit is not provided in the mdxf file.

**What Next**

Please refer to the MDXF Reference Manual and provide attribute distance unit or file version.

---

## MDXF-006

(error) Syntax error in the file : '%s'

**Description**

Syntax error related to XML formatting was found in the specified MDXF file in the error message.

The line number of the syntax error and additional details will also be printed in case of missing operands like quote("), equal sign(=) and end tag(>).

In some other cases of a missing slash tag (/) or start tag(<) etc., the line number corresponding to end of file will be printed, along with error details like 'unexpected end of data' or 'expected element name'

**What Next**

Please fix the syntax error(s) and rerun the command.

---

## MDXF-007

(error) Could not parse mdxf file '%s'.

Feedback

**Description**

There was a major syntax error in the specified mdxf file. It should be a single text file containing 3DIC information. Please refer to messages printed before this message.

**What Next**

Please correct the input mdxf file and rerun the command

---

## MDXF-008

(error) Unsupported %s file '%s' format '%s'.

**Description**

The input/include file format specified is not supported. Hence the command cannot parse the text file.

**What Next**

Provide a valid format, e.g. "mdxf".

---

## MDXF-009

(warning) Ignoring unknown %s : '%s'

**Description**

This message indicates the given section/attribute name is syntactically wrong.

**What Next**

Please refer to the MDXF Reference Manual and provide correct name.

---

## MDXF-010

(error) File '%s' included multiple times.

**Description**

The file specified is either included multiple times or having a cyclic dependency.

**What Next**

Please include the file only once. If file is included only once then check and remove the cyclic dependency.

Feedback

## MDXF-011

(error) Rule '%s' of rule type '%s' is not supported in '%s' section.

**Description**

This rule will not be considered in the mentioned section.

**What Next**

Please refer to the MDXF Reference Manual and provide only supported rule types in the corresponding owner section.

## MDXF-012

(error) Section '%s' is not supported in '%s' section.

**Description**

This section will not be considered in the mentioned owner section.

**What Next**

Please refer to the MDXF Reference Manual and provide only supported section types in the corresponding owner section.

## MDXF-013

(warning) Skipping rule '%s' because of wrong rule name inside '%s'

**Description**

This message indicates the given rule name is syntactically wrong.

**What Next**

Please refer to the MDXF Reference Manual and provide correct rule name.

## MDXF-014

(warning) Skipping rule '%s' because multiple rules with same name provided inside '%s'

**Description**

This message indicates multiple rules with the same rule name has been specified inside owner section mentioned in the message.

Feedback

**What Next**

Please remove the multiple rules specified with the same name.

---

## MDXF-015

(warning) No floorplan rule in current design.

**Description**

This message indicates that there is no floorplan rule in current design.

**What Next**

Please ensure you have opened the proper design or have already read MDXF data.

---

## MDXF-016

(warning) Rule '%s' has been provided with one value '%s' inside '%s', expected two values.

**Description**

This message indicates the given rule name is expected two values but has been provided with one. The rule has been created assuming the two values are equal to the provided value.

**What Next**

Please refer to the MDXF Reference Manual and provide correct number of values.

---

## MDXF-017

(warning) The min and max values of the rule '%s' are given in the wrong order as '%s' inside '%s'.

**Description**

This message indicates the minium value provide is greater than the maximum value i.e. the values has been provided in the wrong order. The values have been swapped while creating the rule i.e. the greater of the two values considered as max and min will be the lesser of the two.

**What Next**

Please provide the values in the correct order.

Feedback

## MDXF-018

(warning) Skipping element '%s' because multiple elements with same name provided inside '%s'

**Description**

This message indicates same element has been specified multiple times inside owner section mentioned in the message. The data of first one will be used.

**What Next**

Please remove the multiple element and specify the correct data.

## MDXF-019

(error) Wrong %s : '%s' provided %s

**Description**

The element data provided is not valid.

Example: If the element data is expecting name as the value, then the name should not contain any special char (i.e. '*', '?', '^', '$'). If the element data is expecting orientation as the value, the orientation value should be one of the valid orientation.

**What Next**

Please refer to the MDXF Reference Manual and provide valid data.

## MDXF-020

(warning) Inefficient usage: Rule '%s' has been provided with overlapped range values as '%s' inside '%s'.

**Description**

This message indicates that among the multiple ranges which are specified, there is a range which is overlapping with another range which leads to inefficient usage.

**What Next**

Please provide the non-overlapping ranges.

## MDXF-021

(error) Error encountered in encrypted sections of the input. Detailed information suppressed to protect encrypted data.

Feedback

**Description**

This message indicates that an error was encountered in the encrypted sections of the input. More detailed information is suppressed to protect encrypted data.

**What Next**

Please refer to the MDXF Reference Manual and correct the encrypted sections of the input.

---

## MDXF-022

(warning) Warning encountered in encrypted sections of the input. Detailed information suppressed to protect encrypted data.

**Description**

This message indicates that a warning was encountered in the encrypted sections of the input. More detailed information is suppressed to protect encrypted data.

**What Next**

Please refer to the MDXF Reference Manual and correct the encrypted sections of the input.

---

## MDXF-023

(warning) Could not determine the z_level of die '%s' : %s

**Description**

This message indicates that there can be a cyclic dependency among the dies or the bottom most die was not found, due to which z_level of die could not be determined.

**What Next**

Please refer to the MDXF Reference Manual and provide correct dependency.

---

## MDXF-024

(error) %s must be the first element inside %s section, if specified.

**Description**

The element should be first element inside the mentioned section.

Feedback

**What Next**

Please refer to the MDXF Reference Manual and provide the elements in the required order.

---

## MDXF-025

(warning) Skipping rule '%s' because of wrong object type inside '%s'

**Description**

This message indicates the given rule object type is syntactically wrong.

**What Next**

Please refer to the MDXF Reference Manual and provide correct rule name.

---

## MDXF-026

(error) Cannot find reference or cell name mentioned in '%s' with value string '%s' inside '%s' section

**Description**

This message indicates that the mentioned reference or cell name in the value string was not found. Reference cell or lib cell with this name was not found in the reference libraries of the current lib. Also, cell instance with this name is not present in the current physical hierarchy of the design.

**What Next**

Please refer to the MDXF Reference Manual and provide correct rule name/value string.

---

## MDXF-027

(error) Cannot find attribute name mentioned in '%s' with value string '%s' inside '%s' section

**Description**

This message indicates that the mentioned attribute name in the value string was not found.

**What Next**

This usually means that this attribute was not defined in this section earlier using the DESIGN_TAG entry. Please refer to the MDXF Reference Manual and provide correct rule name/value string.

Feedback

## MDXF-028

(warning) Skipping rule '%s' because multiple attributes with same name '%s' are provided inside '%s'

**Description**

This message indicates multiple attribute with the same name in same rule has been specified inside owner section mentioned in the message.

**What Next**

Please remove or modify the lines with the same rule specified with the same attribute name.

## MDXF-029

(error) Cannot find reference block '%s' mentioned in '%s' inside '%s' section

**Description**

This message indicates that the mentioned reference block in the value string was not found in the reference libraries of the current lib.

**What Next**

Please refer to the MDXF Reference Manual and provide correct value string.

## MDXF-030

(warning) Rule '%s' is deprecated and will be removed in a future release. Please consider removing it from your file.

**Description**

This message indicates this particular rule has been deprecated and will be removed in a future release.

**What Next**

Please remove the lines with deprecated rules.

## MDXF-031

(warning) The value '%s' mentioned in rule '%s' does not match with '%s'.

Feedback

**Description**

This message indicates the value mentioned in this rule does not match with actual data.

**What Next**

Please provide correct values.

---

## MDXF-032

(warning) At least one '%s' in the value string '%s' mentioned in '%s' is not found.

**Description**

This message indicates that at least one die in the mentioned value string was not found in the current design.

**What Next**

Please modify the MDXF file with correct die names and run again.

---

## MDXF-033

(warning) Section '%s' is deprecated and will be removed in a future release. Please consider removing it from your file and replacing it with '%s'.

**Description**

This message indicates this particular section has been deprecated and will be removed in a future release.

**What Next**

Please remove the lines with deprecated sections and replace them with new section names.

---

## MDXF-034

(warning) Some '%s' of '%s' were not written out because '%s' was not found.

**Description**

This message indicates few sections were not written out since the corresponding refrence was not found.

---

## MDXF-035

(warning) Section '%s' is deprecated and will be removed in a future release.

Feedback

**Description**

This message indicates this particular section has been deprecated and will be removed in a future release.

**What Next**

Please remove the lines with deprecated sections.

# MENU

## MENU-001

(Error) Menu name is empty.

**Description**

An empty string was given as the menu name option value.

**What Next**

Provide a non-empty menu name.

## MENU-002

(Error) The menu name needs to be a full hierarchical menu name.

**Description**

A full hierarchical menu name needs to be specified for the menu name. An example: "&File->Exit".

**What Next**

Check the option value of the -menu option.

## MENU-003

(Error) The -anchor_offset option value needs to be a positive/negative integer and not zero.

**What Next**

Correct the option value of the -anchor_offset option.

Feedback

## MENU-004

(Error) -anchor_offset option needs to be specified when -anchor_item option is present.

## MENU-005

(Error) %s option value is specified incorrectly.

**What Next**

Check and correct the option value for the specified option.

## MENU-006

(Error) -anchor_item option needs to be specified when -anchor_offset option is present.

## MENU-007

(Error) Anchor menu item '%s' not found.

**What Next**

Check the spelling of the option value of the -anchor_menu option. Make sure that the anchor menu item already existed before using it as anchor_menu option value in the gui_create_menu command call.

## MENU-008

(Error) Menu bar items must be popup menus.

**Description**

First-level items on the menu bar must be popup menus.

**What Next**

Check and correct the option value of the -menu option.

## MENU-012

(Error) Menu root: %s not found.

**What Next**

Check and correct the option value of the -menu_root option.

Feedback

## MENU-013

(Warning) Hotkey string: %s is either not supported or reserved by system for other use.

**What Next**

Please check and correct the option value of the -hot_key option. This hotkey key combination may not be supported or has been reserved by the application for some other use.

## MENU-014

(Error) Duplicate menu item: %s .

**Description**

Another existiing menu item already has this menu name.

## MENU-015

(Error) %s option is specified with invalid value: %s.

**What Next**

Check and correct the option value of the specified option.

## MENU-016

(Error) Cannot specify both -anchor_offset and -position options.

## MENU-017

(Error) -position option value must not be a negative integer.

**Description**

Position option value must be zero or a positive integer. It specifies the position of the menu item within the parent popup menu.

## MENU-018

(Warning) Specified hotkey %s for this menu item %s will be ignored. Hotkey is already in use for %s menu item.

Feedback

**Description**

This hotkey has already been mapped to another existing menu item. It will be ignored and not set for this menu item.

**What Next**

Change the -hotkey option value to specify another hotkey or remove this option.

---

## MENU-019

(Error) Menu item '%s' not found.

**Description**

The specified menu item was not found in the currently active window. It could not be executed.

**What Next**

Check the menu name to make sure it matches an existing menu item in the active window.

---

## MENU-020

(Error) There is no active main window.

**Description**

No active main window was found.

**What Next**

Activate a main window before executing this command.

---

## MENU-021

(Error) Menu %s is not a popup menu item.

**What Next**

Add menu items to a popup menu, not to an item with associated command or action. Popup menus are created implicitly by specifying a full hierarchical menu name.

---

## MENU-022

(Warning) Menu bar items must be popup menus. %s not added.

Feedback

**Description**

First-level items on the menu bar must be popup menus.

**What Next**

Do not explicitly create popup menus in hierarchical menus. Pop-up menus are created implicitly by creating command menu items with full hierarhcical names. For example, creating a menu with the menu name "&File->&Open..." creates the "File" pop-up menu in the menu bar.

---

## MENU-023

(Error) Window named %s provided for the -window option was not found.

**Description**

The provided window name is not valid.

**What Next**

Check the spelling of the window name. If you omit the -window option, the currently active top-level main window will be used.

---

## MENU-024

(Error) Window named was not provided and there is no active main window.

**Description**

When no window name is provided for the -window option, the currently active top-level window is used. However, no active top-level main window eixsts.

**What Next**

Create an instance of the top-level main window on which you wish to operate, then provide its name with the -window option or activate the window and omit the -window option.

---

## MENU-025

(Warning) There are no toolbars in the specified window.

**Description**

Since there are no toolbars in the specified window, the operation resulted in no action.

Feedback

## MENU-026

(Error) There is no toolbar with the name %s.

### Description

A toolbar with the given name could not be found. Therefore, the operation resulted in no action.

## MENU-028

(Error) Options %s are not supported with the -window option.

### Description

Supported options for menu attribute setting in a specific window are: -menu_text, -tooltip, and -help_string.

# MIB

## MIB-001

(warning) There are either no MIBs in the design or all MIB blocks are marked un-editable.

### Description

You receive this message when there are no MIBs in the design. This command should only be used in MIB-based designs. You also receive this message when all the MIB instances in the design are disabled for planning or marked read-only using the hierarchical edit control command set_editability.

### What Next

Check for MIB instances in the design. Also, report the hierarchical edit-ability control set on the MIB blocks in the design. Mark the MIB blocks editable if you wish to report perform MIB alignment check on them.

### See Also

- report_mibs
- report_editability

Feedback

## MIB-002

(error) -layers option must be specified only with -wire_tracks option or -pg option.

**Description**

This option is to specify the layer on which wire tracks and/or pg straps will be checked for alignment. It is invalid if -wire_tracks or -pg option is not present.

**What Next**

Specify -wire_tracks or -pg option.

## MIB-003

(warning) There are no P/G wires that intersect MIB blocks and MIB alignment can not be determined.

**Description**

No P/G wires intersect MIB blocks. Alignment check can not be determined.

**What Next**

Create P/G wires in the design first before checking MIB alignment.

## MIB-004

(warning) No site row found in instance %s.

**Description**

No site rows are crossing instance %s. This could be due to the instance is not placed in the core area.

**What Next**

Check the instance and place it properly.

## MIB-005

(error) MIB instance %s's orientation %s is not valid.

**Description**

MIB blocks are not allowed to rotate by 90 or 270 degrees due to alignment issue.

Feedback

**What Next**

Check the MIB rotation.

---

## MIB-006

(error) No grid name.

**Description**

Please specify a non-empty name for the block grid that you want the tool to work on.

**What Next**

Run the command again with a valid grid name.

---

## MIB-007

(error) Invalid value %f for option %s.

**Description**

The options -x_step and -y_step require a positive value. The options -x_offset and -y_offset require a non-negative value. The specified value is not valid.

**What Next**

Correct the value and re-issue the command.

---

## MIB-008

(error) Invalid combination of options.

**Description**

The options -x_step/-y_step/-x_offset/-y_offset/-orientations are for user defined block grid.

The options -pg_strategy/-layers/-site_rows are for automatically derived block grid.

An block grid can either be defined by the user or derived automatically from PG strategies and/or site rows. But it cannot be both. The above two sets of options are mutually exclusive with each other.

**What Next**

Correct the options and re-issue the command.

Feedback

## MIB-009

(error) Options for %s grid is not allowed because block grid %s was previously set to be a %s grid.

**Description**

The options -x_step/-y_step/-x_offset/-y_offset/-orientations are for user defined (manual) block grid.

The options -pg_strategy/-layers/-site_rows are for automatically derived (auto) block grid.

An block grid can either be defined by the user or derived automatically from PG strategies and/or site rows. But it cannot be both.

You are trying to set contradicting options for the specified block grid. It is not allowed.

**What Next**

You must be calling set_grid without -reset option.

If you want the new options to overwrite any existing option on the grid that was previously set, please call the command with the -reset option.

If you want to create a new block grid with the specified options, please call create_grid command.

## MIB-010

(error) No block grid is specified.

**Description**

You must specify an existing block grid for set_grid command.

**What Next**

Check whether the block grid you want to change was created successfully.

## MIB-011

(error) Please specify at least one of or both -x_step and -y_step.

**Description**

To define a manual MIB grid, you need to provide the grid pitch in at least one direction.

**What Next**

Specify -x_step or -y_step or both with command set_grid.

Feedback

## MIB-012

(error) No valid orientation specified.

**Description**

Option -orientations specifies which orientations are allowed for MIB instances that might be associated with the MIB grid in the future.

This option is for user defined MIB grid. The valid orientation values are: R0 (or N), MX (or FS), MY (or FN), R180 (or S). If the option is not in the command line, all four orientations are allowed. If the option is specified, it must be followed with at least one valid orientation value.

**What Next**

Correct the command line and re-issue it.

## MIB-013

(error) Block grid %s already exists.

**Description**

You get this error message because create_grid is called to create a block grid with the specified name. However there is an existing block grid with the same name.

**What Next**

If you want to change the existing block grid, please use set_grid command. If you want to create a new block grid in addition to the existing one, please choose another name for the new block grid.

## MIB-014

(error) Failed to create block grid %s.

**Description**

You get this error message because create_grid is called to create block grid with the specified name, but the tool is unable to create it.

**What Next**

Please check if there are other error or warning messages that indicates the nature of the problem.

Feedback

## MIB-015

(error) Rows with different site definition are not supported.

**Description**

You get this error message because you asked the tool to derive block grid from site rows with different site definitions. This is not supported.

**What Next**

Please specify rows with the same site definition.

## MIB-016

(error) Rows with different rotations are not supported.

**Description**

You get this error message because you asked the tool to derive block grid from horizontal and vertical site rows. This is not supported.

**What Next**

Please specify all horizontal rows or all vertical rows.

## MIB-017

(warning) The new grid %s step size (%.3f) is too large.

**Description**

You get this message because block grid derived from the specified options has a step size that is too big. It would not be possible for applications in the tool, such as shape_blocks, to use this block grid.

**What Next**

Please review all the options you specified for this block grid and consider removing some of them.

## MIB-018

(error) Cell instance %s is not on block grid.

Feedback

### Description

You get this error message because the specified cell instance's snap-point location is not on its associated block grid.

### What Next

Please check the location of the cell. You can use snap_cells_to_block_grid to move the cell to be on grid.

---

## MIB-019

(error) The current orientation of cell instance %s is not allowed by its associated block grid.

### Description

You get this error message because the specified cell instance's orientation is not among the allowed orientations of its associated block grid.

### What Next

Please check the orientation of the cell. Either correct the cell's orientation, or change the block grid.

---

## MIB-020

(error) Please specify -all or the grid to remove.

### Description

You get this error message because remove_grids is called without any option.

### What Next

If you want to remove all block grids, please use the option -all. If you want to remove a specific block grid, please specify the grid.

---

## MIB-021

(error) Cannot specify '-adjust_snap_point_of_cell' with '-designs' or '-grid' or '-snap_point' or '-reset'.

### Description

You get this error message because *set_block_grid_references* is called with option *-adjust_snap_point_of_cell* and at least one other option which is mutually exclusive with *-adjust_snap_point_of_cell*.

Feedback

**What Next**

If you want to adjust the snap point of a cell based on the current location of the cell, please use the option *-adjust_snap_point_of_cell* alone.

If you want to use other options of the command, please call them without *-adjust_snap_point_of_cell*.

---

## MIB-022

(error) Cannot specify '-reset' with '-adjust_snap_point_of_cell' or '-grid' or '-snap_point'.

**Description**

You get this error message because *set_block_grid_references* is called with option *-reset* and at least one other option which is mutually exclusive with *-reset*.

**What Next**

If you want to reset the block grid information of a block reference, please use the option *-reset* alone.

If you want to use other options of the command, please call them without *-reset*.

---

## MIB-023

(error) Must specify '-designs' with '-reset'.

**Description**

You get this error message because *set_block_grid_references* is called with option *-reset* but option *-designs* is not specified.

**What Next**

If you want to reset the block grid information of a block reference, please use the option *-designs* to tell the tool which block reference you want to reset.

---

## MIB-024

(error) Must specify at least one of '-reset', '-grid' or '-snap_point' with '-designs'.

**Description**

You get this error message because *set_block_grid_references* is called with option *-designs* alone.

Feedback

**What Next**

If you want to set the block grid information of a block reference, please use options *-grid* and/or *-snap_point* together with *-designs*.

If you want to reset the block grid information of a block reference, please use option *-reset* together with *-designs*.

---

## MIB-025

(error) Must specify '-designs' with option '%s'.

**Description**

You get this error message because *set_block_grid_references* is called with option *-grid* or *-snap_point* but without option *-designs*.

**What Next**

If you want to set the block grid information of a block reference, please use options *-grid* and/or *-snap_point* together with *-designs*.

---

## MIB-026

(error) Cannot set snap point for block reference %s. The block has no associated block grid.

**Description**

You get this error message because you call *set_block_grid_references* to set snap-point on the specified block reference when the block is not associated with any block grid.

**What Next**

Please use options *-grid* to set up the association to a block grid first.

---

## MIB-027

(error) incorrect type %s. for the option -print.

**Description**

Only the following types are allowed: cell_rows, pg_straps, and wire_tracks.

**What Next**

Please use correct type to print out information in detail.

Feedback

## MIB-028

(warning) MIB instance %s does not contain PG straps for the specified layer.

**Description**

To perform the PG alignment checking, the checked MIB instance need to have PG straps with the specified layer.

**What Next**

Please add PG straps of the specified layer for alignment checking.

## MIB-029

(warning) Cell %s is not associated with any block grid.

**Description**

You get this message when you call *check_dp_design -pre_block_shaping*.

This could happen if the cell is not a block (aka, soft macro), or, if the cell's reference design has not been associated with any block grid.

A block grid can only be associated with a block (aka, soft macro). To associate a block with a block grid, use the command *set_block_grid_references*. Please see the man page of the command for details.

**What Next**

Check if the cell is a block. If it is a block, associate the block reference to the block grid you want.

If you want to snap a cell to an unassociated block grid, please specify the grid using option *-grid* with option *-cells* in command *snap_cells_to_block_grid*.

## MIB-030

(error) No block grid is specified.

**Description**

You must specify corresponding block grid if you have MIB in the design before block shaping.

**What Next**

Check whether the block grid has been set correctly in the design.

Feedback

## MIB-031

(warning) MIB instances that are part of the MIB group of reference-block %s do not contain PG straps.

**Description**

To perform the PG alignment checking, the checked MIB instance need to have PG straps.

**What Next**

Please add PG straps for alignment checking.

## MIB-032

(error) The specified %s in option %s is not correct.

**Description**

This option is to specify objects to be checked.

**What Next**

Specifies correct option value.

## MIB-201

(warning) Misalignment on P/G straps between MIB instances %s and %s.

**Description**

Power and/or ground straps in two MIB instances do not match. This will create errors in MIB block implementation.

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets, or update P/G mesh in top-level design.

## MIB-202

(warning) Misalignment at the site row between MIB instances %s and %s.

**Description**

Site rows in two MIB instances do not match. This will create errors in MIB block implementation.

Feedback

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets.

---

## MIB-203

(warning) Misalignment at track %s on layer %s between MIB instances %s and %s. Track offset of %s is %s, and track offset of %s is %s.

**Description**

Wire tracks %s on layer %s in two MIB instances do not match. This will create errors in MIB block implementation.

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets.

---

## MIB-204

(warning) Option -layer is ignored because -pg_strategy is not specified.

**Description**

Option -layer specifies which layer or layers in the specified PG strategy to consider when creating the grid. It is meaningless to specify -layer without -pg_strategy.

**What Next**

Check the command line, see if you really want to specify -layer but forgot to specify -pg_strategy, or if -layer was given mistakenly.

If -strategy is needed, please add -pg_strategy and re-issue the command. If -layer was given mistakenly and is not needed, no action is needed.

---

## MIB-205

(warning) Invalid orientation %s is ignored.

**Description**

Option -orientations specifies which orientations are allowed for MIB instances that might be associated with the MIB grid in the future.

For a MIB grid that is derived from PG strategy and/or site rows, the allowed orientations are derived automatically by the tool.

This option is for user defined MIB grid only. The valid orientation values are: R0 (or N), MX (or FS), MY (or FN), R180 (or S).

Feedback

**What Next**

If ignoring the said invalid orientation name is ok, no action is needed. If there is a typo and you want to correct it and set it again, please correct the command line and re-issue the command with -add option.

---

## MIB-206

(warning) Cannot find MIB grid %s.

**Description**

The tool is unable to find the MIB grid with the specified name in the current design.

**What Next**

Check if the grid was created successfully, or whether the grid name was spelled correctly.

---

## MIB-207

(warning) More than 2 numbers specified for -offset.

**Description**

The tool expects user to specify two numbers for the -offset option. One for X offset, and the other one for Y offset. If more than 2 numbers are specified, only the first two are taken, the rest are ignored.

**What Next**

No action required, unless the first 2 numbers are incorrect.

---

## MIB-208

(warning) Less than 2 numbers specified for -offset.

**Description**

The tool expects user to specify two numbers for the -offset option. One for X offset, and the other one for Y offset. If less than 2 numbers are specified, there is not enough information to set up the MIB module's offset to its MIB grid.

**What Next**

Please specify the correct offsets. If you want to remove the offset that was set previously, you can call set_grid command with the -grid option again, but without the -offset option.

Feedback

## MIB-209

(warning) Cell %s is not associated with any block grid.

**Description**

You get this message when you call *set_block_grid_references -adjust_snap_point_of_cell* or *snap_cells_to_block_grid -cells <cell_list>* with a cell that has no associated block grid.

This could happen if the cell is not a block (aka, soft macro), or, if the cell's reference design has not been associated with any block grid.

A block grid can only be associated with a block (aka, soft macro). To associate a block with a block grid, use the command *set_block_grid_references*. Please see the man page of the command for details.

**What Next**

Check if the cell is a block. If it is a block, associate the block reference to the block grid you want.

If you want to snap a cell to an unassociated block grid, please specify the grid using option *-grid* with option *-cells* in command *snap_cells_to_block_grid*.

## MIB-210

(warning) Attribute %s of block grid %s is not settable through set_attribute. Because the grid is auto-derived.

**Description**

You get this message when you call *set_attribute* to change the specified attribute of the specified block grid.

Since the block grid is auto-derived from PG strategy and/or site rows, its attributes are not modifiable.

**What Next**

If you want to change the block grid to use a certain pitches and offsets, please use *set_grid* to reset the grid first, then use either *set_attribute* or *set_grid* to set the desired X step, Y step, X offset and Y offset.

## MIB-211

(warning) Cell %s is not associated with block grid %s but is being snapped on to the grid.

Feedback

### Description

You get this message when you call *snap_cells_to_block_grid* to move a cell to a block grid that is different from the one that the cell is associated to.

### What Next

Check and make sure that this operation is intended.

---

## MIB-212

(warning) Cannot find an offset point to allow flipping around the %s axis. Limiting the allowed orientations.

### Description

You get this message when you call *create_grid* to create a block grid by combining PG grid with site row grid. Both the PG grid and site row grid allow the specified flipping. But the tool is unable to find a common offset point that the two grids can both flip around. So the allowed orientations for the combined grid is limited.

For horizontal site rows, the site row grid allows flipping around the Y axis with the grid points either on the edge of a site unit or in the middle of a site unit. If the rows are placed back-to-back flipped, the site row grid would allow flipping around the X axis with the grid points in the middle of two neighboring rows. If the rows are all placed with the same orientation, the flipping around the X axis is not allowed.

Similar rules apply to verical site rows.

### What Next

Check the steps and offsets of the PG grid and site rows reported by *create_grid*. If the report is correct and expected, no action is required. If the report is correct but not expected, you may want to adjust either the PG grid or site row positions to fix the problem. If the report is incorrect, please file a bug report.

---

## MIB-213

(warning) MIB instances %s and %s are not aligned on power/ground strap. Found misaligned horizontal %s strap on metal layer %s at bbox {{%.3f %.3f} {%.3f %.3f}} in instance %s.

### Description

The MIB instance has misaligned horizontal strap.

Feedback

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets, or update P/G mesh in top-level design.

---

## MIB-214

(warning) MIB instances %s and %s are not aligned on power/ground strap. Found misaligned vertical %s strap on metal layer %s at bbox {{%.3f %.3f} {%.3f %.3f}} in instance %s.

**Description**

The MIB instance has misaligned vertical strap.

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets, or update P/G mesh in top-level design.

---

## MIB-215

(warning) MIB instance %s does not have horizontal straps, but MIB instance %s contain horizontal PG straps.

**Description**

One MIB instance does not contain horizontal PG straps, but the other has horizontal PG straps.

---

## MIB-216

(warning) MIB instance %s does not have vertical straps, but MIB instance %s contain vertical PG straps.

**Description**

One MIB instance does not contain vertical PG straps, but the other has vertical PG straps.

---

## MIB-217

(warning) MIB instances %s and %s are not aligned on cell row. Found misaligned cell row %s at %s %.3f in instance %s.

Feedback

**Description**

Site rows in two MIB instances do not match. This will create errors in MIB block implementation.

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets.

---

## MIB-218

(warning) MIB instances %s and %s are not aligned on cell site. Found misaligned cell site in cell row %s at %s %.3f in instance %s.

**Description**

Cell site in two MIB instances do not match. This will create errors in MIB block implementation.

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets.

---

## MIB-219

(error) There is no cell site in cell row %s at %s %.3f in instance %s.

**Description**

There is no cell site in cell row in MIB instance. This will create errors in MIB block implementation.

**What Next**

Create cell row with cell site or not remove cell site in cell row.

---

## MIB-220

(warning) Track %s's direction is not same as prefered direction %s.

**Description**

Wire track do not follow the prefered direction.

**What Next**

Check the prefered direction.

Feedback

## MIB-221

(warning) MIB instances %s and %s are not aligned on wire track. There is track %s that mask is %s on layer %s at location (%s, %s) in %s direction to go through MIB instance %s's boundary edge %s, while there is no same mask track on layer %s at location (%s, %s) in %s direction to go through MIB instance %s's boundary edge %s.

**Description**

Wire tracks in two MIB instances do not match. This will create errors in MIB block implementation.

**What Next**

Move or re-shape the MIB blocks with correct dimension and offsets.

## MIB-301

(info) Reference design %s has no associated block grid.

**Description**

There is no block grid associated with the specified reference design.

**What Next**

Please check if set_block_grid_references was run successfully to associate the reference design with any block grid.

## MIB-302

(info) The PG patterns are not symmetric with respect to %s axis which restricts the grid's allowed orientations.

**Description**

This is an informational message.

**What Next**

If the situation is expected, nothing needs to be done. If you expect symmetric PG pattern, please check your PG pattern/strategy settings.

## MIB-303

(info) The site rows are not symmetric with respect to %s axis which restricts the grid's allowed orientations.

Feedback

**Description**

This is an informational message. When a neighboring row is flipped, it makes the site rows symmetric. When all the rows are of the same orientation, it is not symmetric.

**What Next**

If the situation is expected, nothing needs to be done. If you expect symmetric site rows, please check your site row settings.

# ML

## ML-001

(error) Too few clustered rDRC grids in label extraction; training will fail.

**Description**

estimate_routability found too few clustered rDRC grids in label extraction; training will fail.

**What Next**

Examine the drawing file in mlpao/train/tLabel.draw.<stage>.<design>.nr.csv Pick designs that show more than 5 clustered rDRC grids in the drawing file (this can be told by #lines with non-negative cluster indices in the last column).

# MLUTIL

## MLUTIL-001

(error) Failed to '%s'.

**Description**

You receive this error message when something is wrong in MLUTIL.

**What Next**

Fix your input and re-run.

## MLUTIL-002

(error) Failed to initialize IPC service %s

Feedback

**Description**

You receive this error message when IPC service cannot be initialized.

---

## MLUTIL-003

(error) Cannot create log directory in %s! Please check permission.

**Description**

You receive this error message when directory cannot be created.

**What Next**

Check working directory writing privilege

---

## MLUTIL-004

(error) Python file %s is not found!

**Description**

You receive this error message when Python file cannot be found.

**What Next**

Provide correct path to Python file.

---

## MLUTIL-005

(error) ML is not available in this platform!

**Description**

You receive this error message when your are running on a platform that does not have machine learning capability.

**What Next**

Run in a machine that has Python and machine learning packages.

---

## MLUTIL-006

(error) Please specify the python settings!

**Description**

You receive this message due to the lack of the python settings in mlutil module.

Feedback

**What Next**

Please Specify the python settings.

---

## MLUTIL-007

(warning) The path of shared library is missing.

**Description**

You should specify the shared libary path in product setup.

**What Next**

Please Specify the shared library path.

---

## MLUTIL-008

(error) The cmlp_root path setting is not correct. Please set it by environment variable SYNOPSYS_CMLP_INSTALL_ROOT.

**Description**

The CMLP root path is missing.

**What Next**

Please Specify the CMLP root path by environment variable SYNOPSYS_CMLP_INSTALL_ROOT.

---

## MLUTIL-009

(error) The remote host %s is not reachable!

**Description**

For RSH protocol, the correct host name is needed.

**What Next**

Please check if the remote host can be reached.

---

# MP

---

## MP-001

(info) Pulling level %d cell %s from (%d, %d) to (%d, %d) with orientation %s.

Feedback

**Description**

The message shows that magnet_placement is pulling current level cell towards the magnet object with new location and orientation info.

**What Next**

legalize_placement, check_legality

---

## MP-002

(warning) Tracing stops at %s %s since %s.

**Description**

The message shows that magnet_placement tracing stops at the cell or the net due to the given reason.

**What Next**

report_cell, report_net, report_attributes, get_attribute

---

## MP-003

magnet_placement terminates because %s.

**Description**

The message shows that magnet_placement stops due to the reported reason.

**What Next**

report_cell, report_net, report_attributes, get_attribute

---

# MSE

---

## MSE-001

(error) Hierarchical path name '%s' is not allowed in module scoped editing.

**Description**

While directly editing the module during module scoped editing, hierarchical path names like A/B or A/B/C are not allowed as inputs for cells, nets, ports, terminals. Only the direct hierarchy within the module is editable.

Feedback

### MSE-002

(error) Can't remove module '%s' which is currently being edited.

**Description**

During module scoped editing, the module being edited can't be removed using remove_modules within the editing command's scope.

## MSG

### MSG-1445

(error) Bad filter pattern: '%s'

**Description**

The specified pattern length is too small.

**What Next**

Please specify pattern whose length is more than 3.

### MSG-1446

(error) Maximum count of suppressed patterns (%d) exceeded for tag '%s'

**Description**

The maximum count of suppressed patterns has been reached for the specified tag.

**What Next**

Please remove some patterns before specifying more suppressed pattern.

### MSG-2446

(warning) Filter pattern '%s' does not exist for message tag '%s'

**Description**

The specified pattern does not match with the suppressed patterns for specified tag.

**What Next**

Please refer to print_suppressed_messages to check and specify the correct pattern to be unsuppressed for the specified tag.

Feedback

## MSG-3026

(information) #prnt #trgr #lmt Tag Level Format (or last printed message)

### Description

Prints the header for the message data printed by MSG-3032 message.

```
#prnt means number of times message printed.
#trgr means number of times message triggered for printing.
#lmt means message limit.
Tag means message tag.
Level means message level.
Format means message format.
```

### See Also

- MSG-3032

## MSG-3032

(information) %5d %5d %2d %s

### Description

Prints all data on messages which are triggered or printed from the start of the session. Message data contains number of times message printed, number of times message triggered for printing, message limit, message tag, message level, message format (or last printed message).

### See Also

- MSG-3026

## MSG-3121

(info) set_msg: changed print limit per command of %d message%s matching %s to %d

### Description

Prints the information of the new per command limit of the message(s).

## MSG-3296

(info) Using new severity_first format for messages. e.g. 'Warning: <tag> ... '

Feedback

**Description**

The messaging format : 'Warning: <tag> ... ' will be used to print the messages. Means Severity of the message will be printed first followed by message tag and then message contents.

Example: Message CMD-005 will be printed as below: Error: CMD-005 unknown command 'incorrect_command'

---

## MSG-3446

(info) Filtering out any '%s' tagged output containing pattern '%s'

**Description**

The specified tag's output messages containing specified pattern will be suppressed.

**What Next**

Please use unsuppress_message command if output message containing specified pattern needs to be printed.

---

## MSG-3913

(info) %d out of %d %s messages were not printed due to limit %d %s

**Description**

This message prints the summary of the suppressed messages at the end of every source or mega command. This message will also be printed when we change the limit of a message which was suppressed.

The file information will be printed if this message is triggered before the end of the source file. The message will be printed as below:

3 out of 5 NDMUI-669 messages were not printed due to limit 2 (after 'set_message_info' at test.tcl:21) (MSG-3913) 2 out of 4 ATR-012 messages were not printed due to limit 2 (after 'set_message_info' at test.tcl:22) (MSG-3913)

And if this message is triggered after the completion of the source file. It will be printed as below:

1 out of 3 ATR-012 messages were not printed due to limit 2 (MSG-3913) 1 out of 3 NDMUI-669 messages were not printed due to limit 2 (MSG-3913)

---

## MSG-3915

(info) %d out of %d %s messages were not printed due to per command limit %d %s

Feedback

**Description**

This message gets printed if the per command limit is hit and global limit doesn't.

This message prints the summary of the suppressed messages at the end of every source or mega command. This message will also be printed when we change the limit of a message which was suppressed.

The file information will be printed if this message is triggered before the end of the source file. The message will be printed as below:

3 out of 5 NDMUI-669 messages were not printed due to per command limit 2 (after 'set_msg' at test.tcl:21) (MSG-3915) 2 out of 4 ATR-012 messages were not printed due to per command limit 2 (after 'set_msg' at test.tcl:22) (MSG-3915)

And if this message is triggered after the completion of the source file. It will be printed as below:

1 out of 3 ATR-012 messages were not printed due to per command limit 2 (MSG-3915) 1 out of 3 NDMUI-669 messages were not printed due to per command limit 2 (MSG-3915)

### MSG-3995

(information) %s

**Description**

Prints the machine information of the current run.

## MUX

### MUX-6091

(info) Identified %lu crossbars in module '%s'. %lu out of %lu potentially congested crossbars amongst these are candidates for mux tree implementation.

**Description**

This message signifies that the tool was able to identify some crossbar structures in a given module. A crossbar is a set of SELECT_OPs that have a set of common data inputs. Crossbar structures typically lead to congestion in circuits and can be synthesized to mux trees in congested designs to alleviate such congestion with some trade-off with area.

Feedback

# MUXEO

## MUXEO-001

(warning) %s:%d: One-hot signals not matched to AND/OR.

### Description

This message explains why a one-hot pragma in your RTL is not converted into a tree of MUX standard cells. To be matched, each one-hot signal must be ANDed with a data signal, and the output of the ANDs must be ORed together. The following shows RTL that will match.

//synopsys $onehot(one_hot) assign out = (({64{one_hot[0]}} & data0) | ({64{one_hot[1]}} & data1) | ({64{one_hot[2]}} & data2) | ({64{one_hot[3]}} & data3));

### What Next

You can safely ignore this warning because the RTL will be correctly implemented with AND/OR standard cells. If you want it converted into a tree of MUX standard cells, then rewrite the RTL so that each one-hot signal is ANDed with a data signal, and the output of ANDs are ORed.

# MV

## MV-001

(Error) Top power domain is not created yet.

### Description

This error occurs doing commit_upf if a top scoped power domain has not been created in the UPF constraints. All MV designs required a top power domain (a domain including the top scope /).

### What Next

Use 'set_scope /' to set the current scope to the topmost scope, and create a power domain with create_power_domain at that scope. Alternately, use 'create_power_domain -scope /' to create a power domain at the top scope.

### See Also

- create_power_domain
- set_scope

Feedback

## MV-002

(Error) Primary %s of domain '%s' is not specified.

**Description**

Primary power/ground of power domain is not specified, but is required.

**What Next**

Specify the primary power/ground for all the power domains.

**See Also**

- create_power_domain
- set_domain_supply_net

## MV-003

(Error) %s of explicit supply set '%s' is not resolved to supply net.

**Description**

Power/ground/nwell/pwell of explicit supply set is not resolved to supply net.

**What Next**

Resolve power/ground/nwell/pwell of all explicit supply sets to supply nets. Check if the supply nets are available in all the expected power domains. If this error message is about a pwell supply net, make sure that you do not incorrectly have the mv.upf.enable_nwell_only_support app-option set. If you did intend to use mv.upf.enable_nwell_only_support, no pwell supplies should be referenced in the UPF.

**See Also**

- set_domain_supply_net
- create_supply_set
- connect_supply_net

## MV-004

(error) Design's multi-voltage data is not ready yet. Please run commit_upf and make sure it completes successfully.

Feedback

### Description

This error occurs when placement or optimization is invoked, before UPF data has been successfully processed by commit_upf. IC Compiler II requires that commit_upf is run after all UPF information have been loaded to signal completion and verification of UPF intent.

### What Next

Execute commit_upf and clean up any errors it reports before proceeding.

### See Also

- commit_upf

---

## MV-005

(warning) PG pin '%s' is unconnected.

### Description

This message occurs when the specified PG pin of mapped cell is unconnected. One possible cause is that the supply net connection cannot be determined in power intent.

### What Next

Invoke 'connect_pg_net" command to connect the power and ground pin. Also, check the supply net connection of the PG pin.

### See Also

- connect_pg_net
- report_cell
- MV-009

---

## MV-006

(error) The %s pin '%s' is connected to %s net '%s'.

### Description

This message occurs when the specified PG pin is connected to a net of conflicting power and ground net type. One possible cause is that the PG pin is connected to a supply net of conflicting power and ground type in power intent.

### What Next

Check the pin connection. Also check the supply net connection in power intent.

Feedback

**See Also**

- report_cell
- report_net
- MV-043

---

## MV-007

(error) PG net '%s' has no valid PG source(s) or driver(s).

**Description**

This message occurs when the specified PG net is not connected to any valid pg source(s) or driver(s) in the netlist. One possible cause is that the supply net does not have a valid supply source or driver in power intent and so the resulting PG netlist created by create_pg_net also does not have any valid PG source(s) or driver(s).

**What Next**

Check and make sure the power and ground drivers exist in the PG netlist. If PG net drivers already exist, please run the 'connect_pg_net' command to connect them. Also, check the supply net connection of the PG drivers to make sure they are connected to the correct supply net(s) in power intent.

**See Also**

- report_net
- connect_pg_net
- MV-011

---

## MV-008

(error) PG net '%s' is not defined in UPF as a supply net.

**Description**

This message occurs when the corresponding supply net is not defined in UPF for the power and ground net.

**What Next**

Check the supply nets defined in the correct domain and scope in the power intent.

Feedback

**See Also**

- report_supply_nets
- create_supply_net

---

## MV-009

(error) Supply net connection cannot be determined for PG pin '%s'.

**Description**

This message occurs when the tool cannot determine the supply net connection of the power and ground pin.

The power and ground connection of the PG pin is required to properly power up the cell. Without the supply net connection of the PG pin, the tool will not able to connect the proper PG net to the PG pin. Also, certain operations, including optimization, implementation of tie-off connections etc..., will be skipped for any signal pins with unknown related supply net connection.

**What Next**

Specify additional power intent using the connect_supply_net, set_isolation, set_retention, and create_power_switch commands.

**See Also**

- report_cell
- connect_supply_net
- set_isolation
- set_retention
- create_power_switch

---

## MV-010

(error) PG pin '%s' is connected to PG net '%s' instead of supply net '%s' as specified in power intent.

**Description**

This message occurs when the PG pin is connected to a PG net different from what is specified in power intent.

Feedback

### What Next

Check the supply net and PG net connections of the PG pin. Invoke resolve_pg_nets command to resolve the conflicts between power intent and PG netlist.

### See Also

- report_net
- report_power_domain
- resolve_pg_nets

---

## MV-011

(error) Supply net '%s' does not have any valid supply source(s) or driver(s) in power intent.

### Description

This message occurs when the specified supply net is not connected to any valid supply source(s) or driver(s). A valid supply source or driver can be a supply port or leaf PG pin that drives the supply net.

### What Next

Check the supply net connections in power intent.

### See Also

- connect_supply_net
- report_supply_nets

---

## MV-012

(warning) %s '%s' (supply net '%s' [%s]) cannot drive load pin '%s' (supply net '%s' [%s]) due to voltage difference.

### Description

This message occurs when the voltage difference of driver supply net and load supply net is larger than the voltage threshold. This can happen when the driver supply net and the load supply net have different voltage values in power state table or the port states definitions are incomplete.

Feedback

### What Next

- Check the voltage values of the two supply nets.
- Also, consider to change the voltage threshold if the voltage difference is within acceptable tolerance.
- Check *analyze_mv_design -level_shifter* to report issues that prevent Level Shifter insertion.
- Check *analyze_mv_feasibility* to know why Enabled Level Shifter cells cannot be use for insertion.
- Please check Level Shifter supply availability in Power Domains where cell is expected to be inserted.
- Check if there is a dont_touch present on the net requiring a Level Shifter.
- To debug Enabled Level Shifter issues, check *report_mv_path* for any Isolation or Level Shifter strategy that may apply on the path.

### See Also

## MV-014

(error) Enable pin '%s' of isolation cell '%s' is not connected to any driver(s).

**Description**

This message occurs when the enable pin of the isolation cell is not connected to a net or the net has no driver(s).

**What Next**

Check the pin connection.

**See Also**

- report_cell
- report_net

Feedback

## MV-015

(warning) Found redundant level shifter '%s'%s%s.

### Description

This message occurs when the level shifter exists but it is not required. This can happen when the driver(s) and the load(s) of the level shifter have no voltage difference or the input supply net and output supply net of a dual-rail level shifter have no voltage difference. A level shifter is also not required when it is connected to ground net or tie-low cell. Presence of level shifter cells triggers design constraining, and this may result in QOR loss in the final netlist.

### What Next

Check the supply net connections and their voltage values.

### See Also

- get_related_supply_nets
- report_pst
- report_cell
- report_net

## MV-016

(error) Save and restore pin '%s' of retention cell '%s' is not connected to any driver(s).

### Description

This error occurs when the save and restore pin of the specified retention cell is not connected to a net or a net that has a driver(s).

### What Next

Check the pin connection for a driver manually using the report_nets -connections <net_name> command or try using the all_fanin -flat -to <net_name> command to help locate the source of the subcircuit.

### See Also

- report_cells
- report_nets
- all_fanin

Feedback

## MV-019

(error) Power domain '%s' does not have any primary voltage area.

### Description

This message occurs when primary voltage area of the specified power domain is not defined. The power and ground supplies of primary voltage area of a power domain must match the primary power and ground supplies of the domain.

### What Next

Check the voltage area(s) of the power domain and their power and ground supplies.

### See Also

- report_power_domain
- report_voltage_areas

## MV-020

(error) The backup supply net '%s' of %s cell '%s' is not more always-on than the primary supply net '%s' of the cell.

### Description

This message occurs when the supply net of backup PG pin of the isolation cell or retention cell is not more always-on than the supply net of the primary PG pin. For isolation and state retention, the backup supply net should be more always-on than the primary supply net.

### What Next

Check the supply net connections of the PG pins. Also check the power states of the two supply nets.

### See Also

- report_cell

## MV-021

(information) Total %d %s cell(s) in the design.

Feedback

### Description

This message is printed by commit_upf and associate_mv_cells, and shows the total number of different categories of power management cells, like isolation or level-shifters or repeater, that have been detected in the design.

### What Next

This is an information-only message. No action is required.

### See Also

- commit_upf
- associate_mv_cells

---

## MV-022

(warning) %s of supply port '%s' is unconnected in power intent.

### Description

This message occurs when the inside or outside connection of the supply port is open in power intent. Unless the supply port is not intended to be implemented, a supply port should be properly connected to supply net(s).

### What Next

Check the supply net connections of the supply port in power intent.

### See Also

- connect_supply_net
- report_supply_ports

---

## MV-023

(warning) Found redundant isolation cell '%s'%s.

### Description

This message is printed when an isolation cell exists but it is not required. This can happen when the isolation cell is connected to its driver(s) and relatively power down fanout(s). Presence of isolation cells triggers design constraining, and this may result in QOR loss in the final netlist.

Feedback

### What Next

Please check always-on relationship between the driver(s) and fanout(s) of the isolation cell.

### See Also

- report_net
- report_pst

---

## MV-024

(error) The control pin '%s' of switch cell '%s' is not connected to any driver(s).

### Description

This message occurs when the control pin of the specified switch cell is not connected to a net or the net has no driver(s).

### What Next

Check the pin connection.

### See Also

- report_cell
- report_net

---

## MV-025

(error) The output supply net '%s' of the switch cell '%s' is same as its input supply net.

### Description

This message occurs when the input and output supply net of the specified switch cell is identical. The output supply net of a switch cell should be a switchable supply, and it should be less always-on than the input supply net.

### What Next

Check the supply net connections of the switch cell.

### See Also

- report_cell

Feedback

## MV-026

(error) The output supply net '%s' of the switch cell '%s' is not less always-on than its input supply net '%s'.

### Description

This message occurs when the output supply net of the specified switch cell is not less always-on than its input supply net. The output supply net of a switch cell should be a switchable supply, and it should be less always-on than the input supply net.

### What Next

Check the supply net connections of the switch cell.

## MV-027

(warning) The tie-off connection '%s' has not been implemented.

### Description

This message occurs when 1'b1 or 1'b0 has not been implemented as a tie cell or PG net. Constant nets that are floating or connected to unmapped pins only are excluded.

### What Next

Ensure that related supply net of constant pins can be determined. Use connect_pg_net to connect tie-off pins in either automatic or manual mode.

### See Also

- report_net
- connect_pg_net

## MV-028

(information) Connecting source '%s' to '%d' cells in '%s' mode.

Feedback

### Description

An informational message from connect_power_switch, indicating how many connections have been made from the source of the power switch enable signal to the power switches. It also indicates which style of connection was used (HFN, daisy-chain, clustering or fishbone).

### What Next

Optionally check that the expected number of power switch connections have been made by connect_power_switch.

### See Also

- connect_power_switch
- create_power_switch
- create_power_switch_array
- create_power_switch_ring

---

## MV-029

(Error) The argument '%s' of option -source is not a valid '%s' pin.

### Description

The pin or port specified as the source of this switch network is not of correct type or direction. For example, an input pin of a leaf-level cell cannot be the source for the control signal of the power switch network.In case of clustering mode, the command errors out for hierarchical pins with no location, input pins and output ports.

### What Next

Please re-issue the command with a valid pin or port as source.

### See Also

- connect_power_switch

---

## MV-030

(warning) Skipping cell %s, %s.

Feedback

### Description

This warning message occurs if a given cell:

0

is not a switch cell.

0

is same as the cell of the source pin.

0

has multiple sleep/ack pins but none defined using -lib_pin.

0

has no valid sleep/ack pins.

0

has sleep/ack pins already connected to some other nets.

### What Next

Please check the cell for the above conditions and re-issue the command.

### See Also

- connect_power_switch

---

## MV-031

(error) Error in argument '%s'. '%s'.

### Description

This is an error message indicating syntax errors using the connect_power_switch command. For example, it may be issued if an enumerated option like -mode or -direction is giving an illegal value. It may also be issued if certain options are used in combination that are disallowed together. It is also issued if the same pin is given for the -source and -ack_out options, as well as many other situations.

### What Next

Review the specific information given by the MV-031 error message and refer to the connect_power_switch man page for complete information about using the command.

### See Also

- connect_power_switch

Feedback

## MV-032

(error) None of the cells in the object_list have a valid switch pin of coarse-grain power switch cell.

### Description

This error occurs when connect_power_switch command is not able to find a valid switch pin of coarse-grain power switch cells to connect to.

### What Next

Check the -object_list. The list should only contain a valid list of coarse-grain power switch cells with sleep pins and (or) ack pins.

The sleep pin (or enable pin) of a coarse-grain switch cell will have a switch_pin attribute in liberty (.lib file).

### See Also

- connect_power_switch

## MV-033

(error) Primary PG pin '%s' and backup pin '%s' of the cell '%s' are connected to the same PG net '%s'.

### Description

This message occurs when the primary PG and backup PG pins of the specified cell are connected to the same power and ground net. One possible cause is that the PG pins are connected to the same supply net in power intent.

### What Next

Check the net connection of the PG pins. Also check the supply net connection of the pins in power intent.

### See Also

- report_cell
- MV-101

## MV-034

(error) Cannot find power switch %s.

Feedback

### Description

This message occurs when either the create_power_switch_array or create_power_switch_ring commands are used and the tool cannot find the specified power switch strategy. Power switch strategy is created by UPF command create_power_switch.

### What Next

Check that the create power switch strategy defined in the UPF matches that being used in the create_power_switch command.

### See Also

- create_power_switch
- create_power_switch_array
- create_power_switch_ring

---

## MV-035

(error) Must specify -power_switch.

### Description

This message occurs when the option -power_switch is not specified for create_power_switch_array or create_power_switch_ring. -power_switch is required to insert and associate switch cells.

### What Next

Specify the power switch strategy.

### See Also

- create_power_switch_array
- create_power_switch_ring

---

## MV-036

(error) Cannot specify negative pitch value.

### Description

The pitch value for power switch array must be non-negative as it specifies the distance between centers of power switches or power switch patterns. When they are zero, it indicates one row/column.

Feedback

### What Next

Specify positive pitch value.

### See Also

- create_power_switch_array

---

## MV-037

(error) Cannot specify more than one voltage area.

### Description

User can only specify one voltage area at a time when creating a power switch array or ring.

### What Next

Specify only one voltage area as input.

### See Also

- create_power_switch_array
- create_power_switch_ring

---

## MV-038

(error) Cannot find any lib cell mapped to power switch %s

### Description

This error happens when tool cannot find the corresponding physical lib cells that are mapped to the specified power switch. Usually, one power switch should be mapped to at least (can be more) than one lib cells in the design by the *map_power_switch* command.

### What Next

Check your UPF setting.

### See Also

- create_power_switch_array
- create_power_switch_ring
- map_power_switch

Feedback

## MV-039

(error) Cannot specify more than one lib cell

### Description

This error happens when user specifies more than one lib cell to the -lib_cell option of *create_power_switch_ring* or *create_power_switch_array* command. This option can only take one lib cell at a time.

### What Next

Specify only one lib cell to the -lib_cell option of the command.

### See Also

- create_power_switch_ring
- create_power_switch_array

## MV-040

(error) Voltage area %s does not define power switch strategy %s.

### Description

This warning message occurs in the *create_power_switch_ring* or *create_power_switch_array* command when the power domain of user-specified voltage does not define user-specified power switch strategy.

### What Next

Check your command option and UPF file to ensure the power switch strategy defined in the UPF matches that being passed to the create_power_switch_array or create_power_switch_ring command that is being used.

### See Also

- create_power_switch
- create_power_switch_array
- create_power_switch_ring

## MV-041

(Error) Failed to get load pin/ports.

Feedback

### Description

You need to specify at least one load pin or port.

### What Next

Specify at least on load pin or port with the -loads option.

---

## MV-042

(warning) Unable to derive power and ground type for supply net %s.

### Description

This warning message occurs when the tool cannot determine if the specified supply net and its connected supply_nets through supply ports or power switches are used as power supply nets or ground supply nets.

A supply net and its connected supply nets should be connected to power domains or domain elements and used for one of the following connections:

- `Primary power or ground net of power domain(s)`
- `Explicit connections on power or ground pins of cell(s)`
- `Related supply nets of power or ground pins of cell(s)`
- `Isolation power or ground supply`
- `Retention power or ground supply`
- `Power or ground function of a supply set`

### What Next

Check the UPF constraints and make sure the supply net or its connected supply nets are connected to a domain or domain elements.

### See Also

- set_domain_supply_net
- connect_supply_net
- set_related_supply_net
- set_isolation
- set_retention

Feedback

- create_supply_set
- create_power_switch

---

## MV-043

(error) Supply net %s and its connected supply net(s) are used as both power and ground supply net.

### Description

This error occurs when a supply net and its connected supply_nets through supply ports or power switches are used as power supply net for some power domain(s) or domain element(s), but also as ground supply net for some other power domain(s) or domain element(s).

### What Next

Check all UPF connections and constraints using this supply net and its connected supply nets, and make sure all of them are used only as power supply net or ground supply net.

### See Also

- set_domain_supply_net
- connect_supply_net
- set_related_supply_net
- set_isolation
- set_retention
- create_supply_set
- create_power_switch

---

## MV-044

(Error) Missing required options for check_bufferability.

### Description

check_bufferability can be called in two ways: using both the -net and -voltage_area options together, or alternately using all three of the -driver, -loads, and -voltage_area options together.

Optionally, -verbose can be used with either combination to get additional detailed information about the bufferability.

Feedback

### What Next

Specify all required options to avoid this error.

### See Also

- check_bufferability

---

## MV-045

(error) The input supply net '%s' of the level shifter '%s' is less always-on than its output supply net '%s'.

### Description

This message occurs when the input supply net of the level shifter is less always-on than its output supply net.

### What Next

Check the power state table for the referenced supply nets. You can use the -supplies option with report_pst command to focus only on the referenced supply nets. If the supplies are correct for the net crossing the power domain, than an isolation cell should precede the level shifter to protect the more always-on logic. The commands create_mv_cells -isolation can be used to implement isolation cells based on define isolation strategies in the UPF.

### See Also

- report_cells
- report_pst

---

## MV-046

(error) Level shifter '%s'%s of level shifter type '%s' is incompatible with the voltage conversion from %s to %s.

### Description

This message occurs when the type of level shifter library cell is incompatible with the voltage conversion performed by the specified level shifter.

### What Next

Check the supply nets of the specified level shifter. Also check the level shifter type of the library cell.

Feedback

### See Also

- report_cell

---

## MV-047

(warning) %s voltage %s of %s '%s'%s does not satisfy the voltage range %s defined in the library.

### Description

This message occurs when the level shifter library cell or macro input pin with level shifter inside cannot satisfy the voltage shifting range.

### What Next

Check the supply nets of the specified level shifter. Also, check the voltage range of the library cell.

### See Also

- report_cell

---

## MV-048

(error) Neither driver nor load supply can be determined. Failed to analyze bufferability.

### Description

Errors have occurs during check_bufferability, as supply of driver and/or loads cannot be determined.

### What Next

Please make sure that you can get related supply information from both driver and loads. Ensure you specified a valid leaf signal driver pin, signal driving port, set of leaf signal load pins or set of leaf signal load ports.

### See Also

- all_fanin
- all_fanout
- all_connected

Feedback

## MV-049

(Error) The argument '%s' of option -ack_out is not a valid '%s' pin.

### Description

The pin or port specified as the acknowledge out of this switch network is not of correct type or direction. For example, an output pin of a leaf-level cell may have been specified, which cannot be connected to the output ack_out pin of a power switch cell.

### What Next

Please re-issue the command with valid pin or port connected to ack_out.

### See Also

- connect_power_switch

## MV-050

(error) %s related supply net(s) of signal pin '%s' cannot be determined.

### Description

This message occurs when the tool cannot determine the related supply net(s) of the specified signal pin.

The related supply nets of a signal pin are derived from the supply net connections of its related PG pins. If the related PG pins are not properly defined for the signal pin or their supply net connections in power intent cannot be determined, then the tool will not be able to determine the related supply net connections for the signal pin.

### What Next

Check the related power and ground pins of the specified signal pin. Also check the supply net connections of its related PG pins.

### See Also

- report_cell
- set_domain_supply_net
- connect_supply_net
- MV-009

Feedback

## MV-051

(warning) '%s' is already connected to net '%s'. It might be disconnected.

### Description

This message is printed when a port or pin specified for sleep or ack out is already connected to a net. In this case, the tool might disconnect the original net and reconnect the port or the pin to the new net.

### What Next

Typically this message occurs in relation to ack ports which are usually hierarchical. When connecting these ack ports/nets they can get disconnected or reused in some cases. Please check the connections of the specified port or pin in this case.

### See Also

- connect_power_switch

## MV-052

(error) -net cannot be specified together with -driver or -loads option.

### Description

This error occurred because you have specified incompatible options with the command check_bufferability.

### What Next

Please refer to the manpage of check_bufferability command for usage information and examples.

## MV-053

(warning) Retention cell association skipped the element '%s' of strategy '%s' in power domain '%s' because %s.

### Description

This message indicates that the element of retention strategy was skipped by retention cell association.

### What Next

Check the retention strategy.

Feedback

---

## MV-054a

(information) Total %d level shifter cells have been %s incrementally.

**Description**

This message shows the number of level shifter cells that have been inserted or removed incrementally during optimization flow.

**What Next**

This is an information-only message. No action is required.

---

## MV-054

(information) Total %d %s cells have been inserted.

**Description**

This message shows the number of each type of mv cells (eg, level shifters, isolation cells, repeater cells, etc) that have been inserted with the defined strategies.

**What Next**

This is an information-only message. No action is required. Ensure the expected number of each type was inserted. Otherwise, the strategies might have to be adjusted in the UPF.

**See Also**

- create_mv_cells

---

## MV-055

(information) Total %d %s%s%s been converted from %s-rail to %s-rail.

**Description**

This message shows the number of buffers or inverters that have been converted from single-rail to dual-rail, and vice-versa.

Feedback

### What Next

This is an information-only message. No action is required.

### See Also

- create_mv_cells

---

## MV-057

(information) Total %d enable level shifter cells have been inserted to replace isolation cells.

### Description

This message shows the number of enabled level shifters that have been inserted during Level Shifter insertion, with the same number of isolation cells being replaced by these enabled level shifters.

### What Next

This is an information-only message. No action is required.

### See Also

- create_mv_cells

---

## MV-058a

(error) There are some instantiated single rail cells inside an AO Block Domain without any connect_supply_net, and the primary PG pin connection of the cells is different from the domain main rail supply.

### Description

This message occurs when a single rail cell without explicit connect_supply_net is in the AO Block Domain. If a user expects to connect the primary PG pin with the main rail of the AO Block Domain, the user needs to specify connect_supply_net command explicitly. If a user expects to connect the primary PG pin with the primary supply of the AO Block Domain, the user needs to re-map the single rail cell to the dual rail cell.

### What Next

Check the supply net of cell's primary power and ground pin. Also check the main rail and primary of the power domain. If a user expects to connect the primary PG pin with the primary supply of the AO Block Domain, use "create_mv_cells -map_ao_block" to fix.

Feedback

## MV-058

(warning) Primary PG pin '%s' is connected to supply net '%s' that is different from the primary supply net '%s' of the voltage area.

### Description

This message occurs when the specified primary power and ground pin is connected to a supply net that is different from the primary supply net of the voltage area.

Feedback

### What Next

Check the supply net of primary power and ground pin. Also check the voltage area of the cell.

### See Also

- report_cell
- report_voltage_areas

---

## MV-059

(warning) Isolation cell '%s'%s has been inserted and associated with isolation strategy '%s' but it is not required.

### Description

This message is printed when an Isolation Cell exists due to the specified isolation strategy, but it is not required. This can happen when the Isolation Cell is connected to its driver(s) and relatively power down fanout(s). Presence of isolation cells triggers design constraining, and this may result in QOR loss in the final netlist.

### What Next

- Please check always-on relationship between the driver(s) and fanout(s) of the Isolation Cells.
- Check the isolation strategy associated with the cell.
- Please run *report_mv_path* to report strategies that apply to the path.
- As Tool inserts Isolation Cells according to the defined strategy, modify strategy if an Isolation Cell is not required for certain paths.

### See Also

- report_power_domain
- report_net
- report_pst
- report_mv_path
- report_mv_cells

Feedback

## MV-060

(warning) %s '%s' [supply net '%s', power state '%s'] is less always-on than the load pin '%s' [supply net '%s', power state '%s'] while "-no_isolation" of isolation strategy is specified.

### Description

This message occurs when the supply net of the specified driver pin or PG net is less always-on than the related supply net of the load pin and an isolation cell is missing because "-no_isolation" option of isolation strategy is specified. An isolation cell is required to isolate the signal path if the driver of the net is less always on or unrelated to the load pin.

### What Next

Check the power states of the supply nets. Also, check the isolation strategy.

### See Also

- report_power_domain
- report_net
- report_pst

## MV-062

(warning) Supply net connection cannot be determined for %s PG pin '%s'.

### Description

This message occurs when the tool cannot determine the supply net connection of the power and ground pin.

The power and ground connection of the PG pin may not be required to properly power up the cell. However, if the specified PG pin is the related power or ground pin of any signal pins of the cell, the tool will not be able to determine the related supply net of those signal pins. As a result, certain operations, including optimization, implementation of tie-off connections etc..., will be skipped for those signal pins.

### What Next

Specify additional power intent using the connect_supply_net, set_isolation, set_retention, and create_power_switch commands.

Feedback

### See Also

- report_cell
- connect_supply_net
- set_isolation
- set_retention
- create_power_switch

## MV-066

(error) The propagated clamp value of isolation cell '%s'%s to power domain boundary pin '%s' is '%s' but it differs from the clamp value '%s' specified in the isolation strategy '%s' of power domain '%s' at that power domain boundary pin.

### Description

This message is printed when the propagated clamp value at the power domain boundary pin is different from the clamp value specified in the isolation strategy applied to the specified power domain boundary pin.

When isolation is enabled, the clamp value of the isolation cell is propagated to the power domain boundary through any buffers and/or inverters; the propagated logic value from the isolation cell to the power domain boundary pin should match the clamp value specified in the isolation strategy.

### What Next

Please check the clamp value of both the isolation cell and the isolation strategy. Also, please check the connections of the isolation cell to the power domain boundary pin and make sure the logic value is not inverted unintentionally.

Feedback

### See Also

- report_power_domain
- report_cell

- report_cell

---

## MV-071

(warning) The isolation cell '%s' is not associated with any isolation strategies.

**Description**

This message is printed when the specified Isolation cell is not associated with any Isolation strategies.

The tool cannot associate Isolation Cells with Isolation strategies when there is any discrepancy between them. In such case, supply net connections of the Isolation Cells cannot be automatically derived by the tool. While it is sufficient to continue the implementation flow if supply net connections are explicitly specified, Tool will not be able to check and ensure that the Isolation Cells are properly inserted and consistent with the Isolation strategies intended for the cells.

**What Next**

- Run *analyze_mv_feasibility -isolation -format html* to report detailed reasons for failed association.
- Check the related Isolation strategy and the association of the Isolation Cell.
- Check *report_mv_path* to report supply availability, inputs, outputs, drivers, sinks, associated strategies and corresponding power domain for MV cells.

## MV-072

(information) The level shifter '%s' is not associated with any level shifter strategies.

Feedback

### Description

This message is printed when the specified level shifter is not associated with any level shifter strategies.

When the tool cannot associate level shifter cells with level shifter strategies, it might be caused by one of these reasons: level shifter cell is not inserted based on any strategy, it might purely be inserted to fix the voltage shifting automatically; or the level shifter is inserted base on certain strategy, but the nestlist got changed without introducing any extra violation. In any case, existing power/ground supply nets of the cell are maintained. No association will pose no problem in downstream tools.

### What Next

This is an information-only message. No action is required.

## MV-079

(information) Message '%s' limit (%d) exceeded. Remainder will be suppressed. The limit can be changed with '-max_message_count' option.

### Description

This message indicates that the message limit has been exceeded and the remainder will be suppressed.

### What Next

Run check_mv_design with different value for the -max_message_count option.

### See Also

- check_mv_design

---

## MV-080a

(information) Total %d %s violations.

Feedback

### Description

This message, printed by MV design critical check, gives the total number of a specific type of MV violation.

### What Next

No further action is required.

### See Also

- MV-009

---

## MV-080

(information) Total %d %s violations.

### NAME

*MV-080* (warning) Total %d %s violations.

### Description

This message, printed by check_mv_design, gives the total number of a specific type of MV violation. All violations may not be printed in the report. By default, only 20 of each type of violation are printed. This number can be controlled by the check_mv_design -max_message_count option. To see details of every violation, use check_mv_design -max_message_count all.

### What Next

No further action is required. Optionally, increase the number of printed violations to see more details by using check_mv_design -max_message_count.

### See Also

- check_mv_design

---

## MV-081

(information) Total %d out of %d %s cells have been associated with %s strategy(s).

### Description

This message shows the number of mv cells out of total same type cells in design that have been associated with the strategy. Association is the process of pairing UPF power management strategies (i.e. level shifting, isolation, repeater, etc.) with existing power management cells in the design.

Feedback

### What Next

This is an information-only message. No action is required if the number of associated cells is expected. If some cells are not associated, it is an indication that some part of the defined strategy is not matching with the instantiated power management cell. For example, if the related supplies of a level shifter input and output pin are electrically equivalent, the level shifter will not get associated because voltage differential is needed. The related supplies of a pin can be checked with the get_related_supply_nets command. In order for any cell to get automatically associated, all of the defined UPF constrains associated with that strategy need to match with the implementation of the power management cell. Any discrepancy can lead to an unassociated cell. The following is a partial list of checks performed during automatic association of power management cells:

Level shifters -map cells against instance lib cell -physical location vs. strategy location -related supplies of load and driver -voltage differential against threshold and level shifter rules -included and excluded element list associated with strategy

Isolation cells -map cells vs. instance lib cell -physical location vs. strategy location -related supplies of load and driver and enable pin vs. strategy -connection to the control signal -included and excluded element list associated with strategy

Retention registers -map cells vs. instance lib cell -location vs. power domain -connection to the save and restore signals -associated supply sets -included and excluded element list associated with strategy

Power switches -map cells vs. instance lib cell -location vs. power domain (i.e. voltage area) -connection to sleep and acknowledge pins -related supplies of input, output and control ports -associated supply sets -instances associated with strategy

Repeater cells -location vs. power domain -related supplies of output vs. strategy -included and excluded element list associated with strategy

Association can be manually performed using the set_power_strategy_attribute command. If automatic association fails and manual association is used, check_mv_design report should be used to validate the newly associated cell is not failing multi-voltage checks. If a power management cell is associated with a UPF strategy, the association will be registered under cell attribute power_strategy.

Some useful commands for debugging association issues are: -get_related_supply_net for checking driver and load related supplies -all_fanin or all_fanout for tracing pin connectivity to control signals -report_cell -power for seeing PG pin connectivity of a cell -report_mv_path -full for understanding the connectivity of the multi-voltage path

## MV-083

(warning) Cell '%s' in bias power domain '%s' is mapped to non-bias library cell "%s".

**Description**

This warning message occurs when a cell in a bias power domain is mapped to a non-bias library cell.

**What Next**

Run report_mv_lib_cells to check if the lib-cell has bias pins modeled in the library. Check the library of the lib-cell.

**See Also**

- report_cell

---

## MV-084

(error) Hierarchical pin %s is passed in as either driver or load. Failed to perform check_bufferability.

Feedback

### Description

A hierarchical pin was incorrectly given as input to check_bufferability.

### What Next

Please make sure that you pass only leaf pins or top ports as driver or loads.

---

## MV-085

(warning) The %s supply of supply set '%s' is less always-on than its %s supply.

### Description

is less always-on than its power or ground supply. This warning message occurs because the bias function of the specified supply set is less always-on than its power or ground function.

### What Next

Ensure the bias function of the specified supply set is more or equally always-on than its power or ground function.

### See Also

- report_supply_net
- report_pst

---

## MV-086

(error) The related supply net '%s' of the enable pin of level shifter '%s' is less always-on than its output supply net '%s'.

### Description

This message occurs when the related supply net of level shifter enable pin is less always-on than output supply net of the level shifter.

### What Next

Check the power states of the supply nets.

### See Also

- report_cell
- report_pst

Feedback

## MV-087

(error) There are no level shifter implemented and associated with level shifter strategy '%s' in power domain '%s' which is specified "-force_shift".

### Description

This message occurs when level shifter strategy is specified "-force_shift" but no level shifter inserted.

### What Next

Check the level shifter strategy.

## MV-088

(error) The Driver %s '%s' [supply net '%s', power state '%s'] of enable signal of isolation cell '%s' is less always-on than the load pin '%s' [supply net '%s', power state '%s'] of the cell.

### Description

This message occurs when the related supply net of the enable signal is less always-on than the related supply net of the load pin of an isolation cell. An isolation cell is required to isolate the signal path if the signal is less always on or unrelated to the load pin.

### What Next

Check the power states of the supply nets.

### See Also

- report_net
- report_pst

Feedback

## MV-089

(error) The Driver %s '%s' [supply net '%s', power state '%s'] of data input signal of %s isolation cell '%s' is less always-on than the supply net '%s' [power state '%s'] of the cell.

### Description

This message occurs when the related supply net of data input signal is less always-on than the supply net of the nor/nand style isolation cell. This will cause electrical violation due to power-ground short.

### What Next

Check the power states of the supply nets.

### See Also

- report_net
- report_pst

## MV-096

(error) The %s pin '%s' is tied to the primary %s pin '%s' of the cell but is instantiated in power domain '%s' where the primary %s and primary %s supply nets are different.

### Description

This message occurs when a bias pin is tied to the primary power or ground pin but is instantiated in a power domain where the primary nwell/pwell supply net is different from the primary power or ground supply net.

### What Next

Check the primary power/ground and nwell/pwell supply nets of the power domain. Also, check the supply net connection of the pin.

### See Also

- report_cell
- report_power_domain

## MV-097

(error) There is a forward/reverse bias violation between the backup power pin '%s' [supply net '%s'] and its related bias pin '%s' [supply net '%s'] of a shared-well cell.

Feedback

### Description

This message occurs when there is a voltage difference between the backup supply net and its related bias supply net of a shared-well cell. The voltage difference causes forward/reverse bias violation between the two pins.

### What Next

Check the supply net connections and supply voltages of the backup PG pin and its related bias pin.

### See Also

- report_cell
- report_pst

---

## MV-099

(warning) Supply state(s) has not been defined on the %s '%s'.

### Description

This message occurs when supply states are not defined on the specified supply net or supply port. The tool will assume that any possible combinations of states are possible, and isolation violations or level shifter violations will be flagged between signal pins that are powered by supply nets/ports without any defined supply states.

### What Next

Please check connectivity of the supply net/supply port or define its legal supply states.

### See Also

- add_port_state
- add_power_state
- report_power_domains
- report_pst

---

## MV-100

(error) cannot find voltage area %s.

### Description

This message occurs when the voltage area specified cannot not be found.

Feedback

### What Next

Check the name of the voltage area.

### See Also

- create_voltage_area

---

## MV-101

(warning) Primary PG pin '%s' and backup pin '%s' of the cell '%s' are connected to the same supply net '%s'.

### Description

This message occurs when the primary and backup PG pins of the specified cell are connected to the same supply net.

Typically, dual-rail cells are required when a cell is powered by the backup supply that is different from its primary supply net. If the primary and backup supply of a cell is the same, a dual-rail cell is not required and it should be swapped to a single-rail cell to avoid QOR loss in the final netlist.

### What Next

Check the supply net connections of the PG pins. If the dual-rail cell is not required, swap it to a single-rail cell.

### See Also

- report_cell

---

## MV-102

(warning) The backup supply net '%s' of the dual-rail cell '%s' is PST-equivalent to the primary supply net '%s' of the cell.

### Description

This message occurs when the supply net of backup PG pin of the dual-rail cell is PST-equivalent to the supply net of the primary PG pin.

Typically, dual-rail cells are required when a cell is powered by the backup supply that is different from its primary supply net. If the primary and backup supply of a cell is PST-equivalent, a dual-rail cell is not required and it should be swapped to a single-rail cell to avoid QOR loss in the final netlist.

Feedback

### What Next

Check the supply net connections of the PG pins and the power states of the supply nets. If the dual-rail cell is not required, swap it to a single-rail cell.

### See Also

- report_cell
- report_pst

---

## MV-103

(warning) The sequential element '%s' belonging to retention strategy '%s' in power domain '%s' is not mapped to a retention library cell.

### Description

This warning message indicates that the sequential element is not mapped to retention library cells despite being part of a retention strategy. This results in verification/simulation failure.

Sequential element can be a mapped/unmapped register, ETM or hard-macro with sequential timing arcs.

### What Next

Check the retention strategy commands for the correctness and/or make sure the library has required retention cells and run the command to map the netlist. If the reported sequential element is an ETM or hard-macro and you didn't intend replace it with retention equivalent, you can ignore this message for such elements.

---

## MV-106

(warning) There are no repeater cells implemented and associated with port(pin) '%s' for repeater %s.

### Description

This message is printed when there are no repeater cells implemented and associated with the specified port(pin).

This message is reported even when a repeater was actually inserted but is gobbled due to constant propagation.

Feedback

### What Next

Check the port attributes/strategy of repeater. If the port(pin) is driven by a constant and there is no MV violation, you can ignore this message.

### See Also

- set_port_attributes
- set_repeater

---

## MV-108

(warning) Pin/Port %s is constrained with attribute clamp_value '%s', but the isolation strategy %s from power domain %s that applies on this Pin/Port has the conflicting clamp_value '%s'. Clamp value '%s' will be used while implementing the isolation cell.

### Description

This warning message occurs when the tool encounters design ports or pins that have clamp value settings that do not match the explicit clamp value of the isolation strategy that applies to them. During implementation the tool will honor clamp value settings on the pin being isolated over the clamp value specified for the isolation strategy being implemented.

Clamp value settings for pins or ports are set using the *set_port_attributes* command with the *-clamp_value* option.

Explicit clamp value settings for isolation strategies are managed using the *-clamp_value* option of the *set_isolation command*.

### What Next

Review *set_isolation -clamp_value instances* to fix any clamp value mismatches.

### See Also

- set_port_attributes
- set_isolation

---

## MV-109

(warning) Supply net connection is not specified and related supply of signal pins will be derived from on PG function '%s' of PG pin '%s'.

Feedback

### Description

This message occurs when the tool cannot determine the supply net connection of the internal power and ground pin of a macro.

In the case where supply net connection to internal PG pin is not specified explicitly by connect_supply_net, for related supply of INPUT signal pins related to the internal PG pin, tool will try to get the supply from the pg_function of the internal PG pin. The feature is controlled by app option "mv.upf.use_preswitched_supply_for_macro_pins".

### What Next

Specify additional power intent using the connect_supply_net commands if you do not want to tool to use the supply from PG function.

### See Also

- connect_supply_net
- MV-062
- mv.upf.use_preswitched_supply_for_macro_pins

---

## MV-110

(Error) Power-domain-on-instance element %s is specified in the user (non-derived) section of the UPF constraints for power domain %s. Legal crosstool UPF cannot be generated.

### Description

This message occurs when these conditions are true:

- Power-domain-on-instance (PDOI) repeater elements are present in *create_power_domain* statements in the user section of the UPF file
- The app option *mv.upf.write_crosstool_wrappers* is set true
- The app option *mv.upf.write_crosstool_no_upf_update_command* is set false

Power-domain-on-instance (PDOI) elements are leaf cells as elements in UPF *create_power_domain* statements. This message is specifically about buffers and inverters as leaf cell elements. These are called "physical feedthrough buffers", and are added by the tool automatically with the app option *opt.common.allow_physical_feedthrough* set true. These constraints allow the repeater cell to be placed in a voltage area of a different hierarchy than it logically belongs. When the tool creates UPF changes for these PDOI repeaters, it adds them in the derived section at the end of the UPF file. *create_power_domain -update* statements are created in that section that add these cells to the power domain. This error occurs when *create_power_domain* statements

Feedback

referencing PDOI repeaters are present in the user section of the UPF file. This should not be done by any optimization command in the tool, and if this occurs, it typically means that the user had added these constraints manually to the UPF file. This might have been done by another tool or by manual ECO commands in the tool.

When *mv.upf.write_crosstool_wrappers* is set true, these PDOI leaf instances are removed from the UPF, and replaced by wrapper hierarchies, to support UPF export to other tools that do not support PDOI elements in the UPF. But, the tool is also normally only allowed to modify the derived section of the UPF. So if these PDOI repeaters exist in the user section, they cannot be modified and this error occurs.

**What Next**

There are two approaches to resolve this error:

- Move any create_power_domain statements referencing PDOI repeaters from the user UPF section into the derived section. Typically, the beginning of the UPF file is the user section, and the derived section is at the end. Look for the following, and move these constraints inside. For example:

```
set derived_upf true
if ($derived_upf) {

create_power_domain -elements ... -update
}
```

- Set *mv.upf.write_crosstool_no_upf_update_command* to true. With this setting, the crosstool UPF exported by having *mv.upf.write_crosstool_wrappers* set to true is modified to not include any *-update* options in the UPF commands. This is to support external tools that don't support this newer UPF syntax. To make these changes, the tool has to override it's typical behavior of not modifying the user UPF section. A side effect of this is that the tool is now also free to remove the PDOI leaf instances and replace them with their wrapper hierarchies, even if they are defined in the user section. So setting this app option does have the effect of avoiding the MV-110 error.

## MV-111

(information) DFT %s %s belonging to retention strategy %s of domain %s is skipped from retention mapping.

**Description**

This information message indicates that the reported sequential element is created by DFT engine and is excluded from retention mapping.

Feedback

### What Next

This is just an information message. No action is required. However, if this behavior is not desired, use the following app option to get those DFT sequential elements mapped to retention. *set_app_options -list {mv.upf.skip_retention_on_dft_registers false}* This app option doesn't not apply to lockup latches. They will always be excluded from retention mapping.

## MV-113

(error) The related supply net '%s' [power state '%s'] of driver '%s' pin '%s' is less always-on than the related supply net '%s' [power state '%s'] of load '%s' pin '%s'.

### Description

This message occurs when the related supply net of the driver is less always-on than the related supply net of the load pin and an isolation cell is missing and the driver or load are

Feedback

of direction inout. An isolation cell is required to isolate the signal path if the driver of the net is less always on or unrelated to the load pin.

**What Next**

Check the power states of the supply nets.

**See Also**

- report_net
- report_pst

---

## MV-114

(Information) UPF command format and object tracking feature %s.

**Description**

This information message occurs when UPF object and command order tracking engine gets disabled by the tool.

**What Next**

This is just an information message.

---

## MV-115

(warning) Abutted pins '%s' [related supply net '%s'] and '%s' [related supply net '%s'] have different related supply nets.

**Description**

This message occurs when two physical block pins are abutted together but have different related supply nets. When the hierarchical block pins are abutted together, there is no space outside the sub-blocks to fix any multi-voltage related violations. As a result, the abutted pins should have equivalent related supply net(s) so that any possible multi-voltage violations (e.g. level shifting violations) would only occur and get resolved within the sub-block(s).

**What Next**

Check the related supply nets of the specified pins and consider to assign equivalent related supply nets in the sub-blocks.

Feedback

**See Also**

- get_related_supply_nets
- check_supply_equivalence
- set_related_supply_net
- set_port_attributes

---

## MV-116

(error) Retention register %s belonging to strategy %s of power domain %s does not conform with the mapping directive.

**Description**

This error message indicates one of the following possibilities. - the reported register instance is mapped to a library cell that is not in the list specified by *map_retention_cell* command for the strategy. - retention strategy has different save and restore control signals, but the reported register instance is mapped to a 1-pin or a 0-pin retention library cell.

This might result in strategy association failure during *commit_upf*.

**What Next**

Tool has either mapped or sized this register instance incorrectly. This must be fixed.

**See Also**

- set_retention
- map_retention_cell
- check_mv_design

---

## MV-117

(warning) Net %s connected to PG pins does not have a matching UPF supply net.

**Description**

The PG net listed above does not have a corresponding supply net with the same name in the power intent.

**What Next**

Check the net connection of the PG pins.

Feedback

For inference of PG connections in the power intent, the power intent must have a supply net of the same name as this net. This net can be created using 'create_supply_net' if it does not already exist. If this net is created and inference of supply net connections in the UPF is not disabled, infer_supply_from_pg_net will create connections using 'connect_supply_net' in the power intent, based on the net connections in the RTLPG.

**See Also**

- infer_supply_from_pg_net
- create_supply_net
- connect_supply_net

---

## MV-118

(warning) %d net(s) do not have matching supply nets in the UPF.

**Description**

These PG nets do not have corresponding supply nets of the same names in the power intent.

**What Next**

Please run check_mv_design -power_connectivity for details on which of the nets do not have matching UPF supply nets. For inference of PG connections in the power intent, the UPF must have supply nets with the same names as the PG nets in the design. These supply nets can be created using create_supply_net if they do not exist. If they are created and inference of supply net connections in the UPF is not disabled, commit_upf will create connections using 'connect_supply_net' in the power intent, based on the net connections in the RTLPG.

**See Also**

- commit_upf
- create_supply_net
- connect_supply_net

---

## MV-119

(warning) Power domain '%s' does not have any primary voltage area.

Feedback

### Description

This message occurs when primary voltage area of the specified power domain is not defined. The power and ground supplies of primary voltage area of a power domain must match the primary power and ground supplies of the domain.

### What Next

Check the voltage area(s) of the power domain and their power and ground supplies.

### See Also

- report_power_domain

---

## MV-120

(warning) Net %s is missing %s. Skipping level shifter insertion evaluation for the net.

### Description

This message occurs during level shifter insertion. The net is missing a valid driver or load. It will be skipped during evaluation.

### What Next

Check the net for connectivity problems if you believe it should have a level shifter inserted on it. Otherwise, you can ignore this message.

### See Also

- all_fanin
- all_fanout
- all_connected

---

## MV-121

(warning) Net %s %s %s is missing power supply connection, skip LS insertion/association evaluation of the net.

### Description

This message occurs during level shifter insertion/association, the net driver pin/port is missing power supply definition, it will be skipped during insertion evaluation or level shifter cell association. This may cause the voltage shifting issue or level shifter cell unassociation issue.

Feedback

### What Next

Check the supply connection for the pin/port.

### See Also

- connect_supply_net

---

## MV-122

(Error) No valid library cell available for LS insertion, LS insertion on net %s failed.

### Description

This message occurs during level shifter insertion, there is no valid level shifter reference design can be found from library matching all the conditions, level shifter insertion on this net failed.

### What Next

Check the library setup

---

## MV-123

(Warning) Net has multi-supply loads which cannot be split based on the level shifter strategy setting, and level shifter insertion on net %s failed.

### Description

This message occurs during level shifter insertion in cases where the net has multi-supply loads, but the strategy setting has conflict with splitting the loads so level shifter insertion on this net failed. For example, the strategy defines the inserting location is parent, all the loads inside the domain have different supply settings compared to those outside. In this case then, splitting cannot be done in parent domain.

### What Next

Check the UPF strategy setting.

### See Also

- set_level_shifter

---

## MV-124

(warning) %s supply net %s does not have valid voltage defined. LS insertion will skip evaluating the connected net.

Feedback

### Description

This message occurs during level shifter insertion, supply net does not have valid voltage defined, insertion will skip evaluating the connected net.

### What Next

Check the voltage setting of the supply net, check the port state setting from UPF.

### See Also

- add_port_state

---

## MV-125

(warning) %s supply net %s is not available in domain %s, level shifter cell insertion for strategy %s on net %s failed.

### Description

This message occurs during level shifter insertion in the create_mv_cells command. A level shifter cell could not be inserted because the related supply for either the input or output of the level shifter is not available in the power domain. In this case, the level shifter cell is not inserted.

### What Next

To further debug, use report_mv_path -net <net>, where <net> is the net name from the MV-125 warning. This report gives detailed information about the logic connected to that net, the related supplies of that logic, and any power domain boundaries on that net. The related supplies of the connected logic determine the necessary supplies for the level shifter.

A common reason for level shifter insertion failure is that the required supply is not available in the power domain, in which case it may need to be added using the create_supply_port and create_supply_net commands. Alternately, the level shifter may have been inserted in the wrong domain which doesn't include the required supplies, in which case the set_level_shifter -location option can be modified to change whether the level shifter is inserted in the self, parent, or fanout domain hierarchy.

After correcting the UPF constraints, rerun that part of the flow through commit_upf and create_mv_cells and ensure that the MV-125 warnings go away.

Feedback

**See Also**

- create_mv_cells
- report_mv_path
- set_level_shifter

---

## MV-126

(Error) Command line option strategy_output can be used only for -generate_strategy.

**Description**

This message occurs in create_mv_cells command with -strategy_output option but no -generate_strategy option

**What Next**

Specify -generate_strategy to generate the strategy output file.

---

## MV-127

(Error) Wrong input '%s' for -generate_strategy option, only 'level_shifter' is accepted.

**Description**

This message occurs in create_mv_cells command with -generate_strategy option but not specifying level_shifter. In current version, only level_shifter is supported.

**What Next**

Specify -generate_strategy level_shifter to generate level shifter strategies.

---

## MV-128

(error) Option -keep_order should be specified together with option -object_list.

**Description**

This error occurred because connect_power_switch option -keep_order was not specified with -object_list option.

**What Next**

Please refer to the manpage of connect_power_switch command for usage information and examples.

Feedback

### See Also

- connect_power_switch

---

## MV-129

(Error) Option -keep_order should be specified for -mode daisy.

### Description

This message occurs when the connect_power_switch command is issued with the -keep_order option, but -mode option is not daisy.

### What Next

Specify the -keep_order option only with -mode daisy.

### See Also

- connect_power_switch

## MV-130

(information) Using pin(port) '%s' of net '%s' for connections.

### Description

This message shows the port or pin of the specified net that is being used. The -source and -ack_out options use the driver for connections. If the net does not have a driver, will use the load instead.

### What Next

This is an information-only message. No action is required.

### See Also

- connect_power_switch

---

## MV-131

(warning) Cannot insert repeater cell for pin(port) '%s', because some isolation or level shifter cells already exist on the path.

### Description

This message occurs during repeater insertion. Since the path has already inserted isolation or level shifter cells, the repeater cells will not be inserted.

Feedback

### What Next

Remove isolation or level shifter cells of the path and create_mv_cells again.

---

## MV-132

(Error) Repeater supply ('%s','%s') at pin '%s' is not available to domain '%s'.

### Description

This error message occurs when the repeater supply attribute specified for a port/pin or an element is not found available to the domain where the repeater will be inserted.

### What Next

Make sure the supplies are appropriately brought in to the domain. If the domain is restricted using extra_supplies handle, make the repeater supply available using extra_supplies_# handle. If the supplies are domain dependent, you may need to use -reuse switch to make it available to the domain.

## MV-135a

(Information) No Level Shifter library cell available due to %s.

### Description

This message is from level-shifter insertion engine, only create_mv_cell is specified with -verbose.

No level-shifter cell can be inserted due to a problem with lib_cell availability. And the reasons might be:

1. Library cell is has don't_touch attribute set.
2. Voltage range mismatch: a library cell's voltage range defined in library should match with driver/load supply's voltage range before it can be inserted.
3. Library cell is not overdriven while the path needs overdriven Level Shifter.
4. Library cell is not single ground while single ground library cell is required.
5. Strategy rule mismatch: a library cell's level-shifter type should match with the voltage shifting direction on the path.
6. Standard cell main-rail mismatch: a library cell's main-rail supply should match with the domain primary supply.
7. Library cell has pvt mismatch.
8. Library cell (Enable Level Shifter) clamp has mismatch or cannot perform automatic phase correction due to clamp mismatch
9. Library cell (Enable Level Shifter) sense has mismatch or cannot perform automatic phase correction due to sense mismatch
10. Library cell (Enable Level Shifter) does not have enable pin.

Feedback

11. Library cell is Combo Enable Level Shifter, but has data mismatch.
12. No library cell can be selected due to voltage violation between input and output supply net.

**What Next**

Identify specific lib_cells you expect should be available, check lib_cell information by report_lib_cell and check the PST table definition in UPF file.

## MV-140

(information) MV cell with %s strategy %s cannot be inserted on port %s: standard cells may not be inserted between a pad and the outside world.

### Description

This message occurs when there is an isolation, level shifter or repeater strategy defined on a top-level port that is connected to a pad cell.

### What Next

This is an information-only message. No action is required. However, you should check the power intent to ensure the strategies are specified correctly.

### See Also

- commit_upf
- create_mv_cells

---

## MV-141

(warning) Instance %s connected to top-level port %s has is_pad set to true, while instance %s connected to the same port has 'is_pad' set to false. This should not be implemented as mixture of pad cells and standard cells on the same port is uncommon. Supply at top-level port is set from pad cell supply.

### Description

This message occurs when some pins connected to a top-level port have is_pad : true, and some don't. This may not be physically implementable.

Feedback

### What Next

Check the net connections between the top-level port and pad cell.

### See Also

- commit_upf

---

## MV-142

(warning) Top-level port %s is connected to multiple pad cells, but the supplies are inconsistent. Pad cell %s connected the port with supply net '%s' while pad cell %s connected it with supply net '%s'. UPF supply for the top-level port will be applied.

### Description

This message occurs when more than one cell pin connected to the top-level port has is_pad : true, and the supply of the pins is inconsistent.

### What Next

Check the net connections between the top-level port and the pad cell. Fix the design so only one pad cell is connected to the port, or so that the pad cells connected to the same net have the same related supply.

### See Also

- commit_upf
- report_pst

---

## MV-143

(warning) Pre-existing standard cell %s cannot be connected to pad cell %s: standard cells may not be inserted between a pad and the outside world. is_pad attribute on pad pin %s will be ignored.

### Description

This message occurs when a pin with is_pad : true is not directly connected to top-level port.

### What Next

Check the net connections between top-level port and pad cell. Cell is not allowed to be inserted between a top-level port and a pad cell.

Feedback

### See Also

- commit_upf

---

## MV-144

(information) User has specified '%s' on top-level port %s. The supply net %s derived from pad cells connected with the port is inconsistent with user setting. Supply at top-level port is set from pad cell supply; UPF supply for the port is not applied.

### Description

This message occurs when user has specified UPF constraints like 'set_port_attribute -driver/-receiver supply' or 'set_related_supply_net' on top-level port that is connected to a pad cell. By default, the supply derived from pad cell will be honored.

### What Next

Check the net connections between the top-level port and pad cell.

- commit_upf
- mv.upf.use_driver_receiver_for_io_supplies

---

## MV-145

(error) A leaf cell %s is found for option -hierarchy. Specify only logical hierarchy cells with this option.

### Description

The *check_bufferability -hierarchy* option is required when using the *-driver* option. Without it, accurate checking cannot be performed for bufferability issues related to logical hierarchies such as target library subset constraints and bias optimization.

This option can only take a logical hierarchy cell as an argument, not leaf cells.

### What Next

Change the argument to the *check_bufferability -hierarchy* option to a logical hierarchy cell. It may be sufficient to specify the logical hierarchy owner of the specified leaf cell. For example, if a leaf cell *a/b/buffer1* is specified, instead specify just *a/b*.

The correct logical hierarchy cell to specify depends on what you are trying to learn from the *check_bufferability* call, though. See the *check_bufferability* manpage for more details.

Feedback

**See Also**

- check_bufferability

---

## MV-146

(error) Missing required option(s) %s for check_bufferability.

**Description**

The *check_bufferability* command has two use models:

1. *check_bufferability -nets [-voltage_area]*
2. *check_bufferability -driver [-loads] -hierarchy [-voltage_area]*

The *-voltage_area* option is optional. And either *-nets* or two options *-driver -hierarchy* must be used. For the second usage, *-voltage_area* is optional. This error message indicates that the required combination of command options has not been specified.

**What Next**

Correct the options on *check_bufferability* as described in the error message. Refer to the *check_bufferability* manpage for a detailed description of the usage of this command.

**See Also**

- check_bufferability

---

## MV-147

(error) A hierarchical pin %s is found for option -driver. Specify only a leaf cell pin or a current design port with this option.

**Description**

The *check_bufferability -driver* option can only accept a physical driver pin or port, whether that is a leaf cell pin or a current design port.

**What Next**

Change the *check_bufferability -driver* option to specify a valid physical driver pin or port.

**See Also**

- check_bufferability

Feedback

## MV-148

(error) A wrong direction pin or port %s is found for option -driver. Do not use a leaf cell input pin or a current design output port with this option.

### Description

The *check_bufferability -driver* option can only accept a physical driver pin or port, whether that is a leaf cell output pin or a current design input port. A bidirection (inout) pin or port is also accepted.

### What Next

Change the *check_bufferability -driver* option to specify a valid physical driver pin or port.

### See Also

- check_bufferability

## MV-149

(warning) Option %s is specified together with option(s) %s. The command will only take option %s and ignore the rest.

### Description

The *check_bufferability* command has two usage models:

1. *check_bufferability -nets [-voltage_area]*
2. *check_bufferability -driver [-loads] -hierarchy [-voltage_area]*

This warning is issued if any of the *-driver -loads -hierarchy* options are specified together with *-nets*. In this case, they are ignored and only *-nets* is honored.

### What Next

This is just a warning, and can be ignored if the resulting options accepted by *check_bufferability* still perform the check you want. Otherwise, change the specified options to perform the correct check. See the *check_bufferability* manpage for more details about correct usage of this command.

### See Also

- check_bufferability

Feedback

## MV-150

(warning) Multiple %s type objects are found for option %s. The command will only take the first object and ignore the rest.

### Description

For the options *-net, -driver, -hierarchy,* and *-voltage_area*, they can take either a single name or single object. If more than one name or object is passed to those options, then this warning will occur.

### What Next

You might need to split your query into multiple *check_bufferability* calls to check all of the nets, drivers, hierarchies, or voltage areas you are trying to check.

### See Also

- check_bufferability

## MV-151

(warning) A hierarchical pin %s is found for option -loads. It will be ignored.

### Description

The *check_bufferability -loads* option can only accept physical load pins or ports, whether those are leaf cell pins or current design ports. Any hierarchical pins specified with this option are ignored.

### What Next

The warning can be ignored, as long as it is understood that the specified hierarchical pins will not be used by *check_bufferability*.

### See Also

- check_bufferability

## MV-152

(warning) A wrong direction pin or port %s is found for option -loads. It will be ignored.

### Description

The *check_bufferability -loads* option can only accept physical load pins or ports, whether those are leaf cell input pins or current design output ports. Bidirection (inout) pins or ports are also accepted. Any pins or ports violating this requirement are ignored.

Feedback

### What Next

The warning can be ignored, as long as it is understood that the wrong direction pins or ports are not used by *check_bufferability*.

### See Also

- check_bufferability

---

## MV-153

(warning) The specified -driver, -loads and -hierarchy options do not correspond to a real net segment. Net dont_touch and net is_ideal checks cannot be performed.

### Description

The *check_bufferability* command has two usage models:

1. *check_bufferability -net -voltage_area*
2. *check_bufferability -driver -loads -hierarchy -voltage_area*

For the first, an actual net segment in the design is always identified and queried for dont_touch and is_ideal properties, when checking non-MV reasons that a net cannot be buffered.

For the second, a real net segment can be inferred if the driver and loads all connect to the same net, and at least one segment of that net belongs to the specified hierarchy. Otherwise, this warning message is printed. In this case, dont_touch and is_ideal checks cannot be performed since no actual net segment in the design could be identified corresponding to the specified *-driver -loads -hierarchy* options.

### What Next

In most cases, *check_bufferability* is used to check real net segments. If you are trying to check a real net segment, then this warning is unexpected. The limitations on checking dont_touch and is_ideal attributes will occur, but additionally the rest of the bufferability results may be wrong. Revisit the arguments passed to *-drivers -loads -hierarchy* and correct them so the real net segment can be found. Alternately, just pass that net segment name directly to *check_bufferability -net* instead of using the *-driver -loads -hierarchy* options.

*check_bufferability* can also be used to make hypothetical bufferability queries, with drivers and loads that aren't connected to the same net, or to query an unrelated hierarchy. If you are trying to make a hypothetical query, then this warning is expected. Just be aware that dont_touch and is_ideal bufferability checks cannot be performed.

Feedback

**See Also**

- check_bufferability

---

## MV-154

(warning) Cannot find any loads for net %s. Supply net availability and lib cell availability checks cannot be performed.

**Description**

The *check_bufferability* command performs three categories of checks:

1. Supply availability, to determine if single rail or dual rail buffers are needed, and the buffering supply
2. lib_cell availability, to determine if any lib_cells are available matching the supply requirements
3. Non-MV bufferability checks, such as dont_touch or is_ideal net attributes, and many others

This warning message indicates that the first two categories of checks, supply and lib_cell availability, cannot be performed because the net has no loads. Only the non-MV bufferability checks are performed.

**What Next**

No further action is required.

**See Also**

- check_bufferability

---

## MV-155

(warning) Cannot find any driver for net %s. Supply net availability and lib cell availability checks cannot be performed.

Feedback

### Description

The *check_bufferability* command performs three categories of checks:

1. Supply availability, to determine if single rail or dual rail buffers are needed, and the buffering supply
2. lib_cell availability, to determine if any lib_cells are available matching the supply requirements
3. Non-MV bufferability checks, such as dont_touch or is_ideal net attributes, and many others

This warning message indicates that the first two categories of checks, supply and lib_cell availability, cannot be performed because the net has no driver. Only the non-MV bufferability checks are performed.

### What Next

No further action is required. Once the design problem of "no net driver" is resolved, *check_bufferability* can be rerun to do more complete checking on the net.

### See Also

- check_bufferability

---

## MV-156

(warning) Net %s is not bufferable because it is driven by constant logic 0 or 1. The command assumes the driver will be implemented with normal tie cell to analyze supply availability.

### Description

Since the driver is constant 0 or 1, the net is not bufferable. However, *check_bufferability* will still analyze supply availability by assuming the driver is implemented with normal tie cell.

### What Next

Implement the constant logic 0 or 1 with proper tie cell prior to running *check_bufferability*.

### See Also

- check_bufferability

Feedback

## MV-157

(warning) Multiple drivers are found for net %s. The command will only take the %s as unique driver to perform supply availability and lib cell checks.

### Description

The standard data and CTS buffering engines do not build multi-driven nets that have multiple drivers. *check_bufferability* will report this as one of the non-MV bufferability problems: "The net has multiple drivers". Despite this, *check_bufferability* will still perform supply availability and lib_cell availability checks for buffering this net, by ignoring all drivers except the one listed in this warning message.

### What Next

No further action is required. Be aware that the standard buffering engines will not build this net because of multiple drivers. But for the purposes of checking supply and lib_cell availability for a different buffering solution, like multisource CTS, *check_bufferability* is still useful on such a net.

### See Also

- check_bufferability

## MV-158

(information) Found net %s corresponding to the specified -driver, -loads, and -hierarchy options. It will be used to perform net dont_touch and net is_ideal checks.

### Description

The *check_bufferability* command has two usage models:

1. *check_bufferability -net -voltage_area*
2. *check_bufferability -driver -loads -hierarchy -voltage_area*

For the first, an actual net segment in the design is always identified and queried for dont_touch and is_ideal properties, when checking non-MV reasons that a net cannot be buffered. For the second, a real net segment can be inferred if the driver and loads all connect to the same net, and at least one segment of that net belongs to the specified hierarchy. This information message indicates the an actual net segment was identified. As a result, the complete set of bufferability checks can be performed.

### What Next

No further action is required.

Feedback

### See Also

- check_bufferability

---

## MV-159

(warning) Could not determine a buffering supply. Lib cell availability checks cannot be performed.

### Description

The *check_bufferability* command performs three categories of checks:

1. Supply availability, to determine if single rail or dual rail buffers are needed, and the buffering supply
2. lib_cell availability, to determine if any lib_cells are available matching the supply requirements
3. Non-MV bufferability checks, such as dont_touch or is_ideal net attributes, and many others

In the case that the supply availability check fails to identify a valid buffering supply, the lib_cell availability check cannot be performed. So, the complete set of *check_bufferability* checks is not done on this net.

### What Next

No further action is required. Be aware that if the supply availability problem is resolved, and *check_bufferability* is rerun on this net, it is possible that lib_cell availability failures will now be reported that could not previously be identified when the supply availability issue existed.

### See Also

- check_bufferability

---

## MV-160

(information) No enabled level shifter library cell available due to sense or clamp value mis-matched.

### Description

This message is from level-shifter insertion engine, only create_mv_cell is specified with -verbose.

Feedback

No enabled level-shifter cell can be inserted due to a problem with lib_cell availability. And the reasons might be:

1. Isolation type mismatch: the replaced isolation cell and the enabled level shifter cell should has the same isolation type.
2. Strategy rule mismatch: a library cell's level-shifter type should match with the voltage shifting direction on the path.
3. Voltage range mismatch: a library cell's voltage range defined in library should match with driver/load supply's voltage range before it can be inserted.
4. Sense or clamp value mismatch: the replaced isolation cell and the enabled level shifter cell should has the same sense and clamp value.

this message will be printed for the reason #4.

**What Next**

Identify specific lib_cells you expect should be available and check the options -clamp_value and -sense from the set_isolation command.

**See Also**

- report_mv_lib_cells
- set_isolation

---

## MV-161

(information) No enabled level shifter library cell available due to isolation type mismatched.

**Description**

This message is from level-shifter insertion engine, only create_mv_cell is specified with -verbose.

No level-shifter cell can be inserted due to a problem with lib_cell availability. And the reasons might be:

1. Isolation type mismatch: the replaced isolation cell and the enabled level shifter cell should has the same isolation type.
2. Strategy rule mismatch: a library cell's level-shifter type should match with the voltage shifting direction on the path.

Feedback

3. Voltage range mismatch: a library cell's voltage range defined in library should match with driver/load supply's voltage range before it can be inserted.
4. Sense or clamp value mismatch: the replaced isolation cell and the enabled level shifter cell should has the same sense and clamp value.

this message will be printed for the reason #1.

**What Next**

Identify specific lib_cells you expect should be available.

**See Also**

- report_mv_lib_cells

---

## MV-162

(warning) The timing data is not up-to-date. %s

**Description**

This warning occurs when the timer is not fully updated prior to running *check_bufferability*. *check_bufferability* still runs, because most bufferability checking can be done without the timer. But, the bufferability checks that rely on timing information will be skipped. These can include:

- Dont touch status of a net
- Ideal network status of a net
- Freeze port status of a logical feedthrough hierarchy
- The type of net being buffered (clock, or data, or mixed clock and data)

The MV-162 message indicates which of these checks will be skipped, which can vary depending on the exact timer state.

For dont touch and ideal network constraints, the checking is skipped. It is possible that the net cannot be buffered because of one of these constraints, but that *check_bufferability* reports the net as bufferable, if run without updated timing.

For freeze port constraints, the checking is skipped. It is possible that the net cannot be buffered in logical feedthrough hierarchy because the hierarchy has freeze port constraints, but that *check_bufferability* reports the net as bufferable, if run without updated timing.

Normally *check_bufferability* determines the type of net being buffered, and reports repeater lib cell available with the correct lib cell purpose, usually 'cts' purpose for clock nets and 'optimization' purpose for data nets. If the net type cannot be determined due to

Feedback

the timer state, then *check_bufferability* will query lib cell availability with a purpose of 'cts' OR 'optimization'.

**What Next**

To ensure that all checks are performed, and make the MV-162 warning go away, explicitly run update_timing prior to running *check_bufferability*.

**See Also**

- check_bufferability

## MV-172

(warning) The supply net of isolation cell '%s' is inconsistent with associated strategy '%s'.

### Description

This message occurs when the isolation cell is associated with a strategy but the supply net is inconsistent with the strategy. This is possible that netlist has been changed but association do not update.

### What Next

Try to use associate_mv_cells to re-association isolation cells. Check the power and ground net of isolation cell and the supply net specified by the strategy -isolation_power_net/-isolation_ground_net/-isolation_supply_set.

### See Also

- associate_mv_cells
- report_cell
- report_net

## MV-173

(warning) The location of isolation cell '%s' is inconsistent with associated strategy '%s'.

### Description

This message occurs when the isolation cell is associated with a strategy but logical location is inconsistent with the strategy. This is possible that netlist has been changed but association do not update.

### What Next

Try to use associate_mv_cells to re-association isolation cells. Check if location of isolation cell with the strategy domain boundary match with -applies_to and -location defined in strategy. If the strategy is expected, the isolation cell may need to removed and reinserted. If the isolation cell is expected, the strategy should be updated.

### See Also

- associate_mv_cells
- report_mv_path

Feedback

## MV-174

(warning) The driver or receiver supply sets of isolation cell '%s' is inconsistent with associated strategy '%s'.

### Description

This message occurs when the isolation cell is associated with a strategy but driver or receiver supply sets is inconsistent with the strategy. This is possible that when isolation cell is associated by name, upf intent check will be relaxed.

### What Next

Check if the supply set of driver and receiver of the isolation cell on mv path match with -source/-sink/-diff_supply_only defined in strategy.

### See Also

- associate_mv_cells
- report_mv_path

## MV-175

(warning) The name %s of isolation cell '%s' is inconsistent with associated strategy '%s'.

### Description

This message occurs when the isolation cell is associated with a strategy but name prefix or suffix is inconsistent with the strategy. This is possible that when isolation cell is associated by name, upf intent check will be relaxed.

### What Next

Check if there is strategy change after the isolation cell inserted and associated. The isolation cell may need to removed and reinserted to match the strategy name prefix/suffix.

### See Also

- associate_mv_cells
- report_cell

## MV-176

(warning) The reference library cell '%s' of isolation cell '%s' is inconsistent with associated strategy '%s'.

Feedback

### Description

This message occurs when the isolation cell is associated with a strategy but reference library cell is inconsistent with the strategy. This is possible that when isolation cell is associated by name, upf intent check will be relaxed.

### What Next

Check the reference library cell of the isolation cell with the mapping library defined by map_isolation.

### See Also

- associate_mv_cells
- report_cell

---

## MV-178

(error) specified improper library cell pair: %s and %s.

### Description

This message occurs when user specifies improper library cell pair in the command heal_mv_path for cell swapping. The possible reasons can be:

- `incorrect library cell type: only buffer or inverter is accepted.`

- `library cell type mismatched: it's not accepted that one is buffer while another is inverter.`

- `incorrect rail count: should be single-rail versus dual-rail.`

### What Next

Please make sure to specify the right library cell pair in the option -user_mapping in the command heal_mv_path.

---

## MV-179

(error) Isolation strategy '%s' in power domain '%s' has self dependency issue on element '%s' and control signal '%s'.

Feedback

### Description

This message occurs when the element defined in an isolation strategy will also be used as control signal in the same isolation strategy. The element will be dropped from the isolation strategy.

### What Next

Review the issued strategy for the self dependency definition.

### See Also

- commit_upf
- create_mv_cells

---

## MV-180

(error) Circular dependencies are found among isolation control signals "%s".

### Description

Isolation process has dependency that elements specified as the isolation signal of an isolation strategy should be implemented after other elements.

This message occurs when there is circular dependencies defined multiple isolation strategies. Isolation control signal processing order can not be resolved. For example:

set_isolation iso1 -elements {ctrl1} -isolation_signal ctrl2 set_isolation iso2 -elements {ctrl2} -isolation signal ctrl1 set_isolation iso3 -elements {ctrl3} -isolation_signal ctrl3

### What Next

Check the strategies using issued isolation control signals and fix the circular dependency.

### See Also

- commit_upf
- create_mv_cells

---

## MV-181

(error) %s pin %s of retention register %s belonging to strategy %s of power domain %s has incorrect connection to %s signal.

Feedback

### Description

This error message indicates that the reported register instance has a wrong connection to the save/restore signal of the applicable retention strategy.

### What Next

If you have instantiated the retention register, make sure the save/restore connection matches the save/restore signal and sense specified by the applicable strategy.

### See Also

- set_retention
- check_mv_design

---

## MV-182

(error) Retention register %s belonging to strategy %s of power domain %s has incorrect backup %s supply connection.

### Description

This error message indicates that the reported register instance has a wrong backup retention supply connection which doesn't match the one specified by the applicable retention strategy.

### What Next

Make sure the backup power/ground pins have the same supply as that of the applicable retention strategy.

### See Also

- set_retention
- check_mv_design

---

## MV-183

(information) Adding inverter %s before enable pin of isolation cell %s (isolation strategy = %s).

### Description

We allow to use isolation library cell that has inverse sense than isolation strategy when there is no isolation library cell with correct sense available. Inverter cell will be automatically inserted to make the isolation control sense logic correct.

Feedback

This message occurs when inverter cell gets inserted before isolation cell enable pin.

**What Next**

This is an information-only message. No action is required.

**See Also**

- create_mv_cells

---

## MV-184

(Information) Tool has found no MV Violation to fix for buffer tree driven by '%s'.

**Description**

This message is printed when *fix_mv_design -verbose* runs but it does not find any MV Violation to fix, therefore the command finished without making changes to the specified buffer tree.

**See Also**

- fix_mv_design

---

## MV-185

(Warning) Attribute *is_upf_mim_primary_instance* can only set to true.

**Description**

The message is reported when setting the attribute *is_upf_mim_primary_instance*. You can only set attribute to value *true*.

**What Next**

- Instead of setting the attribute to false, you can remove the attribute by using *remove_attributes -objects [get_cells <instance_name>] -name "is_upf_mim_primary_instance"*.

**See Also**

- set_attribute
- remove_attributes

Feedback

## MV-186

(Warning) Attribute *is_upf_mim_primary_instance* is already set on instance '%s'.

### Description

The message is reported when setting the attribute *is_upf_mim_primary_instance*. You can only set the attribute to one instance of each module.

### What Next

- Make sure which instance should have defined the attribute.
- If the attribute is no longer required for the mentioned instance, you can remove the attribute by using *remove_attributes -objects [get_cells <instance_name>] -name "is_upf_mim_primary_instance"*.

### See Also

- set_attribute
- remove_attributes

## MV-187

(warning) For pin %s, power supply net %s has less voltage than ground supply net %s voltage.

### Description

This message is printed when there is a pin, whose power supply voltage is less than its ground supply voltage. The supply voltages from PST states need to be checked. Pins from power management cells, standard cells, and TIE cells are checked.

### What Next

Check port states on supply nets, and also check how sup- ply nets connect to pins.

### See Also

- add_port_state
- add_power_state
- connect_supply_net

Feedback

## MV-188

(warning) Repeater is not inserted at pin %s as it does not have any %s.

### Description

This message shows the port where no repeater is inserted due to the absence of driver or load on the port.

### What Next

This is a warning message. No action is required.

### See Also

- set_port_attributes
- set_repeater

## MV-189

(warning) For Domain %s, primary power supply net %s has less voltage than primary ground supply net %s voltage.

### Description

This message is printed when, for a given domain, its power supply voltage is less than its ground supply voltage. The supply voltages from PST states need to be checked.

### What Next

Check port states on supply nets, and also check how sup- ply nets connect to pins.

### See Also

- add_port_state
- add_power_state
- connect_supply_net

## MV-190

(information) Total %d out of %d cells missing supply net connections have been inferred with connect_supply_net.

Feedback

### Description

This message shows the number of cells inferred with connect_supply_net by the tool in DMM prototype mode.

### What Next

This is an information-only message. No action is required if the number of cells missing supply net is expected.

### See Also

- commit_upf

---

## MV-192

(warning) Repeater cell %s found for the port(pin) %s matching the repeater strategy %s, but not associated to the strategy.

### Description

This warning message appears when a cell matches the repeater strategy on the port(pin), but that cell is not associated as a repeater to the strategy.

### What Next

Run commit_upf to trigger association.

### See Also

- commit_upf
- set_repeater

---

## MV-193

(error) Pre-instantiated cell %s is situated in an AO Block Domain and cannot be remapped to a physically legal dual-rail cell.

### Description

This message indicates that the given cell, situated in an AO Block Domain (with either no explicit CSN or with a CSN to the primary supply of the AO Block Domain), cannot be remapped by the tool to a physically legal dual-rail cell.

Feedback

### What Next

If the intention is to let the tool proceed and ignore these errors, app-option mv.cells.ignore_remapping_error_for_pre_instantiated_cells_in_ao_block can be set to true. If not, please check the CSN connections of this cell.

### See Also

- create_mv_cells

---

## MV-194

(warning) There are unmapped %s in the design.

### Description

Generally, connect_pg_net requires all cells to be mapped, but if -create_nets_only option is specified or there are only unmapped power switch placeholders, it will still run. This warning just mentions that there are some unmapped cells or power switch placeholders in the design.

### What Next

Check or remove the unmapped cells or power switches in the design.

### See Also

- create_power_switch
- map_power_switch
- commit_upf

---

## MV-195

(error) The design contains at least one unmapped cell: %s.

### Description

Generally, connect_pg_net requires all cells to be mapped, but if there are unmapped power switch placeholders, it will still run. In this case, there is an unmapped cell in the design which is not a power switch placholder, and therefore, connect_pg_net cannot complete.

### What Next

Make sure all cells are mapped to library cells by running compile command.

Feedback

## MV-196

(error) Unknown option detected from UPF command/block: \n\ %s.

### Description

During UPF loading by linking, when unknown option detects, the tool will mark UPF incompatible and print this message.

### What Next

You can check log file to find the unknown option name, and follow the instructions from *MV-167* to fix the incompatible UPF.

### See Also

- CMD-005
- CMD-010
- MV-167

## MV-197

(error) Cannot use %s options at the same time for command %s.

### Description

This message occurs when the command is called with the specified options. Only one of the specified options can be used at a time.

### What Next

Choose only one of the specified options for the command.

## MV-198

(Error) Supply (%s, %s) of terminal boundary pin %s does not match supply (%s, %s) of %s pin %s.

### Description

This error message occurs on terminal boundary port in either of the following conditions:

1. For input port, driver supply defined in 'set_port_attribute -driver_supply' does not match the supply of the driver pin it connects.
2. For output port, receiver supply defined in 'set_port_attribute -receiver_supply' does not match the supply of the load pins it connects.

Feedback

### What Next

Please make sure to avoid the above conditions.

---

## MV-199

(Information) The name of the %s cell is being changed from %s to %s.

### Description

This message occurs when any repeater or isolation cell name is being changed. Changing of repeater/isolation cell name occurs during commit_upf when the existing cell name fails to obey the repeater/isolation naming convention. The changed name satisfies the naming convention.

set mv.cells.rename_isolation_cell_with_formal_name to false can avoid renaming isolation cells at commit_upf.

### What Next

This is just an information message. No action is required.

### See Also

- commit_upf

---

## MV-200

(Error) Always_on_strategy '%s' is not allowed.

### Description

This error message occurs when an invalid always_on_strategy is specified for command 'set_power_domain_constraints'. 'single_power' and 'dual_power' are the only valid candidates.

### What Next

Please input correct value for option '-always_on_strategy' of command 'set_power_domain_constraints'.

### See Also

- set_power_domain_constraints

Feedback

## MV-201

(warning) Repeater at port %s with repeater supply (%s, %s) is not inserted due to non-availability of matching %s in the libraries.

### Description

This message is issued when the tool cannot insert repeaters due to its non availability in the libraries specified.

Either all the cells of required type has been constrained with lib_cell_purpose or the libraries don't have the buffers/inverters.

### What Next

Check for the presence of the required cells in the library using get_lib_cells. If not present, use proper libraries that have the required lib-cells. If present, check for any constraint on the library cells set by set_lib_cell_purpose. If found, remove the constraints.

### See Also

- set_lib_cell_purpose
- get_lib_cells
- set_dont_touch
- create_mv_cells

## MV-202

(Warning) Cell intance '%s' belongs to a power domain in voltage area '%s', but is placed in voltage area '%s'.

### Description

This warning message is printed when a cell is placed in a voltage area different from the one to which its power domain belongs.

### See Also

- create_voltage_area

## MV-203

(Information) Hierarchy cell '%s' is DesignWare component, %s.

Feedback

### Description

This information message is printed during manual or automatic PG connection. Manual PG connection will be aborted if the connection will cross DesignWare component or SynthRef hierarchy. Auto PG connection will skip connection inside DesignWare component or SynthRef hierarchy.

### See Also

- connect_pg_net

---

## MV-204

(information) Supply net '%s' is inferred as '%s' by name.

### Description

This message is reported for a supply net that cannot be inferred as power or ground by supply set, supply connection, isolation or retention strategy, design attribute user PG type and power switch strategy. The PG net type is inferred according to the net name.

### See Also

- MV-205

---

## MV-205

(information) Supply net '%s' is inferred as '%s' by voltage.

### Description

This message is reported for a supply net that cannot be inferred as power or ground by supply set, supply connection, isolation or retention strategy, design attribute user PG type and power switch strategy. The PG net type is inferred according to the voltage.

### See Also

- MV-204

---

## MV-206

(Warning) Supply net '%s' has been assigned as PG type ground because no known type has been assigned.

Feedback

### Description

This message is reported for a supply net that cannot be inferred as power or ground by supply set, supply connection, isolation or retention strategy, design attribute user PG type and power switch strategy. The PG net type is assigned as ground.

---

## MV-207

(warning) %s %s cell on net %s is skipped because this net is marked as analog.

### Description

Isolation cells, repeaters, and level shifters are not inserted on analog nets.

### What Next

Find out why these nets are marked as analogs. A net becomes analog under the following conditions: 1. If the net is connected to a pin that has "is_analog" liberty attribute 2. If the net is connected to a pin, and that pin is set to analog by "set_port_attributes -is_analog" command.

A net becomes analog if it is connected to at least one analog pin.

### See Also

- set_port_attributes

---

## MV-208

(Warning) Pin(s) '%s' of library cell '%s' is(are) missing the "is_unconnected" attribute

### Description

This warning message appears when the tool identifies pins of a library cell where the "is_unconnected" attribute is expected but missing.

The "is_unconnected" attribute is expected on library pins with the following characteristics:

- The pin has no related power/ground pin information
- The pin is not part of a shorted ("short") path in the cell model

Such pins are treated as internally unconnected by the tool and the "is_unconnected" attribute is used as way to confirm that this is the intent of the library creator.

Feedback

### What Next

If you agree with the identified pin(s) being treated as internally unconnected, you can safely ignore this warning. Otherwise, you can use the set_related_supply_net command on each instance of the cell as an override.

### See Also

- set_port_attributes
- set_related_supply_net

---

## MV-209

(Error) Pin(s) '%s' of library cell '%s' have conflictive "is_unconnected" attribute setting

### Description

This error message appears when the tool identifies pins of a library cell where the "is_unconnected" attribute is conflicting with the rest of the pin model.

The "is_unconnected" attribute is expected on library pins with the following characteristics:

- The pin has no related power/ground pin information
- The pin is not part of a shorted ("short") path in the cell model

Such pins are treated as internally unconnected by the tool and the "is_unconnected" attribute is used as way to confirm that this is the intent of the library creator. A library pin with the "is_unconnected" attribute that does not match the above description is considered a modeling error

### What Next

Review the conflictive library cell

---

## MV-210

(warning) %s strategy %s from power domain %s is specified on Pin/Port %s which is on an analog net.

### Description

This warning message is printed when isolation, level shifter or repeater strategy is specified on analog net. Power management cells will not be inserted on analog net.

Feedback

### What Next

Check the power strategies and the analog net. Add *set_isolation -no_isolation* to avoid apply isolation strategy on analog path.

Add *set_level_shifter -no_shift\P to avoid applying level shifter strategy on analog path.*

Use *set_repeater -exclude_elements* to avoid apply repeater strategy on analog path.

### See Also

- set_port_attributes
- set_isolation
- set_level_shifter
- set_repeater

---

## MV-211

(warning) Pin(s) %sis(are) defined as analog on instance %s of module %s, but same pin(s) are not defined as analog on instance(s) %s of module %s.

### Description

This warning message is printed when ports/pins of different instances of same module differ in analog setting. This happens when user has not used -model option to set -is_analog attribute with set_port_attributes command.

### What Next

Check if is_analog attribute can be set with set_port_attributes -is_analog -model so that all instances of a module have same analog settings.

### See Also

- set_port_attributes

---

## MV-212

(warning) %s '%s' is connected with analog net '%s'.

### Description

This warning message is printed when there is an isolation cell or level shifter connected with analog net. Isolation cell or level shifter should not be inserted on analog net.

Feedback

### What Next

Check if the ISO/LS already exists before apply the is_analog attribute. Remove the ISO/LS if the net is expected to be an analog net.

### See Also

- set_port_attributes
- report_nets

---

## MV-213

(warning) Found net %s connected to PG pin %s, while %s UPF constraint use supply net %s to connected with the same pin. UPF constraint will be given precedence.

### Description

This warning message is printed by infer_supply_from_pg_net verbose mode. if UPF CSN conflict with PG netlist, this warning will be reported for each conflict in verbose mode when app option mv.pg.continue_infer_pg_with_conflict is on. UPF CSN will be preserved, and later resolve_pg_net/connect_pg_net will update PG netlist to be consistent as UPF.

### What Next

Check the existing pg netlist.

### See Also

- infer_supply_from_pg_net
- connect_pg_net
- mv.pg.continue_infer_pg_with_conflict

---

## MV-214

(warning) Buffer cell '%s' is connected with analog net '%s'.

### Description

This warning message is printed when there is a buffer or inverter cell connected with analog net. Buffer or inverter cell should not be inserted on analog net.

### What Next

Check if the buffer cell already exists before apply the is_analog attribute. Remove the buffer cell if the net is expected to be an analog net.

Feedback

**See Also**

- set_port_attributes
- report_nets
- remove_buffers

---

## MV-215

(information) Total %d logical feedthrough buffers have been committed.

**Description**

This message shows the number of logical feedthrough buffers that have been committed.

**What Next**

This is an information-only message. No action is required.

---

## MV-216

(information) Total %d hierarchical ports have been created for logical feedthrough buffering.

**Description**

This message shows the number of hierarchical ports that have been created for logical feedthrough buffering.

**What Next**

This is an information-only message. No action is required.

---

## MV-217

(warning) Analog driver '%s' voltage is %s which is different than the analog voltage of the load '%s' at %s.

**Description**

Two analog pins that are connected should have the same voltage.

**What Next**

Find out if these pins are correctly marked as analog. A pin is set to analog either in .lib file or by using set_ports_attributes command.

Feedback

## MV-218

(warning) A mix of analog and digital pins are connected to each other. Driver pins are {%s}, and load pins are {%s}.

### Description

In general analog and digital pins should not be mixed and connected to each other.

### What Next

Find out if these pins are correctly marked as analog. A pin is set to analog either in .lib file or by using set_ports_attributes command.

## MV-219

(warning) Multiple drivers on unresolved supply net '%s'

### Description

This message indicates that multiple power sources are connected to a net specified as unresolved with the create_supply_net command -resolve option.

### What Next

Supply nets specified as unresolved may receive only one driver. Either disconnect other sources or specify the supply net as parallel.

### See Also

- create_supply_net

## MV-220

(Error) There are uncommitted logical feedthrough buffers in the design. Please run commit_logical_feedthrough before saving it.

### Description

This message indicates that there are uncommitted logical feedthrough buffers in the design. Please perform commit_logical_feedthrough to commit the logical feedthrough buffers.

### What Next

Perform commit_logical_feedthrough.

Feedback

## MV-221

(warning) Missing supply net information on pin %s with related power pin %s and related ground pin %s of cell %s

### NAME

*MV-221* (error) Missing supply net information on pin %s with related power pin %s and related ground pin %s of cell %s

### Description

This message occurs when the tool fails to derive the supply net information from pin.

### What Next

Set the related supply net information on pin manually or do connect_supply_net on the pg pins that this pin is related to.

### See Also

- connect_supply_net

## MV-222

(error) Missing supply net information on port %s

### Description

This message occurs when the tool fails to derive the supply net information from the port.

### What Next

Manually set the related supply net information using the set_related_supply_net command.

### See Also

- set_related_supply_net
- get_related_supply_nets

## MV-223

(error) Missing supply net information on pin %s of cell %s, this pin is missing related power/ground pin information

Feedback

**Description**

This message occurs when the tool fails to derive the supply net information from pin.

**What Next**

Need to associate related power/ground pin information on the signal pins that are missing supply information.

---

## MV-224

(error) Missing supply net information on macro pin %s of cell %s

**Description**

This message occurs when the tool fails to derive the supply net information from macro.

**What Next**

Set the related supply net information on pin manually or do connect_supply_net on the pg pins that this pin is related to.

---

## MV-225

(warning) %s supply net same voltage as %s with same AOness with %s is not available in domain %s, level shifter cell insertion for strategy %s on net %s failed.

**Description**

This message occurs during level shifter insertion in the create_mv_cells command. A level shifter cell could not be inserted because the related supply output of the level shifter is not available in the power domain. Inserted Level Shifter output supply will use the same voltage of load supply but maintain the same AO status as driver supply so avoid introducing ISO issue. In this case, the level shifter cell is not inserted.

**What Next**

To further debug, use report_mv_path -net <net>, where <net> is the net name from the MV-225 warning. This report gives detailed information about the logic connected to that net, the related supplies of that logic, and any power domain boundaries on that net. The related supplies of the connected logic determine the necessary supplies for the level shifter.

A common reason for level shifter insertion failure is that the required supply is not available in the power domain, in which case it may need to be added using the create_supply_port and create_supply_net commands. Alternately, the level shifter may have been inserted in the wrong domain which doesn't include the required supplies, in

Feedback

which case the set_level_shifter -location option can be modified to change whether the level shifter is inserted in the self, parent, or fanout domain hierarchy.

After correcting the UPF constraints, rerun that part of the flow through commit_upf and create_mv_cells and ensure that the MV-225 warnings go away.

### See Also

Feedback

## MV-233

(information) Isolation strategy %s(%s) can't be implemented at domain boundary %s with location %s to isolate path to pin(s)/port(s)%s.

### Description

Isolation cell can't be inserted at location specified in strategy due to hetero-fanout.

### What Next

This is an information-only message. No action is required.

### See Also

- create_mv_cells

## MV-234

(warning) Caution with argument '%s'. '%s'.

### Description

This is a warning message for connect_power_switch command. Among other cases, it may be issued if certain options that are unnecessary for certain modes are entered but being ignored.

### What Next

Review the specific information given by the MV-234 error message and refer to the connect_power_switch man page for complete information about using the command.

### See Also

- connect_power_switch

## MV-235

(error) Either -layers or -region has to be specified.

### Description

This message occurs when neither -layers nor -region option is specified for create_secondary_pg_placement_constraints command.

### What Next

Specify either -layers or -region.

Feedback

### See Also

- create_secondary_pg_placement_constraints

---

## MV-236

(error) secondary_pg_constraints '%s' has been created already.

### Description

This message occurs when the name specified for create_secondary_pg_placement_constraints command conflicts with existing secondary_pg_placement_constraints.

### What Next

Specify differnt name for create_secondary_pg_placement_constraints.

### See Also

- create_secondary_pg_placement_constraints

---

## MV-237

(error) Related supply of data output pin of the retention cell '%s' belonging to strategy '%s' of power domain '%s' doesn't match -use_retention_as_primary requirement of the strategy.

### Description

This error message occurs when user has applied a retention strategy specified with -use_retention_as_primary option to a retention cell which is mapped to a library cell that doesn't have its data output pin related to the backup PG pin.

### What Next

Specify correct library cells or library cell types in map_retention_cell, that would match -use_retention_as_primary requirement. You could also remove -use_retention_as_primary option from the strategy if library doesn't have library cells matching this requirement.

### See Also

- set_retention
- map_retention_cell

Feedback

## MV-238

(warning) Retention library cell %s is unsuitable for retention strategy %s of power domain %s.

### Description

This warning indicates that retention library cell specified in map_retention_cell command is not suitable to use for the retention strategy. This message appears when retention strategy specifies two different signals for save and restore (which indicates 2-pin retention library cell to be used for mapping) and map_retention_cell has 1-pin or 0-pin retention library cells. Such unsuitable library cells will not be considered for mapping.

### What Next

No action is needed if commit_upf doesn't report any error. But if you don't see the expected retention library cell in the netlist or if all library cells are unsuitable, revisit your map_retention_cell and give library cells that are suitable for the strategy.

### See Also

- set_retention
- map_retention_cell
- commit_upf

## MV-239

(warning) PG-MUX Cells %s and %s are PGMUX with equivalent internal/output supply nets %s and %s, but the tool was not able to establish the equivalence of their %s pins

### Description

This message indicates two PG-MUX cells have equivalent internal/output supply nets but the tool was not able to establish equivalence of their input control or PG pins.

### What Next

Find out if the internal/output supply pins of these two PG-MUX cells should be connected. If so, check why their control pins or their input PG pins are not connected to the same net.

### See Also

- connect_supply_net

Feedback

## MV-240

(warning) map_retention_cell is not specified for the retention strategy %s in power domain %s.

### Description

This warning indicates that mapping constraints have not been defined on the retention strategy for the specified power domain using the map_retention_cell command. If registers specified in the set_retention command are SEQGENs, they will be mapped to non-retention library cells and if registers are mapped retention registers, they will be preserved as retention.

### What Next

Define the mapping constraints for the retention strategy using the map_retention_cell command.

### See Also

- set_retention
- map_retention_cell
- report_power_domain

## MV-241

(error) Tool tried to perform auto commit_upf but it failed.

### Description

This error occurs when tool tries to perform commit_upf under the hood but it fails. This error is seen while executing commands that require the UPF intent to be ready.

### What Next

Execute commit_upf and clean up all the errors it reports before proceeding.

### See Also

- commit_upf

## MV-242

(error) Voltage area setup is not ready for physical implementation.

Feedback

### Description

This message occurs when physical implementation commands, such as create_power_switch_ring, create_power_switch_array, create_placement, place_opt etc. are called but the voltage areas have not been created for all power domains. Note, that voltage areas are required for all power domains, except power domains containing only macros and/or I/O pads.

### What Next

If the UPF has been successfully committed then create voltage areas for all power domains that require a voltage area (all power domains except those containing only macro and/or IO pads, including voltage areas in abstracts). You can use the 'check_mv_design' command to identify any power domains that are missing a voltage area, such power domains are reported under the "Power domain rule" section.

Then you can use "create_voltage_area" command to assign voltage areas to power domains, or turn on the "mv.incomplete_upf.enable" to enable incomplete UPF flow to bypass this check with default VA assigned to those "missing VA" domains.

### See Also

- load_upf
- commit_upf
- check_mv_design
- mv.incomplete_upf.enable
- mv.upf.enable_missing_voltage_area
- MV-511

---

## MV-243

(error) Tool tried to perform auto commit_upf but it cannot be done since the design has unpropagated physical blocks. Explicit commit_upf is required for constraints propagation.

### Description

This error occurs when tool tries to perform commit_upf under the hood but it cannot be performed as the design has unpropagated physical blocks.

### What Next

Execute commit_upf and and make sure constraints propagation is done for all the physical blocks.

Feedback

**See Also**

- commit_upf

---

## MV-244

(warning) Cell %s is partially outside the VA-shape(s) for secondary_pg_placement constraint of supply %s

**Description**

This message indicates the cell is not placed inside the VA-shape(s) completely for secondary_pg_placement constraint of the supply.

**What Next**

Run legalize_placement to have the cell placed in the correct VA-shape.

---

## MV-245

(error) Cell %s violation secondary_pg_placement constraint for supply %s

**Description**

This message indicates the cell is not placed in the VA-shape for secondary_pg_placement constraint of the supply.

**What Next**

Run legalize_placement to have the cell placed in the correct VA-shape.

---

## MV-246

(error) Found net %s connected to PG pin %s, it is conflict with supply net %s defined in %s connect_supply_net constraint in UPF.

**Description**

This error message is printed by infer_supply_from_pg_net. if UPF CSN conflict with PG netlist, by default this error will be reported for each conflict.

**What Next**

Check the existing pg netlist.

Feedback

### See Also

- infer_supply_from_pg_net
- mv.pg.continue_infer_pg_with_conflict
- MV-247

---

## MV-247

(error) Total %d conflict(s) are found between existing PG connection in netlist and UPF constraint.

### Description

This error message is printed by infer_supply_from_pg_net. if UPF CSN conflict with PG netlist, by default this error will be reported for conflict summary.

### What Next

User infer_supply_from_pg_net verbose mode to check each conflict.

### See Also

- infer_supply_from_pg_net
- mv.pg.continue_infer_pg_with_conflict
- MV-246

---

## MV-248

(error) Advanced Legalizer has not been turned on.

### Description

This message shows when user trying to do commit_secondary_pg_placement_constraints, but advanced legalizer has not been turned on. Currently only advanced legalizer can support secondary_pg_placement constraints.

### What Next

Please check with legalization team if advanced legalizer can be applied to this design. If yes, you have to turn it on by setting place.legalize.enable_advanced_legalizer to true. If not, this design cannot have secondary_pg_placement constraints.

Feedback

### See Also

- commit_secondary_pg_placement_constraints

---

## MV-249

(error) Power switch insertion/connection cannot be implemented for power switch strategy %s : %s.

### Description

This error message is printed when the power switch insertion or connection cannot be implemented when multiple power domains share a single voltage area. In such a case, power switch strategy from the master domain should be implemented.

### What Next

Please check the power switch strategy, power domain of the strategy and the voltage area that is shared by this power domain.

### See Also

- report_power_domains
- report_voltage_areas

---

## MV-250a

(warning) Power domains %s cannot be assigned to default voltage area due to shared_voltage_area attribute conflict.

### Description

This warning message is printed only when missing va flow and shared va flow are both on. It is issued when multiple power domains are specified in UPF design attribute "shared_voltage_area", but they are conflicting with missing VA domain list which will be assigned to default voltage area by the tool.

### What Next

You can use the 'check_mv_design' command to identify any power domains that are missing a voltage area, such power domains are reported under the "Power domain rule" section.

Then you can use "create_voltage_area" command to assign voltage areas to power domains.

Feedback

**See Also**

- check_mv_design
- report_power_domains
- report_voltage_areas
- mv.upf.enable_missing_voltage_area

---

## MV-250

(error) Power domains of the voltage area and shared_voltage_area attribute are different : power domain '%s' is not specified as part of the %s.

**Description**

This error message is printed when multiple power domains share a single voltage area, but power domains of the voltage area are different from the power domain list of UPF design attribute 'shared_voltage_area'.

**What Next**

Please check the power domains of the voltage area and shared_voltage_area attribute.

**See Also**

- report_voltage_areas

---

## MV-251

(error) Voltage area '%s' is not completely in current physical block '%s'.

**Description**

This message shows when voltage area specified is not completely in current physical block for create_secondary_pg_placement_constraints.

**What Next**

Please only specify voltage area which is completely in currently physical block (doesn't have any portion in linked physical block).

**See Also**

- create_secondary_pg_placement_constraints

Feedback

## MV-252

(error) Supply '%s' is domain primary of voltage area '%s'.

### Description

This message shows when the supply specified is domain primary of the voltage area for create_secondary_pg_placement_constraints.

### What Next

Please only specify voltage area which the supply is non-domain-primary.

### See Also

- create_secondary_pg_placement_constraints

## MV-253

(error) Supply '%s' is not available in the power domain of voltage area '%s'.

### Description

This message shows when the supply specified is not available in the power domain of the voltage area for create_secondary_pg_placement_constraints.

### What Next

Please remove the voltage area if the supply is really not available in it, or update the UPF to make the supply available.

### See Also

- create_secondary_pg_placement_constraints

## MV-254

(error) Cannot find qualified voltage area for constraint '%s'.

### Description

This message shows when tool cannot find any qualified (non-domain-primary and is available in the domain) for the secondary_pg_placement constraint.

### What Next

Please remove this constraint if it's not needed, or recreate the secondary_pg_placement constraint with correct supply and/or voltage_area.

Feedback

**See Also**

- create_secondary_pg_placement_constraints

---

## MV-255

(error) Cannot find PG strap in voltage area '%s' for constraint '%s'.

**Description**

This message shows when tool cannot find any PG strap for the voltage area specified for the secondary_pg_placement constraint (with -layers).

**What Next**

It's possible that the voltage_area is wrongly specifed, or the PG strap hasn't been implemented. If the PG strap hasn't been implemented yet, user should use -region for creating secondary_pg_placement constraint.

**See Also**

- create_secondary_pg_placement_constraints

---

## MV-256

(error) Cannot derive any valid shape for constraint '%s'.

**Description**

This message shows when tool cannot derive any valid shape the secondary_pg_placement constraint.

**What Next**

Remove the constraint if it's not needed, or recreate it with correct options.

**See Also**

- create_secondary_pg_placement_constraints
- commit_secondary_pg_placement_constraints

---

## MV-257

(warning) If set_power_domain_constraints -prefer_tie_off_nwell/-prefer_tie_off_pwell is used, and mv.upf.auto_enable_type2n3_selection is set, set_power_domain_constraints gets precedence.

Feedback

### Description

If mv.upf.auto_enable_type2n3_selection is already set, and -prefer_tie_off_nwell/ -prefer_tie_off_pwell options of set_power_domain_constraints are used, the set_power_domain_constraints command takes precedence. Insulated tied-off cells will be 'preferred' only in those power domains specified with the -domains option of set_power_domain_constraints.

### What Next

The app-option mv.upf.auto_enable_type2n3_selection will be deprecated in future releases. Switch to using the new command options of set_power_domain_constraints command

---

## MV-258

(warning) If set_power_domain_constraints -disallow_forward_biasing/-disallow_reverse_biasing is used, and either of mv.cells.disallow_forward_biasing/ mv.cells.disallow_forward_reverse_biasing/mv.cells.disallow_reverse_biasing are set, set_power_domain_constraints gets precedence.

### Description

If either of mv.cells.disallow_forward_biasing/mv.cells.disallow_forward_reverse_biasing/ mv.cells.disallow_reverse_biasing is already set, and -disallow_forward_biasing/-disallow_reverse_biasing options of set_power_domain_constraints are used, the set_power_domain_constraints command takes precedence.

### What Next

App-options mv.cells.disallow_forward_biasing/mv.cells.disallow_forward_reverse_biasing/ mv.cells.disallow_reverse_biasing will be made obsolete in future releases. Switch to using the new command options of set_power_domain_constraints command

---

## MV-259

(warning) %s %s cell on net %s is skipped because this net is connected with leaf pin related with relative PG pin.

### Description

Isolation cells, repeaters, and level shifters are not inserted on relative signal nets.

### What Next

Find out why these nets are marked as relative signal nets. A net becomes relative signal net when it connected with a leaf signal pin which use relative PG pin as related power pin or ground pin.

Feedback

A leaf PG pin, it will be called as relative PG pin, when it used as 'related power pin' for one signal pin and 'related ground pin' for another signal pin. Relative PG pin can be queried by: 1. "relative PG" liberty attribute that derived by liberty. 2. on-the-fly marking that generated by "set_port_attributes -relative_pg" command.

**See Also**

- set_port_attributes

---

## MV-260a

(Warning) Name based matching has failed for Isolation cell %s since it can match strategy (%s,%s) on pin %s or strategy (%s,%s) on pin %s.

**Description**

This message occurs during isolation cell matching when multiple isolation strategies can be matched to the same isolation cell. Due to the ambiguity, name based isolation cell matching has failed. Topology based matching will still attempt to match and associate the isolation cell.

**What Next**

Use unique power domain and or isolation strategy name in order to distinguish isolation cells.

---

## MV-260

(Error) Isolation cell %s matches both strategy (%s,%s) on pin %s and (%s,%s) on pin %s, matching failed.

**Description**

This message occurs during isolation cell matching when multiple isolation strategies can be matched to the same isolation cell. Due to the ambiguity, isolation cell match fails.

**What Next**

Use unique power domain and or isolation strategy name in order to distinguish isolation cells.

---

## MV-261

(information) Inferring supply port %s for RTL PG port %s.

Feedback

### Description

This message is printed by infer_supply_from_pg_net verbose mode when a new create_supply_port UPF constraint get inferred from PG netlist.

### What Next

This is an information-only message. No action is required.

### See Also

- infer_supply_from_pg_net
- create_supply_port

---

## MV-262

(information) Inferring supply net %s connection to %s port %s.

### Description

This message is printed by infer_supply_from_pg_net verbose mode when a new connect_supply_net UPF constraint get inferred from PG netlist.

### What Next

This is an information-only message. No action is required.

### See Also

- infer_supply_from_pg_net
- connect_supply_net

---

## MV-263

(warning) Driver '%s' (supply set (%s, %s)) cannot drive load pin '%s' (supply set (%s, %s)) due to voltage difference on relative signal path.

### Description

Two pins that are connected by relative signal net should have the same voltage. A net is recoginized as relative signal net if the net is connected with leaf pin which is related with relative PG pin.

It will compare driver power supply with load power supply and compare driver ground supply with load ground supply, violation will be reported if one of the comparison find voltage difference.

Feedback

### What Next

Find out if related power/ground pin of these pins are correctly marked as relative PG pin. A pin is set to relative PG pin either in .lib file or by using set_ports_attributes command.

---

## MV-264

(warning) The option -direction should not be used to speicfy ring connection, please use -ring_connection instead.

### Description

This is a warning message for connect_power_switch command. When the switch cells are placed as a ring, and user has specified -direction to connect them.

### What Next

Suggest to use -ring_direction to specify clockwise or counter_clockwise. It is now a warning to keep backward compatability with old script.

### See Also

- connect_power_switch

---

## MV-265

(warning) Pin '%s' of %s cell '%s' is connected with relative signal net '%s'.

### Description

This warning message is printed when there is an existing cell connected with a net which is connected to leaf pin related with relative PG pin. Only analog pin and cell contains relative PG pin allow to connected with such net.

### What Next

Remove the existing cell if the net is expected to be a relative signal net.

---

## MV-266

(warning) Unknown type %s is skipped.

### Description

Option -type must specify a predefined connection type. This warning message indicates the unknown type is skipped.

Feedback

**What Next**

Make sure predefined type is specified.

---

## MV-267

(warning) Strategy %s is ignored for %s because strategy %s has already been specified.

**Description**

There shall be only one strategy specified for a given setting of option type and/or dft_target_domain/dft_source_supply. The strategy is ignored if tool detects a strategy has been defined.

**What Next**

Make sure the setting of option type and/or dft_target_domain/dft_source_supply is correct.

---

## MV-268

(warning) Isolation cell '%s' pin '%s' is connected with relative supply net %s.

**Description**

This warning message occurs when the isolation cell use relative supply net as primary or backup supply.

**What Next**

Remove the existing isolation cell if it is unexpected.

---

## MV-269

(warning) Level shifter cell '%s' pin '%s' is connected with relative supply net %s.

**Description**

This warning message occurs when the level shifter cell use relative supply net as primary or backup supply.

**What Next**

Remove the existing level shifter cell if it is unexpected.

---

## MV-270

(warning) Retention cell '%s' pin '%s' is connected with relative supply net %s.

Feedback

### Description

This warning message occurs when the retention cell use relative supply net as primary or backup supply.

### What Next

Remove the existing retention cell if it is unexpected.

---

## MV-271

(warning) Power switch cell '%s' use relative supply net %s as %s supply.

### Description

This warning message occurs when the power switch instance use relative supply net as input or output supply.

### What Next

Remove the existing power switch instance if it is unexpected.

---

## MV-272

(warning) Sequential element %s belonging to strategy %s of domain %s has incorrect retention_equivalent attribute set on its library cell. Reason : %s

### Description

This warning message indicates that the reported register instance is a complex non-retention library cell with no functional information and the instance could not be remapped to complex retention library cell based on the *retention_equivalent* attribute specified on the complex non-retention library cell. Reasons will be one of the following. - No complex retention library cell was found in the reference library with the name specified in retention_equivalent attribute - Complex retention library cell was not found in *map_retention_cell* command for the retention strategy - Complex retention library cell was not found suitable for the PVT requirements - Syntax used to specify pin map in retention_equivalent is wrong - Complex retention library cell didn't have all the pins of its complex non-retention counterpart - Not all the pins specified in the pin map were found either on non-retention or on retention library cell

### What Next

Make sure retention_equivalent attribute on the complex non-retention library cell is of the syntax {complex_retention_library_cell_name {old_pin_name new_pin_name}*}. and reference library has a retention cell with the name used in the attribute and it has all the pins of the non-retention variant. Also, pins specified in the pin map of retention_equivalent attribute must all be present on the respective library cells.

Feedback

- define_user_attribute
- set_attribute
- check_mv_design
- mv.cells.infer_complex_retention_cells

---

## MV-273

(warning) Power domain '%s' (supply: '%s') and its primary voltage area '%s' (supply: '%s') have different primary %s supplies.

### Description

This message occurs when the primary supply of the specified power domain is different from the supply net of primary voltage area of the power domain. This may potentially cause bad logic as the primary pg pins of the core cells in the voltage area by default are physically connected to and powered by the primary supply of the voltage area.

### What Next

Check the voltage area(s) of the power domain and their power and ground supplies. If the power domain should not belong to the specified voltage area, please consider to add the power domain to a different voltage area.

### See Also

- create_power_domain
- set_voltage_area
- report_power_domain
- report_voltage_areas
- mv.upf.enable_missing_voltage_area

---

## MV-274

(error) region specified for constraint '%s' overlaps with non-qualified voltage_area '%s' (%s).

### Description

This message shows when the region specified for command create_secondary_pg_placement_constraints overlaps with non-qualified voltage_area

Feedback

(a gas-station type of voltage_area or the supply is domain primary or the supply is not available in this voltage_area).

**What Next**

Adjust the region to cover only qualified voltage_area(s).

**See Also**

- create_secondary_pg_placement_constraints

---

## MV-275

(error) The primary %s supply nets '%s' of power domain '%s' and '%s' of power domain '%s' in the same shared voltage area list have different driver types.

**Description**

This error message is printed when multiple power domains are part of a shared voltage area list specified by the 'shared_voltage_area' design attribute, but the primary supply nets of those power domains have different driver types.

**What Next**

Please check the primary supply nets of the power domains of the shared voltage area and their drivers.

**See Also**

- report_power_domains
- report_voltage_areas

---

## MV-276

(error) The primary %s supply '%s' of power domain '%s' is same as primary %s supply of power domain '%s' that is not in the same shared voltage area list.

**Description**

This error message is printed when multiple power domains are part of a shared voltage area list specified by the 'shared_voltage_area' design attribute, but the primary supply net of the specified power domain is same as the primary supply net of the power domain that are not the master power domain. As a result, the primary supply net will not be physically implemented.

Feedback

### What Next

Please check the primary supply nets of the power domains and the power domains of the shared voltage area.

### See Also

- report_power_domains

---

## MV-277

(error) Power switch strategy '%s' is not valid for power switch insertion/implementation.

### Description

This error happens when the specified power switch strategy is invalid for switch cell insertion and physical implementation. Possible causes include undefined output supply net of the strategy, unknown PG type of the supply net etc...

### What Next

Check the power switch strategy.

### See Also

- create_power_switch_ring
- create_power_switch_array
- create_power_switch

---

## MV-278

(warning) Level shifter cell %s belonging to strategy %s of power domain %s does not conform with the mapping directive.

### Description

This error message indicates that the reported level shifter instance is mapped to a library cell that is not in the list specified by the *map_level_shifter_cell* command for the strategy.

This might result in strategy association failure during *commit_upf*.

### What Next

Tool has either mapped or sized this level shifter instance incorrectly. This needs to be fixed.

Feedback

### See Also

- set_level_shifter
- map_level_shifter_cell
- check_mv_design

---

## MV-279

(error) Invalid value specified for one or more command options of set_power_domain_constraints.

### Description

This error message indicates that one or more of the bias related command options of set_power_domain_constraints have invalid values specified. These options take only boolean true/false values. Specifying any other value other than "true" or "false" is an error.

### What Next

check your set_power_domain_constraints command to see if set_power_domain_constraints is being used correctly.

### See Also

- report_power_domain

---

## MV-281

(Information) Query rules have been created for renamed isolation cells. Query rules are used during read_def if app option "file.def.rule_based_name_matching" is set to true and get_* commands if app option "design.enable_rule_based_query" is set to true.

### Description

This information message is printed during commit_upf. When pre-instantiated isolation cells are renamed to conform with Synopsys naming rules, query rules will be created for read_def and get_* commands purpose.

### See Also

- set_query_rules

Feedback

## MV-282

(Warning) The switch cell '%s' is skipped for ring connection when it's specified by option '%s'.

### Description

This warning message is reported only when the switch cell is specified in -object_list/ -voltage_area and power switch ring connection skips it because it's not closest to the voltage area edge or other reasons which have been reported - source pin is same as ack pin or sleep pin is same as ack out.

We only report at most 5 switch cells to avoid bogus message.

### See Also

- connect_power_switch
- MV-030

## MV-283

(error) Retention strategy %s of power domain %s applies to safety register %s.

### Description

This error message indicates that safety registers (TMR candidates and Failsafe FSM registers) are part of retention strategy. Since safety registers are not expected to shut down, retention strategies are not allowed to be defined on safety registers.

### What Next

Refine the UPF to exclude safety registers from being target of *set_retention* commands.

### See Also

- set_retention
- create_safety_register_group
- create_safety_register_rule
- set_safety_register_rule

## MV-284

(warning) Options -layers/-margin/-voltage_areas are specified together with -region. Options -layers/-margin/-voltage_areas will be ignored.

Feedback

### Description

This message occurs when -layers/-margin/-voltage_areas are specified together with -region for create_secondary_pg_placement_constraints command. Only -region will be considered, -layers/-margin/-voltage_areas will be ignored.

### What Next

Specify either -region or -layers/-margin/-voltage_areas.

### See Also

- create_secondary_pg_placement_constraints

---

## MV-285

(error) The driver %s '%s' [supply net '%s', power state '%s'] of enable signal of NOR/NAND isolation cell implemented on the output port %s of MACRO instance %s is less always-on than the load pin '%s' [supply net '%s', power state '%s'] of the cell.

### Description

This message occurs when the related supply net of the enable signal is less always-on than the related supply net of the load pin of an NOR isolation cell implemented on a output port of a MACRO instance.

For single enable NOR isolation inside MACRO, check is performed between the driver of the enable pin to load pin. In the case of multiple enable pins, as they do not drive the output pin of NOR directly, the ON-ness check is performed with the enable pins.

### What Next

Check the power states of the supply nets.

### See Also

- report_net
- report_pst

---

## MV-286

(error) The driver %s '%s' [supply net '%s', power state '%s'] of data input pin (having alive_during_power_up attribute) of NOR/NAND isolation cell implemented in the MACRO instance %s is less always-on than the data pin '%s' [supply net '%s', power state '%s'] of the cell.

Feedback

### Description

This message occurs when the related supply net of the driver of data input pin is less always-on than the related supply net of the data pin with alive_during_power_up attibute of a NOR isolation cell implemented at an input port of a MACRO instance. This can cause subthreshold leakage.

### What Next

Check the power states of the supply nets.

### See Also

- report_net
- report_pst

---

## MV-287

(error) The %s supply [supply net '%s', power state '%s'] of output pin of %s isolation cell implemented in the output port %s of MACRO instance %s is less always-on than the load pin '%s' [supply net '%s', power state '%s'] of the cell.

### Description

This message occurs when the related ground(NOR)/power(NAND) supply net of the output pin is less always-on than the related ground/power supply net of the load pin of the NOR/NAND isolation cell implemented in a output port of a MACRO instance.

### What Next

Check the power states of the supply nets.

### See Also

- report_net
- report_pst

---

## MV-288

(error) The related %s pin [supply net '%s'] of enable pin %s of %s isolation cell implemented in the output port %s of MACRO instance %s is different than the related %s pin of the output pin [supply net '%s'].

Feedback

### Description

This error message occurs when there is a NOR/NAND isolation cell in MACRO output which is driven by single enable pin and the related supply net of the enable pin is different than the related supply net of the output pin.

### What Next

Check the power states of the supply nets.

### See Also

- report_net
- report_pst

---

## MV-289

(warning) Supply net %s is available in power domain %s according to UPF, but not physically available due to secondary pg constraint %s under block %s .

### Description

This message occurs when there is a supply net defined as available in UPF, but is excluded from supply availability due to secondary pg constraints.

### What Next

Check secondary pg constraints

### See Also

- create_secondary_pg_placement_constraints
- remove_secondary_pg_placement_constraints

---

## MV-290

(error)Value of app option mv.upf.save_upf_line_width or mv.upf.save_upf_line_indent is negative.

### Description

This message occurs when value of app option mv.upf.save_upf_line_width or mv.upf.save_upf_line_indent is negative. Both of them should be set as non-negative.

### What Next

Specify a non-negative value by set_app_options.

Feedback

**See Also**

- mv.upf.save_upf_line_width
- mv.upf.save_upf_line_indent

---

## MV-291

(error) The value of app option mv.upf.save_upf_line_width is not bigger than that of mv.upf.save_upf_line_indent.

**Description**

This message occurs when the value of app option mv.upf.save_upf_line_width is less than that of mv.upf.save_upf_line_indent, which will result in the continuing line cannot be output correctly for a command in multiple lines.

The value of app option mv.upf.save_upf_line_width should be bigger than that of mv.upf.save_upf_line_indent

**What Next**

Specify the value of app option mv.upf.save_upf_line_width bigger than that of mv.upf.save_upf_line_indent by set_app_options.

**See Also**

- mv.upf.save_upf_line_width
- mv.upf.save_upf_line_indent

---

## MV-292

(Warning) Always-on strategy cannot be set on a power domain in child design.

**Description**

This message is reported for users try to set always-on strategy on a power domain in child design. Only power domains on current top design can be set successfully.

---

## MV-293

(error) Supply '%s' is unresolved implcit supply net.

**Description**

This message shows when the supply specified for create_secondary_pg_placement_constraints is an unresolved implicit supply net

Feedback

### What Next

Please only specify either explicit supply net or implicit supply net but being resolved already.

### See Also

- create_secondary_pg_placement_constraints

---

## MV-294

(error) Either -supply or -exclude_supply should be specified.

### Description

This message shows when neither -supply nor -exclude_supply is specified for create_secondary_pg_placement_constraints or both -supply and -exclude_supply are specified.

### What Next

Please specify either -supply or -exclude_supply for create_secondary_pg_placement_constraints.

### See Also

- create_secondary_pg_placement_constraints

---

## MV-295

(error) -layers and -region should not be specified together with -exclude_supply.

### Description

This message shows when either -layers or -region is specified together with -exclude_supply for create_secondary_pg_placement_constraits

### What Next

Please do not specify either -layers or -region when -exclude_supply is specified for create_secondary_pg_placement_constraints.

### See Also

- create_secondary_pg_placement_constraints

Feedback

## MV-296

(error) Supply '%s' or its equivalent supply from secondary pg constraint %s cannot be specified as physically unavailable for voltage area '%s', because it is already used by pin or port %s'.

### Description

This message shows when the supply specified in create_secondary_pg_placement_constraint -exclude_supply is already used in one of the existing cells in the netlist, or one of the top level port. When this happens, the secondary pg constraint with -exclude_supply will be ignored

### What Next

Please remove the secondary pg constraint that has primary supply specified in -exclude_supply.

### See Also

- create_secondary_pg_placement_constraints
- remove_secondary_pg_placement_constraints

## MV-297

(error) Supply '%s' cannot be specified as physically unavailable, because it is a supply that required by power management cells in domain %s for power strategy: %s.

### Description

This message shows when the supply specified in create_secondary_pg_placement_constraint -exclude_supply is a supply that might be used by power management cells. When this happens, the secondary pg constraint with -exclude_supply will be ignored

### What Next

Please remove the secondary pg constraint that has primary supply specified in -exclude_supply.

### See Also

- create_secondary_pg_placement_constraints
- remove_secondary_pg_placement_constraints

Feedback

## MV-298

(warning) Supply '%s' cannot be specified as physically unavailable for voltage area '%s', because there are already explicit secondary pg constraints indicating this supply is physically available for the same VA.

### Description

This message shows when the supply specified in create_secondary_pg_placement_constraints -exclude_supply is already a physically available supply derived by other create_secondary_pg_placement_constraints -supply

### See Also

- create_secondary_pg_placement_constraints
- remove_secondary_pg_placement_constraints

## MV-299

(error) Supply '%s' is not available in VA '%s' from UPF standpoitn, but there are '%s' straps available within VA '%s'.

### Description

This message occurs during check_secondary_pg_placement_constraints. It shows that even though a certain supply is not available in VA from UPF standpoint, there are straps available in area which belongs to the VA. This would be a waste of resource, as there will not be cells trying to use the straps.

### What Next

Fix the inconsistency between UPF and the PG network. Either remove the unnecessary straps, or add the secondary supply to UPF.

### See Also

- remove_shapes

## MV-300

(warning) voltage value (corner "%s", %s) of '%s' is invalid.

Feedback

### Description

This warning message is printed when specified voltage value is invalid or uninitialized. As a result, the voltage value in the voltage_map of the budget shell will be incorrect and may cause potential error(s) when generating the budget shell library.

### What Next

Check the voltage values of the specified object.

### See Also

- set_voltage
- report_supply_nets

---

## MV-302

(Information) There is at least one library cell with is_soi attribute and PG connection checks for bias will be performed accordingly.

### Description

This message is to inform users that there are library cells with is_soi attribute and bias PG connection checks will be performed accordingly.

---

## MV-303

(error) Strategy %s is not element based.

### Description

Command set_dft_isolation only accepts element based isolation strategy.

### What Next

Make sure an element-based strategy is specified.

### See Also

- set_isolation

---

## MV-304

(warning) UPF update is not supported when compile_fusion starts from stage %s.

Feedback

### Description

When compile_fusion starts from a stage other than initial_map, UPF update is only supported for gate-level insert_dft flow where UPF update happens between gate-level insert_dft and the successive compile_fusion session which starts from stage initial_place, initial_drc or initial_opto.

### What Next

Check if the UPF update is intended.

---

## MV-305

(error) The isolation enable signal "%s" in strategy "%s" applied on port "%s", cannot isolate the load "%s" from driver "%s".

### Description

The message is given when the constrained value of the isolation signal does not assert the clamp condition on the isolation cell causing an "X" to propagate to the output loads from the driver.

The message is only issued for the enable signal of a isolation strategy which is constrained to a value '0' or '1' using the "-logic_expr" in an add_power_state command.

### What Next

Check if the isolation signal is the correct signal to be isolating the specified driver and load pair and if it's value is correctly constrained in the add_power_state command.

---

## MV-306

(warning) The logic value of the isolation enable signal "%s" in strategy "%s" is not specified or constrained in any system power state. The tool will not perform corruption propagation checks for this strategy.

### Description

The message is seen because only some of the isolation enable signals of the design are specified or constrained in the system power states and others are not.

The message is issued for all the isolation signals which are not specified or constrained in the system power states.

### What Next

Please check if the all the necessary isolation enable signals have been specified in the system power states.

Feedback

## MV-307

(error) cannot use -voltage_area_shape option for check_bufferability when secondary pg placement constraints are not up to date.

### Description

The error is seen when user tries to use -voltage_area_shape option in check_bufferability when secondary pg placement constraints are not committed and up to date.

### What Next

Please do commit_secondary_pg_placement_constraints manually and specify the up to date voltage area shape name with -voltage_area_shape option

### See Also

- commit_secondary_pg_placement_constraints
- create_secondary_pg_placement_constraints

## MV-308

(error) Unable to connect the sleep and ack of the shared power domains: %s.

### Description

This error message is printed when '-connect_sleep_and_ack_in_shared_domains' is specified but the command failed to connect the sleep and ack signals of the shared power domains due to the specified reason.

### What Next

Please check the reason that caused the connection to fail.

### See Also

- connect_power_switch

## MV-309

(error) Invalid %s is specified by '-fine_grained_lib_pins' command option: %s.

### Description

This error message is printed when '-fine_grained_lib_pins' is specified but the specified pairs of sleep and ack library pins of fine-grained macro are invalid. An example of

Feedback

valid option value is : -fine_grained_lib_pins {{macroLib/macroLibCellA/sw macroLib/macroLibCellA/ack} {macroLib/macroLibCellB/sw macroLib/macroLibCellB/ack}}

**What Next**

Please make sure that the sleep and ack library pin pairs of fine-grained macro are valid.

**See Also**

- connect_power_switch

---

## MV-310

(Error) %s supply (%s, %s) on soft macro pin %s is %s on than supply (%s, %s) on its %s pin %s.

**Description**

This error message occurs on soft macro boundary pins in either of the following situations:

1. The driver supply specified in *set_port_attribute -driver_supply* on the pin is more on than the supply on the actual driver pin to which is connected.
2. The receiver supply specified in *set_port_attribute -receiver_supply* on the pin is less on than the supply on the actual load pins to which is connected.

Isolation insertion based on the port attributes on the soft macro boundary pin might not be sufficient for correcting electrical violations on the path.

**What Next**

Correct the supplies set on soft macro boundaries to match the actual supplies in the design.

---

## MV-311

(Warning) %s supply (%s, %s) on soft macro pin %s is %s on than supply (%s, %s) on its %s pin %s.

Feedback

**Description**

This error message occurs on soft macro boundary pins in either of the following situations:

1. The driver supply specified in *set_port_attribute -driver_supply* on the pin is less on than the supply on the actual driver pin to which is connected.
2. The receiver supply specified in *set_port_attribute -receiver_supply* on the pin is more on than the supply on the actual load pins to which is connected.

**What Next**

This is a warning message only. No action is required, but consider correcting the supplies set on soft macro boundaries to match the actual supplies in the design.

---

## MV-312

(Error) Voltage value on %s supply (%s, %s) on soft macro pin %s is different from that of supply (%s, %s) on its %s pin %s.

**Description**

This error message occurs on soft macro boundary pins in either of the following situations:

1. The driver supply specified in *set_port_attribute -driver_supply* on the pin has a different voltage value from that of the supply on the actual driver pin to which is connected.
2. The receiver supply specified in *set_port_attribute -receiver_supply* on the pin has a different voltage value from that of the supply on the actual load pins to which is connected.

Level shifters insertion based on the port attributes on the soft macro boundary pin might not be sufficient for correcting voltage violations on the path.

**What Next**

Correct the supplies set on soft macro boundaries to match the actual supplies in the design.

---

## MV-313

(error) exclude supply net specified in constraint '%s' is gas station '%s' '%s', this supply cannot be excluded.

Feedback

### Description

This message shows when -exclude_supply is specified for a supply that cannot be excluded from the given gas station. The disqualified supply includes gas station power supply, gas station ground supply, gas station nwell supply and gas station pwell supply.

### What Next

remove this secondary pg placement constraint or specify different power/ground/nwell/pwell supply for gas station.

### See Also

- create_secondary_pg_placement_constraints
- create_voltage_area
- set_voltage_area

---

## MV-314

(warning) PG pin connections of some cells have changed. Please run connect_pg_net to reconnect PG nets.

### Description

The *fix_mv_buffer_trees* command has changed PG pin connections of some buffers, inverters, level shifters, or enable level shifters. Existing PG nets connecting to these cells are removed. Please run the *connect_pg_net* command to reconnect these PG pins.

### See Also

- connect_pg_net

---

## MV-315a

(information) Total %d %s cells not mapped were removed(not inserted) in design.

### Description

This message shows the number of each type of mv cells (eg, level shifters, isolation cells, repeater cells, etc) that cannot be mapped successfully with the library cells are removed from the design, they are not finally get inserted in the design.

### What Next

This is an information-only message. No action is required. The unmapped report will be generated to show some failure reason for mapping .

Feedback

### See Also

- create_mv_cells

---

## MV-315

(information) The %s cell %s was not inserted because a matching library cell cannot be found in user technology library.

### Description

This message warning message occurs in create_mv_cells command if a multi-voltage cell is needed but not inserted because a valid reference for the cell is not found in the user provided technology library.

### What Next

Please provide the required technology library cells to avoid multi voltage violations.

### See Also

- create_mv_cells

---

## MV-316

(Error) %s options should be specified together.

### Description

This error message occurs in create_mv_cells command if the option -multibit is specified without the -mapped option.

### What Next

Plase specify the option -multibit along with the option -mapped in create_mv_cells.

### See Also

- create_mv_cells

---

## MV-318

(information) Message '%s' limit (%d) exceeded. Remainder will be suppressed. To print all the messages use '-verbose' option.

Feedback

### Description

This message indicates that the message limit has been exceeded and the remainder will be suppressed.

### What Next

Run create_mv_cells with the -verbose option.

### See Also

- create_mv_cells

---

## MV-319

(Error) Neither option -buffer nor option -diodes is specified in fix_mv_design command.

### Description

This error message occurs when neither option -buffer nor option -diodes is specified in fix_mv_design command. fix_mv_design needs requires user to specify either -buffer or -diodes.

### What Next

Specify either -buffer or -diodes in fix_mv_design command

### See Also

- fix_mv_design

---

## MV-320

(Error) Option -from/-lib_cells/-minimize_dual_rail/-level_shifter/-silent/-debug/-html/-csv/-no_split/-report_all/-mapped/-output cannot be specified together with option -diodes in fix_mv_design command.

### Description

This error message occurs when one of more of the options in the following option lists {-from, -lib_cells, -min_dual_rail, -level_shifter, -silent, -debug, -html, -cvs, -no_split, -report_all, -mapped, -output} is specified together with option -diodes in command fix_mv_design.

### What Next

When specify -diodes in fix_mv_design, do not specify option -from/-lib_cells/-min_dual_rail/-level_shifter/-silent/-debug/-html/-cvs/-no_split/-report_all/-mapped/-output

Feedback

### See Also

- fix_mv_design

---

## MV-321

(information) %d connections are made to connect sleep and ack signals of shared power domains.

### Description

An informational message from connect_power_switch, indicating how many connections have been made to connect the sleep and ack signals of shared power domains from the ack_out pin that is specified as command option.

### What Next

Optionally check that the expected number of connections have been made by connect_power_switch.

### See Also

- connect_power_switch
- create_power_switch

---

## MV-322

(Information) Derive secondary pg constraints based on pg straps. All prior existed tool derived secondary pg constraints will be removed.

### Description

This information message occurs user issues derive_secondary_pg_placement_constraints. All prior existed tool derived secondary pg constraints will be removed first.

### What Next

This is just an information message.

---

## MV-323

(error) MV failed to process multi bit buffer chain.

Feedback

### Description

This message occurs when MV fails to process the multi bit buffer chain during set_eco_power_intent. The failure could be due to input/output not having the same supplies; input being a tree of buffers/inverters other than chain; buffer chain having a mix of multi bit buffers/inverter and normal/single bit buffer/inverters and many others.

### What Next

Please check to make sure the input is correct.

---

## MV-324

(error) MV failed to annotate MV information on buffer/inverters in the multi bit buffer chain.

### Description

This message occurs when MV fails to annotate supply or power domain information on the buffer/inverters in the multi bit buffer chain during set_eco_power_intent. The failure could be due to required supply being not available; PD-VA mismatch being unsolvable; lib cell type being incorrect and many others.

### What Next

Please check the upf to make sure the required supply is available or change the lib cell type so that we can annotate the supply information correctly. If its because PD-VA mismatch issue, please check the PFT setting.

---

## MV-325

(error) Supply '%s' in secondary pg constraint '%s' does not have physical straps in the region specified in the constraint.

### Description

This message occurs during check_secondary_pg_placement_constraints. The secondary pg constraint is trying to specify certain supply being available in a given region. However, there is no physical straps existed in that region.

### What Next

Specify the secondary pg constraint correctly so that it matches the physical straps availability, or re-compile pg.

Feedback

### See Also

- remove_secondary_pg_placement_constraints
- create_secondary_pg_placement_constraints
- compile_pg

---

## MV-326

(warning) Supply '%s' in secondary pg constraint '%s' does not have physical straps in VA '%s' which is specified in the constraint.

### Description

This message occurs during check_secondary_pg_placement_constraints. The secondary pg constraint is trying to specify certain supply being available in a voltage area. However, there is no physical straps existed in that voltage area.

### What Next

Specify the secondary pg constraint correctly so that it matches the physical straps availability, or re-compile pg.

### See Also

- remove_secondary_pg_placement_constraints
- create_secondary_pg_placement_constraints
- compile_pg

---

## MV-327

(warning) Exclude supply '%s' in secondary pg constraint '%s' does have physical straps in VA '%s' which is specified in the constraint.

### Description

This message occurs during check_secondary_pg_placement_constraints. The secondary pg constraint is trying to exclude certain supply being used in a voltage area. However, there is physical straps for that supply existed in that voltage area.

### What Next

Specify the secondary pg constraint correctly so that it matches the physical straps availability, or re-compile pg.

Feedback

**See Also**

- remove_secondary_pg_placement_constraints
- create_secondary_pg_placement_constraints
- compile_pg

---

## MV-328

(error) Tool derived secondary pg constraint '%s' is conflicting with the following user specified secondary pg constraints '%s'.

**Description**

This message occurs during check_secondary_pg_placement_constraints or commit_secondary_pg_constraint. There is a tool derived secondary pg constraint for certain supply. However, there are also user specified secondary pg constraints on the same or equivalent supply. The user specified pg constraints will be honored. The tool derived constraints will be removed automatically during commit_secondary_pg_placement_constraints.

**What Next**

Specify the secondary pg constraint correctly so that there will be no conflicts

**See Also**

- remove_secondary_pg_placement_constraints
- create_secondary_pg_placement_constraints
- check_secondary_pg_placement_constraints
- commit_secondary_pg_placement_constraints

---

## MV-329

(error) Invalid region. Region is outside of the current physical block boundary.

**Description**

You receive this error when you are trying to specify a region which is outside of the current physical block boundary during create_secondary_pg_placement_constraints command. The region you specified should always be within the current physical block boundary.

Feedback

### What Next

Specify a region inside the current physical block boundary and try this command again.

### See Also

- create_secondary_pg_placement_constraints

---

## MV-330

(error) Physical hierarchy '%s' is not ready in terms of secondary pg constraints.

### Description

This message occurs during top level commit secondary pg constraints. It is required that if there are secondary pg constraints in subblocks, there should be commit happened at the block level prior to the blocks being linked back to the top. The tool will error if the blocks are not committed yet when commit is happening at the top.

### What Next

User can do commit_secondary_pg_placement_constraints -commit_subblock or he/she can open the specific subblock and commit secondary pg at the block level.

### See Also

- create_secondary_pg_placement_constraints
- commit_secondary_pg_placement_constraints

---

## MV-331

(error) Margin specified cannot be negative value.

### Description

This message occurs when the margin you specified is less than zero. The tool allows user to specify margin with -margin option in create_secondary_pg_placement_constraints and derive_secondary_pg_placement_constraints. The margin you specified has to be value equal or greater than zero.

### What Next

User can respecify -margin in create_secondary_pg_placement_constraints command or derive_secondary_pg_placement_constraints command.If you do not know the margin value, you do not have to specify any value.

Feedback

### See Also

- create_secondary_pg_placement_constraints
- derive_secondary_pg_placement_constraints

---

## MV-332

(error) Incorrect layer name '%s' specified.

### Description

This message occurs when the layer name you specified is incorrect.
You can only specify interconnect layer names when you specify
-layers in create_secondary_pg_placement_constraints command and
derive_secondary_pg_placement_constraints command.

### What Next

User can respecify -layers in create_secondary_pg_placement_constraints command or derive_secondary_pg_placement_constraints command. You can get a list of interconnect layers by doing get_layers -filter {layer_type==interconnect}

### See Also

- create_secondary_pg_placement_constraints
- derive_secondary_pg_placement_constraints
- get_layers

---

## MV-333

(error) Missing required option(s) -net or -pin for generate_mv_feedback.

### Description

One of -net or -pin option must be specified for command generate_mv_feedback.

### What Next

Correct the options on *generate_mv_feedback* as described in the error message. Refer to the *generate_mv_feedback* manpage for a detailed description of the usage of this command.

### See Also

- generate_mv_feedback

Feedback

## MV-334

(Information) Total number of MV cells in the design.

### Description

This information message is printed during MV cell insertion compile flow step.

### What Next

This is just an information message.

## MV-335

(information) power domain root cell '%s' is being deleted.

### Description

This message occurs during the root cell of a power domain is being deleted since it is an empty hierarchy.

### What Next

To prevent a power domain root cell from being deleted by optimization, app-option mv.upf.preserve_power_domain_root_cells can be set to true.

## MV-336

(warning) The 'set_port_attributes %s %s' setting on macro pin '%s' would result in an isolation violation if used as the %s supply of the macro pin.

### Description

This warning message lets the user know that if the tool were to perform implementation using the mentioned set_port_attribute setting instead of the real driver/load supply an isolation violation would occur.

### What Next

Review the UPF to make sure the setting is correct.

### See Also

- set_port_attributes

## MV-337

(warning) App option %s is not applicable with command %s, and it's setting is ignored.

Feedback

### Description

This message occurs during execution of above specified command where certain app option setting is not applicable. The value set on the app option is ignored by the above command.

### What Next

Check the app option setting is intended. You can ignore this message if app option setting is not intended for this command.

---

## MV-338

(warning) Swapping of complex sequential instance %s to its retention equivalent failed. %s.

### Description

Fusion Complier does automatic swapping of complex sequential instances when *mv.cells.infer_complex_retention_cells* is set to true. When any of the conditions required for the successful swapping is not met, tool issues this warning, along with the reason.

### What Next

Use *check_mv_design* to know the detailed reason(s) for the swapping failure.

### See Also

- set_retention
- map_retention_cell
- check_mv_design
- mv.cells.infer_complex_retention_cells

---

## MV-339

(Warning) Can't find a power domain using (%s, %s) as primary supply nets for %s '%s'.

### Description

This warning message occurs when *-update_power_domain {}* is specifed to *fix_mv_design* command. Because no specific power domain is specified in the option, tool tries to find a power domain using the specified driver supply nets as domain primary supply but fails to find one. Tool will use the current power domain for the specified buffer or inverter.

Feedback

### What Next

Please add a power domain using the specified supply nets as domain primary supply and specify it in *-update_power_domain* option.

### See Also

- fix_mv_design

---

## MV-340

(Warning) Found %d power domains using (%s, %s) as primary supply nets: fix_mv_design chooses %s as power domain for %s '%s'.

Found %d power domains available for %s '%s' in -update_power_domain option: power domain '%s' will be used.

### Description

This warning message occurs when *-update_power_domain {}* is specifed to *fix_mv_design* command. Because no specific power domain is specified in the option, tool tries to find a power domain using the specified driver supply nets as domain primary supply but it found multiple matching power domains. Tool will use the first matching power domain it found for the specified buffer or inverter.

### What Next

Please add a power domain using the specified supply nets as domain primary supply and specify it in *-update_power_domain* option.

### See Also

- fix_mv_design

---

## MV-341

(information) Power and ground nets will be connected to mapped cells only. Unmapped instances and switch placeholder cells in the design are skipped.

### Description

connect_pg_net makes power and ground connections to mapped cells only, and unmapped instances and switch placeholder cells in the design will be skipped.

### What Next

This message is informational. No action is required.

Feedback

### See Also

- connect_pg_net

---

## MV-342

(warning) Pin/Port %s is constrained with attribute async_clamp_value '%s', but the isolation strategy %s from power domain %s that applies on this Pin/Port has the conflicting async_clamp_value '%s'. Async clamp value '%s' will be used while implementing the isolation cell.

### Description

This warning message occurs when the tool encounters design ports or pins that have async clamp value settings that do not match the explicit async clamp value of the isolation strategy that applies to them. During implementation the tool will honor async clamp value settings on the pin being isolated over the async clamp value specified for the isolation strategy being implemented.

Async clamp value settings for pins or ports are set using the *set_port_attributes* command with the *-UPF_async_clamp_value* option.

Explicit async clamp value settings for isolation strategies are managed using the *-UPF_async_clamp_value* option of the *set_isolation command*.

### What Next

Review *set_isolation -async_clamp_value instances* to fix any async clamp value mismatches.

### See Also

- set_port_attributes
- set_isolation

---

## MV-343

(warning) Isolation strategy %s from power domain %s that applies to pin/port %s does not have async_clamp_value specified in set_isolation, nor UPF_async_clamp_value on this pin/port, -async_set_reset option will be ignored.

### Description

This warning message occurs when the isolation strategy is specified with -async_set_reset option, but there is no -async_clamp_value specified in the set_isolation or through set_port_attributes.

Feedback

Async clamp value settings for pins or ports are set using the *set_port_attributes* command with the *-UPF_async_clamp_value* option.

Explicit async clamp value settings for isolation strategies are managed using the *-async_clamp_value* option of the *set_isolation command*.

**What Next**

Review *set_isolation -async_clamp_value* to fix any async clamp value mismatches.

**See Also**

- set_port_attributes
- set_isolation

---

## MV-344

(warning) Pin/Port %s is constrained with attribute clamp_value '%s', "-async_set_reset" and "-async_clamp_value" option of the isolation strategy %s from power domain %s that applies on this Pin/Port will be ignored. Clamp value '%s' will be used while implementing the isolation cell.

**Description**

This warning message occurs when the tool encounters design ports or pins that have clamp value settings which is not latch. "-async_set_reset" and "-async_clamp_value" option will be ignore. During implementation the tool will honor clamp value settings on the pin being isolated.

Clamp value settings for pins or ports are set using the *set_port_attributes* command with the *-clamp_value* option.

**What Next**

Review *set_isolation -clamp_value instances* to fix any clamp value mismatches.

**See Also**

- set_port_attributes
- set_isolation

## MV-345

(Error) No power switch cells found in the design.

Feedback

### Description

This error message occurs when no power switch cells can be found in the design when the tool attempts to run connect_power_switch.

### What Next

Please check the design and libraries to see if power switch cells are set up correctly.

### See Also

- connect_power_switch

---

## MV-346

(warning) Isolation signal '%s' of isolation strategy '%s' in power domain '%s' is connected to power/ground pin.

### Description

This message occurs when isolation signal of isolation strategy is driven by power/ground pin.

### What Next

Review isolation signal net connections.

## MV-348

(warning) Strategy '%s' specified by command '%s' does not exist in power domain '%s'.

**Description**

This message occurs when the strategy cannot be found in the power domain. Strategy will be dropped from map_retention_clamp_cell command.

**What Next**

Check the domain name or the strategy name to make sure the strategy is created before this command is issued.

**See Also**

- map_retention_clamp_cell

---

## MV-349

(Error) None of retention strategies specified in '%s' exists in power domain '%s'.

**Description**

This warning message occurs when all strategy names specified with map_retention_clamp_cell command are illegal.

**See Also**

- map_retention_clamp_cell

---

## MV-350

(warning) Cannot apply %s on retention strategy '%s' of power domain '%s' because -no_retention is specified.

**Description**

This message occurs when map_retention_clamp_cell is specified for the retention strategy with -no_retention. Strategy will be dropped from map_retention_clamp_cell command.

Feedback

### What Next

Check the specified retention strategy.

### See Also

- map_retention_clamp_cell

---

## MV-351

(error) Library cell specified with %s in map_retention_clamp_cell is already specified.

### Description

This error message occurs when library cells is specified in map_retention_clamp_cell with duplicated "UPF_GENERIC_CLOCK" or "UPF_GENERIC_ASYNC_LOAD".

### See Also

- map_retention_clamp_cell

---

## MV-352

(warning) The reference library cell '%s' of isolation cell '%s' is specified in map_retention_clamp_cell command. It should not be used for isolation cell mapping.

### Description

This message occurs when the reference library cell of isolation cell is specified in map_retention_clamp_cell, which can only be used for retention clamp cell unless it is also specified in map_isolation_cells command.

### What Next

Check the reference library cell of the isolation cell with the mapping library defined by map_isolation_cells and map_retention_clamp_cells.

### See Also

- report_cell

---

## MV-353

(warning) The reference library cell '%s' of retention clamp cell '%s' is inconsistent with associated strategy '%s'.

Feedback

### Description

This message occurs when the retention clamp cell is associated with a strategy but reference library cell is inconsistent with the strategy.

### What Next

Check the reference library cell of the retention clamp cell with the mapping library defined by map_retention_clamp_cell.

### See Also

- associate_mv_cells
- report_cell
- map_retention_clamp_cell

## MV-355

(warning) Related %s supply '%s' of bump pin '%s' is different from related supply '%s' of port '%s'.

### Description

This message occurs when related supply of bump pin and port are different. Related supply net of bump pin will be ignored.

### What Next

Check the related supply net of top-level port and bump cell.

Feedback

### See Also

- commit_upf

---

## MV-356

(error) Bump pin '%s' is connected to standard cell '%s' but does not have connection to any ports.

### Description

This message occurs when the specified bump pin is connected to standard cell(s) but does not have any connection to any ports. A bump cell is the physical implementation of the logical port. Unless the bump cell is not connected or used, bump cell should always be connected to a port.

### What Next

Check the net connections of top-level port and bump cell.

### See Also

- commit_upf

---

## MV-357

(information) Net '%s' has been disconnected from %s '%s' to resolve conflicts between power intent and PG netlist.

### Description

This is a informational message indicating the net has been disconnected from the pin/port to resolve conflicts between power intent and PG netlist.

### What Next

Check the net connection and power intent of the specified port/pin.

### See Also

- resolve_pg_nets

---

## MV-358

(information) %s '%s' is already connected to net '%s' and will be skipped.

Feedback

### Description

This is an informational message indicating the specified pin/port is skipped because it has an existing net connection while reconnection is disallowed.

### What Next

Check the net connection of the specified port/pin. If reconnection is desired, rerun the command and specify that reconnection is allowed with the "-reconnect" command option.

### See Also

- connect_pg_net

---

## MV-359

(information) -lib_cells will be obsolete in a near future release. Please replace with -clock_clamp_lib_cells or -async_clamp_lib_cells.

### Description

map_retention_clamp_cell -lib_cells will be obsolete in a near future release, customer should use -clock_clamp_lib_cells or -async_clamp_lib_cells to specify lib cells instead.

### What Next

```
stop using -lib_cells for map_retention_clamp_cell command.
```

---

## MV-360

(warning) Connection to pg pin '%s' is skipped due to illegal supply net connection to supply net '%s'.

### Description

This message occurs when the specified supply net connection to the pg pin is illegal and the supply net is not visible in the scope of the pg pin.

### What Next

Check the supply net connection of the pg pin.

### See Also

- connect_pg_net
- connect_supply_net

Feedback

## MV-361

(warning) Connection to pg pin '%s' is skipped due to name conflict during port punching across different scopes.

### Description

This message occurs when the net connection to the pg pin is skipped because port punching from the scope of supply net to the specified pg pin may cause potential name conflict(s) in the resulting pg netlist.

### What Next

Check the supply net connection of the pg pin.

### See Also

- connect_pg_net
- connect_supply_net
- create_supply_net

## MV-362

(information) Supply net '%s' has been created to resolve name conflict during port punching across different scopes.

### Description

This is an informational message indicating that the named supply net has been created in UPF intent to resolve name conflict during port punching across different scopes.

### What Next

This message is informational. No action is required.

### See Also

- connect_pg_net
- resolve_pg_nets
- MV-361

Feedback

## MV-363

(information) Supply port '%s' has been created to resolve name conflict during port punching across different scopes.

### Description

This is an informational message indicating that the named supply port has been created in UPF intent to resolve name conflict during port punching across different scopes.

### What Next

This message is informational. No action is required.

### See Also

- connect_pg_net
- resolve_pg_nets
- MV-361

## MV-364

(information) PG pin '%s' is reconnected to supply net '%s' to resolve name conflict during port punching across different scopes.

### Description

This is an informational message indicating that the PG pin is reconnected to the specified supply net in UPF intent to resolve name conflict during port punching across different scopes.

### What Next

This message is informational. No action is required.

### See Also

- connect_pg_net
- resolve_pg_nets
- MV-361

Feedback

## MV-365

(information) %d name conflict(s) during port punching across different scopes are resolved by updating to different UPF supply net connection(s).

### Description

The informational message shows the number of name conflict(s) during port punching across different scopes that are resolved by updating to different UPF supply net connection(s).

### What Next

This message is informational. No action is required.

### See Also

- connect_pg_net
- resolve_pg_nets
- MV-361

## MV-366

(warning) Given design is detected to be an SOI design and enable_bias derived will proceed to derive nwell to power and pwell to ground where applicable.

### Description

This message indicates that given design is an SOI design and enable_bias attribute is set to 'derived'. Tool will proceed with auto-derivation of bias supplies similar to non-SOI designs where nwell is derived from power and pwell is derived from ground where applicable.

### What Next

Check enable_bias attribute value setting and refine the UPF if needed.

### See Also

- set_design_attributes
- MV-302

Feedback

## MV-367

(error) Root cells of power domain %s must either be all bias-enabled blocks or all bias-disabled blocks.

### Description

This message indicates that given power domain has some elements with bias enabled and some with bias disabled. Mixing of bias and non-bias blocks in the same power domain is not supported.

### What Next

Check power intent.

### See Also

- set_design_attributes

## MV-368

(error) Setting does not match the current matching type being used.

### Description

It is not allowed to mix the -dft_target_domain/-dft_source_domain options with the -dft_source_supply/-dft_sink_supply options across set_dft_isolation setting. All defined strategies must use one or the other.

### What Next

Make sure that all defined set_isolation_isolation strategy that require source/sink matching use either the -dft_taget_domain and -dft_source_domain options, or the -dft_sink_supply and -dft_source_supply options.

## MV-369

(information) '%s' is determined as supply net which is available in power domain '%s' to drive tie-off pin '%s' with heterogeneous supplies %s.

### Description

The specified supply net is derived as supply net that is available in power domain of the tie-off net to drive the constant pin with heterogeneous supplies.

### What Next

This message is informational. No action is required.

Feedback

### See Also

- connect_pg_net

---

## MV-370

(Error) '-suggest_domain_based' cannot be used due to existing set_dft_isolation strategy with supply-based filtering option.

### Description

The '-suggest_domain_based' argument of the 'check_isolation_coverage' command cannot be used when there are 'set_dft_isolation' strategies present that use the '-dft_source_supply' and/or '-dft_sink_supply' options.

### What Next

Remove the '-suggest_domain_based' argument. Tool will generate 'set_dft_isolation' strategy suggestions with a matching style that follows existing 'set_dft_isolation' strategies

---

## MV-371

(Warning) Cell/Library Cell %s is not supported with this command.

### Description

The set_non_bias_approved_list command can be used to suppress bias checks related to non-bias cell being inserted in a bias domain. However, this check cannot be suppressed for any types of Multi-voltage cells including Isolation, Level-shifter, Enable-Level-Shifter, Repeater, Retention and Always-on buffer/inverter cells.

### What Next

Check and refine the options of set_non_bias_approved_list command.

### See Also

- set_non_bias_approved_list

---

## MV-372

(error) Virtual %s pin '%s' of tap cell '%s' is instantiated in power domain '%s' while its bias supply net '%s' and primary supply net '%s' are different and cause a short.

Feedback

### Description

This message occurs when the virtual bias pin of tap cell is instantiated in a bias power domain and the different bias and primary supply nets cause a short.

### What Next

Check the primary and bias supply nets of the tap cell. Also check whether this tap cell with virtual pg pin(s) should be used in the specified power domain.

### See Also

- report_cell
- report_power_domain

---

## MV-373

(error) -force can not be specified with -supply. -force can only be specified with -exclude_supply.

### Description

This message occurs when -force is specified together with -supply.

### What Next

Please specify -force with -exclude_supply

### See Also

- create_secondary_pg_placement_constraints

---

## MV-374

(error) invalid lib cell type is specified with -lib_cell_types.

### Description

This message occurs when invalid lib cell type is specified with -lib_cell_types. The valid lib cell types are: isolation_cells, level_shifters, enable_level_shifters, retention_registers, repeaters and tie_cells.

### What Next

Please specify valid lib cell types with -lib_cell_types

Feedback

### See Also

- create_secondary_pg_placement_constraints

---

## MV-375

(Warning) Hierarchical cells are not supported with this command. Cell %s will be ignored.

### Description

The set_non_bias_approved_list command can be used to suppress bias checks related to non-bias cell being inserted in a bias domain, however this command does not support hierarchical cells specified with -cells.

### What Next

Check and refine the options of set_non_bias_approved_list command.

### See Also

- set_non_bias_approved_list

---

## MV-376

(Error) Option -from/-tie_cell/-minimize_dual_rail/-level_shifter/-move_within_x/-move_within_y/-mapped/-update_power_domain/-diode cannot be specified together with option -eco in fix_mv_design command.

### Description

This error message occurs when one of more of the options in the following option lists {-from, -min_dual_rail, -level_shifter, -mapped, -tie_cell, -update_power_domain, -move_within_x, -move_within_y, -diode} is specified together with option -eco in command fix_mv_design.

### See Also

- fix_mv_design

## MV-377

(information) Total %d DFT ports are added to isolation strategy.

### Description

This message shows the number of DFT ports are added to isolation strategy with -update to address isolation violation on DFT paths.

Feedback

### What Next

This is an information-only message. No action is required.

### See Also

- generate_upf_strategies

---

## MV-378

(warning) Total %d DFT paths with isolation violation not fixed.

### Description

This message shows the number of DFT paths still have isolation violation not fixed.

### What Next

This is an information-only message. To fix the violations, user can use define_upf_isolation_rule to create a new strategy for the violating path.

### See Also

- generate_upf_strategies
- define_upf_isolation_rule

---

## MV-379

(information) DFT port "%s" is added to isolation strategy "%s" to fix iso violation from (%s, %s) to (%s, %s).

### Description

This message occurs when DFT port is added to isolation strategy with -update to address isolation violation on path.

### What Next

This is an information-only message. No action is required.

### See Also

- generate_upf_strategies

---

## MV-380

(warning) Isolation violation on DFT path from "%s" (%s, %s) to "%s" (%s, %s) is not fixed.

Feedback

### Description

This message occurs isolation violation on DFT path can't be auto fixed with generate_upf_strategies.

### See Also

- generate_upf_strategies

---

## MV-381

(warning) Isolation violation on DFT path from "%s" to "%s" is not fixed, as path is hetero-fanout.

### Description

This message occurs when isolation violation on DFT path can't be fixed with generate_upf_strategies.

### See Also

- generate_upf_strategies

---

## MV-382

(info) Connections of %d power/ground pin(s) are created or changed.

### Description

This message occurs when user executes the *connect_pg_net* command. It shows the number of connections of pin(s) that are created or changed.

### See Also

- connect_pg_net

---

## MV-383

(information) Can insert single rail tie %s cell (%d lib cells) powered by supply nets (%s).

### Description

This is an informational messages printed by *check_tie_cell_insertion* command to shows the number of single rail cell were powered by a supply net.

Feedback

## MV-384

(information) Cannot insert single rail tie high cell because there is no appropriate tie cells in the library.

### Description

This is an informational messages printed by *check_tie_cell_insertion* command. It tells if there is any single rail that cannot be found in the library.

### What Next

Verify if you have proper lib-cells available to be used. Also check if their lib-cell purpose is correctly set.

- To check if there are tie high cells on the library run get_lib_cells */* -filter "@function_id=~a0.0"
- To check the purpose of the lib-cell run: get_attribute -objects <lib_name>/<cell_name> -name valid_purposes

e.g: get_attribute -objects bias_std_cells.tied_to/TIEHHVT_tied_to -name valid_purposes

### See Also

- get_lib_cells

## MV-385

(information) Can insert ao tie %s cell (%d lib cells) powered by supply nets (%s).

### Description

This is an informational messages printed by *check_tie_cell_insertion* command to shows the number of AO cell were powered by a supply net.

## MV-386

(information) Cannot insert ao tie high cell because there is no appropriate tie cells in the library.

### Description

This message is reported by *check_tie_cell_insertion* command when the user library has no AO tie high cells.

Feedback

### What Next

Verify if you have proper lib-cells available to be used. Also check if their lib-cell purpose is correctly set.

- To check if there are tie high cells on the library run get_lib_cells */* -filter "@function_id=~a0.0 && @always_on==true"
- To check the purpose of the lib-cell run: get_attribute -objects <lib_name>/<cell_name> -name valid_purposes

e.g: get_attribute -objects bias_std_cells.tied_to/TIEHHVT_tied_to -name valid_purposes

### See Also

- get_lib_cells

---

## MV-387

(information) Can insert insulated ao tie low cell (%d lib cells) powered by supply nets (%s).

### Description

This is an informational messages printed by *check_tie_cell_insertion* command to shows the number of insulated AO cells which were powered by the specified supply net.

---

## MV-388

(information) Cannot derive supply required to power tie high/low cells.

### Description

This message is reported by *check_tie_cell_insertion* when there is no supply nets to power tie cells.

### What Next

Verify if you declare all the neccessary supply nets in the UPF.

---

## MV-389

(error) Isolation rule "%s" with source/sink supply (%s, %s) is functional equivalent to isolation rule "%s" with (%s, %s) defined earlier. Second rule will be dropped.

Feedback

### Description

It is not allowed to have multiple isolation rules with functional equivalent source and sink supply. Second rule will be dropped.

### What Next

Make sure that isolation rule defined have different source/sink.

### See Also

- define_upf_isolation_rule

---

## MV-390

(error) Isolation rule with name "%s" is defined earlier. Second rule will be dropped.

### Description

It is not allowed to have multiple isolation rules with same name. Second rule will be dropped.

### What Next

Make sure that isolation rule defined have different name.

### See Also

- define_upf_isolation_rule

---

## MV-391

(information) Isolation rule "%s" can't be used for boundary port "%s" in domain "%s", as isolation supply "%s" is not available in this domian.

### Description

Isolation rule can't be used to generate isolation strategy in domain if isolation supply is not available.

### What Next

Make isolation supply available to the domain before running generate_upf_strategies command.

Feedback

### See Also

- define_upf_isolation_rule
- generate_upf_strategies
- MV-392
- MV-393

---

## MV-392

(information) Isolation rule "%s" can't be used for boundary port "%s" in domain "%s", which is either not specified in -domains or specified in -exclude_domains.

### Description

Isolation rule can't be used to generate isolation strategy in domain if domain is not specified in -domains or specified in -exclude_domains.

### What Next

Make isolation supply available to the domain before running generate_upf_strategies command.

### See Also

- define_upf_isolation_rule
- generate_upf_strategies
- MV-391
- MV-393

---

## MV-393

(information) Isolation rule "%s" can't be used for boundary port "%s" in domain "%s", as location "%s" can't be implemented.

### Description

Isolation rule can't be used to generate isolation strategy in domain if isolation location can't be implemented.

Feedback

### See Also

- define_upf_isolation_rule
- generate_upf_strategies
- MV-391
- MV-392

---

## MV-394

(information) Isolation rule "%s" can't be used for boundary port "%s" in domain "%s", as path's driver supply (%s, %s) and load supply (%s, %s) does not match isolation rule source and sink supply.

### Description

Isolation rule can't be used to generate isolation strategy for the path if driver supply and load supply do not match with isolation rule source and sink supply.

### See Also

- define_upf_isolation_rule

---

## MV-395

(information) Isolation rule "%s" can't be used for boundary port "%s" in domain "%s" with target location "%s".

### Description

Isolation rule can't be used to generate isolation strategy in domain if target location does not match.

### See Also

---

## MV-451

(information) The net %s can be buffered with single rail buffers/inverters.

Feedback

### Description

The check_bufferability command analyzed the bufferability on this net and concluded that this net can be buffered with single rail buffers or inverters.

### What Next

If you believe a single-rail repeater is acceptable on this net, no further action is required. However, if you believe otherwise, please check the related supply nets of the driver and loads.

---

## MV-452

(information) Can buffer with single rail buffers ( number of buffers %d ) and inverters ( number of inverters %d ) powered by ( power %s, ground %s ).

### Description

check_bufferability command analyzes the bufferability and concludes that the tool can buffer between the driver and loads in the given voltage area with this number of single rail buffers and this number of single rail inverters with the relevant power and ground.

### What Next

This is an information-only message. No action is required.

### See Also

- check_bufferability

---

## MV-453

(information) Can insert single rail buffers (%d lib_cells) and inverters (%d lib_cells) with supply nets (%s).

### Description

The *check_bufferability* command found a valid buffering supply and available lib_cells for single rail buffering. No buffering problems are detected.

### What Next

The net is bufferable, no further action is required. For further information about how the buffering supply is determined, or which lib_cells are available for buffering, use *check_bufferability -verbose*.

Feedback

### See Also

- check_bufferability

---

## MV-454

(information) Can insert dual rail buffers (%d lib_cells) and inverters (%d lib_cells) with supply nets (%s).

### Description

The *check_bufferability* command found a valid buffering supply and available lib_cells for dual rail buffering. No buffering problems are detected.

### What Next

The net is bufferable, no further action is required. For further information about how the buffering supply is determined, or which lib_cells are available for buffering, use *check_bufferability -verbose*.

### See Also

- check_bufferability

---

## MV-455

(information) Can insert insulated dual rail buffers (%d lib_cells) and inverters (%d lib_cells) with supply nets (%s).

### Description

The *check_bufferability* command found a valid buffering supply and available lib_cells for insulated dual rail buffering. No buffering problems are detected.

### What Next

The net is bufferable, no further action is required. For further information about how the buffering supply is determined, or which lib_cells are available for buffering, use *check_bufferability -verbose*. Insulated dual rail buffers are only used in bias designs, in cases where the power domain primary nwell bias supply is less-on than the required backup supply for the dual rail cell. If a standard dual rail buffer is expected, use *report_pst* to examine the power state table and see why an insulated cell is required.

### See Also

- check_bufferability
- report_pst

Feedback

## MV-456

(information) Cannot insert single rail buffers or inverters because of no available lib_cells. But required supply nets (%s) are available.

### Description

The *check_bufferability* command found a valid supply for single rail buffering, but no lib_cells are available to use. No other buffering problems are detected.

### What Next

The net is not bufferable due to a problem with lib_cell availability. Individual lib_cells may be unavailable for one of the following reasons:

1. An incompatible *set_lib_cell_purpose*
2. A *set_dont_touch* constraint on the lib_cell
3. A *set_target_library_subset* constraint excludes this lib_cell in this hierarchy
4. A mismatch in site_def between the lib_cell and the available site_rows in the voltage area
5. Incompatible supply rails: for example, a backup power pin when a single rail cell is expected
6. Bias mismatch: for example, a lib_cell with nwell/pwell pg_pins when none are expected
7. Voltage mismatch: the lib_cell is not characterized for the supply voltage

Identify specific lib_cells you expect should be available for buffering this net, and use *check_bufferability -verbose* to get a list of all unavailable lib_cells with the reason they are unavailable.

### See Also

- check_bufferability
- set_lib_cell_purpose
- set_dont_touch
- set_target_library_subset

## MV-457

(information) Cannot insert dual rail buffers or inverters because of no available lib_cells. But required supply nets (%s) are available.

Feedback

### Description

The *check_bufferability* command found a valid supply for dual rail buffering, but no lib_cells are available to use. No other buffering problems are detected.

### What Next

The net is not bufferable due to a problem with lib_cell availability. Individual lib_cells may be unavailable for one of the following reasons:

1. An incompatible *set_lib_cell_purpose*
2. A *set_dont_touch* constraint on the lib_cell
3. A *set_target_library_subset* constraint excludes this lib_cell in this hierarchy
4. A mismatch in site_def between the lib_cell and the available site_rows in the voltage area
5. Incompatible supply rails: for example, a backup power pin when a single rail cell is expected
6. Bias mismatch: for example, a lib_cell with nwell/pwell pg_pins when none are expected
7. Voltage mismatch: the lib_cell is not characterized for the supply voltage

Identify specific lib_cells you expect should be available for buffering this net, and use *check_bufferability -verbose* to get a list of all unavailable lib_cells with the reason they are unavailable.

### See Also

---

## MV-459

(information) Cannot insert buffers or inverters because no valid supply for buffering.

### Description

The *check_bufferability* command did not find a valid supply for buffering, so the net segment cannot be buffered. No other bufferability problems were detected, though lib_cell availability checking is skipped, because it cannot be performed without a valid buffering supply.

Feedback

### What Next

For most nets, the buffering supply is determined by first considering the related supply of all drivers and loads being considered. Find the related supplies of the drivers and loads from the output of *check_bufferability -verbose*, or by using the *get_related_supply_nets* command on the driver and load pins. From the set of related supplies of drivers and loads, a valid buffering supply must satisfy two criteria:

1. It must be available in the voltage area being buffered, or a PST equivalent supply must be available. Supply availability can be determined from the *check_bufferability -verbose* output, or from *report_power_domain*. PST equivalence of supplies can be determined from the *report_pst* PST tables, or using the *check_supply_equivalence* command.
2. It must not cause an MV violation (isolation or voltage shifting violation). This means the supply must be of a compatible voltage with all driver and load related supplies. It also must be less-than-or-equal-on as the driver related supply, and more-than-or-equal-on than all load related supplies. The voltages and on-ness are determined from the supply states as defined by either the *add_port_state* or *add_power_state* command.

For special nets that have loads which are isolation cells, enable level shifter cells, or overdriven level shifter cells, the buffering supply can only be the driver related supply or a PST equivalent supply. The load related supplies are not considered for these nets.

Use this information about buffering supplies to understand why no supply was available, and what can be done to resolve the problem. Possibilities include:

o Make sure the correct voltage area is specified to *check_bufferability* for analysis.

o This net segment may not be bufferable, but the net could still be buffered if other net segments are bufferable. Use *check_bufferability* to investigate other segments of the same net for bufferability.

o Some supplies that are restricted from use in the power domain of the voltage area may need to be made available through the UPF constraints for buffering to occur. By default, all supplies are available in all power domains, as long as they are in the scope of the power domain. Restrictions may have been in the UPF by specifying *create_supply_net -domain* to define a domain specific supply. Alternately, *create_power_domain -supply* can be used to restrict extra supplies available in a power domain.

o Floorplan changes may be necessary if a net must cross a wide unbufferable voltage area.

## MV-461

(information) The net %s can be buffered with dual rail buffers/inverters.

### Description

The check_bufferability command analyzed the bufferability on this net and concluded that this net can be buffered with dual rail buffers or inverters.

### What Next

If you believe a dual-rail repeater is acceptable on this net, no further action is required. However, if you believe otherwise, please check the related supply nets of the driver and loads.

---

## MV-462

(information) Can buffer with dual rail buffers (number of buffers %d ) and inverters ( number of inverters %d ) powered by ( power %s, ground %s )

### Description

check_bufferability command analyzes the bufferability and concludes that the tool can buffer between the driver and loads in the given voltage area with this number of dual rail buffers and this number of dual rail inverters.

### What Next

This is an information-only message. No action is required.

- check_bufferability

Feedback

## MV-463

(information) Single rail buffers (%d lib_cells) and inverters (%d lib_cells) with supply nets (%s) are available, but there are other issues that will prevent or restrict buffering.

### Description

The *check_bufferability* command found a valid buffering supply and available lib_cells for single rail buffering. But, buffering is prevented or restricted by other reasons.

### What Next

The bufferability problems will be listed in the 'Bufferability Problems' section of the report. They may include:

- The net has no driver
- The net has multiple drivers
- The net is dont_touch
- The net is ideal
- The net is tri-state
- The net belongs to a read only block
- The net is not in the block of the given voltage area
- The net's hierarchy is not in the domain scope of the given voltage area
- Physical feedthrough buffering must be enabled to buffer the net in the given voltage area

### See Also

- check_bufferability

## MV-464

(information) Dual rail buffers (%d lib_cells) and inverters (%d lib_cells) with supply nets (%s) are available, but there are other issues that will prevent or restrict buffering.

### Description

The *check_bufferability* command found a valid buffering supply and available lib_cells for dual rail buffering. But, buffering is prevented or restricted by other reasons.

Feedback

### What Next

The bufferability problems will be listed in the 'Bufferability Problems' section of the report. They may include:

- The net has no driver

- check_bufferability

---

## MV-466

(information) Supply nets (%s) are available for single rail buffering, but cannot insert buffers or inverters because of no available lib_cells. There are also other issues that will prevent or restrict buffering.

### Description

The *check_bufferability* command found a valid buffering supply for single rail buffering. But, there are no lib_cells that can be used to implement that buffering. In addition, buffering is prevented or restricted by other reasons.

### What Next

The net is not bufferable in part due to a problem with lib_cell availability. Individual lib_cells may be unavailable for one of the following reasons:

1. An incompatible *set_lib_cell_purpose*
2. A *set_dont_touch* constraint on the lib_cell
3. A *set_target_library_subset*constraint excludes this lib_cell in this hierarchy
4. A mismatch in site_def between the lib_cell and the available site_rows in the voltage area
5. Incompatible supply rails: for example, a backup power pin when a single rail cell is expected
6. Bias mismatch: for example, a lib_cell with nwell/pwell pg_pins when none are expected
7. Voltage mismatch: the lib_cell is not characterized for the supply voltage

Feedback

Identify specific lib_cells you expect should be available for buffering this net, and use *check_bufferability -verbose* to get a list of all unavailable lib_cells with the reason they are unavailable.

The other bufferability problems will be listed in the 'Bufferability Problems' section of the report. They may include:

- The net has no driver
- The net has multiple drivers
- The net is dont_touch
- The net is ideal
- The net is tri-state
- The net belongs to a read only block
- The net is not in the block of the given voltage area
- The net's hierarchy is not in the domain scope of the given voltage area
- Physical feedthrough buffering must be enabled to buffer the net in the given voltage area

**See Also**

## MV-469

(information) Cannot insert buffers or inverters because no valid supply for buffering, and/or other issues that will prevent or restrict buffering.

### Description

The *check_bufferability* command did not find a valid supply for buffering, so the net segment cannot be buffered. In addition, there are other reasons that will prevent or restrict buffering on the net. In this case, lib_cell availability is inconclusive. Checking is skipped, because it cannot be performed without a valid buffering supply.

### What Next

For most nets, the buffering supply is determined by first considering the related supply of all drivers and loads being considered. Find the related supplies of the drivers and loads from the output of *check_bufferability -verbose*, or by using the *get_related_supply_nets* command on the driver and load pins. From the set of related supplies of drivers and loads, a valid buffering supply must satisfy two criteria:

1. It must be available in the voltage area being buffered, or a PST equivalent supply must be available. Supply availability can be determined from the *check_bufferability -verbose* output, or from *report_power_domain*. PST equivalence of supplies can be determined from the *report_pst* PST tables, or using the *check_supply_equivalence* command.
2. It must not cause an MV violation (isolation or voltage shifting violation). This means the supply must be of a compatible voltage with all driver and load related supplies. It also must be less-than-or-equal-on as the driver related supply, and more-than-or-equal-on than all load related supplies. The voltages and on-ness are determined from the supply states as defined by either the *add_port_state* or *add_power_state* command.

For special nets that have loads which are isolation cells, enable level shifter cells, or overdrive level shifter cells, the buffering supply can only be the driver related supply or a PST equivalent supply. The load related supplies are not considered for these nets. Use this information about buffering supplies to understand why no supply was available, and what can be done to resolve the problem.

Feedback

The other bufferability problems will be listed in the 'Bufferability Problems' section of the report. They may include:

- The net has no driver
- The net has multiple drivers
- The net is dont_touch
- The net is ideal
- The net is tri-state
- The net belongs to a read only block
- The net is not in the block of the given voltage area
- The net's hierarchy is not in the domain scope of the given voltage area
- Freeze ports are found and not able to find LFT hierarchy
- No LFT buffer insertion is allowed for the given voltage area, please check its voltage area routing rule.
- Physical feedthrough buffering must be enabled to buffer the net in the given voltage area

---

## MV-471

(information) The net %s cannot be buffered

**Description**

Analyze_bufferability command analyzes the bufferability on this net and concludes that this net can not be buffered.

**What Next**

You need to check for the availability of both the required supply net and the appropriate dual rail buffers.

---

## MV-472

(information) Cannot insert buffer/inverter between the given driver and loads in the given voltage area.

Feedback

### Description

check_bufferability command analyzes the bufferability and concludes that the tool cannot buffer between the driver and loads in the given voltage because of various reasons. Please use -verbose to find detailed information.

### What Next

You need to check for the availability of the supplies in the given voltage area

### See Also

- check_bufferability

---

## MV-491

(information) Required supply is ( power %s, ground %s ), cannot find appropriate single rail buffers/inverters in the library.

### Description

This message occurs when there is no required single rail buffers/inverters in the libraries

### What Next

Please make sure to link the required logical and physical libraries during library preparation stage.

---

## MV-492

(information) Required supply is ( power %s, ground %s ), cannot find appropriate dual rail buffers/inverters in the library.

### Description

This message occurs when there is no required dual rail buffers/inverters in the libraries

### What Next

Please make sure to link the required logical and physical libraries during library preparation stage.

---

## MV-493

(Error) Failed to create ISO/LS cell instance %s due to system problem.

Feedback

### Description

This is a low level system error occurring during create_mv_cells. This command is attempting to insert an isolation or level shifter cell, but is unable to due to a system problem. The error is not related to MV criteria for cell insertion. It can be caused by memory or other machine issues on the icc2_shell host machine.

### What Next

This is a serious error impacting the entire icc2_shell session, which may become unstable or crash due to a system issue. Check the host machine to ensure enough memory is available for this job. Restart your job with more memory or on a new host machine to try to resolve this error.

---

## MV-498

(error) Found %d power domain%s without valid voltage area:%s.

### Description

This message occurs during physical implementation when tool found power domains which do not have valid voltage areas. Note that voltage areas should be created for all power domains during physical implementation (except power domain containing only macros and/or I/O pads).

### What Next

Create voltage areas for all listed power domains. You can run *check_mv_design* to verify that all power domains have a valid voltage area.

### See Also

- check_mv_design

---

## MV-501

(error) PG net %s is not match with the input supply %s of power switch strategy %s of domain %s.

### Description

This error occurs when the specified PG net associated with the pg_strategy or pg_strap does not match with the input supply specified by the UPF power switch strategy. Switch insertion fails because inserting the power switch would be a violation of the power switch strategy.

Feedback

### What Next

You could fix the mismatch in two ways:

1. Changing the UPF power switch requirements
2. Specifying vertical straps or pg_strategy that matches the required supply of the UPF power switch strategy.

Use report_power_domain or save_upf commands to view the specified power switch strategy and related supply. To view available pg_strategy definitions and associated PG nets, use the report_pg_strategies command.

- create_power_switch_array
- create_power_switch_ring
- set_voltage_area

---

## MV-503

(error) Cannot specify more than one voltage area shape.

Feedback

### Description

User can only specify one voltage area shape at a time when creating power switch array or ring.

### What Next

Specify only one voltage area shape as input.

### See Also

- create_power_switch_array
- create_power_switch_ring

---

## MV-504

(error) Invalid -align_pg_mesh argument. Please specify { pg_xPitch pg_yPitch pg_xOffset pg_yOffset }

### Description

This message occurs when -align_pg_mesh argument specified by users is invalid. Users need to provide four numbers representing xPitch, yPitch, xOffset, yOffset of the power mesh.

### What Next

Please provide valid pitch and offset of the power mesh to be aligned.

### See Also

- create_power_switch_array

---

## MV-505

(error) Power switch cell %s has multiple input or output supply pins.

### Description

This error occurred because incompatible switch cells have been used. Tool only supports power switch cell with one input supply pin and one output supply pin.

### What Next

You can either replace the power switch cells with switch cells that are supported by the tool, or manually connect the PG pin of the existing power switch cells using connect_pg_net command.

Feedback

Use report_cells -power with the specified cell to report the related PG pin information for the cell to verify the extra input or output supply pins exist.

- check_mv_design

---

## MV-509

(error) No valid driver cell is specified.

### Description

This message occurs when -placement_type is array and no valid driver cell is specified. A valid driver power switch cell must be specified with -driver option for an array based power switch placement pattern.

### What Next

Please specify a valid driver cell.

Feedback

### See Also

- set_power_switch_placement_pattern

---

## MV-510

(warning) MV data or voltage area setup is not ready for physical implementation.

### Description

This message occurs when physical implementation commands, such as create_power_switch_ring, create_power_switch_array, create_placement, place_opt etc. are called but the MV data is not ready. There are two main reasons that cause this message to be issued.

1. commit_upf has not been ran successfully 2. voltage areas have not been created for all power domains. Note, that voltage areas are required for all power domains, except power domains containing only macros and/or I/O pads.

### What Next

If commit_upf has not been ran successfully, invoke the 'commit_upf' command and make sure the power intent is committed, resolve any errors that are reported until commit_upf succeeds.

If the UPF has been successfully committed then create voltage areas for all power domains that require a voltage area (all power domains except those containing only macro and/or IO pads, including voltage areas in abstracts). You can use the 'check_mv_design' command to identify any power domain not assigned to a voltage area, such power domains are reported under the "Power domain rule" section. Then you can use the "create_voltage_area" command to assign voltage areas to power domains, or turn on the "mv.incomplete_upf.enable" app option to enable the incomplete UPF flow to bypass this check.

## MV-513

(warning) Specified %s point (%.4f %.4f) is projected to the closest point (%.4f %.4f) on the boundary of power switch insertion region.

### Description

This message occurs when -start_point or -end_point specified by users is not on the boundary of power switch insertion region. The tool automatically projects the specified point to the boundary.

### What Next

Please check if the specified/projected point is correct.

### See Also

- create_power_switch_ring

---

## MV-514

(warning) Switch cells are dropped along edge (%.3f %.3f) (%.3f %.3f).

### Description

This message occurs when switch cells cannot be inserted along certain edge. Switch cells may be dropped because they are outside the core area, or blocked by blockages, including macros, keep-out margin, placement blockages, other voltage areas and existing switch cells.

### What Next

If users want to have switch cells outside the core area, please set app option "plan.mtcmos.allow_power_switch_outside_core", i.e. set_app_options -name plan.mtcmos.allow_power_switch_outside_core -value true.

### See Also

- create_power_switch_ring

Feedback

## MV-515

(warning) No power switches are inserted because there is no overlapping between voltage area regions and user specified boundary.

### Description

This message occurs when user specified boundary is not overlapping with voltage area regions.

### What Next

Please check the boundary of power switch insertion region

### See Also

- create_power_switch_array

## MV-516

(error) report_mv_path cannot report %s simultaneously.

### Description

This message occurs when two or more of -isolation, -level_shifter or -repeater options are specified with single report_mv_path command. Since the path driving and loading conditions are processed differently for Isolation, Level Shifter and Repeater, only one type of the report can be done. If need to report more than one, please run the command separately with -isolation, -level_shifter or -repeater option. Default is -isolation.

## MV-523

(error) Lib cell %s is not a valid switch cell.

### Description

This error happens when the specified lib cell does not have valid sleep/acknowledge pins.

### What Next

Check your library cell.

### See Also

- create_power_switch_ring
- create_power_switch_array
- map_power_switch
- create_power_switch

---

## MV-524

(error) Cannot find library cell %s.

### Description

This message occurs when specified library cell is not found in the design referenced library.

### What Next

Only library cells in the design referenced libraries can be used with -lib_cell option. Check for the specified cell reference using the get_lib_cells command. You can also use the get_ref_libs command to see a list of libraries referenced by the current design.

Feedback

**See Also**

- get_lib_cells

- set_power_switch_placement_pattern

---

## MV-525

(error) Power switch placement pattern %s does not exist.

**Description**

This error occurs when a power switch placement pattern is specified using the -pattern option, but the pattern does not exist.

**What Next**

The -pattern option can only be used to specify a predefined placement pattern. You can use the command report_power_switch_placement_patterns to view a list of existing placement patterns defined in the design. You can create a new placement pattern with the set_power_switch_placement_pattern command.

**See Also**

- set_power_switch_placement_pattern
- report_power_switch_placement_patterns
- create_power_switch_ring
- create_power_switch_array

---

## MV-526

(warning) User specified %s value is smaller than the %s of the %s, reset %s to the %s of the %s.

**Description**

This message occurs when user specified pitch is smaller than the width/height of power switch cell/pattern. Tool automatically resets the pitch to the width/height of power switch cell/pattern.

Feedback

### What Next

If using the set_power_switch_placement_pattern check the pitch specified to create_power_switch_array, this should be greater than the pattern given. For individual cell insertion please check the pitch given is greater than the width/height of the cell as relevant. Please double check the pitch value.

### See Also

- set_power_switch_placement_pattern
- create_power_switch_array

---

## MV-527

(error) User specified collection of wires is not legal. Please specify a collection of wires of same PG net.

### Description

This message occurs when user specified wires for -pg_straps option are not legal for power switch insertion. The reason could be 1: there are non-PG wires in the collection. 2: there are multiple nets in the collection.

### What Next

Please specify a collection of wires of same PG net.

### See Also

- create_power_switch_array

---

## MV-528

(error) Power switch placement pattern syntax error: %s.

### Description

This message occurs when the syntax for the set_power_switch_placement_pattern command is not correct.

### What Next

Review the error message details and the manpage for set_power_switch_placement_pattern to correct the syntax.

Feedback

### See Also

- set_power_switch_placement_pattern

---

## MV-529

(warning) Found unused isolation cell '%s'%s.

### Description

This message is printed when an isolation cell exists but it is not used. This can happen when the isolation cell does not have any drivers or it does not have any loads. Presence of isolation cells triggers design constraining, and this may result in QOR loss in the final netlist.

### What Next

Remove cell from the design

---

## MV-530

(error) Net %s does not have a non-PG real driver. A multi-voltage path report cannot be generated.

### Description

This error occurs when the specified pin or net on a multi-voltage path is traced, but a drive is not found for the subcircuit. report_mv_path cannot generate a report for a path without a driver.

### What Next

Check the path for a driver manually using the report_nets -connections <net_name> command or try using the all_fanin -flat -to <net_name> command to help locate the source of the subcircuit.

### See Also

- all_fanin
- report_net

---

## MV-531

(error) Setup of Voltage Area '%s' with multiple Power Domains is invalid: %s.

Feedback

### Description

This error message occurs when the specified Voltage Area with multiple Power Domains is not set up properly. Power Domains must be electrical-equivalent in order to be implemented together as one Voltage Area.

### What Next

- Check the Power Domains of the Voltage Area. • Check the UPF intent of each power domain.

### See Also

---

## MV-536

(error) Please specify either "-power_switch" or "-lib_cell" option

### Description

This error happens when user does not specify either -lib_cell or -power_switch option for *create_power_switch_ring* or *create_power_switch_array* command. One of the two options is required for these commands to proceed. These options are used by the command to find the library cell to be instantiated.

### What Next

Specify either -power_switch or -lib_cell options with correct values.

### See Also

- create_power_switch_ring
- create_power_switch_array
- create_power_switch

---

## MV-537

(error) Please specify one of the following options: "-power_switch","-voltage_area" or "-voltage_area_shape"

### Description

This error happens when user does not specify one the following options for *create_power_switch_ring* or *create_power_switch_array* commands: -power_switch, -voltage_area or -voltage_area_shape. One of the these options is required for these

Feedback

commands to proceed. These options are used by the command to determine the hierarchy where library cells are to be inserted.

**What Next**

Specify one of these options : -power_switch, -voltage_area or -voltage_area_shape with correct values.

**See Also**

- create_power_switch_ring
- create_power_switch_array
- create_power_switch

---

## MV-538

(error) Please specify "-power_switch" if "-pg_strategy" is specified.

**Description**

This error happens when user does not specify -power_switch for *create_power_switch_ring* or *create_power_switch_array*. The options is required for these commands to proceed. These options are used by the command to determine how power switch should be aligned to pg strategy.

**What Next**

Specify -power_switch with correct values.

**See Also**

- create_power_switch_ring
- create_power_switch_array
- create_power_switch

---

## MV-540

(warning) %s related supply net(s) of switch cell '%s' does not match supply net '%s' specified in UPF.

**Description**

This message occurs when the related supply net for control or ack pins of a given switch cell does not match the supply nets specified with the -supply_set option of

Feedback

create_power_switch command. The related supply nets of a control or ack pin are derived from the supply net connections of its related PG pins.

**What Next**

Check the supply set specified by the -supply_set option of the create_power_switch command.

**See Also**

- report_cell
- set_domain_supply_net
- connect_supply_net
- create_power_switch

---

## MV-541

(error) Lib cell %s is skipped as it conflicts with the power switch strategy %s.

**Description**

This error happens when the specified lib cell conflicts with the power strategy it is mapped to. This happens when the strategy specifies a header cell and library cell is a footer cell or vice versa.

**What Next**

Check the library cell list specified for map_power_switch.

**See Also**

- create_power_switch_ring
- create_power_switch_array
- map_power_switch

---

## MV-542

(error) Specified options "-orient" if "-snap_to_site_row" are conflict.

**Description**

This error happens when user specifies -orient R90, R270, MXR90 or MYR90. Those orientation cannot snap power switch to siterow.

Feedback

### What Next

Please adjust value of -orient or set -snap_to_site_row to falses.

### See Also

- create_power_switch_ring
- create_power_switch_array
- create_power_switch

---

## MV-543

(error) Voltage area setup is not ready for design implementation with missing va.

### Description

This message occurs when voltage area setup is not ready for design implementation because some power domains do not have a user-specified voltage area and cannot be automatically assigned to default voltage area by the tool. Note, that voltage areas are required for all power domains, except power domains containing only macros and/or I/O pads.

### What Next

You can use the 'check_mv_design' command to identify any power domains that are missing a voltage area, such power domains are reported under the "Power domain rule" section. Also, check why such power domain(s) cannot be assigned to default voltage area automatically.

Then you can use "create_voltage_area" command to assign voltage areas to power domains.

### See Also

- MV-250a
- mv.upf.enable_missing_voltage_area

Feedback

## MV-545

(information) Support for always-on library cells without primary power pin is enabled: regular dual-rail library cells will not be used.

### Description

This message occurs when app option *mv.cells.ao_cells_without_primary_pg_pin* is set to true. This will enable the support of always-on library cells without primary power pin in the tool. Whenever there is a need for dual-rail buffers or inverters, only always-on library cells without primary power pin will be considered. Regular dual-rail library cells will be skipped.

### What Next

No action required.

### See Also

- set_app_options
- report_app_options

## MV-546

(error) Regular dual-rail library cell '%s' cannot be used for cell '%s' because it has primary power pin.

### Description

This message occurs when app option *mv.cells.ao_cells_without_primary_pg_pin* is set to true but a regular dual-rail library cell is used by the design. This is illegal because only always-on library cells without primary power pin can be used in dual-rail situations when the app option is enabled.

### What Next

If the library cell is a buffer or inverter, you can run *fix_mv_design -buffer* to correct the problem. If there is any dont_touch attribute on the cell, please remove it so that tool can swap the library cell into an always-on library cell without primary power pin.

### See Also

- check_mv_design
- fix_mv_design
- report_cell

Feedback

## MV-547

(warning) Backup power pin '%s' of always-on library cell '%s' which has no primary power pin is connected to domain primary power '%s'.

### Description

This message occurs when app option *mv.cells.ao_cells_without_primary_pg_pin* is set to true and the backup power pin of an always-on library cells without primary power pin is connected to the same supply net as the domain primary power. This is illegal because the backup power pin of such cell should be connected to a supply net which is different from the domain primary power.

### What Next

If the library cell is a buffer or inverter, you can run *fix_mv_design -buffer* to correct the problem. If there is any dont_touch attribute on the cell, please remove it so that tool can swap the library cell into an always-on library cells with no primary power pin.

### See Also

- check_mv_design
- fix_mv_design
- report_cell

## MV-548

(warning) The backup supply net '%s' of always-on cell '%s' which has no primary power pin is PST-equivalent to domain primary power '%s'.

### Description

This message occurs when app option *mv.cells.ao_cells_without_primary_pg_pin* is set to true and the supply net of backup PG pin of an always-on library cell without primary power pin is PST-equivalent to the domain primary supply net.

Typically, an always-on library cell without primary power pin is required when a cell is powered by a backup supply that is different from its primary supply net. If the primary and backup supply of a cell is PST-equivalent, always-on library cell without primary power pin is not required and it should be swapped to a single-rail cell to avoid QOR loss in the final netlist.

### What Next

Check the supply net connections of the PG pins and the power states of the supply nets. If the always-on library cell without primary power pin not required, please swap it to a

Feedback

single-rail cell. If the library cell is a buffer or inverter, you can run *fix_mv_design -buffer* to correct the problem.

**See Also**

- fix_mv_design
- report_cell
- report_pst

---

## MV-550

(warning) Net %s has multiple drivers, skip LS insertion/association evaluation of the net.

**Description**

This message occurs during level shifter insertion/association, the net has multiple drivers, cannot determine real driver of the path for supply voltage evaluation.

**What Next**

Check the driver of the path.

---

## MV-560

(error) Inserting mapped MV cells in Wordview flow design is not supported.

**Description**

This error happens when user specified -mapped in wordview flow for create_mv_cells to insert mapped PM cells.

**What Next**

Insert gtech PM cells in wordview flow.

---

## MV-562

(warning) Always-On legalization failed in buffer trees. Design may have voltage, isolation, or other MV errors.

**Description**

Tool fails to fix MV violations in buffer trees in the design. These violations may include: - Voltage violation - Isolation violation - PVT mismatch - Bias mismatch - Target library subset violation - Lib cell subset violation - Lib cell purpose violation

Feedback

### What Next

Please run check_mv_design to identify any MV violations existing in the design.

### See Also

- check_mv_design
- fix_mv_design
- set_target_library_subset
- set_lib_cell_purpose

---

## MV-611

(warning) %d nets required level shifters but matching level shifters were not found.

### Description

This warning message shows the total number of global nets which requires Level Shifters but no suitable non-GTECH Level Shifters can be found in user library. In general, to successfully insert Level Shifters, all conditionals including Level Shifters type, operating conditions, Standard Cell Main Rail setting, input/output voltage range, and availability of supply nets should be satisfied.

### What Next

- Run *analyze_mv_design -level_shifter -global_report -verbose* to know which error affect each global net. For each global net (driver pin), run *analyze_mv_design -level_shifter -through* to obtain specific failure reasons and try to solve those issues before continuing.
- Use *create_mv_cells -verbose* to display possible reasons why required Level Shifters are not inserted in each net.
- Use *report_mv_path to report strategies applied to path.*
- Check *analyze_mv_feasibility* to report mapping failures for Enabled Level Shifters.

### See Also

Feedback

- report_mv_path
- report_mv_lib_cells

## MV-612

(information) report all heterogeneous paths only with -all_heterogeneous_paths option, any other option will be ignored.

### Description

This information message just to inform the report_mv_path with -all_heterogeneous_paths option will report all heterogeneous paths in the design. It will ignore all other options.

## MV-616

(Warning) Level shifter '%s'%s of level shifter type '%s' is incompatible with the voltage conversion from %s to %s, but user level shifter strategy '%s' with rule '%s' is set.

### Description

This message occurs when the type of level shifter library cell is incompatible with the voltage conversion performed by the specified level shifter and a user level shifter strategy with a different rule of high_to_low/low_to_high is set.

### What Next

Check the supply nets of the specified level shifter. Also check the level shifter type of the library cell and the rule of the strategy. But if the level shifter strategy is set as intended, this warning can be ignored.

### See Also

- report_cell

## MV-617

(Warning) %s '%s' (supply net '%s' [%s]) cannot drive load pin '%s' (supply net '%s' [%s]) due to voltage difference. Level shifter insertion is prevented due to a no_shift level shifter strategy.

### Description

This message occurs when there is voltage difference between a driver supply net and load supply net in a path with a level shifter strategy with -no_shift.

Feedback

### What Next

Check the voltage values of the two supply nets or the level shifter strategy. If the strategy is done with this intent, the message can be ignored.

### See Also

- report_net
- report_supply_nets
- report_pst
- set_level_shifter

---

## MV-654

(information) Total %d %s cells have been mapped successfully in design.

### Description

This message shows the number of each type of mv cells (eg, level shifters, isolation cells, repeater cells, etc) that have been mapped successfully with the library cells.

### What Next

This is an information-only message. No action is required. Ensure the expected number of each type was mapped. Otherwise, the unmapped report will be generated to show some failure reason for mapping .

### See Also

- create_mv_cells

---

## MV-655

(error) analyze_mv_feasibility -element can be used for only one type of cell report.

### Description

analyze_mv_feasibility command -element option can be used for only one type of cell report, don't specify multiple cells report in the meantime, different type of cell report accept different type of element.

### What Next

correct the command option

Feedback

### See Also

- analyze_mv_feasibility

---

## MV-660

(error) Assign_feedthrough_supply fails due to domain boundary ports on MIM instances have different level shifter strategy, %s(%s) v.s. %s(%s).

### Description

Assign_feedthrough_supply requires domain boundary ports on all the paths go through the same MIM design to have the same level shifter strategy. No boundary supply will be assigned on the path when inconsistent level shifter stratgy is found.

### What Next

correct the design

### See Also

- assign_feedthrough_supply

---

## MV-1030

(warning) PVT mismatch found in %d %s%s.

### Description

This message occurs when PVT mismatch is found in the specified type of cells in the design. For example:

```
Warning: PVT mismatch found in 2 level shifters. (MV-1030)
Warning: PVT mismatch found in 4 isolation cells. (MV-1030)
Warning: PVT mismatch found in 1 retention register. (MV-1030)
```

Possible reasons for mismatch can be:

```
• Cell is powered by a supply net whose voltage does not match the
supported voltage range of the library cell.

• Cell's hierarchy has a temperature setting which does not match
the supported temperature range of the library cell.

• Cell's hierarchy has a process number setting which does not match
that of the library cell.

• Cell's hierarchy has a process label setting which does not match
that of the library cell.
```

Feedback

```
• Library cell does not match set_target_library_subset constraints
applied to the hierarchy.

• Library cell does not match site def of the voltage area.

• Library cell does not have a valid lib cell purpose.

• Library cell has a user don't touch setting.

• Library cell has incorrect bias settings.

• Library cell has a subset_name attribute which does not match
the cell.

• Library cell has a threshold_voltage_group attribute which does
not match threshold voltage group type required by tool.
```

### What Next

Please run *check_mv_design* to find out if there is any issues with the specified type of cells in the design.

### See Also

---

## MV-1031

(warning) PVT mismatch found in %s (%s).

### Description

This message occurs when PVT mismatch is found in the specified cell. This message is printed if app option *mv.cells.report_pvt_verbose* is set to true. For example:

```
Warning: PVT mismatch found in MID1/in_UPF_ISO (LIB1/iso). (MV-1031)
Warning: Can't use LIB1/ISO because it doesn't match isolation power
supply net voltage (VDD2 = 0.500V) in corner 'default'. (PVT-1201)
```

Feedback

```
Warning: PVT mismatch found in MID2/in_UPF_ISO (LIB2/iso). (MV-1031)
Warning: Can't use LIB2/ISO because it doesn't match process number
 (2.000)
in corner 'default'. (PVT-1201)
Warning: PVT mismatch found in 2 isolation cells. (MV-1030)
```

Possible reasons for mismatch can be:

- Cell is powered by a supply net whose voltage does not match the supported voltage range of the library cell.
- Cell's hierarchy has a temperature setting which does not match the supported temperature range of the library cell.
- Cell's hierarchy has a process number setting which does not match that of the library cell.
- Cell's hierarchy has a process label setting which does not match that of the library cell.
- Library cell does not match set_target_library_subset constraints applied to the hierarchy.
- Library cell does not match site def of the voltage area.
- Library cell does not have a valid lib cell purpose.
- Library cell has a user don't touch setting.
- Library cell has incorrect bias settings.
- Library cell has a subset_name attribute which does not match the cell.
- Library cell has a threshold_voltage_group attribute which does not match threshold voltage group type required by tool.

### What Next

Please run *check_mv_design* to find out if there is any issues with the specified type of cells in the design.

## MV-1055

(Information) Related supply assignment details reported in %s.

**Description**

Indicates the name of the output report of *assign_feedthrough_supply*.

**See Also**

- assign_feedthrough_supply

---

## MV-1056

(Information) Related Supplies assigned for %d nets.

**Description**

Indicates the number of nets which *assign_feedthrough_supply* successfuly propagate.

**See Also**

- assign_feedthrough_supply

---

## MV-1057

(Information) Related Supplies cannot be assigned for %d nets.

**Description**

Indicates the number of nets which *assign_feedthrough_supply* failed to propagate.

**See Also**

- assign_feedthrough_supply

Feedback

## MV-1058

(Information) Net driven by '%s' cannot be processed by assign_feedthrough_supply because it has bidirectional pins.

### Description

This message occurs when *assign_feedthrough_supply* cannot process the specified net because Tool cannot work with bidirectional pins.

### What Next

- Check which pin in the net is bidirectional in the net with *get_attribute -name direction -objects pin*. If the returned value is *inout* it means it's bidirectional.

### See Also

- get_attribute
- assign_feedthrough_supply

## MV-1059

(Information) Net driven by '%s' is a clock net and cannot be processed by assign_feedthrough_supply as automatic Level Shifter insertion is disabled on clock nets.

### Description

When the application option *mv.upf.auto_ls_clock_nets* has the default value of *"*"*, *assign_feedthrough_supply* can run on any clock net. If the value of *mv.upf.auto_ls_clock_nets* is different than "*", you must add the specified net to the list of permitted clock nets in order for *assign_feedthrough_supply* to process it.

### What Next

- Check why *mv.upf.auto_ls_clock_nets* has non-default value. If this is intended, add the specified clock nets to the list of permitted clock nets using the application option *mv.upf.auto_ls_clock_nets*.

### See Also

- set_app_options
- mv.upf.auto_ls_clock_nets
- assign_feedthrough_supply

Feedback

## MV-1060

(Information) Net driven by '%s' cannot be processed by assign_feedthrough_supply because it is an analog net.

### Description

This message occurs when *assign_feedthrough_supply* cannot process the specified net because Tool cannot work with analog nets.

### What Next

- Check for a call to command *set_port_attributes -is_analog true*. When this property is assigned to a port, it's also propagated to the whole net.

### See Also

- assign_feedthrough_supply
- set_port_attributes

## MV-1061

(Error) Net driven by '%s' has Level Shifter Violation. Please, fix the violation before continuing.

### Description

This message occurs when *assign_feedthrough_supply* cannot process the specified net because it has Level Shifter Violation.

### What Next

- Run *analyze_mv_feasibility -level_shifter* to get detailed information about Level Shifter Violation.
- Run *analyze_mv_design -level_shifter -through* on the specified net to know the failure reasons.
- Run *report_mv_path -level_shifter -pin pin* to analyze Level Shifter Violation along a specified path.

### See Also

- assign_feedthrough_supply

Feedback

## MV-1062

(Information) Net driven by '%s' cannot be processed by assign_feedthrough_supply because it is driven by bump cell.

### Description

This message occurs when *assign_feedthrough_supply* cannot process the specified net because Tool cannot work with nets driven by a bump cell.

### What Next

- Check why a bump cell drives the net.

### See Also

- assign_feedthrough_supply

## MV-1063

(Information) Net driven by '%s' cannot be processed by assign_feedthrough_supply because net does not cross any physical boundary.

### Description

This message occurs when *assign_feedthrough_supply* cannot process the specified net because it does not cross any physical boundary.

### What Next

- Make sure the net cross a physical boundary to run *assign_feedthrough_supply*
- Check if *place_pins* finishes correctly. If a cell remains unplaced it could have their pins assigned in the wrong direction.

### See Also

- assign_feedthrough_supply

## MV-1064

(Information) Net driven by '%s' cannot be processed by assign_feedthrough_supply because it's undriven.

### Description

This message occurs when *assign_feedthrough_supply* cannot process the specified net because the net has no driver (undriven).

Feedback

### What Next

- Please, check why the net is undriven.

### See Also

- assign_feedthrough_supply

---

## MV-1090

(error) Cannot use %s options at the same time.

### Description

This message occurs when the create_mv_cells command is called with the specified options. Only one of the specified options can be used at a time.

### What Next

Choose only one of the specified options for the create_mv_cells command.

### See Also

- create_mv_cells

---

## MV-1091

(info) User library has %d level shifter%s and %d enabled level shifter%s available to be used.

### Description

This message occurs when user executes the *create_mv_cells* command with *-verbose* option. It shows the number of level shifter and enabled level shifter library cells that are available to the tool. Notice that if a library cell has the dont_touch attribute set to true, it cannot be used by the tool.

### What Next

No action is required.

### See Also

- set_level_shifter
- create_mv_cells

## MV-1093

(info) User library has %d ISO-LS type of enabled level shifter%s.

### Description

This message occurs when user executes the *create_mv_cells* command with *-verbose* option. It shows the number of ISO-LS type of enabled level shifters in the user library.

### What Next

No action is required.

### See Also

- set_level_shifter
- create_mv_cells

## MV-1094

(warning) Total %d supply net%s not found in PST: %s

Feedback

### Description

This message occurs when supply nets are defined but not included in PST or the supply nets only have OFF power states. These missing supply nets will not be considered in voltage violation and level shifter insertion. Required level shifters may not be inserted.

### What Next

Add the missing supply nets to PST.

### See Also

- create_pst
- add_pst_state
- add_port_state
- add_power_state
- set_level_shifter
- create_mv_cells

---

## MV-1095

(warning) User library has no level shifter or enabled level shifter available to be used.

### Description

This message occurs when user executes the *create_mv_cells* command with *-verbose* option. There are no level shifter or enabled level shifters available in the user library. Tool will not be able to insert level shifters to fix voltage violation. Notice that if a library cell has the dont_touch attribute set to true, it cannot be used by the tool.

### What Next

Make sure that user library has available level shifters or enabled level shifter to be used. Use *set_dont_touch* to make level shifter library cells available to be used by the tool.

### See Also

- set_level_shifter
- create_mv_cells
- set_dont_touch

Feedback

## MV-1096

(warning) fix_mv_design -move_within_x or -move_within_y is specified but both physical and logical feedthrough are not enabled in voltage area '%s'.

### Description

This message occurs when user executes the *fix_mv_design* command with *-move_within_x* or *-move_within_y* option so that the command can move a buffer or inverter to a nearby voltage area. However, the command cannot do so if both physical and logical feedthrough are not enabled in the target voltage area.

### What Next

Enable physical or logical feedthrough or both in *create_voltage_area_rule* command.

```
Example:
create_voltage_area_rule -default_rule \\
  -allow_physical_feedthrough true \\
  -allow_logical_feedthrough true
```

### See Also

- fix_mv_design
- create_voltage_area_rule

## MV-1100

(error) Cannot insert level shifter for global net driven by driver pin '%s' because the global net does not cross any power domain boundary.

### Description

This message occurs when the global net driven by the specified driver pin has a voltage violation but the global net does not cross any power domain boundary. As a result, there is no available power domain boundary pin to insert a level shifter.

### What Next

Change the design so that the specified global net crosses at least one power domain boundary.

### See Also

- create_mv_cells
- set_level_shifter

Feedback

## MV-1101

(error) Cannot insert level shifter in the path from driver pin '%s' (related supply net: %s [%s]) to load pin '%s' (related supply net: %s [%s]) because the path does not cross any power domain boundary.

### Description

This message occurs when the specified driver pin has a voltage violation to the specified load pin but the signal path does not cross any power domain boundary. As a result, there is no available power domain boundary pin to insert a level shifter.

### What Next

Change the design so that the specified signal path crosses at least one power domain boundary.

### See Also

- create_mv_cells
- set_level_shifter

## MV-1102

(error) Cannot insert enabled level shifter in the path from driver pin '%s' (related supply net: %s [%s]) to load pin '%s' (related supply net: %s [%s]) because there is no isolation cell on the path.

### Description

This message occurs when the specified driver pin has both voltage and isolation violations driving the specified load pin. An enabled level shifter is required to fix both the voltage and isolation violations. However, there is no isolation cell on the path which is needed for the insertion of enabled level shifter.

### What Next

Add an isolation strategy on a domain boundary pin along the path.

### See Also

- set_isolation
- set_level_shifter
- create_mv_cells

Feedback

## MV-1103

(error) Cannot convert isolation cell '%s' into enabled level shifter because of no_shift level shifter strategy '%s'.

### Description

This message occurs when the specified isolation cell needs to be converted into an enabled level shifter to fix a voltage violation but a user no_shift level shifter strategy prevents the conversion.

### What Next

Remove the no_shift level shifter strategy

### See Also

- set_level_shifter
- set_isolation
- create_mv_cells

## MV-1104

(error) Cannot fulfill level shifter strategy '%s' at pin '%s' because driver power supply (%s) is not available in pin's power domain (%s).

### Description

This message occurs when user specifies a level shifter strategy at the specified pin but power supply of the driver pin is not available in the specified pin's power domain. As a result, tool cannot insert a level shifter at the specified pin.

### What Next

Add the driver supply to the available supply list of the specified pin's power domain or apply the level shifter strategy to another pin in a power domain in which the driver power is available.

### See Also

- set_level_shifter
- create_power_domain
- create_mv_cells

Feedback

## MV-1105

(error) Cannot fulfill level shifter strategy '%s' at pin '%s' because all load power supplies (%s) are not available in pin's power domain (%s).

### Description

This message occurs when user specifies a level shifter strategy at the specified pin but power supplies of all load pins are not available in the specified pin's power domain. As a result, tool cannot insert a level shifter at the specified pin.

### What Next

Add the load power supplies to the available supply list of the specified pin's power domain or apply the level shifter strategy to another pin in a power domain in which the load power supplies are available.

### See Also

- set_level_shifter
- create_power_domain
- create_mv_cells

## MV-1106

(error) Cannot fulfill level shifter strategy '%s' at pin '%s' in power domain '%s' because the primary power supply (%s) cannot drive any load power supply.

### Description

This message occurs when:

- User specifies a level shifter strategy at the specified pin; and
- The specified pin's domain primary supply cannot drive any power supplies of the load pins without voltage violations; and
- All level shifter library cells available to the design or specified in map_level_shifter_cell/map_isolation_cell command use output rail as standard cell main rail (i.e., output supply of these level shifter library cells need to be connected to the domain primary supply).

As a result, tool cannot insert a level shifter at the specified pin because it will result in a standard cell main rail violation.

Feedback

### What Next

You can do one of the followings:

- Apply the level shifter strategy to another domain boundary pin in a power domain in which the primary supply can drive the load supplies without voltage violations; or
- Add level shifter library cells which use input rail as standard cell main rail to the design or applicable map_level_shifter_cell/map_isolation_cell command; or
- Ignore standard cell main rail checking in level shifter insertion by:

```
set_app_options -as_user_default -list {mv.upf.ignore_ls_main_rail
 true}
```

### See Also

- set_level_shifter
- create_mv_cells

---

## MV-1107

(error) Cannot insert level shifter in the path from driver %s '%s' (related supply net: %s [%s]) to load pin '%s' (related supply net: %s [%s]) because no domain primary supply along the path can drive the load supply.

### Description

This message occurs when:

- the driver pin has a voltage violation when driving the load pin; and
- none of the primary supplies of power domains along the path from the driver pin to the load pin can drive the load supply without a voltage violation; and
- all level shifter library cells available to the design or specified in map_level_shifter_cell/map_isolation_cell command use output rail as standard cell main rail (i.e., output supply of these level shifter library cells need to be connected to the domain primary supply).

As a result, tool cannot insert a level shifter at any domain boundary pins along the path from the driver pin to the load pin because it will result in a standard cell main rail violation.

Feedback

### What Next

You can do one of the followings:

- Add level shifter library cells which use input rail as standard cell main rail to the design or applicable map_level_shifter_cell/map_isolation_cell command; or
- Ignore standard cell main rail checking in level shifter insertion by: set_app_options -global {upf.ignore_ls_main_rail true}

### See Also

- create_mv_cells

---

## MV-1108

(error) Cannot insert level shifter in the path from driver %s '%s' (related supply net: %s [%s]) to load pin '%s' (related supply net: %s [%s]) because the path does not have an effective level shifter strategy. %s

### Description

This message occurs when user specifies the app option upf.insert_ls_on_user_cstr_only to be true (i.e. tool can only insert a level shifter at a domain boundary pin with user level shifter strategy specified) but there is no effective level shifter strategy found from the driver pin to the load pin. An effective level shifter strategy is defined as one which does not have -no_shift option specified and the applied domain boundary pin is not on a don't touch net or don't touch network.

### What Next

Add a level shifter strategy which does not have -no_shift option specified to one of the domain boundary pins between the driver pin and the load pin. Make sure that the applied domain boundary pin is not on a don't touch net or don't touch network.

### See Also

- set_level_shifter
- set_dont_touch
- set_dont_touch_network
- create_mv_cells

Feedback

## MV-1109

(error) Cannot convert isolation cell '%s' into enabled level shifter because the path has %s voltage transition but no %s enabled level shifter is included in %s.

### Description

This message occurs when there is high-to-low, low-to-high, or both types of voltage transitions going through the specified isolation cell. The isolation cell needs to be converted into an enabled level shifter in order to fix the violation violation. However, enabled level shifters which can perform this type of voltage transition are not available in the user library or user isolation strategy. Therefore the tool cannot fix the voltage violation going through the specified isolation cell.

### What Next

Add the required type of enabled level shifters to user library or isolation strategy.

### See Also

- set_isolation
- set_level_shifter
- create_mv_cells

## MV-1110

(error) Cannot insert level shifter in the path from driver %s '%s' (related supply net: %s [%s]) to load pin '%s' (related supply net: %s [%s]) because driver supply net %s is not available in any power domain along the path.

### Description

This message occurs when:

- the driver pin has a voltage violation; and
- the driver supply net is not available in any power domain along the path from the driver pin to the load pin; or if the driver supply net is available, the domain boundary pin is not available for level shifter insertion because there is a -no_shift strategy, a conflicting -location strategy, or other dont_touch reasons.

  As a result, tool cannot insert a level shifter at any domain boundary pins along the path from the driver pin to the load pin because it cannot power the input side of a level shifter with the driver supply net.

### What Next

Please make the driver supply net available in at least one of the power domains along the path from the driver pin to the load pin.

### See Also

- create_mv_cells

---

## MV-1111

(error) Cannot convert isolation cell '%s' with bias supplies (nwell=%s, pwell=%s) into enabled level shifter because no enabled level shifter with %sbias support is included in %s.

### Description

This message occurs when there is a voltage violation going through an isolation cell and the applied isolation strategy has specified an isolation supply set with bias supplies. However, tool cannot convert the isolation cell into enabled level shifter because user library or map_isolation_cell command does not include such lib cells which can support bias (or insulated bias).

### What Next

Add enabled level shifters with bias (or insulated bias) support in the user library or map_isolation_command.

### See Also

- set_isolation
- set_level_shifter
- create_mv_cells

---

## MV-1112

(error) Cannot insert level shifter for global net driven by driver pin '%s' because no level shifter with bias support is included in %s.

### Description

This message occurs when there is a voltage violation in the global net driven by the specified driver pin. The global net goes through power domains which have bias supplies specified. Therefore tool needs to insert level shifters with bias support in these power domains. However, user library or map_level_shifter_cell command does not include level shifters with bias support.

Feedback

### What Next

Add level shifters with bias support in the user library or map_level_shifter_cell command.

### See Also

- set_isolation
- set_level_shifter
- create_mv_cells

---

## MV-1113

(error) Found level shifter strategy '%s' with -location parent on pin '%s' but tool cannot insert level shifter in the parent power domain because net '%s' has a user don't touch attribute.

### Description

This message occurs when there is a level shifter strategy with -location parent set on a power domain boundary pin. However, there is a user dont touch attribute set on the net connecting to the pin in the parent power domain. Therefore tool cannot insert level shifter in the parent power domain of the pin.

### What Next

Remove the dont touch attribute set on the net in the parent power domain or change the level shifter strategy to use -location self.

### See Also

- create_mv_cells
- report_dont_touch
- set_dont_touch
- set_level_shifter

---

## MV-1114

(error) Found level shifter strategy '%s' with -location self on pin '%s' but tool cannot insert level shifter in the power domain because net '%s' has a user don't touch attribute.

### Description

This message occurs when there is a level shifter strategy with -location self set on a domain boundary pin. However, there is a user dont touch attribute set on the net

Feedback

connecting to the pin in its power domain. Therefore tool cannot insert level shifter in the power domain of the pin.

**What Next**

Remove the dont touch attribute set on the net in the power domain or change the level shifter strategy to use -location parent.

**See Also**

- create_mv_cells
- report_dont_touch
- set_dont_touch
- set_level_shifter

---

## MV-1115

(error) Cannot convert isolation cell '%s' into %s enabled level shifter because power supplies (%s, %s) of its driver pin '%s' cannot drive domain primary supplies (%s, %s) of the isolation cell.

**Description**

This message occurs when:

- There is a voltage violation from the specified driver pin to the data input pin of an isolation cell; and
- The supply of the specified driver pin cannot drive the domain primary supply of the isolation cell because of voltage or isolation violation; and
- All high-to-low (or low-to-high) enabled level shifter library cells available to the design or specified in map_level_shifter_cell/map_isolation_cell command use input rail as standard cell main rail (i.e., input supply of these enabled level shifter library cells needs to be connected to the domain primary supply).

As a result, tool cannot convert the specified isolation cell into a high-to-low (or low-to-high) enabled level shifter because it will result in a standard cell main rail violation.

Feedback

### What Next

You can do one of the followings:

- Add high-to-low (or low-to-high) enabled level shifter library cells which use output rail as standard cell main rail to the design or applicable map_level_shifter_cell/ map_isolation_cell command; or
- Ignore standard cell main rail checking in level shifter insertion by:

```
set_app_options -as_user_default -list {mv.upf.ignore_ls_main_rail
 true}
```

### See Also

- set_level_shifter
- create_mv_cells

---

## MV-1116

(error) Cannot convert isolation cell '%s' into %s enabled level shifter because its domain primary supplies (%s, %s) cannot drive any of its loads.

### Description

This message occurs when:

- There is a voltage violation from the output pin of an isolation cell to its loads; and
- The domain primary supply of the isolation cell cannot drive any of its loads because of voltage or isolation violation; and
- All high-to-low (or low-to-high) enabled level shifter library cells available to the design or specified in map_level_shifter_cell/map_isolation_cell command use output rail as standard cell main rail (i.e., output supply of these enabled level shifter library cells needs to be connected to the domain primary supply).

As a result, tool cannot convert the specified isolation cell into a high-to-low (or low-to-high) enabled level shifter because it will result in a standard cell main rail violation.

Feedback

### What Next

You can do one of the followings:

- Add high-to-low (or low-to-high) enabled level shifter library cells which use input rail as standard cell main rail to the design or applicable map_level_shifter_cell/ map_isolation_cell command; or
- Ignore standard cell main rail checking in level shifter insertion by:

```
set_app_options -as_user_default -list {mv.upf.ignore_ls_main_rail
 true}
```

### See Also

- set_level_shifter
- create_mv_cells

---

## MV-1117

(error) Cannot use driver supply net %s (of driver pin '%s') to power %s '%s' because the supply net is not available in the %s's power domain (%s).

### Description

This message occurs when the driver supply net is not available in a Level Shifter's, Enable Level Shifter's or Isolation Cell's power domain. As a result, tool cannot use the driver supply net as the input supply net of the Level Shifter, Enable Level Shifter or Isolation Cell.

### What Next

Please make the driver supply net available in the power domain of the Level Shifter, Enable Level Shifter or Isolation Cell.

### See Also

- create_mv_cells

---

## MV-1118

(error) Tool cannot insert level shifter in net '%s' because has a don't touch attribute.

### Description

This message occurs when the net in wich a level shifter should be inserted has don't touch attribute.

Feedback

### What Next

Remove the dont touch attribute set on the net

### See Also

- create_mv_cells
- report_dont_touch
- set_dont_touch
- set_level_shifter
- analyze_mv_design

---

## MV-1119

(Information) Tool cannot insert Level Shifter because there is no usable lib cell for this insertion point. The initial %s lib cells where filtered by: %s.

### Description

This message occurs when there is no lib cell that can be used to insert a Level Shifter at this insertion point. Reasons might be:

1. Library cell is has dont_touch attribute set.
2. Voltage range mismatch: a library cell's voltage range defined in library should match with driver/load supply's voltage range before it can be inserted.
3. Library cell is not overdriven while the path needs overdriven Level Shifter.
4. Library cell is not single ground while single ground library cell is required.
5. Strategy rule mismatch: a library cell's level-shifter type should match with the voltage shifting direction on the path.
6. Standard cell main-rail mismatch: a library cell's main-rail supply should match with the domain primary supply.
7. Library cell has pvt mismatch.
8. Library cell (Enable Level Shifter) clamp has mismatch or cannot perform automatic phase correction due to clamp mismatch
9. Library cell (Enable Level Shifter) sense has mismatch or cannot perform automatic phase correction due to sense mismatch
10. Library cell (Enable Level Shifter) does not have enable pin.

Feedback

11. Library cell is Combo Enable Level Shifter, but has data mismatch.
12. No library cell can be selected due to voltage violation between input and output supply net.

**What Next**

Check the *map_level_shifter_cell* command associated with this insertion point if any. Check the operating conditions for the Level Shifter lib cells available for use with *report_mv_lib_cells -level_shifter*. If current insertion point has Isolation (or Isolation strategy) use *analyze_mv_feasibility* to see a detailed information for unmap Enabled Level Shifter cells.

**See Also**

- add_power_state
- create_pst
- report_mv_lib_cells
- set_level_shifter
- analyze_mv_feasibility
- map_level_shifter_cell

---

## MV-1120

(error) Cannot insert level shifter in the path from driver %s '%s' (related supply net: %s [%s]) to load pin '%s' (related supply net: %s [%s]) because load supply net %s is not available in any power domain along the path.

**Description**

This message occurs when:

- there is a voltage violation; and
- the load supply net, required to implement a level shifter, is not available in any power domain along the path from the driver pin to the load pin; or if the load supply net is available, the domain boundary pin is not available for level shifter insertion because there is a -no_shift strategy, a conflicting -location strategy, or other dont_touch reasons.

  As a result, tool cannot insert a level shifter at any insertion point along the path from the driver pin to the load pin, because it cannot power the level shifter with the driver supply net.

Feedback

### What Next

Please make the load supply net available in at least one of the power domains along the path from the driver pin to the load pin.

### See Also

- create_mv_cells

---

## MV-1121

(Error) User library has no level shifter cells of type '%s' available to be used.

### Description

Tool detects one or more voltage violations that need level shifter cells of type 'high-to-low' (HL), 'low-to-high' (LH) or both (HL_LH) but user library does not contain level shifter cells of the specified type. Tool is not be able to perform level shifter insertion to solve voltage shift violations.

### What Next

o Check if user library contains level shifters of the specified type (HL, LH or HL_LH) using *report_mv_lib_cells -level_shifter*.

o Also check if lib cells have *dont_touch attribute* (dt) in the report of *report_mv_lib_cells -level_shifter*. Lib cells with 'dont_touch attribute' cannot be used by insertion engine. Use *set_dont_touch* to make level shifter library cells available to be used by the tool.

## NDM-016

(error) NDM file version %s is no longer supported. Current compatible version is %s.

**Description**

This version of the NDM file is not supported.

**What Next**

Re-generate design and library data with the latest binary.

---

## NDM-017

(error) Failed to read %s object from file %s.

Feedback

**Description**

The specified object could not be read correctly read from file because of an I/O error.

**What Next**

Re-create the file with the latest executable.

---

## NDM-018

(error) Failed to restore %s object from file %s.

**Description**

The object cannot be correctly restored from file because of an I/O error.

**What Next**

Re-create the file with the latest executable.

---

## NDM-019

(error) Cannot save the library or block because it is in read-only mode.

**Description**

The library or block cannot be saved to disk because it was opened in read mode.

**What Next**

Close the library or block and reopen it in edit mode.

---

## NDM-020

(error) '%s' is not a valid NDM binary file

**Description**

The file cannot be read because not in valid NDM binary format.

**What Next**

Verify the file location is correct or re-create it with the latest binary.

---

## NDM-021

(warning) re-binding failed for %s '%s'.

Feedback

**Description**

Re-binding a cell to a valid reference block failed during *open_block*.

Binding failed either because the target reference block could not be found, or because the target reference block port interface has changed since the last time this cell was bound.

**What Next**

If the target block was not found, verify that the search_path location or reference library list setting correctly identifies the target block and try again.

If the target block port has changed, use the *link_block* command to update the cell's pin interface to match the referenced block's new port interface.

---

## NDM-022

(warning) '%s' is logical only. Placement status is not available.

**Description**

Placement status cannot be set on a logical only cell/port.

---

## NDM-023

(error) Placement status cannot be set on object type '%s'.

**Description**

Placement status can only be set on cells and ports.

---

## NDM-024

(error) Invalid %s placement status '%s'.

**Description**

For ports, valid status values are unplaced, placed, fixed, and locked. For cells, valid status values are unplaced, placed, legalize_only, application_fixed, fixed, and locked.

**What Next**

Specify a valid placement status.

---

## NDM-025

(error) The value %f is too %s causing an arithmetic overflow error.

Feedback

**Description**

The specified value cannot be represented within the database. It is either too large or too small, causing an arithmetic overflow error when converted into internal database units.

**What Next**

Check the technology units and specify a valid value.

---

## NDM-026

(error) Can not create hier_boundary as the cell already has a hier_boundary.

**Description**

The hierarchical cell already has a hier_boundary associated with it, therefore hier_boundary creation has failed.

**What Next**

Please provide proper input to command.

---

## NDM-027

(error) Can not create partition as the cell is already a partition.

**Description**

The hierarchical cell is already a partition, therefore partition creation has failed.

**What Next**

Please provide proper input to command.

---

## NDM-028

(warning) Block '%s.%s' is out of sync with the '%s' view. '%s' view has changed since last synced.

**Description**

The specified block view has changed since it was set to be in-sync with its source view.

**What Next**

please re-sync the (derived) block with its source view.

Feedback

## NDM-029

(error) '%s' failed. Block '%s' is being edited by process %d %s@%s.

**Description**

The specified operation failed because write acccess is held by another process.

**What Next**

Please coordinate with the user holding the block for edit about saving and releasing the write access.

## NDM-030

(error) %s for design %s does not match design %s: found '%s', expected '%s'

**Description**

While comparing two designs, the function id does not match.

**What Next**

If running the library manager, this design will be removed from the library in question. However, libraries with this sort of error are probably out of date and should not be used.

## NDM-031

(error) Port %s missing on %s

**Description**

While comparing two designs, a port was found on one but not the other.

**What Next**

If running the library manager, this design will be removed from the library in question. However, libraries with this sort of error are probably out of date and should not be used.

## NDM-032

(error) Direction '%s' for port %s on %s\n \tdoes not match expected value '%s' from %s

**Description**

While comparing two designs, a port has a different direction in each design.

Feedback

### What Next

If running the library manager, this design will be removed from the library in question. However, libraries with this sort of error are probably out of date and should not be used.

---

## NDM-033

(Error) %s '%s' for pin %s on %s does not match the expected value '%s' from %s.

### Description

The tool issues this warning message if it detects a pin that has a different *port_type* or *pg_type* attribute when comparing two designs. The *port_type* attribute identifies the type of the library cell pin, such as *signal*, *power*, or *ground*. The *pg_type* attribute identifies the type of a PG pin, such as *backup*, *internal*, or *primary*.

- The *check_workspace* command issues this message for *pg_type* mismatches between two designs in the library workspace.
- The *compare_db* command issues this message for both *port_type* and *pg_type* mismatches between the design in the base library and the comparison library.

### What Next

If you get this message during library preparation, by default, the design is removed from the reference library. To modify this behavior, set a mismatch configuration.

If you get this message during library validation, the library is probably out-of-date and you not should use it.

### See Also

- check_workspace
- create_mismatch_config
- set_current_mismatch_config
- compare_db

---

## NDM-034

(error) Cannot locate block %s for instance %s.

### Description

The instance is attempting to bind to a physical block, but the requested view of the physical block cannot be located, so the instance is unbound.

Feedback

**What Next**

A number of things can go wrong when looking for a view of a block.

Verify that the block exists, and is in a library that is loaded into the session.

Verify that the library is on the reference library list of the library containing the top block.

The desired view may be obscured by another block in an earlier library. Look at the viewtype requested for that instance. Verify that the desired view (DESIGN ABSTRACT OUTLINE) exists for that block in the first reference library that contains a block of that name.

---

## NDM-035

(error) NDM_LOCK_FAIL_ACTION `%s' not one of: `off', `complain', or `die'. Turning off.

**Description**

This is a internal error. Please report to Synopsys.

**What Next**

Internal error, please report to Synopsys.

---

## NDM-036

(info) %s lock check failed!.

**Description**

This is a internal message. Please report to Synopsys.

**What Next**

Internal message, please report to Synopsys.

---

## NDM-037

(warning) Conn count of instance '%s' does not match reference module '%s'

**Description**

The conn count of the specified instance '%s' does not match its reference module. This could be caused by a change in the port interface after the instance was created.

**What Next**

Verify the port interface of the reference module matches the instance.

Feedback

## NDM-038

(warning) power_domain '%s' is already associated with a voltage_area.

**Description**

The specified power_domain is already associated with a voltage_area.

**What Next**

Specify a different power_domain and try this command again.

## NDM-039

(warning) Top-level power_domain '%s' is reserved for default voltage_area.

**Description**

The specified top-level power_domain is reserved for the default voltage_area.

**What Next**

Specify a different power_domain and try this command again.

## NDM-040

(information) NDM file '%s', version %s does not match current version %s.

**Description**

The NDM file is of an earlier version than the current version.

## NDM-041

(info) Net '%s' has been created.

**Description**

This is a verbose message indicating the named net has been created.

## NDM-042

(info) Port '%s' has been created.

**Description**

This is a verbose message indicating the named port has been created.

Feedback

## NDM-043

(info) Net '%s' has been connected to %s '%s'.

**Description**

This is a verbose message indicating the net has been connected to the pin/port.

## NDM-044

(info) Net '%s' has been disconnected from %s '%s'.

**Description**

This is a verbose message indicating the net has been disconnected from the pin/port.

## NDM-045

(error) Unable to create net '%s'. A net of that name already exists.

**Description**

This is an internal error. Please report to Synopsys.

## NDM-046

(warning) Connection from net '%s' to %s '%s' is not consistent with supply net '%s'.

**Description**

The intended connection is not consistent with supply net, but the manually specified connection has been made.

## NDM-047

(warning) Unable to create net '%s'. A net of that name already exists. Net is renamed to '%s'.

**Description**

Net has been renamed in order to make specified connection.

## NDM-048

(error) MV data is not ready.

Feedback

**Description**

MV data is not ready to run this command. Please run commit_upf.

---

## NDM-049

(error) The conflicts between PG network (%s'%s') and UPF (%s'%s') have not been resolved.

**Description**

The conflicts between PG network and UPF must be resolved before running this command.

---

## NDM-050

(error) Unable to create port '%s'. A port of that name already exists.

**Description**

This is an internal error. Please report to Synopsys.

---

## NDM-051

(error) Unable to determine the supply net to connect to the tie net '%s'.

**Description**

This is an internal error. Please report to Synopsys.

---

## NDM-052

(error) Cannot push into partition '%s'.

**Description**

The partition cannot become current block.

---

## NDM-053

(error) Unable to determine supply net to connect to %s '%s'.

**Description**

Supply net cannot be determined to make tie connection.

Feedback

### What Next

Fix your power constraints and try again.

---

## NDM-054

(warning) Unable to determine supply net to connect to %s '%s'. %s

### Description

Supply net cannot be determined to make tie connection. This could be due to related power/ground pin is not defined for the signal pin in library or supply net connection cannot be determined for the related power/ground pin by UPF.

### What Next

Check whether related power/ground pin is defined for the signal pin in library or supply net connection for the related power/ground pin is defined in UPF. If the pin is a macro input pin that is related to an internal pg pin, consider to set the app option "mv.upf.use_preswitched_supply_for_macro_pins" to use the pre-switched supply to determine the supply net for the tie connection.

### See Also

- mv.upf.use_preswitched_supply_for_macro_pins

---

## NDM-055

(info) In block '%s', uniquifying module '%s' from '%s' for cell '%s'.

### Description

This is a verbose message indicating the multiply instantiated module (MIM) has been automatically split into two modules so that changes to that instance of the module for that logical cell will not be replicated into all cells that reference that module.

A cell's module can be auto-uniquified whenever the contents of the cell are changed. Only multiply instantiated cell modules (MIMs) will be auto-uniquified. Physical blocks and lib cells are never uniquified.

### What Next

This message can be enabled or disabled by setting the *design.verbose_uniquify* app option.

You can get a cell's reference module with the *ref_name* attribute.

You can get all the modules in a block with the *get_modules* command.

Feedback

**See Also**

- get_attribute
- get_modules
- set_app_options
- uniquify
- cell_attributes
- design_options

---

## NDM-056

(info) Port '%s' is removed.

**Description**

This is a verbose message indicating the port is removed.

---

## NDM-057

(info) Net '%s' type is set to be '%s'.

**Description**

This is a verbose message indicating the net type is set.

---

## NDM-058

(info) Net '%s' name is set to be '%s'.

**Description**

This is a verbose message indicating the net name is set.

---

## NDM-059

(info) Net '%s' is removed.

**Description**

This is a informational message indicating the net is removed when resolve_pg_nets resolves the conflicts between power intent (based on UPF) and pg net connections (from DEF or PG netlist).

Feedback

### What Next

Please check the power intent.

### See Also

- commit_upf
- resolve_pg_nets

---

## NDM-060

(info) Port '%s' direction is set to '%s'.

### Description

This is a verbose message indicating the port direction is set.

---

## NDM-061

(info) %s '%s' cannot be created because the %s is not PG type.

### Description

This is a verbose message indicating that the named port/net cannot be created since the supply port/net is not PG type.

---

## NDM-062

(warning) Block '%s.%s' is out of sync with the '%s' view. Both views have changed since last synced.

### Description

The specified block views have changed since they were set to be in-sync.

### What Next

please re-sync the block views.

---

## NDM-063

(information) Block '%s' is not being saved because it is in read mode.

### Description

The specified block view is not saved because it is open in read mode.

Feedback

### What Next

Open the block in edit mode and try again.

---

## NDM-064

(info) Creating block '%s', mode '%s'.

### Description

This is a verbose message indicating the named block has been created with the named open mode.

A block can have one of three open modes: A new, unsaved block has an open mode of 'new'. A block open for modification has an open mode of 'edit'. A block open read-only has an open mode of 'read'.

### What Next

This message can be enabled or disabled by setting the *design.verbose_io* app option.

You can get a block's open mode with the *open_mode* attribute.

### See Also

- create_block
- get_attribute
- set_app_options
- design_options

---

## NDM-065

(info) Opening block '%s', mode '%s'.

### Description

This is a verbose message indicating the named block has been read in from its library with the named open mode.

### What Next

This message can be enabled or disabled by setting the *design.verbose_io* app option.

You can get a block's open mode with the *open_mode* attribute.

Feedback

**See Also**

- get_attribute
- open_block
- set_app_options
- design_options

---

## NDM-066

(info) Saving block '%s'.

**Description**

This is a verbose message indicating the named block has been written to its library.

**What Next**

This message can be enabled or disabled by setting the *design.verbose_io* app option.

**See Also**

- save_block
- set_app_options
- design_options

---

## NDM-067

(info) Closing block '%s'.

**Description**

This is a verbose message indicating the named block has been closed and removed from memory.

**What Next**

This message can be enabled or disabled by setting the *design.verbose_io* app option.

**See Also**

- remove_blocks
- set_app_options
- design_options

Feedback

## NDM-068

(info) Changing block '%s' mode from '%s' to '%s'.

### Description

This is a verbose message indicating the named block's open mode has been changed from its previous mode to a new mode.

A block can have one of three open modes: A new, unsaved block has an open mode of 'new'. A block open for modification has an open mode of 'edit'. A block open read-only has an open mode of 'read'.

### What Next

This message can be enabled or disabled by setting the *design.verbose_io* app option.

You can get a block's open mode with the *open_mode* attribute.

### See Also

- get_attribute
- reopen_block
- set_app_options
- design_options

## NDM-069

(error) Cannot include read-only block '%s' as an editable part of abstract '%s'.

### Description

When creating an editable abstract, all of the editable sub-blocks of the abstract must first be opened in edit mode. It is possible the the read-only block in question is already part of an existing abstract.

The new abstract cannot be created.

### What Next

Use the reopen_block command to obtain edit permission for the given block. Alternatively, you could create a read-only abstract.

Feedback

### See Also

- reopen_block
- create_abstract

---

## NDM-070

(error) Cannot include '%s' as a part of new abstract '%s'. Existing abstract '%s' must be merged or removed first.

### Description

When creating a new abstract, none of the sub-blocks of the abstract may be part of an existing editable abstract. The abstract cannot be created.

### What Next

You can merge the changes in the existing editable abstract by using the merge_abstract command. After running that command, the abstract will no longer be editable, and new abstracts can be created.

Alternatively, you can remove the existing editable abstract by using the remove_abstract command.

### See Also

- merge_abstract
- remove_abstract

---

## NDM-071

(information) Saving '%s' and adding it as a part of editable abstract '%s'.

### Description

The given block is now part of an editable abstract. The block has been written to disk, and has been set to read-only. The block will remain read only while the editable abstract still exists.

### What Next

You might see future information messages that the read-only block cannot be saved. This is OK, because it was saved in this step.

In order to make your block editable again, you must either merge the changes in the editable abstract by using merge_abstract, or you can remove the existing editable abstract by using the remove_abstract command.

Feedback

### See Also

- merge_abstract
- remove_abstract

---

## NDM-072

(warning) Non-editable abstract '%s' can only be opened as read-only

### Description

An attempt was made to open a read-only abstract in edit mode. The abstract has been opened in read-only mode instead.

### What Next

If you want to edit or optimize the logic inside of an abstract, you must create an editable abstract. Refer to the create_abstract man page for details.

### See Also

- create_abstract

---

## NDM-073

(information) %s view of block '%s' is not being saved because it is in read mode.

### Description

The specified block view is not saved because it is open in read mode.

### What Next

Open the block in edit mode and try again.

---

## NDM-074

(warning) Block '%s' can only be opened as read-only because it is part of an editable abstract '%s'.

### Description

When a block is included in an editable abstract, it becomes read-only. The abstract must be processed or deleted before the block may be edited again.

Feedback

### What Next

In order to make your block editable again, you must remove the existing editable abstract by using the remove_abstract command.

Alternatively, you may force the block to be editable by using "reopen_block -edit". If you do this, the editable abstract will be rendered unusable.

Changes made in the editable abstract view since its creation are automatically merged to the design view when the design view is loaded into memory.

### See Also

- merge_abstract
- remove_abstract

---

## NDM-075

(warning) Block '%s' was part of editable abstract '%s'. The abstract has been downgraded to read-only.

### Description

When a block is included in an editable abstract, it becomes read-only. The abstract must be processed or deleted before the block may be edited again.

By using the reopen_block command, you have forced the block to be editable. This means that the editable abstract is no longer usable. You will not be able to perform the merge_abstract operation.

### What Next

If you need a new editable abstract, you need to rerun the create_abstract command.

### See Also

- create_abstract
- remove_abstract

---

## NDM-076

(error) The abstract for block '%s' is not editable. The merge_abstract operation is not possible.

### Description

Only editable abstracts can be merged back into their parent block.

Feedback

### What Next

Please refer to the create_abstract man page for details about creating editable abstracts.

### See Also

- create_abstract

---

## NDM-077

(error) The abstract for '%s' depends on the design view of block '%s:%s', but the design view has changed or is missing. The merge_abstract operation is not possible.

### Description

When using editable abstracts, it is important to preserve the original design view block hierarchy on which the abstract is based. It is not possible to merge changes from the abstract back to the design view, if the block has changed or you are using a different copy of the block.

### What Next

It is possible that you changed the original design view hierarchy by using "reopen_block" or "remove_abstract". If the design view has changed, then you cannot run merge_abstract. Use remove_abstract on your top-level block to return it to a writable state.

It is also possible that you did not change your original design view hierarchy, but you are instead using a modified *copy* of your original design view. Try to find the copy of the block that was used to create the abstract.

### See Also

- create_abstract
- merge_abstract

---

## NDM-078

(error) Cannot include view '%s' of block '%s:%s' in an abstract.

### Description

When creating an abstract, the subblocks of the design must either be a "design" view or an "abstract" view.

Feedback

### What Next

Use the change_link command to include the proper view for the subblock.

### See Also

- change_link

---

## NDM-079

(information) %s view of block '%s:%s' has been restored to edit mode.

### Description

After merging or deleting an editable abstract, the blocks on which the abstract was based are reverted to edit mode.

### What Next

No action is required.

### See Also

- merge_abstract
- remove_abstract

---

## NDM-080

(warning) Orientation %s of cell %s is not allowed for grid %s.

### Description

A snap to grid operation is called trying to move the specified cell instance to be on the specified grid. However, the current orientation of the cell instance is not allowed for the specified grid. The cell is not moved.

### What Next

Check the cell's orientation, see if it needed to be rotated. Also check the association of the cell and the grid, see if the cell needs to be using another grid.

### See Also

- set_block_grid_references

Feedback

## NDM-081

(warning) Cell %s is not associated with grid %s.

### Description

A snap to grid operation is called trying to move the specified cell instance to be on the specified grid. However, the cell instance is not associated with the specified grid. The cell is not moved.

### What Next

Check the association of the cell and the grid.

### See Also

- set_block_grid_references

## NDM-082

(warning) Problem exporting %s %s : %s.

### Description

A problem was encountered when exporting the specified object to the specified format, likely due to differences between the object's configuration in the current database versus the configurability of the object in the target format.

## NDM-083

(error) Write-access request for %s failed. Library '%s' is being edited by process %d %s@ %s.

### Description

Write ccess requested by the specified operation failed because the library is being edited by another process.

### What Next

Please either try again (write-access on libraries are only held for a short time during actual write-to-disk and read-from-disk operation), or coordinate with the user holding the library for edit about releasing it.

The maximum wait time is controlled by the app_option "lib.setting.max_wait_time". The default value is 3600 seconds.

Feedback

## NDM-084

(error) '%s' failed. Another process has modified and saved library '%s' while this process was running, or a library with the same name has been copied, renamed or unpacked into this save location.

### Description

The specified operation failed because the library was modified and saved by another process while this process was running, or a library with the same name has been copied, renamed or unpacked into this save location.

### What Next

Please use save_lib -as to save your work to another library, or move/remove the conflicting on-disk library.

## NDM-085

(error) Cannot %s %s %s because %s.

### Description

The specified remove, modify, or create operation for the named type of the object given at full path has failed for the reason stated. or a library with the same name has been copied, renamed or unpacked into this save location.

### Examples

ERROR: Cannot remove net Reset because net is marked don't touch. (NDM-085)

### What Next

Obey the restriction, which is meant to keep the user from making unsafe changes that will have side effects in the flow. If this is not practical, set the app option design.eco_restrictions to false, and the operation will be permitted. Note that in the case of permitted unsafe changes, the performance may suffer significantly due to the requirements for more detailed checking and updating or recreation of many parts of the system data.

## NDM-086

(error) NDM file version %s is newer than the currently supported version %s. Use '%s <new_name>' in your original %s program to create an NDM library which can be read by this version of %s. See the man page for '%s' for further details.

Feedback

### Description

The library version is newer than the currently supported version.

### What Next

Use the original program that creates the library and save it to a supported version:

```
On IC Compiler II:

prompt> open_lib <lib_name>
prompt> save_lib -version J-2014.12 -as <new_name>

On IC Compiler II Library Manager:

prompt> create_workspace <workspace_name>
prompt> open_lib <lib_name>
prompt> commit_workspace -version J-2014.12
```

### See Also

- save_lib
- commit_workspace

---

## NDM-087

(warning) Block %s not found in current design, skipping.

### Description

A block listed in the connect_pg_net -block option could not be found instantiated in the current design. Connect_pg_net will skip missing blocks.

### What Next

To eliminate warnings, update -block list to include only blocks which are instantiated directly in current design.

---

## NDM-088

(info) Attempting to acquire write access for library (max wait until timeout is %d seconds).

### Description

Waiting to acquire write access on library which is held by another process.

Feedback

## NDM-089

(error) Another process has modified attributes and saved library '%s' while this process was running.

**Description**

The specified operation failed because attributes in this library were modified and saved by another process while this process was running.

**What Next**

Please use save_lib -as to save your work to another library, or move/remove the conflicting on-disk library.

## NDM-090

(error) Multiple processes have simultaneously attempted to create the same design '%s' and save to library '%s'.

**Description**

The specified operation failed because multiple processes attempted to simultaneously create and save the same design to a library.

**What Next**

Please use save_lib -as to save your work to another library, or move/remove the conflicting on-disk library.

## NDM-091

(error) Another processes attempted to delete the open design '%s' (detected while saving to library '%s').

**Description**

The specified operation failed because another processes attempted to delete a design that is open in the current process.

**What Next**

Please use save_lib -as to save your work to another library, or move/remove the conflicting on-disk library.

## NDM-092

(error) Unable to create %s '%s'. A %s already exists%s.

Feedback

**Description**

The specified operation failed because an object with the given name/attribute already exists.

**What Next**

Choose a different name/attribute for this new object.

---

## NDM-093

(error) '%s' has an experimental schema version '%s' incompatible with this production binary. The binary schema version is '%s'.

**Description**

The file has an experimental schema version. It is meant only for testing and it can only be opened with binaries from the same experimental branch. This schema version is incompatible with regular release versions and cannot be opened with production binaries.

**What Next**

Try again with a binary from the same experimental branch.

---

## NDM-094

(error) '%s' of experimental schema version '%s' is incompatible with this experimental binary from a different experimental branch. The binary schema version is '%s'.

**Description**

The file has an experimental schema version. It is meant for testing only and can be opened with binaries from the same experimental branch. This schema version is incompatible with regular release binaries or binaries with a different experimental suffix (The last portion of the schema version after .X).

**What Next**

Try again with a binary from the same experimental branch.

---

## NDM-095

(warning) Could not restore binding for reference '%s'.

**Description**

During *open_block* a block or lib cell reference could not be restored.

Feedback

The block being opened contains a reference to another block or lib cell. A block or lib_cell of that name could not be found in that library. The binding to that referenced block or lib cell could not be restored.

**What Next**

Verify that the requested library is in the ref_lib list and is open.

Check the named library to verify that a block with that name exists.

Use the *link_block* command to restore the bindings of the references in this block.

**See Also**

- link_block
- open_block
- set_ref_libs
- search_path

---

## NDM-096

(warning) Could not restore binding. Cannot locate library for reference '%s'.

**Description**

During *open_block* a block or lib cell reference could not be restored.

The block being opened contains a reference to another block or lib cell. The binding to that referenced block or lib cell could not be restored because the referenced library could not be found in the current ref_lib list.

**What Next**

Verify that the search_path location or reference library list setting correctly identifies the target block and try again.

If the reference libraries have moved but are still in the search_path, update the path to the ref_libs and re-link the design:

```
prompt> set_ref_libs -rebind
prompt> link_block
```

If the search_path to ref_lib list needs to be updated, do so, then re-link the design:

```
prompt> set_ref_libs -ref_libs { ... }
prompt> link_block
```

Feedback

### See Also

- link_block
- open_block
- set_ref_libs
- search_path

---

## NDM-097

(warning) Could not restore binding. Cannot locate block view '%s' for reference '%s'.

### Description

During *open_block* a block or lib cell reference could not be restored.

The block being opened contains a reference to another block or lib cell. The binding to that referenced block or lib cell could not be restored because the referenced block view could not be found in that library.

### What Next

Check the referenced library to see what views exist of that block:

```
prompt> get_blocks -all -lib_cells LIBRARY-NAME:BLOCK-NAME.*
```

If the desired block view is in another library, make that library part of the reference library list with the *set_ref_libs* command. Then re-link the design with the *link_block* command.

If a different block view is desired, change the cell's reference with the *change_view* or *set_reference* command.

### See Also

- change_view
- get_blocks
- link_block
- open_block
- set_ref_libs
- set_reference
- search_path

Feedback

## NDM-098

(warning) Could not restore binding. Port interface of block '%s' does not match reference '%s'.

### Description

During *open_block* a block or lib cell reference could not be restored.

The block being opened contains a reference to another block or lib cell. The binding to that referenced block or lib cell could not be restored because the port interface of the referenced block has changed since the block was last saved.

### What Next

Update the cell's pin interface to match the referenced block's new port interface using the *link_block* command:

```
prompt> link_block
```

### See Also

- link_block
- open_block

## NDM-099

(info) Running auto PG connection.

### Description

This is a message indicating auto PG connection is running.

## NDM-100

(error) Another process deleted design '%s' (detected while syncing to library '%s').

### Description

The specified operation failed because another process deleted a design that is not yet opened in the current process.

### What Next

The specified design is no longer available. Check the flow or concurrent library environment.

Feedback

## NDM-101

(error) Cannot open block '%s'. Binding to technology library is missing.

### Description

The reference technology library for this block is required but is missing. The block cannot be opened until this reference is resolved. Check the refLib list on the library and verify all refLibs are bound.

### What Next

Use report_ref_libs to verify all refLibs are bound. Unbound refLibs are those refLibs whose name or location are not available. If there are unbound refLibs, modify the search_path so that the refLib paths are reachable and use set_ref_libs -rebind to restore the binding.

```
prompt> report_ref_libs
****************************************
Report : Reference Library Report
Library: 1
****************************************

   Name Path      Location
   -----------------------
   -    tech_lib  -
    "-" = Name and location not available
1

prompt> set_ref_libs -rebind
```

### See Also

## NDM-102

(warning) Technology '%s' used for frame-view creation in library '%s', is inconsistent with the current technology '%s' of library '%s'. Please run derive_design_level_via_regions to generate up-do-date via region in the design library.

### Description

The technology of the reference library is inconsistent with technology of the design library. Need to run derive_design_level_via_regions to generate up-do-date via region in the design library.

Feedback

**What Next**

Update the library with consistent technology and try again. Or run derive_design_level_via_regions to generate up-do-date via region in the design library.

**See Also**

- create_lib
- open_lib
- read_tech_file
- derive_design_level_via_regions

---

## NDM-103

(info) %s Sparse View library '%s' %s base library '%s'.

**Description**

This is a message indicating set/update of the base library attribute of a Sparse View library.

---

## NDM-104

(info) Updating %s of Sparse View library '%s' from base library '%s'.

**Description**

This is a message indicating synchronization of a Sparse View library to pull-in updates from its base library.

---

## NDM-105

(info) Adding %s '%s' to Sparse View library '%s'.

**Description**

This is a synchronization message indicating addition of remote content to the Sparse View library from the local on-disk content of the base library.

---

## NDM-106

(info) Removing %s '%s' from Sparse View library '%s'.

Feedback

**Description**

This is a synchronization message indicating removal of remote content from the Sparse View library because its local on-disk content doesn't exist in the base library.

---

## NDM-107

(error) Cannot open '%s'. It is an internal file within a directory format library.

**Description**

The specified path is an internal data file within a directory format library. It cannot be opened directly.

**What Next**

Find out the name of the library and use open_lib to open it:

prompt> *open_lib <lib_path>*

**See Also**

- open_lib
- open_block

---

## NDM-108

(error) The given drc error file does not exist.

**Description**

This error message occurs when the specified file does not exist in the directory. It may be either misspelled or an empty string.

**What Next**

Verify that you specified the correct path for the file and the name string.

---

## NDM-109

(error) Cannot restore site name on '%s'. Site definition '%s' is missing from technology.

**Description**

The specified site definition is missing. Add the missing site definition to the technology and try again.

Feedback

### See Also

- open_block
- create_site_def
- get_site_defs

---

## NDM-110

(information) Recycled %d file descriptors.

### Description

The specified number of file descriptors have been recycled as the user-specified open file limit has been reached.

### See Also

- open_lib

---

## NDM-111

(warning) Frame views in library '%s' is inconsistent with technology '%s'.

### Description

The technology of this library has changed after frame creation. Frame views in this library are out-of-sync with the technology and should be re-created.

### What Next

Re-generate the frame views using a consistent technology.

### See Also

- open_lib
- create_frame
- create_workspace

---

## NDM-112

(Information) Opening block '%s' in read-only mode.

Feedback

**Description**

The block is being opened in read-only mode because system resources have been exhausted.

---

## NDM-113

(Information) Changing block '%s' to read-only mode.

**Description**

The block is being changed to read-only mode because system resources have been exhausted.

---

## NDM-114

(error) Invalid port to be %s the port bus.

**Description**

Ports which have the same base name as port bus and are part of vector can be added or removed from the port bus.

**What Next**

Verify that you specified the correct port for the bus port.

---

## NDM-115

(error) Port %s will create a hole in the port bus.

**Description**

Ports addition/removal should be done from the sides of the port bus. Post update there should not be any hole in the port bus.

**What Next**

Verify that you specified the correct port for the bus port.

---

## NDM-116

(error) Port can not be removed from the port bus having single port.

**Description**

There should be non empty port bus post port removal.

Feedback

**What Next**

Verify that bus port should not become empty post removal.

---

## NDM-117

(Information) The specified row/column should not less than cut row/column number '%u/%u' of base vias inherited from the via def '%s'.

**Description**

The cut row/column number isn't specified or the specified number is too small resulting that the number less than the cut row/columhn inherited from the via def. The row/column change doesn't succeed.

---

## NDM-118

(error) cannot change %s for the custom via def.

**Description**

This command cannot change row/column/XPitch/YPitch of the specified base via. Base via must be simple base via, and simple base via cannot be changed to custom base via.

**What Next**

Please provide the correct input for simple base via only.

---

## NDM-119

(error) Invalid net to be %s the net bus.

**Description**

Nets which have the same base name as net bus and are part of vector can be added or removed from the net bus.

**What Next**

Verify that you specified the correct net for the bus net.

---

## NDM-120

(error) Net %s will create a hole in the net bus.

Feedback

**Description**

Nets addition/removal should be done from the sides of the net bus. Post update there should not be any hole in the net bus.

**What Next**

Verify that you specified the correct net for the bus net.

---

## NDM-121

(error) Net can not be removed from the net bus having single net.

**Description**

There should be non empty net bus post net removal.

**What Next**

Verify that bus net should not become empty post removal.

---

## NDM-122

(information) Loading M-2016.12 library '%s'.

**Description**

This message is to inform the user that a forward version library, created from M-2016.12 binary is being loaded. The library and its design data will be saved in M-2016.12 format by default, or can be down converted with the save_lib -as <lib_name> -version L-2016.03 command

---

## NDM-123

(error) Can't create supernet bundle '%s' as another bundle exists by same name.

**Description**

Data was saved using a version that created supernet bundles and then was taken back into an older version with same schema that doesn't know about supernet bundles wherein new bundle was created with the same name as that of the supernet bundle. The data was saved in this older version and then brought back into current version.

**What Next**

Please use a different name than the name of supernet bundle while creating bundle in the older version.

Feedback

## NDM-124

(error) %s '%s' as an object of supernet bundle '%s' doesn't exist.

### Description

Supernet bundle contains supernets and/or bundles of supernets. Data was saved using a version that created supernet bundles and then was taken back into an older version with same schema that doesn't know about supernet bundles.

If the message refers to another bundle of supernets then a new bundle was created in the older version with the same name as that of a supernet bundle. If message refers to a supernet then the supernet was removed in the older version. The data was saved in this older version and then brought back into current version.

### What Next

If the message refers to another bundle of supernets then please use a different name than the name of supernet bundle while creating bundle in the older version. If message refers to a supernet then it is fine as it was removed in the older version by intent.

## NDM-125

(error)Specified row and column(%u %u) exceed via matrix size %u and %u for %s.

### Description

The Specified row and column should be non negative and less than via matrix size.

### What Next

Specify the row and column between 0 and via matrix size.

## NDM-126

(warning) Hierarchical edit-control of uneditable (read-only) block %s is violated for modification of %s object %s(%d)%s.

### Description

This message is issued when a read-only block is being modified. The hierarchical edit-control of the block doesn't allow edit but the reported object of such uneditable (read-only) block is being modified.

### What Next

Report this issue to Synopsys.

Feedback

## NDM-127

(warning) Saving uneditable (read-only) block %s because it has already been modified.

**Description**

This message is issued when a read-only block is being saved. The hierarchical edit-control of the reported block doesn't allow edit but the uneditable (read-only) block has already been modified and requires save.

**What Next**

Report this issue to Synopsys.

## NDM-128

(information) Uneditable (read-only) block %s is not being saved.

**Description**

This message is issued when a read-only block is not being saved. The hierarchical edit-control of the reported block doesn't allow edit and hence the block doesn't require save.

## NDM-129

(information) The hierarchical edit-control of committed block %s is set editable in the top-level context of %s.

**Description**

This message is issued when a physical hierarchy is being committed as a new block. The hierarchical edit-control of the reported block is set to allow edits.

## NDM-130

(information) The hierarchical edit-control of uncommitted block %s is cleared from the top-level context of %s.

**Description**

This message is issued when a physical hierarchy is being uncommitted and its block disappears. The hierarchical edit-control of the reported block is cleared from its top-level context.

Feedback

## NDM-131

(information) Master lock use for library "%s" changed to "%s" due to detection of %s.

**Description**

This message is issued when the lock mechanism is changed from the user-defined value. This change is due to the detection of another lock mechanism in use for the lib.

**What Next**

If the resulting change causes an error, close the library and notify other session that are using the lib to close the library and either let you open the library first, or change their design.master_lock to the same value you are using.

## NDM-132

(warning) Resulting %s bound has %d elements, suggested limit is %s.

**Description**

This message is issued when the given type of bound has more than the suggested number of elements. The suggested number usually indicates a good threshold for maintaining good performance during placement operations.

**What Next**

If resulting placement operations slow down significantly consider reducing the number of elements in this bound.

## NDM-133

(error) Repelling bound requires argument -dimension.

**Description**

A repelling bound must have dimensions set upon creation.

**What Next**

Create the bound with -dimension argument specified.

## NDM-134

(error) Resulting repelling bound contains only port objects.

Feedback

**Description**

A repelling bound cannot consist of only port objects as ports are fixed. As such a repelling bound containing only ports cannot respect a given repulsion dimension.

**What Next**

Try including at least one cell in the bound.

---

## NDM-135

(information) Overwriting design '%s' in library '%s' created by another process.

**Description**

This info message is to alert the user that a design created by another process is being overwritten.

---

## NDM-136

(warning) The Path '%s' is an all angle path. The the boundary coordinates of the path will be displayed similar to 45 degree path.

**Description**

This message is issued when the input path shape is an all angle path. The polygon path will be dispalyed similar to all angle paths with 45 degree points.

**What Next**

If the returned path points are not desirable, the centre point coordinates can be modified to make it a 45 degree path.

---

## NDM-137

(information) Setting blockage type to '%s' requires blocked percentage to be set as well. Blocked percentage is set to 100.

**Description**

Setting blockage type to above requires blocked percentage to be set as well. Blocked percentage is set to 100.

**What Next**

Please set blockage percentage using "set_attribute -object 'foo' -name blocked_percentage -value 'bar'"

Feedback

## NDM-138

(information) Setting blockage type to '%s' requires category name to be set as well. Category name is set to "".

### Description

Setting blockage type to above requires category name to be set as well. Category name is set to "".

### What Next

Please set category name using "set_attribute -object 'foo' -name category -value 'bar'"

## NDM-139

(error) Can't create shield overhang '%s' as another constraint group exists by same name.

### Description

Data was saved using a version that created shield overhangs and then was taken back into an older version with same schema that doesn't know about shield overhangs wherein new constraint group was created with the same name as that of the shield overhang. The data was saved in this older version and then brought back into current version.

### What Next

Please use a different name than the name of shield overhang while creating constraint group in the older version.

## NDM-140

(error) %s '%s' as an object of shield overhang '%s' doesn't exist.

### Description

Shield overhang contains objects of types nets, bundles or topology edge. Data was saved using a version that created shield overhangs and then was taken back into an older version with same schema that doesn't know about shield overhangs.

The mentioned object in the message was removed in the older version. The data was saved in this older version and then brought back into current version.

### What Next

The mentioned object was removed in the older version by intent. It is no longer possible to have that object in the shield overhang constraint group.

Feedback

## NDM-141

(error) Unable to open_block '%s' due to license check failure. The license key '%s' is required.

**Description**

Ths block is license protected. Opening it requires certain licenses to be available. The tool was not able to check out the required licenses, so the block cannot be opened.

**What Next**

Please make sure the required licenses are available and can be checked out.

## NDM-142

(error) Cannot add shape '%s' to via ladder because it is connected to a different net than other shapes in this via ladder.

**Description**

The specified shape cannot be added to the via ladder because it is connetced to a different net than other shapes in this via ladder. All the shapes in a via ladder should be connected to the same net.

**What Next**

Pass a collection of shapes to the createViaLadder api command which belong to the same net and try again.

## NDM-143

(error) Shape '%s' is a part of an existing via ladder object.

**Description**

A shape can only be a part of exactly one via ladder object.

**What Next**

Please remove this shape from the list of shapes for the current via ladder.

## NDM-144

(error) Cannot delete rule '%s' since it is being referenced by group '%s' .

Feedback

**Description**

There is some problem in remove. This could happen when object is getting referenced by some other object.

**What Next**

First remove the rule from group then remove rule.

---

## NDM-145

(warning) The pin %s is not of any of the types specified in the rule.

**Description**

There is some problem in pin(s). This could happen when type of pin(s) does not match with the type(s) specified in the rule.

**What Next**

Specify the pin matching with the type specified in rule.

---

## NDM-146

(information) Layer %s (%d) in the source technology file %s does not match the layer of the same name in the destination library.

**Description**

You get this message when you apply a new technology file which has layer number and layer name different from current technology.

**What Next**

Make sure that the differences are expected or replace with correct technology file. If differences are expected then update various layer mapping files also e.g. related with read_parasitic_tech etc. as per layers in new technology file.

---

## NDM-147

(information) Layer %s (%d) is in the destination library but not in the source technology file %s.

**Description**

You get this message when you apply a new technology file which is missing layer(s) which are present in the current technology.

Feedback

**What Next**

Make sure that the differences are expected or replace with correct technology file. If differences are expected then update various layer mapping files also e.g. related with read_parasitic_tech etc. as per layers in new technology file.

---

## NDM-148

(error) Resulting %s bound has %d cores, while the limit is %d.

**Description**

This message is issued when the given type of bound has more than the allowed number of cores. Cores are modelled as either hierarchical cells or repelling bound groups.

**What Next**

Reduce the number of cores in this bound.

---

## NDM-149

(error) Failed to open the cell-rename map file '%s'.

**Description**

The cell-rename map file could not be opened. Verify the file-permissions and retry.

---

## NDM-150

(error) Required section '%s' was not found before section '%s'.

**Description**

The name mapping for mask-shifted cells comprises three sections: MASKSHIFTLAYER, MASKSHIFTPATTERN and CELLMAP. You need to define the sections in the order above.

**What Next**

Supply the required section.

---

## NDM-151

(error) Invalid mask shift layer '%s'%s.

**Description**

This error message occurs when the specified mask shift layer is invalid, it must meet the following conditions. 1. Multiple cell mapping files should have the same mask shift layer,

Feedback

whether the number or the order of layer must be the same. 2. The layers must exist in the current library.

**What Next**

Please check and correct the mask shift layer, then try again.

---

## NDM-152

(warning) Incorrect syntax '%s' specified for cell-rename entry. The entry will be ignored.

**Description**

The syntax for the cell-rename entry is not a valid one. Refer the man-page of write_verilog/write_gds for the appropriate syntax.

---

## NDM-153

(error) Invalid mask shift pattern '%s'%s.

**Description**

This error message occurs when the specified mask shift pattern is invalid, it must meet the following conditions. 1. Multiple cell mapping files should have the same mask shift pattern. 2. The number of the mask shift combination is equal to or less than pow(m, n), where n is the number of layers specified in MASKSHIFTLAYER and m is the count of the shift values. For 2-mask layers, valid shift values are 0 and 1, so m is 2. For 3-mask layers, valid shift values are 0, 1, 3, 4 and 5, so m is 5. When the shift value is 3, 4 or 5, the shifted layer must have fixed mask 1, 2 or 3, repectively and its number_of_masks must be more than 2. 3. MASKSHIFTPATTERN must contain the mask shift combination for the cell without any mask shifting.

**What Next**

Please check and correct the mask shift pattern, then try again.

---

## NDM-154

(error) Invalid cell mapping value '%s'.

**Description**

The number of the cell mapping value is not consistent with the number of the specified mask shift pattern.

**What Next**

Please check and correct the cell mapping value, then try again.

Feedback

## NDM-155

(error) Mask shifted cell '%s' does not have its corresponding mapping in the map file.

**Description**

There is not a corresponding mapping for the mask shifted cell in the map file.

**What Next**

Please add the corresponding mapping to the map file and then try again.

## NDM-156

(error) Mask shift property mismatch on cell '%s'.

**Description**

There is mask shift property mismatch between different map files.

**What Next**

Please correct the mask shift property and then try again.

## NDM-157

(error) Fail to find the pattern '%s' for cell '%s'.

**Description**

The pattern is not specified in MASKSHIFTPATTERN section.

**What Next**

Please check and correct it, and then try again.

## NDM-158

(warning) The design '%s' with the view '%s' is not found in Library '%s'. But different views of the design exists in the library.

**Description**

The design with the specified name and view is not found in the searched library. But other views of the design exists in the Library.

**What Next**

Please specify the correct Library for the search.

Feedback

## NDM-159

(Info) Don't support alternating mask pattern.

**Description**

Don't support 'alternating' mask pattern. The valid mask pattern is one of uniform, arbitrary, alternate_rows, alternate_columns.

**What Next**

Please specify the valid mask pattern.

## NDM-160

(warning) Cannot edit %s because it is part of via_ladder.

**Description**

The specified object cannot be edited or deleted because it is member of a via ladder and via ladder protection is enabled.

**What Next**

Disable via ladder protection using app option design.via_ladder_protection or remove the object from its via ladder.

## NDM-161

(error) Attempt to write '%s' failed due to '%s'.

**Description**

Unable to write a file.

## NDM-162

(error) Cannot delete fsm '%s' since it is being referenced by rule or group '%s' .

**Description**

There is some problem in remove. This could happen when object is getting referenced by some other object.

**What Next**

First remove the rule or group then remove fsm.

Feedback

## NDM-163

(error) Invalid '%s' option usgae : It can only be used with '%s' type objects in the list.

**Description**

Command option '-original_parent' can only be used with cell type of objects in the list and not with port or module/block objects.

**What Next**

Please provide cell type of objects with '-original_parent' option otherwise don't use this option for other type of objects in the list.

## NDM-164

(error) Reading from '%s' failed due to '%s'.

**Description**

Error at reading a file

## NDM-165

(information) Waiting to acquire write access for %s. Library '%s' is being edited by process %d %s@%s.

**Description**

Unable to acquire write access to the library because write access is held by another process. The specified operation will be retried until the maximum wait time is reached.

The maximum wait time is controlled by the app_option "lib.setting.max_wait_time". The default value is 3600 seconds.

## NDM-166

(warning) Rail index %d is invalid on port %s.

**Description**

The rail index on the specified port is invalid, since it is corrupted data, the rail attribute on the port will be dropped when loading the reference library. To be specific, the input_signal_level and output_signal_level attributes on signal port will be lost, and rail attribute on power or ground port will be lost . There is a known issue in Library Preparation on 2019.12-SP2 release which leads to this error. The problem was fixed in 2020.09-SP6 release. The missing rail attributes on port could impact the result of

Feedback

downstream tools, so it is highly recommended to regenerate the reference libraries using 2020.09-SP6 or later releases.

**What Next**

Regenerate the reference libraries using 2020.09-SP6 or later releases.

---

## NDM-167

(Error) The current shell cannot open designs of type '%s'.

**Description**

Some design types may only be opened in specific applications. For example designs specific to 3dic systems (3dic, package, substrate, bridge and interposer) may only be opened by the 3dic shell and not by Fusion Compiler and IC Compiler II.

**What Next**

Open the design in the application used to create the design.

---

## NDM-168

(Warning) This type of repelling group bounds for functional safety is deprecated and replaced by safety_core_groups.

**Description**

The use of repelling bounds for specifying dual-core lockstep for functional safety is deprecated and has been replaced by safety_core_groups.

**What Next**

Use create_safety_core_rule and create_safety_core_group commands to define dual-core lockstep (DCLS) functionality.

---

## NDM-169

(warning) Cannot change net_type from %s to %s on net '%s'.

**Description**

The segment net is "*Logic0*" or "*Logic1*". These are reserved by Synopsys for the tie-low and tie-high constant nets. Their types cannot be changed.

**What Next**

No action is required.

Feedback

### NDM-170

(information) Restored app option '%s' with value '%s'.

**Description**

This info message is to alert the user that app option is restored.

### NDM-171

(error) Could not find a system startup file '%s' in '%s' .

**Description**

There is some problem in sourcing system startup files. This could happen when the system startup file is not available or permission is not proper.

**What Next**

Please check if the system startup file is available or if the file permissions are proper.

## NDMIO

### NDMIO-010

(warning) App option '%s' of design '%s' is not registered in current tool version, hence not effective. This setting will be stored internally for compatibility purpose.

**Description**

The specified app option is not registered. This could happen when an app option is removed after the app option data was saved.

**What Next**

Use get_app_options to verify that the app option is available. Also can use 'report_app_options -unknown' to report the unknown app option values.

### NDMIO-011

(warning) The value for the app option '%s' of design '%s' could not be set. This setting will be stored internally for compatibility purpose.

Feedback

**Description**

The specified app option value couldnot be set. This could happen when an app option value type is modified after the app option data was saved.

**What Next**

Use get_app_options to verify that the app option is available. Also can use 'report_app_options -unknown' to report the unknown app option values.

# NDMUI

## NDMUI-001

(warning) Boundary option is ignored when hierarchy_type being changed to normal.

**Description**

The boundary option is ignored in the command *set_cell_hierarchy_type* when the new *hierarchy_type* is *normal*.

**What Next**

Nothing is needed, boundary specified is ignored

## NDMUI-002

(error) Only one cell can be specified as input%s

**Description**

This command accepts only one object

**What Next**

Please provide the correct input.

## NDMUI-003

(error) The command '%s' can only be used for resolved hierarchical cells. Cell '%s'.

**Description**

Only hierarchical cells can be used in this command. The cell must also be resolved during link.

Feedback

**What Next**

Use hierarchical cells instead of leaf cells

---

## NDMUI-004

(error) The hierarchical cell belongs to different physical hierarchy.

**Description**

The cell used as input to command *set_cell_hierarchy_type* must belong to the top physical hierarchy.

**What Next**

Please provide the correct input.

---

## NDMUI-005

(error) Failed to create %s.

**Description**

hier_boundary or partition could not be created for the specified cell.

**What Next**

Please check the errors issued in the command.

---

## NDMUI-006

(error) Only hierarchical cells which are physical hierarchies can be used.

**Description**

Only a cell which is a physical hierarchy can be specified. The cell must also be fully resolved. Unresolved cells cannot be accepted as input to this command.

**What Next**

Please provide the correct input.

---

## NDMUI-007

(error) Only rectangles are supported.

**Description**

The option *-coordinate* must specify a rectangle for this command.

Feedback

**What Next**

Please provide the correct input.

---

## NDMUI-008

(error) Failed to create routing guide.

**Description**

The routing guide could not be created.

**What Next**

Please check any previous errors and provide correct input.

---

## NDMUI-009

(error) Design with name %s already exists in current library.

**Description**

The current library already has a design with the specified name, therefore a new design with the same name can not be created.

**What Next**

Please specify a name which does not conflict with existing design names

---

## NDMUI-010

(warning) The '%s' command cannot be used on library cell '%s' which has no logical model.

**Description**

The command is valid only for library cells with a logical/timing model from .lib/.db.

**What Next**

If there is a .db library file for this library, perform library data preparation again with this data included. If not, re-enter the command with library cells that do have a logical model.

---

## NDMUI-011

(error) cannot find via definition '%s'.

Feedback

**Description**

Specified via definition cannot be found.

**What Next**

Please provide the correct via definition name.

---

## NDMUI-012

(error) value '%d' for '%s' is invalid; must be an integer>=1.

**Description**

Specified value is invalid; The value must be an integer>=1;

**What Next**

Please provide the correct input.

---

## NDMUI-013

(error) Cannot instantiate current_design within itself.

**Description**

The *create_cell* command was used to try to create a cell in the current design that referenced the current design. This would create a cycle in the design hierarchy, which is not allowed.

**What Next**

Choose a different *reference* for the *create_cell* command.

---

## NDMUI-014

(error) Cell %s already exists.

**Description**

The *create_cell* command was used to try to create a cell, but a cell with that name already exists.

**What Next**

Choose a different *cell name* for the *create_cell* command.

Feedback

## NDMUI-015

(error) Invalid reference specified.

**Description**

The *create_cell* can only accept library cells or physical blocks as reference. Any other object type is invalid.

**What Next**

Please specify a lib cell or block as reference.

## NDMUI-016

(error) Cannot set origin of cell '%s'.

**Description**

The *create_cell* command was used to create an instance of logical hierarchy, and the origin was specified. That origin could not be set on the newly created cell.

Instances of logical hierarchy do not have locations. Only instances of physical designs or lib_cell designs can have locations.

**What Next**

Do not specify *-origin* for logical hierarchy cells. Only specify *-origin* for instances of lib_cells or physical designs.

## NDMUI-017

(error) Cannot create cell '%s'.

**Description**

The *create_cell* command was unable to create the cell.

**What Next**

Try using a different name for the cell. Or try using a different reference.

## NDMUI-018

(error) Cannot remove cell '%s'.

**Description**

The *remove_cell* command was unable to remove the specified cell.

Some hierarchical cells cannot be removed while their contents are active.

**What Next**

Try removing the contents of a hierarchical cell before removing the parent cell. Try removing a different cell.

---

## NDMUI-019

(error) Cannot remove net '%s'.

**Description**

The *remove_nets* command was unable to remove the specified net.

**What Next**

Try removing a different net.

---

## NDMUI-020

(error) Cannot remove port '%s'.

**Description**

The *remove_ports* command was unable to remove the specified port.

**What Next**

Try removing a different port.

---

## NDMUI-021

(error) Cannot remove pin '%s'.

**Description**

The *remove_pins* command was unable to remove the specified pin.

**What Next**

Try removing a different pin.

Feedback

## NDMUI-022

(error) Cannot connect driver pin '%s' to pins:

### Description

The *connect_pins* command was unable to connect the given driver pin to the given load pins. Some levels of hierarchy could not have ports created in them.

### What Next

Try removing some of the load pins from the connect_pins command to discover which part of the hierarchy could not be connected through.

## NDMUI-023

(error) Cannot size cell '%s' because the new lib_cell '%s' not compatible with current lib_cell '%s'.

### Description

The *size_cell* command was unable to change the lib_cell used for the specified cell. The new lib_cell either has a different port interface, or a different function from the current lib_cell.

The *size_cell* command cannot be used to change the functionality or the connectivity of the net list.

### What Next

Try using a different lib_cell when sizing this cell.

## NDMUI-024

(error) Cannot size cell '%s', the new reference design %s has a different port interface.

### Description

The *size_cell* command was unable to set the cell to the new reference the given design. The new reference design has a different port interface from the current design.

The *size_cell* command cannot be used to change the connectivity of the net list.

### What Next

Try using a different lib_cell when sizing this cell.

Feedback

## NDMUI-025

(error) Cannot remove buffer '%s' because it has %u pins.

**Description**

The *remove_buffers* command can only removes buffer that have 2 pins. Buffers with more or less than 2 pins cannot be removed with the *remove_buffers* command.

The *remove_buffers* command doesn't know how to restore the net connections for cells that have other than 2 pins.

**What Next**

Manually remove the cell and restore the net connections with the *remove_cell* and *connect_net* commands.

## NDMUI-026

(error) Cannot remove cell '%s' because has no %s connection.

**Description**

The *remove_buffers* command can only remove buffers that have input and output net connections. Without both an input and output, the net connection cannot be restored after the buffer is removed.

**What Next**

Manually remove the cell and restore the net connections with the *remove_cell* and *connect_net* commands.

## NDMUI-027

(error) Cannot remove buffer cell '%s'.

**Description**

The *remove_buffers* command was unable to remove the specified buffer.

Perhaps the cell is not a buffer, the cell could not be removed, or is not connected to nets.

**What Next**

Manually remove the cell and restore the net connections with the *remove_cell* and *connect_net* commands.

Feedback

## NDMUI-028

(error) Module '%s' already exists in design '%s'.

**Description**

A module with the given name already exists in this design. Or this design already references another design with this name.

**What Next**

Choose a different name for this new module.

## NDMUI-029

(error) Cannot create module '%s' because a module with that name already exists in design '%s'.

**Description**

A module with the given name already exists in this design. Or this design already references another design with this name.

**What Next**

Choose a different name for this new module.

## NDMUI-030

(error) Cannot remove top module '%s' from design '%s'.

**Description**

The *remove_modules* command attempted to remove the top module from this design. Only unused hierarchical children modules may be removed from a design.

**What Next**

Remove the entire design with the *remove_block* command.

## NDMUI-031

(error) Cannot remove module '%s' used in design '%s'.

**Description**

The *remove_modules* command attempted to remove a module that is currently used as a hierarchical cell instance in the design.

Feedback

The module cannot be removed before all instances of that module are removed.

**What Next**

Locate all cells that reference the module by filtering the result of the *get_cells* command with the *ref_module_name* attribute. Then remove those cells with the *remove_cell* command.

---

## NDMUI-032

(error) Cannot change view of cell '%s' because it is not an instance of a lib_cell or block.

**Description**

The *change_view* command attempted to change the referenced view of a logical hierarchy cell. Views can only be changed on cells that instantiate physical designs, or lib_cells.

**What Next**

Choose a leaf cell, or a cell that instantiates a physical design.

---

## NDMUI-033

(error) Min (%d) can not be greater than max (%d).

**Description**

The *min_routing_layer* specified can not be greater than the *max_routing_layer* specified.

**What Next**

Provide the correct inputs and rerun the command.

---

## NDMUI-034

(info) Update of ignored layers for design %s %s.

**Description**

Informational message showing whether the update succeeded or failed.

**What Next**

This is informational message only. To turn it off, do not use the verbose option to the command

Feedback

## NDMUI-035

(error) Data type '%s' may be included only with format '%s'.

**Description**

This data type cannot be used with the currently specified format. It is only supported format indicated in the error message.

**What Next**

To continue including this data type, specify the supported format with the *-format* option. Or to continue using this format, remove this data type from the *-include* option, or explicitly exclude this data type using the *-exclude* option.

## NDMUI-036

(error) The specified object '%s' is in a different physical design.

**Description**

The input to this command must be a object in the current physical design. The specified object belongs to a different physical design.

**What Next**

Use the command 'current_design' to switch to the design which actually owns the object and rerun the command with proper input.

## NDMUI-037

(warning) voltage_area_shape '%s' is already at the top of the stack.

**Description**

The specified voltage_area_shape is already at the top of the position stack. set_voltage_area_shape will be a no-op.

## NDMUI-038

(warning) voltage_area_shape '%s' is already at the bottom of the stack.

**Description**

The specified voltage_area_shape is already at the bottom of the position stack. set_voltage_area_shape will be a no-op.

Feedback

## NDMUI-039

(warning) voltage_area_shape '%s' is already directly %s voltage_area_shape '%s'.

**Description**

The voltage_area_shape is already directly above or below the specified shape. set_voltage_area_shape will be a no-op.

## NDMUI-040

(error) A voltage_area_shape cannot be placed below the default voltage_area_shape.

**Description**

The first shape of the default voltage_area corresponds to the core area and must remain at the bottom of the position stack.

## NDMUI-041

(error) voltage_area_shape cannot be moved below or above itself.

**Description**

It is an error to move a voltage_area_shape relative to itself.

## NDMUI-042

(error) voltage_area_shape '%s' belong to a different design '%s'.

**Description**

Each each has a separate voltage_area_shape stack. It is an error to move a voltage_area_shape from one design to another.

## NDMUI-043

(error) Unable to apply connect_pg_net to '%s' net '%s'. Only power and ground nets are allowed.

**Description**

Only power and ground nets can be specified in this command.

**What Next**

Specify a power or ground net.

Feedback

## NDMUI-044

(error) Default voltage_area_shape cannot be moved.

**Description**

The first shape of the default voltage_area corresponds to the core area and must remain at the bottom of the position stack.

## NDMUI-045

(information) Command %s will be obsoleted, please use %s instead.

**Description**

This message informs you that the command specified in the information message will be obsolete. You are advised to use the specified replacement command instead.

**What Next**

Use the replacement command instead.

## NDMUI-046

(error) Option '%s' must be used when using options '%s' and '%s' together in this command.

**Description**

The option '-physical_context' must be used when 'get_nets' is invoked with '-hierarchical' and '-of_objects'. Further, the objects specified as input to '-of_objects', must be a net. No other use of '-hierarchical' and '-of_objects', is permitted for 'get_nets'.

**What Next**

Please provide the correct inputs.

## NDMUI-047

(error) May specify no more than one of the -design, -library, and -global arguments.

**Description**

This command applies to the view switch list of either a design, library, or the global session. Therefore only one of the -design, -library, or -global arguments may be specified.

Feedback

**What Next**

Change the arguments to include no more than one of -design, -library, or -global. Note that removing them all is equivalent to using the -global switch.

---

## NDMUI-048

(error) Duplicate view '%s' specified in view switch list.

**Description**

The view switch list argument of this command must be a list of unique view names.

**What Next**

Remove the duplicate view names from the view switch list argument.

---

## NDMUI-049

(error) View of the current design and view of the design being uncommitted are different.

**Description**

The view of the current design and the view of the design being uncommitted do not match. The design associated with the physical hierarchical cell being uncommitted must be of the same view as the current design.

**What Next**

Please provide the correct inputs.

---

## NDMUI-050

(error) Value '%s' for routing corridor shape is invalid. It must be in rectangle, rectilinear or path format.

**Description**

The value of points must specify a legal shape of routing corridor. The legal shape must be a rectangle, or rectilinear or path.

**What Next**

Please provide the correct input representing legal routing corridor shapes.

---

## NDMUI-051

(error) Value '%s' for routing corridor min_layer (max_layer) is invalid.

Feedback

**Description**

Min layer and max layer must be legal routing layers. For specified min routing layer, it must be lower than max routing layer. For specified max routing layer, it must be higher than min routing layer.

**What Next**

Please provide the correct inputs.

---

## NDMUI-052

(error) Unable to create routing corridor '%s'. A corridor of that name already exists.

**Description**

The *create_routing_corridor* command was used to try to create a routing corridor, but a routing corridor with that name already exists.

**What Next**

Choose a different *routing corridor name* for the *create_routing_corridor* command.

---

## NDMUI-053

(warning) Object of name '%s' already exists in the routing %s '%s'. It will be ignored.

**Description**

The specified net has already been associated with this routing-corridor or routing-blockage object.

**What Next**

There is no need to specify a net already associated with this routing-corridor or routing-blockage object.

---

## NDMUI-054

(warning) Object of name '%s' does not exist in the routing %s '%s'. It will be ignored.

**Description**

The specified net has not been associated with this routing-corridor or routing-blockage object.

**What Next**

Please provide the correct input.

Feedback

## NDMUI-055

(error) Failed to add object '%s' to the given bundle

**Description**

The specified object could not be added to the given bundle.

**What Next**

Please provide the correct inputs.

## NDMUI-056

(error) Failed to remove object '%s' from the given bundle

**Description**

The specified object could not be removed from the given bundle.

**What Next**

Please provide the correct inputs.

## NDMUI-057

(error) Failed to remove bundle '%s' from the design

**Description**

The specified bundle could not be removed.

**What Next**

Please provide the correct inputs.

## NDMUI-058

(error) A bundle with the name '%s' already exists

**Description**

The design already contains a bundle with the name specified, for creating a new bundle.

**What Next**

Please provide the correct inputs.

Feedback

## NDMUI-059

(error) Only nets, bundles or supernets can be added to bundles

**Description**

As of now, only nets, bundles or supernets can be added to bundle objects. Any other object is not supported.

**What Next**

Please provide the correct inputs.

## NDMUI-060

(error) Only objects in the current design can be added to bundles

**Description**

Only those objects which are physically present in the design, can be added to a bundle.

**What Next**

Please provide the correct inputs.

## NDMUI-061

(error) %s be specified

**Description**

The number of bundles specified is invalid.

**What Next**

Please provide the correct inputs.

## NDMUI-062

(error) Cell '%s' cannot be committed.

**Description**

The cell is either a leaf cell, an instance of another block, or an unbound instance. In these cases, the cell cannot be committed to form a new block.

Feedback

**What Next**

Check the cell to verify that it is an instance of logic hierarchy within the same block, and not a reference to another block.

---

## NDMUI-063

(warning) %s '%s' is not physical.

**Description**

The indicated object is not physical. Only physical objects may be added to a routing corridor. This object is skipped and not added.

**What Next**

Check that the correct physical objects are added.

---

## NDMUI-064

(information) Removed design '%s' from memory and disk.

**Description**

The remove_blocks command removes a design from memory, and from disk as well if the design has an on-disk copy in a directory-format library. Please use with caution.

---

## NDMUI-065

(error) The boundary is not valid.

**Description**

The specified boundary is not rectilinear or its area is zero. The boundary must be a rectilinear polygon or rectangle. In addition, its area must be greater than zero.

**What Next**

Correct the boundary.

---

## NDMUI-066

(error) %sNet '%s' has already been added to routing corridor '%s'.

**Description**

The specified net or super net has already been added to another routing corridor. Nets or super nets cannot be added to more than one routing corridor.

Feedback

**What Next**

Use the remove_from_routing_corridor command to remove the net or super net from its current routing corridor, and then call this command again.

---

## NDMUI-067

(error) Cannot remove object '%s' (type %s).

**Description**

The *remove_objects* command was unable to remove the specified object.

**What Next**

Modify the object's configuration so that it may be removed.

---

## NDMUI-068

(warning) '-all' option is ignored, as the reference of the specified cell has no other instances.

**Description**

The "-all" option in this command makes sense only when the operation is meant to be performed for "all" other instances of the reference, as the given cell. In this case, the given cell is the only instance of the reference, hence the option does not have any meaning.

**What Next**

Next time use the command without the "-all" option.

---

## NDMUI-069

(error) The specified polygon or path as corridor shape is not rectilinear.

**Description**

The shape specified must be a rectilinear polygon or path. In addition, its area must be greater than zero.

**What Next**

Correct the points.

Feedback

## NDMUI-070

(error) All the specified cells do not have the same reference.

**Description**

All the cells specified as input to this command, must have the same reference. Cells with different references can not be processed in one run of the command.

**What Next**

Only specify the cells with same reference.

## NDMUI-071

(Warning) Specified cell '%s' could not be uniquified.

**Description**

This warning is displayed during "uniquify" and "uniquify_block" commands, when some error happens while uniquifying mentioned cell.

## NDMUI-072

(Warning) Skipping cell '%s' because it does not have reference object of type "%s".

**Description**

Cell specified does not have reference of required type. For uniquify command, reference should be of type "logical module". For uniquify_block command, reference should of type "block". For both the commands, cell of a library cell will be invalid input.

**What Next**

Specify cell with reference of required type for the respective command.

## NDMUI-073

(error) All the specified cells are not bound to the same view.

**Description**

All the cells specified as input to this command, must be bound to the same view of the reference design. Cells bound to different views of the reference can not be processed in one run of the command.

Feedback

**What Next**

Only specify the cells with bound to the same view of the reference.

---

## NDMUI-074

(error) Module with name '%s' not found in the current design.

**Description**

A module with the specified name must already exist in the current design, for the command to work properly.

**What Next**

Specify a module which already exists in the design.

---

## NDMUI-075

(error) Port interface of the new %s is not same as that of the existing %s

**Description**

The reference or view of cells can be changed only with a reference or view with a identical port interface.

**What Next**

Specify a reference or view with a port interface identical to the current one.

---

## NDMUI-076

(error) The type of current reference ('%s') and new reference ('%s') do not match.

**Description**

The reference of cells can be changed only with a reference of the same type. A cell whose current reference is a module, must have a module as new reference. A cell whose current reference is a design, must have a design as new reference.

**What Next**

Specify a reference of the same type as the current reference of the cells

---

## NDMUI-077

(warning) '%s' is not physical net.

Feedback

### Description

The indicated net is not physical. Only physical nets are supported. This net is skipped and will not be added to or removed from the corridor.

### What Next

Check that the correct physical nets are added to or removed from the routing corridor.

---

## NDMUI-078

(error) The specified cell '%s' is multiply instantiated.

### Description

The input to this command must either be a uniquely instantiated hierarchical cell or the "-all" option must be used. For multiply instantiated cells, either use the option "-all" to commit all instances of the same master, or use the command "uniquify" to create a unique master.

### What Next

Please provide the correct input.

---

## NDMUI-079

(error) Design '%s' is not in the reference library list of library '%s'.

### Description

The referenced design must belong to the current library containing the current design, or a reference library of the current library.

### What Next

Either choose a different library for the reference design, or add the desired library to the current design's library reference library list.

To see what library a design is in, use the *get_attribute* command:

```
get_attribute [get_designs MID] lib
  RefLibB
```

Or use the *get_libs* command:

```
get_libs -of [get_designs MID]
  {RefLibB}
```

Feedback

To see what libraries are in the current library's ref_lib list, use the *get_attribute* command:

```
get_attribute [current_lib] ref_libs
  RefLibA RefLibC leafCellLib
```

To add a library to the current library's ref_lib list, use the *set_ref_libs* command:

```
set_ref_libs
  RefLibA RefLibC leafCellLib
  set_ref_libs -ref_libs {RefLibA RefLibB RefLibC leafCellLib}
  RefLibA RefLibB RefLibC leafCellLib
```

Then re-run the command.

---

## NDMUI-080

(error) '%s' cannot be used in user specified names for the requested object.

**Description**

The specified character is a reserved for internally generated names and can not be used in user specified names for the requested object.

**What Next**

Please provide the correct inputs.

---

## NDMUI-081

(error) No objects found to add to the bundle.

**Description**

No valid objects could be found in the specified objects to add to the bundle.

**What Next**

Please provide the correct inputs.

---

## NDMUI-082

(error) The object before which new objects are to be added, does not exist in the bundle.

**Description**

The object specified as input to option '-beforeObject' does not exist in the specified bundle. Therefore new objects cannot be added to the bundle.

Feedback

**What Next**

Please provide the correct inputs.

---

## NDMUI-083

(error) Only normal hierarchy type can be used for uncommitting Multiple-Instantiated Modules (MIMs).

**Description**

Only normal hierarchy type can be used for uncommitting Multiple-Instantiated Modules (MIMs).

**What Next**

Please specify hierarchy type normal.

---

## NDMUI-084

(error) The library %s is read only.

**Description**

*commit_cell* command needs to modify the library %s. If the library is read only, *commit_cell* command cannot be completed.

**What Next**

Please change the write permission of the library.

---

## NDMUI-085

(information) The design does not have any cells referencing block '%s'.

**Description**

All cells referencing the given block were specified as input to this command. But the design does not contain any cells that reference the given block. So no cells were specified.

**What Next**

Check that the correct block was specified.

Check that the current block is the expected current block.

Feedback

## NDMUI-086

(error) Reference block does not exist.

### Description

The specified reference does not exist. The command failed because a cell could not be created without a valid reference block.

### What Next

Please provide the correct inputs.

## NDMUI-087

(error) Cells must reference a block or lib cell.

### Description

All the cells given are logic-only module references. The *set_reference* command failed because it requires cells that are references to either lib cells or another block of physical hierarchy.

### What Next

Choose only physical cells for the *set_reference* command. To convert a logical cell into a physical cell, see the *commit_block* command.

### See Also

- commit_block
- set_reference

## NDMUI-088

(error) Block '%s' port interface is different from '%s'.

### Description

The port interface on the new block is different from the pin interface on the specified cells and the *-pin_rebind none* option was given which requires that all mappings be made without changes to the cell pin interface.

The *set_reference* command cannot set the reference without changing the cell's pin interface, so the *set_reference* command failed.

Feedback

### What Next

Run the *set_reference* command with the *-pin_verbose* option for more information on what pin changes the *set_reference* command would make with this block and this cell. Use the *-pin_rebind test* option to get the pin rebind mapping information without making any changes to the cells.

Verify that the new block is the correct block to be used.

Verify that the correct cells to be changed were specified.

Check the new block's port interface to verify that required ports are present on the block.

```
prompt> current_block newBlock
  {myLib:newBlock.design}
  prompt> get_ports
  {i1 i2 i3 i4 i5 i6 i7 ...}
```

### See Also

- current_block
- get_blocks
- get_ports
- set_reference

---

## NDMUI-089

(warning) Skipping cell '%s' to avoid dropping cell pin net connection.

### Description

The *set_reference* command is skipping that cell because changing the cell's reference would drop a pin on the cell that is connected to a net.

The *set_reference* command is using *-pin_rebind safe* which will not change the reference of the cell if that requires dropping net connections for that cell.

### What Next

Run the *set_reference* command with the *-pin_verbose* option for more information on what pin changes the *set_reference* command would make with this block and this cell. Use the *-pin_rebind test* option to get the pin rebind mapping information without making any changes to the cells.

Verify that the new block is the correct block to be used.

Verify that the correct cells to be changed were specified.

Feedback

Check the new block's port interface to verify that required ports are present on the block.

```
prompt> current_block newBlock
  {myLib:newBlock.design}
  prompt> get_ports
  {i1 i2 i3 i4 i5 i6 i7 ...}
```

Use the *set_reference* option *-pin_rebind force* to force *set_reference* to disconnect nets from pins that will be removed from the cell.

**See Also**

- current_block
- get_blocks
- get_ports
- set_reference

## NDMUI-090

(warning) Bound created without any cells or ports.

**Description**

Only cells and ports may be assigned to the bound.

**What Next**

Use the *add_to_bound* command to assign cells and ports to the bound.

## NDMUI-091

(error) No cells or ports are specified.

**Description**

Only cells and ports may be assigned to the bound.

**What Next**

Specify cells and ports in the *cell_and_port_list* option.

## NDMUI-092

(warning) Via mapping from '%s' to '%s' already exists. Duplicated definition is ignored.

Feedback

**Description**

A via mapping with the given new 'from' and 'to' via pattern already exists in the via mapping table, therefore a new mapping with the same contents can not be created. The new mapping must not already be used in the design.

**What Next**

Specified a new via mapping.

---

## NDMUI-093

(error) The number of contacts '%s' in the '%s' direction of via mapping is invalid.

**Description**

The number of contact must be an integer>=1.

**What Next**

Specified the correct number.

---

## NDMUI-094

(error) The -all option cannot be used with -from or -to options.

**Description**

-all option cannot be used with -from ot -to options.

**What Next**

Specified the correct option.

---

## NDMUI-095

(error) Via pattern '%s' not found in via mapping table.

**Description**

Specified via definition name cannot be found in via mapping table.

**What Next**

Specified the valid via definition name.

Feedback

## NDMUI-096

(warning) Unable to determine primary power because multiple power or ground nets exist in the design and UPF has not been committed. Auto PG connection is skipped.

### Description

This message is issued when running connect_pg_net automatic mode on a design with multiple power or ground nets, and the design has no UPF committed. IC Compiler II supports auto PG connection for designs with only one pair power and ground nets.

If no UPF is loaded and committed and the pair of power and ground nets do not exist in design, tool uses app options mv.pg.default_power_supply_net_name and mv.pg.default_ground_supply_net_name to determine the power and ground nets name and connects all PG pins. If the pair power and ground nets exist in the design, then tool uses the existing power and ground nets and connects all PG pins to them.

Unexpected power and ground nets may be coming from analog blocks or special hard macros. To see what power & ground nets are being used in the design use the get_supply_nets command.

For designs with multiple power and ground nets but no user UPF committed, auto mode connect_pg_net does not work.

### What Next

To get PG nets, 'get_nets -hier -filter "net_type==power||net_type==ground"' can be used. There are two possible methods to resolve this issue:

1. Add user power intent by loading UPF using load_upf command followed by commit_upf. With UPF loaded, the PG connections will be made automatically.

-or-

2. Perform manual PG net connections with connect_pg_nets command, specifying the supply net with the -net option and providing a complete list of pins and port it needs to connect to.

## NDMUI-097

(information) Disconnecting net '%s' from pin '%s'.

### Description

The *set_reference* command is removing the pin from the net because that port does not exist on the new block so the pin will be dropped from the cell.

The *set_reference* command is using *-pin_rebind force* which will drop net connections as needed when removing pins from cells.

Feedback

### What Next

Run the *set_reference* command with the *-pin_verbose* option for more information on what pin changes the *set_reference* command would make with this block and this cell. Use the *-pin_rebind test* option to get the pin rebind mapping information without making any changes to the cells.

Verify that the new block is the correct block to be used.

Verify that the correct cells to be changed were specified.

Check the new block's port interface to verify that required ports are present on the block.

```
prompt> current_block newBlock
  {myLib:newBlock.design}
  prompt> get_ports
  {i1 i2 i3 i4 i5 i6 i7 ...}
```

Use the *set_reference* option *-pin_rebind safe* to keep *set_reference* from changing a cell's reference if that means disconnecting nets from pins that will be removed from the cell.

To restore the previous cell references, cell pins and net connections, use the *undo* command.

### See Also

- current_block
- get_blocks
- get_ports
- set_reference
- undo

---

## NDMUI-098

(error) '%s' layer of via mapping is invalid.

### Description

The specified lower, upper, or cut layer in via mapping must be consistent.

### What Next

Specified the correct contact to map.

Feedback

## NDMUI-099

(information) Disconnecting net '%s' from pin '%s' for cell '%s' and all instances of module '%s' from block '%s'.

### Description

The *set_reference* command is removing the pin from the net because that port does not exist on the new block so the pin will be dropped from the cell.

The *set_reference* command is using *-pin_rebind force* which will drop net connections as needed when removing pins from cells.

If the cell is a multiply instantiated module (MIM) or block (MIB), the net will be disconnected from all instances of the cell in the design hierarchy.

### What Next

Run the *set_reference* command with the *-pin_verbose* option for more information on what pin changes the *set_reference* command would make with this block and this cell. Use the *-pin_rebind test* option to get the pin rebind mapping information without making any changes to the cells.

Verify that the new block is the correct block to be used.

Verify that the correct cells to be changed were specified.

Check the new block's port interface to verify that required ports are present on the block.

```
prompt> current_block newBlock
  {myLib:newBlock.design}
  prompt> get_ports
  {i1 i2 i3 i4 i5 i6 i7 ...}
```

Use the *set_reference* option *-pin_rebind safe* to keep *set_reference* from changing a cell's reference if that means disconnecting nets from pins that will be removed from the cell.

To restore the previous cell references, cell pins and net connections, use the *undo* command.

## NDMUI-100

(error) Invalid coordinates '%s' in list.

**Description**

A coordinate list argument is expected to contain a list of coordinates. The specified value is not a valid coordinate pair such as { x y }.

**What Next**

Fix the offending list element.

---

## NDMUI-101

(error) Invalid coordinate list '%s'; %s.

**Description**

A coordinate list argument is expected to contain a list of coordinates. The specified list is not a valid coordinate list for the specified reason.

**What Next**

Fix the offending list.

---

## NDMUI-102

(error) Regions in routing corridor '%s' are not connected.

**Description**

The regions in the routing corridor are not connected. A legal routing corridor must contain connected regions.

**What Next**

Fix the routing corridor with connected corridor regions.

---

## NDMUI-103

(error) Routing corridor '%s' does not cover %s '%s'.

Feedback

**Description**

The routing corridor does not cover the port or pin. A legal routing corridor must cover all ports and pins its member nets connected.

**What Next**

Fix the routing corridor to cover all ports and pins.

---

## NDMUI-104

(error) The reference of the specified cell is a internal module.

**Description**

The cell specified as input to the command create_blackbox, must have an unresolved design as its reference.

**What Next**

Please provide correct input.

---

## NDMUI-105

(error) The reference of the specified cell is already resolved.

**Description**

The cell specified as input to the command create_blackbox, must have an unresolved design as its reference.

**What Next**

Please provide correct input.

---

## NDMUI-106

(error) The library '%s' specified to create the new design in, is not a reference library of the current design

**Description**

The library specified as input to create the blackbox design in, must be a reference library for the library containing the current design. Otherwise, the design can not be linked properly.

**What Next**

Please provide correct input.

## NDMUI-107

(error) The library '%s' specified to create the new design in, is invalid.

**Description**

The library specified as input to create the blackbox design in, must be a design cell library and must be opened in edit mode. The specified library does not meet this one or more of these criteria and can not be used.

**What Next**

Please provide correct input.

## NDMUI-108

(error) Invalid orientation '%s' in list.

**Description**

The specified orientation is invalid. The orientation must be one of these values: R0, R90, R180, R270, MX, MXR90, MY, MYR90

**What Next**

Fix the offending orientation.

## NDMUI-109

(error) Only module hierarchy type can be used for uncommitting Multiple-Instantiated Blocks (MIBs).

**Description**

Only module hierarchy type can be used for uncommitting Multiple-Instantiated Blocks (MIBs).

**What Next**

Please specify hierarchy type module for MIB blocks.

## NDMUI-110

(error) The required option %s is not specified for the given type of routing guide.

**Description**

This option is a required option for the type of routing guide.

Feedback

**What Next**

Check the command man page and specify the required option.

---

## NDMUI-111

(error) Value '%s' for option '%s' does not specify a rectangle. Rectangle syntax is { { llx lly } { urx ury } }.

**Description**

The reported option must specify a rectangle. A rectangle is defined by its lower-left and upper-right vectices. The syntax is: { { llx lly } { urx ury } }

**What Next**

Provide the correct value to the reported option.

---

## NDMUI-112

(error) Value '%s' for option '%s' does not specify a polygon. Polygon syntax is { x1 y1 } { x2 y2 } ... { xn yn } }.

**Description**

The reported option must specify a polygon. A polygon is defined by a list of 3 or more points. The syntax is: { { x1 y1 } { x2 y2 } ... { xn yn } } in which n is 3 or more.

**What Next**

Provide the correct value to the reported option.

---

## NDMUI-113

(error) Value '%s' for option '-path' does not specify a 2-point path. Path syntax is { { x1 y1 } { x2 y2 } }.

**Description**

The -path option must specify a 2-point path when used with the '-shape_type path' option. A 2-point path is defined by a list of exactly two points. The syntax is: { { x1 y1 } { x2 y2 } }

**What Next**

Provide the correct value to the -path option.

Feedback

## NDMUI-114

(error) Must specify option '%s' when a variable endcap is specified for option '%s'.

**Description**

When specifying a variable endcap on the path, the extension value must be specified. The extension is a non-negative distance value. The start extension indicates how far passed the first path coordinate the endcap extends. The end extension indicates how far passed the last path coordinate the endcap extends.

**What Next**

Provide the extension value.

## NDMUI-115

(error) Cannot specify option '%s' when a %s endcap is specified for option '%s'.

**Description**

When specifying a flush, full_width, half_width, or octagon endcap on the path, the extension value cannot be specified. The extension value is automatically derived for these endcap styles.

**What Next**

Remove the extension option.

## NDMUI-116

(error) Cannot specify option '%s' when a custom via definition is specified for option '%s'.

**Description**

When creating an instance of a custom via definition, the cut array size and pitch may not be specified. Custom via geometries are predefined and may not be modified.

The cut array pitch and size may be specified for instances of simple via definitions.

**What Next**

Remove the indicated option or specify a simple via definition.

## NDMUI-117

(warning) Ignoring option '%s'; the via contains a single cut.

Feedback

**Description**

Single cut vias do not have pitch attributes. If a pitch is specified, it will be ignored.

**What Next**

Remove the indicated option.

---

## NDMUI-118

(error) %s '%s' cannot be added to net '%s'; it currently belongs to net '%s'. No objects were added to the net.

**Description**

The specified shape or via is owned already by another net as indicated in the message. Each shape or via may belong to at most one net.

The command exited without adding any shapes or vias to the net.

**What Next**

Use the remove_from_net command to remove the shape or via from its owner net, and then call this command again.

---

## NDMUI-119

(error) %s '%s' cannot be added to net '%s'; it belongs to terminal '%s' of port '%s'. No objects were added to the net.

**Description**

The specified shape or via is owned by a terminal as indicated in the message. Each shape or via may belong to a net or terminal, but not both.

The command exited without adding any shapes or vias to the net.

**What Next**

Remove the shape from the terminal using *remove_terminals*, then call this command again.

---

## NDMUI-120

(error) Space value cannot be zero.

**Description**

You receive this error because the specified space value is zero.

Feedback

### What Next

Please use the non-zero space value.

### See Also

- create_track
- get_tracks
- remove_tracks
- report_tracks

---

## NDMUI-121

(error) Couldn't get the pitch value of the layer '%s' from the library.

### Description

You receive this error because the specified layer's pitch value cannot be fetched from the edit library.

### What Next

Please check the technology information of the edit library.

### See Also

- create_track
- get_tracks
- remove_tracks
- report_tracks

---

## NDMUI-122

(warning) Coordinate value is not specified. Using coordinate that is half of the space distance inside of the die area.

### Description

You receive this warning because the value of the start of the first track is not specified. If the track's boundary box is given, the tool is able to derive the start coordinate from the boundary box. However, in this case, the boundary box is not specified either. When the coordinate value is not specified and boundary ix is also not specified, the tool attempts to use half of the space from the left(bottom) coordinate of the die area.

### What Next

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

### See Also

- create_track
- get_tracks
- remove_tracks
- report_tracks

---

## NDMUI-123

(error) specified count value is not consistent with the specified bounding box, based on its space value.

### Description

You receive this error message because the number of tracks to be created based on the given bounding box is not the same as the number of tracks to be created based on given count.

### What Next

Specify only one of bounding box and count, but not both. If both are specified, count must be consistent with number of tracks the given bounding box can have.

### See Also

- create_track
- get_tracks
- remove_tracks
- report_tracks

---

## NDMUI-124

(warning) Space is not specified. Using pitch.

Feedback

### Description

You receive this warning because the space between the tracks is not provided. The tool uses the default value, which is the pitch value provided by the library.

### What Next

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

### See Also

- create_track
- remove_tracks
- report_tracks

---

## NDMUI-125

(warning) Direction is not specified. Using the layer preferred direction.

### Description

You receive this warning because the direction is not specified in the command invoked, so the tool uses the layer preferred direction.

### What Next

No action is required on your part unless you want to specify a direction. You can examine the design to see the layer preferred direction and the man page for the command that caused the warning for detailed information on specifying a direction value.

### See Also

- create_track
- remove_tracks
- report_tracks

---

## NDMUI-126

(warning) Coordinate value is not specified. Defaulting to the left or bottom coordinate of the track's bounding box.

Feedback

### Description

You receive this warning because the value of the start of the first track is not specified. When the coordinate value is not specified, the tool attempts to use the left(bottom) coordinate of the track's bounding box.

### What Next

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

### See Also

- create_track
- remove_tracks
- report_tracks

---

## NDMUI-127

(error) specified start value is not consistent with the specified bounding box.

### Description

You receive this error message because the given start value does not match the given track bounding box. For horizontal track, the start value must match the Y coordinate of the lower left corner of given bounding box. For vertical track, the start value must match the X coordinate of the lower left corner of given bounding box.

### What Next

Specify only one of bounding box and start, but not both. If both are specified, correct the start or bounding box values.

### See Also

- create_track
- remove_tracks
- report_tracks

---

## NDMUI-128

(error) Could not find pin '%s' on reference '%s'.

Feedback

### Description

The *set_reference* command option *-pin_map* could not find a pin on the source reference or a port on the destination reference with the given name.

### What Next

Verify that the name was entered correctly and that the source and destination pin names were not accidentally swapped.

Verify that the new block is the correct block to be used.

Verify that the correct cells to be changed were specified.

Check that the source reference has a pin with the given name.

```
prompt> get_pins u15/u23/selectPin4
  {u15/u23/selectPin4}
```

Check that the destination reference has a port with the given name.

```
prompt> current_block newBlock
  {myLib:newBlock.design}
  prompt> get_ports driverPin1
  {driverPin1}
```

Run the *set_reference* command with the options *-pin_verbose -pin_rebind test* to see the pin mappings on the source cell and destination block reference.

```
prompt> set_reference -block newBlock u15/u23 \\
    -pin_verbose -pin_rebind test
  ...
  Pin mapping from 'myLib:oldBlock.design' to 'myLib:newBlock.design':
    Pin    1 selectPin4 stays at pin    1
  ...
```

### See Also

- current_block
- get_blocks
- get_pins
- get_ports
- set_reference

---

## NDMUI-129

(warning) Cannot remove %s '%s' because it is not in the current design.

Feedback

**Description**

The specified object cannot be removed because it belongs to another design or lib_cell. This command may only remove objects from the current design.

**What Next**

Set current_design to the design that contains the object, and then remove it.

---

## NDMUI-130

(warning) %s '%s' cannot be removed because it does not belong to net '%s'; %s.

**Description**

The specified object is not owned by the net, and so it cannot be removed from the net. Each shape or via may be removed only from its owner net or terminal.

The command successfully removed the rest of the objects from the net.

**What Next**

Check the option values and verify that you are removing the correct shapes from the correct owner.

---

## NDMUI-131

(error) Terminal cannot be created with %s '%s'; the %s currently belongs to terminal '%s'.

**Description**

The terminal cannot be created with the specified shape or via, because the object is already owned by another terminal. Each shape or via may belong to at most one terminal.

**What Next**

Remove the shape or via from its current terminal using the remove_terminals command, or specify another shape or via that is not already owned by a terminal.

---

## NDMUI-132

(error) Terminal cannot be created on port '%s'; the %s '%s' belongs to net '%s'.

**Description**

The terminal cannot be created with the specified shape or via, because the shape or via is owned by a net. Each shape or via may belong to a net or terminal, but not both.

Feedback

**What Next**

Remove the shape from the net using *remove_from_net*, then call this command again.

---

## NDMUI-133

(error) Terminal cannot be created with %s '%s'; terminals cannot be created with %s shapes.

**Description**

A terminal cannot be created with a text shape. They may only be created with rects, polygons, paths, and vias.

**What Next**

Do not specify a text. Specify only rects, polygons, paths, or vias.

---

## NDMUI-134

(error) %s '%s' cannot be added to net '%s'; nets cannot contain any %s shapes. No objects were added to the net.

**Description**

A net cannot own text shapes. It may only own rects, polygons, paths, and vias.

**What Next**

Do not specify any text. Specify only rects, polygons, paths, or vias.

---

## NDMUI-135

(error) %s value '%s' cannot be used with other values in list.

**Description**

The specified value cannot be used with other values in the list. This value is mutually exclusive with all other possible values.

**What Next**

Specify only this value in the list.

---

## NDMUI-136

(warning) Count value is not specified. Covering the bounding box of track, depending on its space value.

Feedback

### Description

You receive this warning because the number of tracks to be created is not specified. When the count value is not specified, the tool attempts to calculate the count with the width of track's bounding box divided by track's space value.

### What Next

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

### See Also

- create_track
- get_tracks
- remove_tracks
- report_tracks

---

## NDMUI-137

(error) power_domains '%s' and '%s' do not share equivalent primary power and ground supply_net.

### Description

When associating multiple power_domains to a voltage_area, the primary supplies of the power_domains must be electrically equivalent, meaning that their supply_nets must either be the same, or connected via supply_ports.

---

## NDMUI-138

(error) Cell '%s' is already associated with voltage_area '%s'.

### Description

Each cell must belong to a single voltage_area. It is an error if the cell to be added already explicitly or implicitly associated with another voltage_area.

### What Next

Verify the cell to be added does not belong to a voltage_area with the get_voltage_areas command

Feedback

## NDMUI-139

(error) voltage_area '%s' already exists in this design.

**Description**

Each voltage_area must have a unique name. It is an error if there is an existing voltage_area of the specified name.

**What Next**

Please use a different name for this voltage_area.

## NDMUI-140

(error) Please specify a name for this voltage_area with the -name option.

**Description**

A unique name must be provided when creating a voltage_area with multiple power_domains, or with a single power_domain that already has a primary voltage_area.

**What Next**

Please provide a name for this voltage_area.

## NDMUI-141

(warning) Logical hierarchical cell '%s' is not added to %s.

**Description**

Only physical cells can be added to a voltage_area/voltage_area shape. When adding a hierarchical cell, only the physical cells residing under it are added. The hierarchical cell itself is not added. In the case when the hierarchical cell is purely logical and contains no physical cells, no cells will be added to the voltage_area/voltage_area_shape.

**What Next**

Verify the cell is physical by checking the "is_physical" attribute or that the cell contains at least one physical cell with the get_cells -of <hier_cell> -filter "is_physical == true" option.

## NDMUI-142

(warning) power_domain '%s' is already associated with voltage_area '%s'.

Feedback

**Description**

The specified power_domain is already associated with the voltage_area. Adding it to the voltage_area again will be a no op.

**What Next**

Use the get_voltage_areas -of <power_domain> command to see if this power_domain and voltage_area is already associated.

---

## NDMUI-143

(error) Option '-use_power_domain_cells' is not allowed if the voltage_area already contains explicitly assigned cells.

**Description**

It is illegal to specify the '-use_power_domain_cells' option when creating or updating a voltage_area, if the voltage_area or any of its voltage_area_shape already contain explicitly assigned cells.

---

## NDMUI-144

(error) The '-is_fixed' option is not allowed if the voltage_area do not have any voltage_area_shapes.

**Description**

It is illegal to specify the 'is_fixed" option when creating or updating a voltage_area unless the voltage_area has at least one voltage_area_shape.

---

## NDMUI-145

(warning) power_domain '%s' is not associated with voltage_area '%s'.

**Description**

The specified power_domain is not associated with this voltage_area. Removing it from the voltage_area will be a no op.

---

## NDMUI-146

(warning) Cell '%s' is not associated with this %s.

Feedback

**Description**

To remove a cell for a voltage_area or a voltage_area_shape, the cell must have been explicitly assigned to this voltage_area or voltage_area_shape, otherwise the cell is ignored.

**What Next**

Verify the cell does belong to this voltage_area/voltage_area_shape with the get_voltage_areas/get_voltage_area_shapes command.

---

## NDMUI-147

(error) Cell '%s' is already associated with voltage_area_shape '%s'.

**Description**

Each cell can only be assigned to one voltage_area_shape. It is an error if the cell to be added is already explicitly assigned to another voltage_area_shape.

**What Next**

Verify the cell to be added does not belong to a voltage_area_shape with the get_voltage_area_shapes command.

---

## NDMUI-148

(error) Option '-use_power_domain_cells' is not allowed on voltage_area with no power_domain association.

**Description**

It is illegal to specify the '-use_power_domain_cells' option when creating or updating a voltage_area unless the voltage_area has at least one power_domain association.

---

## NDMUI-149

(warning) Cell '%s' was already added to this %s.

**Description**

A cell can only be associated with a voltage_area/voltage_area_shape once. Adding a cell to the same voltage_area/voltage_area_shape a second time will be a no-op.

**What Next**

Use the get_voltage_areas/get_voltage_area_shapes -of <cell> command to check if the cell is already associated with this voltage_area/voltage_area_shape.

Feedback

## NDMUI-150

(error) power_domain '%s' already has a voltage_area '%s' with implicit cell membership.

**Description**

The specified power_domain is already associated with the voltage_area with implicit cell membership. Each power_domain can have at most one voltage_area created with the -use_power_domain_cells option.

**What Next**

Create a voltage_area with explicit cell assignment without the -use_power_domain_cells option.

## NDMUI-151

(error) Value '%s' for option '-region' does not specify a single rectangle or polygon.

**Description**

The -region option must specify a single rectangle or polygon. For backward script compatibility, the app_option "voltage_area.disable_region_list" can be set to false to allow the -region option to continue accepting a list of rectangles/polygons.

set_app_options -global {voltage_area.disable_region_list false}

**What Next**

Provide a single rectangle or polygon for this option.

## NDMUI-152

(information) The '-merge_regions' option is an no-op. The voltage_area needs at least 2 shapes for a merge to happen.

**Description**

The "-merge_regions" option is an no operation when the voltage_area contains zero or 1 shape.

## NDMUI-153

(information) Merging existing shapes that abuts or overlaps with the new shape in voltage_area '%s'.

Feedback

**Description**

The "-merge_regions" will merge the input shape with existing shapes within the voltage_area that abuts or overlaps with it.

---

## NDMUI-154

(information) Merging abutted and overlapping shapes in voltage_area '%s'.

**Description**

The "-merge_regions" option will merge the existing abutted and overlapping shapes in the voltage_area into a minimum set of disjoint shapes.

**What Next**

create_voltage_area create_voltage_area_shape

---

## NDMUI-155

(error) Cell '%s' does not belong to a power_domain associated with this voltage_area.

**Description**

To add a cell to a voltage_area, the cell must belong to one of the power_domains associated with the voltage_area.

**What Next**

Get the power_domain of this cell:

get_power_domains -of [get_cells xxx]

Verify this power_domain is associated with this voltage_area:

get_voltage_areas -of [get_power_domains -of [get_cells xxx]]

---

## NDMUI-156

(error) Voltage Area cannot be created on logical hierarchical cell '%s'.

**Description**

Voltage area can only be created on physical hierarchical. It is an error to specify a logical hierarchical cell with the -cell option.

Feedback

### What Next

Verify the cell is physical by checking the "is_physical" attribute or that the cell contains at least one physical cell with the get_cells -of <hier_cell> -filter "is_physical == true" option.

---

## NDMUI-157

(error) The specified supply_net '%s' does not match any of the available supply_nets on the power_domain.

### Description

When specifying a power or ground supply net on a voltage_area, the supply net must be available on the power_domain.

---

## NDMUI-158

(error) Pins '%s' and '%s' mapped to same target port '%s' on block '%s'.

### Description

The *set_reference* command option *-pin_map* attempted to map two source pins to the same target port.

The *set_reference* command can add, remove, or move cell pins. It cannot merge two pins, because that would require merging two or more nets for each cell.

### What Next

Verify that the correct source and target name pairs were passed as to the *-pin_map* options.

Manually update the net connections for each cell, and drop the unneeded pins.

### See Also

- current_block
- disconnect_net
- get_blocks
- get_cells
- get_nets
- get_pins
- set_reference

Feedback

## NDMUI-159

(error) Invalid shapes specification '%s'; %s.

**Description**

A shape specification is expected to contain a layer name and a list of coordinates. The specified list is not a valid shape specification for the given reason.

**What Next**

Fix the offending list.

## NDMUI-160

(error) Design '%s' is an outline view; run the 'expand_outline' command before calling '%s'.

**Description**

This command cannot be executed on an outline view.

**What Next**

Open or create the design view of this design. To create the design view from the outline view use *expand_outline*.

## NDMUI-161

(error) Cell instance '%s' cannot be committed. It is already a physical block.

**Description**

The cell has already been committed, and exists in the top cell as a block instance already. It cannot be re-committed.

**What Next**

Be sure to attempt to commit a cell that has not already been committed.

## NDMUI-162

(error) The relative placement group '%s' already exists in this design.

**Description**

Each relative placement group must have a unique name. It is an error if there is an existing relative placement group of the specified name.

Feedback

### What Next

Please use a different name for this relative placement group.

---

## NDMUI-163

(error) The specified row %d is out of limit for RP group '%s', which has only %d rows.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object to a Relative Placement group in a row that is out of range of the rows for that group.

### What Next

Choose a new row that is within the rows of the relative placement group. After making any changes, rerun the command.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-164

(error) The specified column %d is out of limit for RP group '%s', which has only %d columns.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object to a Relative Placement group in a column that is out of range of the columns for that group.

### What Next

Choose a new column that is within the columns of the relative placement group. After making any changes, rerun the command.

Feedback

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-165

(error) The specified %s '%s' already belongs to relative placement group '%s'.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object, which is already part of a relative placement group. An object can be added only once in any relative placement group.

### What Next

Either remove object from its previous location or skip this addition. After making any changes, rerun the command.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-166

(error) The specified column %d and row %d of relative placement group '%s' is already occupied.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object to a column and row position that is already occupied by another object. Each lattice position of a Relative Placement (RP) group can only contain one object.

### What Next

Either remove the object already located at the given lattice position before inserting another object at that location, or choose another location that is empty. After making any changes, rerun the command.

Feedback

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-167

(error) The specified cell '%s' can not be added to relative placement group '%s', because it is hierarchical.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add a cell, which is hierarchical. Only leaf cells can be added to relative placement group.

### What Next

The leaf cells within hierarchical cell can be added in relative placement group.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-168

(Warning) The first cell of the given list will be added to the relative placement group.

### Description

This message occurs when the *add_to_rp_group* command detects that you tried to add multiple cells in a single location of relative placement group. First cell of the given multiple cells will be added to relative placement group.

### What Next

Please add other cells of the list in other empty locations or skip adding them.

Feedback

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-169

(error) Relative Placement Blockage name cannot be empty.

**Description**

Relative Placement Blockage name must not be empty.

**What Next**

Please specify a non-empty blockage name.

---

## NDMUI-170

(error) The specified %s '%s' does not belong to relative placement group '%s'.

**Description**

This error message occurs when the *remove_from_rp_group* command detects that you tried to remove an object, which does not belong to provided relative placement group. The provided object to be removed either does not belong to any relative placement group or is part of some other group.

**What Next**

Provide correct object to be removed.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-171

(error) The specified object '%s' has not been added to any relative placement group yet.

Feedback

### Description

This error message occurs when the *get_rp_group_object_position* command detects that you tried to get position of an object which is not part of any relative placement group.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-172

(error) The relative placement group '%s' could not be removed.

### Description

This error message occurs when the *remove_rp_groups* command could not delete the specified relative placement group. Please note that error will be issued only for top level group, if *-hierarchical* option is given.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-173

(info) There are no relative placement groups in the design.

### Description

This info message occurs when relative placement command detects that there are no any relative placement groups in the design.

### See Also

- get_rp_groups

Feedback

## NDMUI-174

(Information) The object for only first relative placement group of the given list will be collected.

### Description

This error message occurs when the *get_rp_group_objects* command detects that you tried to find object at a location using *-at* option for multiple relative placement groups. The object will be collected only for the first RP group in the list.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group
- get_rp_groups

## NDMUI-175

(error) View '%s' of referenced block %s does not exist.

### Description

The block does not have indicated view.

### What Next

Look at the referenced block to see what views are available to *change_view* to. Or use the *-force* option to change to a non-existent view.

## NDMUI-176

(error) No references to %s found in block %s.

### Description

This block does not contain references to the named block.

### What Next

Check that the name of the referenced block is spelled exactly without any wild card characters.

Feedback

## NDMUI-177

(error) Cannot change view for reference '%s'.

### Description

The view of specified reference cannot be changed.

### What Next

Check if the indicated view exists.

## NDMUI-178

(error) The specified row %d and num_rows %d trying to add cell out of limit for RP group '%s', which has only %d rows.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object to a relative placement group in multiple rows, and one or more of the specified rows are out of range of the rows for that group.

### What Next

Choose a new starting row using option *-row* or change number of multiple rows using option *-num_rows*. After making any changes, rerun the command.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## NDMUI-179

(error) The specified column %d and num_columns %d trying to add cell out of limit for RP group '%s', which has only %d columns.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object to a relative placement group in multiple columns and one or more of the specified columns are out of range of the columns for that group.

Feedback

### What Next

Choose a new starting column using option *-column* or change number of multiple columns using option *-num_columns*. After making any changes, rerun the command.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-180

(error) Matching type '%s' already exists in the design.

### Description

A matching type with the specified name already exists in the design.

### What Next

Specify a different matching type name, or use the remove_matching_types command to remove the existing matching type and then run this command again.

---

## NDMUI-181

(error) %s '%s' cannot be added to the matching type; it is not physical.

### Description

Only physical cells and pins can be added to a matching type. Logical-only cells and pins are not allowed.

### What Next

Verify that the cell or pin is physical. To verify a cell, check its is_physical attribute. To verify a pin, check its cell's is_physical attribute.

---

## NDMUI-182

(error) %s '%s' cannot be added to the matching type; %s is already in matching type '%s'.

Feedback

**Description**

The object cannot be added to the matching type for the indicated reason. An object cannot be in multiple matching types. If it is already in a matching type, it must be removed from its current matching type before adding it to a new matching type.

A pin and its terminals cannot both be added to matching types. Either assign the pin to a matching type, or assign its terminals to matching types, but not both. If a pin is in a matching type, the pin must be removed from its matching type before adding its terminals to matching types. If a terminal is in a matching type, the terminal must be removed from its matching type before adding its pin to a matching type.

**What Next**

Use the remove_from_matching_type command to remove the object from the indicated matching type, and then call this command again.

---

## NDMUI-183

(warning) %s '%s' cannot be removed from the matching type; %s.

**Description**

The specified object cannot be removed from the matching type. Objects may only be removed from the matching type in which it is in.

**What Next**

If the object is in another matching type, call this command with the correct matching type.

---

## NDMUI-184

(error) Port terminal '%s' cannot be added to the matching type; it is not a pin terminal.

**Description**

Only pin terminals can be added to a matching type. Top-level port terminals are not allowed in a matching type.

**What Next**

Remove the port terminal from the object list and run this command again..

---

## NDMUI-185

(error) The option '-pin_name' is missing with pin alignment specified using option '-alignment'.

Feedback

### Description

This error message occurs when the *set_rp_group_options* command detects that you tried to set pin alignment on relative placement group using option *-alignment*, but did not provide pin name on which to do alignment using *-pin_name* option.

### What Next

Please provide option *-pin_name* along with *-alignment pin*.

### See Also

- create_rp_group
- remove_rp_groups

---

## NDMUI-186

(error) The option -pin_name can not be set on cell '%s' because its parent relative placement group does not have pin alignment.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to set pin name on a cell using option *-pin_name*, while adding it in a relative placement group not having pin alignment set on it.

### What Next

Please set pin alignment on relative placement group using *-pin_name -alignment pin* or do not provide option *-pin_name* when adding a cell.

### See Also

- create_rp_group
- remove_rp_groups
- add_to_rp_group
- remove_from_rp_group

---

## NDMUI-187

(error) The object list '%s' is not homogeneous.

Feedback

**Description**

The specified object list contains objects of different types. The object list may only contain objects of one type.

**What Next**

Specify objects of one type only.

---

## NDMUI-188

(error) Invalid polygon operation

**Description**

The specified polygon operation is not valid. Valid polygon operations are "AND", "OR", "XOR", and "NOT".

**What Next**

Specify a valid polygon operation.

---

## NDMUI-189

(error) Invalid value for "size" parameter.

**Description**

The "size" parameter of the resize_polygons command must be a list of either 1, 2, or 4 numerical values.

**What Next**

Specify a list of 1, 2, or 4 numbers as the "size" parameter value.

---

## NDMUI-190

(error) Polygon is empty and cannot be resized.

**Description**

The resize_polygon command was called on an empty polygon. Empty polygons cannot be resized.

**What Next**

Specify a non-empty polygon.

Feedback

## NDMUI-191

(error) Invalid value for "-output" argument.

**Description**

An invalid value was specified for the "-output" argument of the split_polygons command. Valid values are "geo_mask" and "poly_rect".

**What Next**

Specify either "geo_mask" or "poly_rect" for the "-output" argument.

## NDMUI-192

(Error) Technology information of the layer '%s', differs with that of the design '%s'.

**Description**

The specified layer is associated with a different technology than that of the current design.

**What Next**

Please provide a layer whose technology information matches with that of the current design.

## NDMUI-193

(warning) Disassociating shape '%s' from its current environment.

**Description**

Removes the pin/net connections of a shape and gives information to user as warning.

## NDMUI-194

(error) The value for option -group_orientation is not valid. Specify one of: R0, MX, MY, R180.

**Description**

This error message occurs when the *set_rp_group_options* command detects that you tried to set an invalid orientation on relative placement group.

**What Next**

Please provide one of R0, MX, MY, R180 as -group_orientation for RP group.

Feedback

## NDMUI-195

(Error) Invalid options specified for user grid.

**Description**

This error message occurs when an option other than x_step, y_step, x_offset and y_offset is specified for a user grid.

**What Next**

Please use only x_step, y_step, x_offset and y_offset options for a user grid.

## NDMUI-196

(Error) No grid specified.

**Description**

This error message occurs when no grid object is specified as input.

**What Next**

Please specify a valid grid object to operate on.

## NDMUI-197

(Error) A %s grid by name '%s' already exists.

**Description**

This error occurs when a grid with a same name already exists in the block.

**What Next**

Please use a different name for the grid.

## NDMUI-198

(Error) %s grid associated with the block.

**Description**

Either there are no grids, or more than one grid is, associated with the block

**What Next**

Please provide a valid grid name.

Feedback

## NDMUI-199

(Error) No objects matched grid type '%s'.

### Description

This error occurs when none of the objects from the resultant collection is of the requested grid type.

## NDMUI-200

(Error) %s grid object specified.

### Description

This error occurs when an object of grid other than block-grid is specified.

### What Next

Please provide a valid object of block grid.

## NDMUI-201

(Error) The pin named '%s' does not exist on cell '%s'.

### Description

This error message occurs when the *add_to_rp_group* command detects that the pin provided using option *-pin_name* or using *set_attribute* command does not exist on cell.

### What Next

Please provide the name of a pin on the given cell.

### See Also

- create_rp_group
- add_to_rp_group
- remove_from_rp_group
- set_attribute

## NDMUI-202

(Error) The option -pin_name is applicable for pin alignment only and can not be specified with '%s' alignment.

Feedback

### Description

This error message occurs when the *set_rp_group_options* command detects that the option *-pin_name* is provided with left or right alignment using option *-alignment*.

### What Next

Please set pin alignment on relative placement group using *-pin_name -alignment pin* or do not provide option *-pin_name*.

### See Also

- create_rp_group
- remove_rp_groups
- add_to_rp_group
- remove_from_rp_group

---

## NDMUI-203

(error) The specified '%s' '%s' cannot be added to relative placement group '%s', because its voltage area is not same as relative placement group.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add a relative placement cell or a group which has a voltage area different from the relative placement group. The voltage area of the relative placement group is the voltage area of its cells.

### See Also

- create_rp_group
- remove_from_rp_group
- create_voltage_area

---

## NDMUI-204

(error) The specified cells can not be added to voltage area '%s'.

### Description

This error message occurs when the *create_voltage_area* or *set_voltage_area* command detects that you tried to add a cell, which belongs to a relative placement group. The cell

Feedback

was not allowed to be added because voltage area of all the cells of top relative placement group must be same.

**What Next**

Please add all the cells of top relative placement group together.

**See Also**

- create_voltage_area
- set_voltage_area
- add_to_rp_group

---

## NDMUI-205

(error) The specified cell '%s' can not be added to group bound '%s', because it is a relative placement cell.

**Description**

This error message occurs when the *create_bound* command detects that you tried to add a relative placement cell to a group bound. A cell cannot be part of both Group Bound and relative placement group.

**See Also**

- create_bound
- add_to_bound
- add_to_rp_group

---

## NDMUI-206

(error) The specified cells can not be added to bound '%s'.

**Description**

*create_bound* or *add_to_bound* does not allow cells of relative placement group to be added unless all cells of relative placement group are added. All the cells of relative placement group and its hierarchies must share the same move bound and group bound.

**What Next**

Please add all the cells of top relative placement group together. The following example adds all cells from the top relative placement group of cell "cell1" to bound "bound1".

Feedback

add_to_bound bound1 [get_cells -of_objects -hierarchical [get_rp_groups -top -of_objects cell1]]

**See Also**

- create_bound
- add_to_bound
- add_to_rp_group
- get_cells

## NDMUI-207

(error) The specified %s '%s' can not be added to relative placement group '%s', because its bounds are not same as relative placement group's bounds.

**Description**

This error message occurs when the *add_to_rp_group* command detects that you tried to add a cell or a child relative placement group which does not have the same named move or group bound(s) as the parent relative placement groups's bound(s). The bound of the relative placement group is the bound of its cells.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group
- create_bound

## NDMUI-208

(warning) Option *-new_name* is ignored for blackbox cell %s.

**Description**

This warning message occurs when option *-new_name* is specified with command *create_blackbox* on a successfully bound logical hierarchy cell.

The tool would commit the specified logical hierarchy cell into a physical block which is a black_box typed design. This operation, similar to *commit_block*, uses the current reference name of the cell as the committed block's name. It does not accept user specified new name.

Feedback

### See Also

- commit_block

---

## NDMUI-209

(error) The specified cell '%s' can not be added to relative placement group '%s', because it is part of a group bound.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add a cell which belong to a group bound. into relative placement group. A cell cannot be part of both Group Bound and relative placement group.

### See Also

- create_bound
- add_to_bound
- add_to_rp_group

---

## NDMUI-210

(error) Anchor corner options are not allowed for non-top relative placement group %s.

### Description

This error message occurs when the *set_rp_group_options* command is given anchor corner options for non-top relative placement group. The options *-x_offset*, *-y_offset* and *-anchor_corner* are anchor corner options.

### See Also

- create_rp_group
- add_to_rp_group

---

## NDMUI-211

(error) Both anchor corner and offset values has to be provided for relative placement group %s.

Feedback

### Description

This error message occurs when the *set_rp_group_options* command tries to set only offset value (*-x_offset* or *-y_offset*) or *-anchor_corner*.

### What Next

Please set both anchor corner and offset values for the relative placement group.

### See Also

- create_bound
- add_to_bound
- add_to_rp_group

---

## NDMUI-212

(error) Allowable orientation of a cell cannot be more than eight.

### Description

This error message occurs when the *add_to_rp_group* command tries to set more than eight allowable orientation on relative placement cell.

### What Next

Please remove any duplicate orientation value from the list of orientation and rerun the command.

### See Also

- add_to_rp_group

---

## NDMUI-213

(error) Specify pins of the same instance.

### Description

This warning message occurs when the user specifies a pair of pins in the *-pins* option and the pins do not belong to the same instance.

### What Next

Please specify one pair of pins belonging to the same instance and rerun the command.

Feedback

**See Also**

- set_supernet_exceptions
- remove_supernet_exceptions

## NDMUI-214

(warning) Cannot disable non-repeater cell with no supernet transparent pins.

**Description**

This warning message occurs when the user specifies a cell to disable using the *-disable_cells* option which does not have any supernet transparent pins defined.

**What Next**

Please specify a cell which has supernet transparent pins defined to disable.

**See Also**

- set_supernet_exceptions

## NDMUI-215

(warning) Repeater does not have disable_cell settings.

**Description**

This warning message occurs when the user tries to enable a repeater cell as supernet transparent using the *-cells* option of the *remove_supernet_exceptions* command which was not disabled using the *-disable_cells* option of *set_supernet_exceptions* command.

**What Next**

Please specify a cell which has been disabled and rerun the command.

**See Also**

- set_supernet_exceptions
- remove_supernet_exceptions

## NDMUI-216

(warning) Non-repeater cell has no supernet transparent pins to remove.

Feedback

### Description

This warning message occurs when the user tries to remove the supernet transparent pins of a cell using the option *-cells* which does not have any supernet transparent pins set.

### What Next

Please specify a cell which has supernet transparent pins and rerun the command.

### See Also

- remove_supernet_exceptions

---

## NDMUI-217

(warning) Cannot delete non supernet transparent pins.

### Description

This warning message occurs when the user specifies a pair of pins using the *-pins* option which were not set as supernet transparent.

### What Next

Please specify pins which are supernet transparent and rerun the command.

### See Also

- remove_supernet_exceptions

---

## NDMUI-218

(error) The specified '%s' '%s' cannot be added to relative placement group '%s', because its power domain is not same as relative placement group.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add a relative placement cell or a group which has a power domain different from the relative placement group. The power domain of the relative placement group is the power domain of its cells.

### See Also

- create_rp_group
- remove_from_rp_group
- create_voltage_area

Feedback

## NDMUI-219

(warning) The block %s is not in the instance tree of the Physical object %s.

**Description**

This block option is not in the instance tree of the current physical object.

**What Next**

Check the command man page and specify the correct block option.

## NDMUI-220

(error) The name subscripting app_options 'design.bus_delimiters' and 'design.name_expansion_delimiters' cannot be set to the same value.

**Description**

The name subscripting delimiters cannot be set to the same value, because this creates ambiguous object name searches.

**What Next**

Change one of the values using the *set_app_options* command, so that it is different from the other value.

## NDMUI-221

(error) Width %s specified for layer '%s' is less than the layer minimum width %s.

**Description**

The indicated routing_rule width is invalid, because it is less than the layer minimum width. The routing_rule width specified for each layer must be greater than or equal to the corresponding layer's minimum width in the technology file.

**What Next**

Change the indicated routing_rule width, so that it is at least the layer minimum width.

## NDMUI-222

(warning) The objects passed to the option %s is inappropriate as the input is of type %s.

**Description**

The objects passed as input to the given option is not a valid input.

Feedback

### What Next

Change the objects(s) or collection passed to input for the option.

---

## NDMUI-223

(warning) The object passed to -of_objects is of type Lib Pin. The object will be ignored.

### Description

The objects passed is not a valid input for the current command. The object will be ignored.

### What Next

Change the objects(s) or collection passed to -of_objects.

---

## NDMUI-224

(error) Cannot remove fill_cell '%s'.

### Description

The *remove_fill_cells* command was unable to remove the specified fill_cell.

### What Next

Please make sure that the specified fill_cell belongs to the current_block. If all arguments are correct and the command still fails, it indicates an internal error. Please report to Synopsys.

---

## NDMUI-225

(error) Provided %s is out of core area.

### Description

This error message occurs when provided *-x_offset* or *-y_offset* for *set_rp_group_options* command is outside of core area.

### See Also

- create_rp_group
- add_to_rp_group

Feedback

## NDMUI-226

(error) Input region specified for option (%s) is of zero area.

### Description

The get_objects_by_location command was called on an empty region. Empty region cannot be specified for physical search.

### What Next

Specify a non-empty region.

## NDMUI-227

(error) Cells must all be in the same parent module.

### Description

The *group_cells* command requires that all of the cells being grouped are in the same module.

### What Next

Specify cells that are all in the same module.

### See Also

- group_cells

## NDMUI-228

(error) Unable to group cells.

### Description

The *group_cells* command is unable to group the specified cells due to problems that were detected while checking the cell list. These problems are reported separately.

### What Next

Examine the log file and correct any reported errors, then try the command again.

### See Also

- group_cells

Feedback

## NDMUI-229

(error) cell_list or -all must be specified.

### Description

You must specify either a list of cells or the *-all* option with the *ungroup_cells* command.

### What Next

Specify the list of cells or use the *-all* option to indicate that all hierarchical cells in the current instance should be ungrouped.

### See Also

- ungroup_cells

## NDMUI-230

(warning) Design has no hierarchy. No cells can be ungrouped.

### Description

You specified the *-all* option with the *ungroup_cells* command, but the current module contains no hierarchy, so there is nothing that can be ungrouped.

### See Also

- ungroup_cells

## NDMUI-231

(warning) Cannot ungroup %s cell %s.

### Description

The *ungroup_cells* command operates on logic hierarchical cells. You will see this message if you specified a cell that is not hierarchical or it is an instance of a block or an instance of a synthetic module.

A synthetic module, represents a tool generated module and is not allowed to be manipulated by the user.

### What Next

The command continued after excluding any leaf or block instance cells from the list of cells to ungroup. If the results are what you want, no action is required.

Feedback

### See Also

- ungroup_cells

---

## NDMUI-232

(error) Unable to ungroup cells.

### Description

The *ungroup_cells* command is unable to ungroup the specified cells due to problems that were detected while checking the cell list. These problems are reported separately.

### What Next

Examine the log file and correct any reported errors, then try the command again.

### See Also

- ungroup_cells

---

## NDMUI-233

(error) The specified %s %d is out of limit for relative placement group '%s', which has only %d %s.

### Description

This error message occurs when relative placement group commands detect that the row/column value given in input is out of range of the rows/columns for the specified relative placement group.

### What Next

Choose a new row/column that is within the total number of rows/columns of the relative placement group. Please rerun the command after making any changes.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

Feedback

## NDMUI-234

(error) All locations of multiple location cell '%s' do not belong to specified %s of the relative placement group %s.

### Description

This error message occurs when the *modify_rp_groups* command detects that you tried to modify a relative placement group's rows/columns where all locations of multiple location cell do not belong to specified rows/columns of the relative placement group.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## NDMUI-235

(error) The specified number of %s to be deleted %d at %s %d is out of limit for relative placement group '%s', which has only %d %s.

### Description

This error message occurs when the *modify_rp_groups* command detects that you tried to delete number of rows/columns at a row/column of a relative placement group that is out of range of the rows/columns for that group.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## NDMUI-236

(error) The specified %s %d and %d is same so swap will not be performed for relative placement group.

### Description

This error message occurs when the *modify_rp_groups* command detects that you tried to swap a row/column with itself.

Feedback

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-237

(error) All %s of the relative placement group cannot be removed.

**Description**

This error message occurs when the *modify_rp_groups* command detects that you tried to delete all rows/columns of the relative placement group.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-238

(error) The second argument of %s option cannot be 0.

**Description**

This error message occurs when the *modify_rp_groups* command detects that you tried to add/remove the rows/columns of the relative placement group with the second argument as 0.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-239

(error) Invalid shapes specification '%s'.

Feedback

**Description**

A shape specification is expected to contain a layer name and a list of coordinates. The specified value is not a list of valid shape specifications such as { { layer {x1 y1} {x2 y2} ...} ... }.

**What Next**

Fix the offending list.

---

## NDMUI-240

(error) Invalid track color '%s' in list.

**Description**

The specified track color is invalid. The track color must be one of these values: mask_one, mask_two, mask_three

**What Next**

If you're attempting to clear the track color list, use an empty string. Otherwise, fix the offending track color.

---

## NDMUI-241

(error) Too many track color values (%d) in list.

**Description**

The track color specification is invalid because it contains too many entries. The maximum number allowed for the repeating pattern is 5.

**What Next**

Reduce the repeating track color pattern to contain no more than five values.

---

## NDMUI-242

(error) Invalid layer: '%s'.

**Description**

A shape specification is expected to contain a valid layer name and a list of coordinates. The specified layer could not be found.

**What Next**

Provide the name of a valid layer in the relevant tech.

Feedback

## NDMUI-243

(error) Cannot specify current block as reference.

**Description**

The current block cannot be specified as the reference for this command. Only blocks or library cells instantiated in the current block can be specified.

**What Next**

Please specify a block which has a interface mismatch with its instance.

## NDMUI-244

(error) Specified reference '%s' is not bound to current block.

**Description**

The reference specified as input is not bound to any instance in the current block. Therefore it cannot be used. Only blocks or library cells instantiated in the current block can be specified.

**What Next**

Please specify a block which has a interface mismatch with its instance.

## NDMUI-245

(information) Specified reference '%s' does not have any port mismatch.

**Description**

The reference specified as input has the same interface as the instances referring it.

**What Next**

Nothing to be done, this reference is not mismatched. This is just an information message

## NDMUI-246

(Error) No objects matched keepout type '%s'.

**Description**

This error occurs when none of the objects from the resultant collection is of the requested keepout type.

Feedback

## NDMUI-247

(Warning) Cannot set outer keepout margins on design '%s', as there are no instances which refer to this design.

### Description

Outer keepout margin is set on instances of the particular design in all the parent designs, where it is used as reference.

### What Next

Do not set outer keepout for the design.

## NDMUI-248

(warning) The specified cell '%s' cannot be added to relative placement group because it is fixed.

### Description

This warning message occurs when the *add_to_rp_group* command detects that you tried to add a cell, whose status is fixed. A cell can be added to relative placement group only if it is not fixed.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## NDMUI-249

(Error) Cell list must contain exactly one cell if -phys_wrapper is specified.

### Description

The *group_cells* command's *-phys_wrapper* option is used to create a new hierarchy around a single, hierarchical cell. You will see this message if you used the *-phys_wrapper* option and specified more than one cell for the cell list.

### What Next

Use the *-phys_wrapper* option with a single, hierarchical cell.

Feedback

### See Also

- group_cells

---

## NDMUI-250

(Error) The specified cell must be hierarchical if -phys_wrapper is specified.

### Description

The *group_cells* command's *-phys_wrapper* option is used to create a new hierarchy around a single, hierarchical cell. You will see this message if you used the *-phys_wrapper* option with a non-hierarchical cell.

### What Next

Use the *-phys_wrapper* option with a single, hierarchical cell.

### See Also

- group_cells

---

## NDMUI-251

(error) One or more objects, their parents, and/or their children have locked status.

### Description

This error message occurs when a command tries to transform or remove an object or a collection of objects, at least one of which either has locked status or is a parent/child of an object with locked status.

For example, a net may not be locked, but if it has a shape that is locked, then it will produce this error. This works the other way around as well. A shape may not be locked, but if it is owned by a net that is locked then it will produce this error.

Use "-force" option with the command to ignore locked status of the objects.

### What Next

If you see this error then one of three cases has occurred. One, one of the objects in the list has locked status. Two, a parent (at any level of the hierarchy) of one of the objects in the list has locked status. Three, a child (at any level of the hierarchy) of one of the objects in the list has locked status.

To resolve the error check the attributes of the objects, their parents, and their children to determine which objects need to be unlocked.

Feedback

**See Also**

- remove_shapes
- move_objects
- set_object_layer

---

## NDMUI-252

(warning) No port mismatches were fixed.

**Description**

The command was unable to fix any port mismatches in the design. This could happen due to one of the following reasons. a) There are no instances that needed to be fixed b) Instances with port mismatch were found but different instances for the same reference were bound to different views c) Fixing the mismatches would have caused some pins on instances to be deleted, but those pins were connected to a net

**What Next**

If the reason was "b" above, please run this command for the particular reference, specifying the reference you want to keep. If the reason was "c" above, please use "-force" option.

---

## NDMUI-253

(error) Invalid custom via_def shape: '%s'. Custom via_defs can contain only non-zero-sized Manhattan polygons.

**Description**

A custom via_def shape must be a non-zero size Manhattan (right-angled) polygon. The given shape is either zero size or contains non-right angles.

**What Next**

Provide a valid Manhattan shape specification.

---

## NDMUI-254

(error) Attribute '%s' cannot be set on via_def '%s' because it is not defined for custom via_defs. It is defined for simple via_defs only.

Feedback

**Description**

A custom via_def is defined by a collection of shapes. Some via_def attributes are not applicable to custom via_defs.

**What Next**

Use 'report_attributes' to review the set of attributes defined on the given via_def.

---

## NDMUI-255

(error) Attribute '%s' cannot be set on via_def '%s' because it is a custom via_def. This attribute is settable for simple via_defs only.

**Description**

A custom via_def is defined by a collection of shapes. Some attributes of a custom via_def are derived from its shape collection and are therefore not settable.

**What Next**

Modify the custom via_def's collection of shapes instead to achieve the desired attribute value.

---

## NDMUI-256

(error) Exactly two pins must be specified as input to "-pins" option.

**Description**

The "-pins" option for commands "set_supernet_exceptions" and "remove_supernet_exceptions" expects a list or collection with exactly two pins.

**What Next**

Please provide the correct input. If you're using a collection, make sure the collection has exactly two pins.

---

## NDMUI-257

(error) Attribute 'is_default' cannot be set on custom via_def '%s'. It is settable for simple via_defs only.

**Description**

A custom via_def is defined by a collection of shapes. A custom via_def cannot be a default via_def for a cut layer. .

Feedback

### What Next

Use 'report_via_defs' to review the set of via_defs. Choose one or more simple via_defs as default via_defs for this cut layer.

---

## NDMUI-258

(error) Term '%s' is already an anchor for a supernet.

### Description

The specified pin or port is already used an anchor for a supernet. A given pin or port can only be used as anchor for only one supernet.

### What Next

Please specify a pin or port which is not an anchor for a supernet. You can also use the existing supernet on the specified pin or port.

---

## NDMUI-259

(error) Name cannot be specified, when multiple anchors are provided.

### Description

A supernet is created for each specified anchor point. Each supernet must have a different name. When multiple anchors are specified, the name for the supernets cannot be given.

### What Next

Please rerun the command either without a name or with exactly one anchor.

---

## NDMUI-260

(Information) Query rules are not defined in block '%s'.

### Description

Query rules have not been defined in the specified block.

### What Next

Read a name map file, containing query rules, using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

Feedback

## NDMUI-261

(Error) Map application name '%s' is not supported.

### Description

In the name map file's *define_name_maps* command call, the specified application name is not supported. The application name must be 'golden_upf'.

### What Next

Correct the map application name in the name map file, then reload it using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

## NDMUI-262

(Error) Map design name '%s' does not match the current block name '%s'.

### Description

In the name map file's *define_name_maps* command call, the specified design name does not match the current block name. Name maps are loaded into the current block, so the intended destination design name must match the current block name.

### What Next

Correct the map design name in the name map file, then reload it using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

## NDMUI-263

(Error) Map column names must be '{class pattern options names}'.

Feedback

### Description

In the name map file's *define_name_maps* command call, the specified column names are not supported. The column names must match the predefined column names for the 'golden_upf' application. It must be the list {class, pattern, options, names}.

### What Next

Correct the map column names in the name map file, then reload it using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

---

## NDMUI-264

(Error) Map class name '%s' is not supported.

### Description

In the name map file's *define_name_maps* command call, the specified class name is not supported. The supported classes are cell, port, pin, net, power_domain, supply_net, supply_set, supply_port, and power_switch.

### What Next

Correct the map class name in the name map file, then reload it using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

---

## NDMUI-265

(Error) Map option name '%s' is not supported.

### Description

In the name map file's *define_name_maps* command call, the specified option name is not supported. The supported options are transitive, nocase, leaf, noleaf, in, out, and inout.

Feedback

### What Next

Correct the map option name in the name map file, then reload it using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

---

## NDMUI-266

(Error) Map entry '%s' is invalid; %s.

### Description

In the name map file's *define_name_maps* command call, the specified entry is invalid. Each entry must contain 4 elements (i.e., class, pattern, options, names). The list of names cannot be empty.

### What Next

Correct the map entry in the name map file, then reload it using the *read_name_map* command.

### See Also

- read_name_map
- write_name_map

---

## NDMUI-267

(Error) Query rule regsub '%s' is invalid; %s.

### Description

In the name map file's *set_query_rules* command call, the specified regsub is invalid. Each regsub must contain 3 elements (i.e., switches, match_regexp, substitution_exp).

### What Next

Correct the query rule regsub in the name map file, then reload it using the *read_name_map* command.

Feedback

### See Also

- read_name_map
- write_name_map

---

## NDMUI-268

(error) The specified relative placement group '%s' cannot be added to itself or one of its hierarchical relative placement groups.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add a relative placement group to itself or one of its hierarchical relative placement groups.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-269

(error) Value '%s' for option '%s' does not specify at least 2 points. The syntax is { { x1 y1 } { x2 y2 } ... }.

### Description

The reported option must specify points which form a path. A path is defined by a list of at least two points. The syntax is: { { x1 y1 } { x2 y2 } ... }

### What Next

Provide the correct value to the reported option.

---

## NDMUI-270

(error) The command '%s' is prohibited in freeze-silicon mode.

### Description

The design is in freeze_silicon mode. Only a small set of commands that modify the database can actually run properly in this mode. This command cannot run properly in freeze_silicon mode and is therefore prohibited.

Feedback

**What Next**

If you need to run this command please set the app option design.eco_allow_all_commands to enable all commands to run in this mode

---

## NDMUI-271

(error) Value '%s' for option -cuts is invalid; %s.

**Description**

This option requires a list in the format {{cut_layer_name {cut_name number_of_cuts} ...} ...}.

The cut_layer_name must correspond to a cut layer defined in the technology file with defined fat tables (i.e., fatTblThreshold, fatTblFatContactNumber, fatTblFatContactMinCuts) and cut tables (i.e., cutNameTbl, cutWidthTbl, cutHeightTbl).

The cut_name must correspond to a cut name in the cut layer's cut tables (i.e., cutNameTbl).

The number_of_cuts must be an integer greater than 0.

**What Next**

Provide the correct value to the option.

---

## NDMUI-272

(Error) The height '%f' of site def '%s' doesn't match the FinFET grid's Y pitch '%f'.

**Description**

This message was issued because the height of the Site def to be used doesn't match FinFET grid's Y pitch.

**What Next**

1.Make sure set_technology is set.

2.If 1 not work, change the Site def to be used, so that it matches the FinFET Grid.

---

## NDMUI-273

(Error) The width '%f' of site def '%s' doesn't match the FinFET grid's X pitch '%f'.

Feedback

**Description**

This message was issued because the width of the Site def to be used doesn't match FinFET grid's X pitch.

**What Next**

Change the Site def to be used, so that it matches the FinFET Grid.

---

## NDMUI-274

(Error) The height '%f' of site def '%s' with orientation '%s' doesn't match the FinFET grid's Y pitch '%f'.

**Description**

This message was issued because the effective height of the Site def for a user specified orientation doesn't match FinFET grid's Y pitch.

**What Next**

Change the Site def to be used, so that it matches the FinFET Grid.

---

## NDMUI-275

(Error) The width '%f' of site def '%s' with orientation '%s' doesn't match the FinFET grid's X pitch '%f'.

**Description**

This message was issued because the effective width of the Site def for a user specified orientation doesn't match FinFET grid's X pitch.

**What Next**

Change the Site def to be used, so that it matches the FinFET Grid.

---

## NDMUI-276

(Warning) The length '%f' of '%s' is not an integral multiple of the FinFET grid's Y pitch '%f'.

**Description**

This message was issued because the Y direction length is not an integral multiple of FinFET grid's Y pitch and hence not falling into the FinFET grid.

**What Next**

May need to change the length, so that it falls into the FinFET Grid.

Feedback

## NDMUI-277

(Warning) The length '%f' of '%s' is not an integral multiple of the FinFET grid's X pitch '%f'.

**Description**

This message was issued because the X direction length is not an integral multiple of FinFET grid's X pitch and hence not falling into the FinFET grid.

**What Next**

May need to change the length, so that it falls into the FinFET Grid.

## NDMUI-278

(Warning) The user specified coordinate '(%f, %f)' does not align with the FinFET grid.

**Description**

This message was issued because the user specified coordinate doesn't align with the FinFET grid and hence is violating the condition that all Fins should align with the FinFET grid.

**What Next**

May need to change the user specified coordinate, so that it aligns with the FinFET Grid.

## NDMUI-279

(warning) Via spacing %s is less than the minimum spacing %s of via layer '%s'.

**Description**

The indicated routing_rule via spacing is invalid, because it is less than the via layer minimum spacing. The router will use the via layer minimum spacing instead of the routing_rule via spacing.

**What Next**

Change the indicated routing_rule via spacing, so that it is at least the via layer minimum spacing.

## NDMUI-280

(error) Defining multiple via spacings between layers '%s' and '%s' is not allowed.

Feedback

**Description**

Defining multiple via spacings between layers is not allowed.

**What Next**

Specify only one via spacing between the two via layers.

---

## NDMUI-281

(error) Value for option -port_contact_selections is invalid; %s.

**Description**

This option requires a list in the format {{portName {contactCodeName ...}} ...}.

The contactCodeName must correspond to a ContactCode in technology file.

**What Next**

Provide the correct value to the option.

---

## NDMUI-282

(warning) The create_routing_rule %s option is deprecated.%s

**Description**

The indicated *create_routing_rule* option is deprecated and no longer supported.

The *-taper_distances* option is now supported by the *-taper_distance* option, which takes a single distance value, instead of a list of distance values.

The *-driver_taper_distances* option is now supported by the *-driver_taper_distance* option, which takes a single distance value, instead of a list of distance values.

The *-spacing_weights* option is now supported by the *-spacing_weight_levels* option, which takes weight levels, instead of weight float values.

The *-min_routing_layer* and *-max_routing_layer* options are now supported by the *set_routing_rule* command. The minimum and maximum routing layers are applied to each net, instead of each routing rule.

These options have no replacement: *-routing_effort_level*, *-spacing_efforts*, *-taper_level*, *-taper_modes*,

**What Next**

Remove the indicated option and use the replacement option if any.

Feedback

## NDMUI-283

(error) Attribute '%s' cannot be set on via_def '%s' because it is derived from the shapes of a custom via_def. It is settable for simple via_defs only.

**Description**

A custom via_def is defined by a collection of shapes. Some via_def attributes are not settable on custom via_defs.

**What Next**

Use 'report_attributes' to review the set of attributes that are settable on the given via_def.

## NDMUI-284

(error) Layer '%s' is not a valid cut layer. The cut layer of a simple via_def must be of type VIA_CUT or LOCAL_VIA_CUT.

**Description**

The cut layer of a simple via_def can only be of type VIA_CUT or LOCAL_VIA_CUT. Other types, such as INTERCONNECT or LOCAL_INTERCONNECT are not valid types for the cut layer.

**What Next**

Check the layers available in the tech for appropriate candidates of the allowed types.

## NDMUI-285

(Error) The height '%f' of '%s' is not an integral multiple of the FinFET grid's Y pitch '%f'.

**Description**

This message was issued because the Y direction length is not an integral multiple of FinFET grid's Y pitch and hence not falling into the FinFET grid.

**What Next**

Change the height of the object, so that it falls into the FinFET Grid.

## NDMUI-286

(Error) The width '%f' of '%s' is not an integral multiple of the FinFET grid's X pitch '%f'.

Feedback

### Description

This message was issued because the X direction length is not an integral multiple of FinFET grid's X pitch and hence not falling into the FinFET grid.

### What Next

Change the Width of the object, so that it falls into the FinFET Grid.

---

## NDMUI-287

(error) The specified utilization '0' for the relative placement group is not allowed.

### Description

This error message occurs when the *set_rp_group_options* command detects that you tried to set the utilization of a relative placement group to '0'. The utilization of a relative placement group should be greater than '0' and less than or equal to '1.0'.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-288

(Error) Invalid symmetry option '%s', please specify a set composed with strings "X", "Y" and "R90".

### Description

This message indicates that an invalid symmetry value is specified. The acceptable value of this option is a set composed with the strings "X", "Y" and "R90".

### What Next

Change the symmetry value to a set composed with valid strings - "X", "Y" and "R90". Example: { X } or { Y R90 } or { X Y R90 } etc.

---

## NDMUI-289

(error) The specified cell '%s' is a spare cell. This command cannot be run for this cell.

Feedback

**Description**

The design is in freeze_silicon mode. The command (change_link or set_reference) can only be used for regular cells in freeze_silicon mode.

**What Next**

Please specify regular cells to change the reference.

---

## NDMUI-290

(error) Cells may only be set to a via_def of type "through_silicon_via_def".

**Description**

Cells may be set to reference via_defs, but only those of type "through_silicon_via_def".

**What Next**

Please specify a through-silicon via_def in the "-via_def" argument of the command when using the "-cells" argument.

---

## NDMUI-291

(error) One or more TSV cells could not be created.

**Description**

One or more through-silicon via ("TSV") cells could not be created, likely due to a name collision.

**What Next**

Please specify cell names that are unique in the current block.

---

## NDMUI-292

(error) The layers list must have the same length as the boundary list.

**Description**

If the "-layers" option is specified, then the list of layers must have the same length as the boundary list, so that a one-to-one correspondence is formed between the layers and poly_rects with the associated boundaries.

**What Next**

Modify the layers list to have a layer corresponding to each respective boundary in the boundary list.

Feedback

## NDMUI-293

(error) Attribute 'shapes' cannot be set on simple via_def '%s'. It is settable for custom via_defs only.

### Description

A simple via_def is defined by its layer and geometrical parameters. The 'shapes' attribute is derived from those and cannot be set directly.

### What Next

The 'shapes' attribute of a simple via_def can be set indirectly by setting the layer, height and width parameters for each layer of the via_def. Use 'list_attributes' to review the set of parameters that define a simple via_def, and 'set_attribute' to set them.

## NDMUI-294

(error) Attribute 'shapes' could not be set on custom via_def '%s'. One or more objects in the given collection was not a poly_rect.

### Description

The 'shapes' attribute of a custom via_def is defined by a collection of poly_rects. When 'set_attribute' is used to set the 'shapes' of a custom via_def, all objects in the given collection must be poly_rects.

### What Next

Remove the non-poly_rects from the input collection. Consider using 'create_poly_rect' to create a homogeneous collection of poly_rects representing the 'shapes' of the custom via_def.

## NDMUI-295

(Error) Application option '%s' is not enabled for subscripted access/modifications.

### Description

The application option was registered to not allow subscripted access/modifications. The application option has to be of the form {name value} and needs to be enabled for subscripted access/modifications.

## NDMUI-296

(Information) Application option '%s' is global scoped. Ignoring the '%s' option.

Feedback

**Description**

Global scoped app-options cannot be set on a block.

---

## NDMUI-297

(Error) Subscript '%s' is not set on application option '%s'.

**Description**

The requested subscript is not set on the application option.

**What Next**

Try "get_app_option_value -name <applicationOptionName>" to look at all the subscripts that are set.

---

## NDMUI-298

(Information) Cell is already uniquified. Child hierarchy will be uniquified if not already uniquified.

**Description**

For "uniquify" and "uniquify_block" commands, if an already uniquified cell is provided along with "-uniquify_children" option, then the commands will uniquify children hierarchy of cell's reference.

---

## NDMUI-299

(Error) Cannot %s design scoped application option '%s', as the design is not specified.

**Description**

The current block is not set and the '-block' option is not specified. The design on which the design scoped application option is to be set could not be determined.

**What Next**

Either set the current block or specify the design to be used using the '-block' option.

---

## NDMUI-300

(Warning) Cannot use unordered layer '%s' with negative mask_order as reference_layer in '%s' option.

Feedback

**Description**

The relative mask_order cannot be determined from an unordered reference layer.

**What Next**

The mask_order would be set to its default value -1.

---

## NDMUI-301

(Warning) Blockage '%s' isn't a routing-blockage.

**Description**

The specified blockage is NOT a routing- blockage.

**What Next**

Please specify a routing-blockage.

---

## NDMUI-302

(Warning) Routing blockage '%s' cannot be used for both net and net_type specific association simultaneously.

**Description**

A routing-blockage applies to either all nets or only the specified nets. Nets can be specified by associating EITHER individual specific nets (blocks only the specified nets) OR specific net_type (example -net_types clock blocks all clock nets).

**What Next**

Please use any one of net or net_type specific association for the routing-blockage.

---

## NDMUI-303

(Error) Cannot specify the side-numbers for the given start/end object. Side numbering is to be used only when the start/end object is an object of '%s' or '%s' or '%s.

**Description**

The side numbers to be used as a topological pin feedthrough constraint is applicable only for objects of certain types.

---

## NDMUI-304

(Error) The offset value '%f' should be less than the maximum side length '%f'.

Feedback

**Description**

The offset value is limited by the maximum side length of the given start/end object.

**What Next**

Use a value within the limit specified

---

## NDMUI-305

(Error) The offset range '%s' should be less than the offset '%s'.

**Description**

The offset-range represents a distance from the offset that a pin may be placed. The range should be less than the current offset value.

**What Next**

Use a value smaller than the current offset.

---

## NDMUI-306

(Error) %s '%s' must be logically connected to the owner.

**Description**

The port or the pin object that is used as a start/end object for a particular topological pin feedthrough constraint should be logically connected to the owner of the constraint.

**What Next**

Use a port/pin that is logically connected to the owner.

---

## NDMUI-307

(Error) %s '%s' is not logically connected to the owner %s '%s'.

**Description**

The port or the pin object that is used as a start/end object for a particular topological pin feedthrough constraint should be logically connected to the owner of the constraint.

**What Next**

Use a port/pin that is logically connected to the owner.

Feedback

## NDMUI-308

(Error) The %s option cannot be specified for %s object of type '%s'.

**Description**

The option to specify side-numbers can only be used for objects of type cell, voltage-area or voltage-area-shape.

## NDMUI-309

(Error) Current block does not have the physical information for %s '%s'.

**Description**

The physical representation of the start/end object (port, pin and cell) should exist in the current block. Topological pin feedthrough constraints cannot be created across physical hierarchies.

## NDMUI-310

(Error) Invalid type '%s' specified. Supported object types are '%s'.

**Description**

The object specified as the start/end object for the constraint belongs to an unsupported type. The valid types are specified in the output.

**What Next**

Use the supported object type as a start/end object.

## NDMUI-311

(Error) Cannot specify an object of '%s' type for both the %s and %s options.

**Description**

The start/end object of a topological pin feedthrough constraint cannot be of the same type unless it is a cell.

**What Next**

Use objects of different types for the start/end object.

Feedback

## NDMUI-312

(Error) Object '%s' is in design '%s' which is not the same as the constraint's design '%s'.

**Description**

The start and end objects of a topological pin feedthrough constraint must be in the design of the constraint. It could be either in the same physical hierarchy as the constraint or a lower level of physical hierarchy.

**What Next**

Use objects in the constraint's design as the start and end objects. When specifying objects in the lower physical hierarchy, be sure to get it through the hierarchy by specifying the full hierarchical path name.

## NDMUI-313

(Error) Existing topological pin feedthrough constraint '%s' has similar configurations.

**Description**

The topological pin feedthrough constraints in a block should be unique. The tool does not allow creation of duplicate topological pin feed through constraints.

**What Next**

Use the existing topological pin feedthrough constraint or create a new one with different configuration.

## NDMUI-314

(Error) Failed to create topological pin feedthrough constraint for owner object '%s'.

**Description**

The topological pin feedthrough constraint creation command failed to create a topological constraint on the current block.

## NDMUI-315

(Error) The '%s' attribute cannot be set for %s object of type '%s'.

**Description**

The side numbers to be used as a topological pin feedthrough constraint is applicable only for objects of certain types.

Feedback

## NDMUI-316

(Error) Attribute '%s' is applicable only for start/end objects of type '%s' or '%s' or '%s'.

**Description**

The side numbers to be used as a topological pin feedthrough constraint is applicable only for objects of certain types. Subsequently the offset attribute can be specified only on objects for which the side-number attribute is applicable.

## NDMUI-317

(Error) The topological pin feed through constraint '%s' does not have the %s %s set. Cannot set the %s attribute.

**Description**

The offset and offset-range attribute can be specified only if the side numbers are set on the topological pin-feedthrough constraint.

## NDMUI-318

(Error) Valid side-number range for the object %s is (1 - %u).

**Description**

The sides numbers provided is out of the valid range for the start/end object.

**What Next**

Use the side-numbers in the range displayed.

## NDMUI-319

(Error) Voltage area '%s' has more than one (%u) regions. Cannot use the side-numbers for this voltage-area.

**Description**

If the voltage-area is used as a start/end object and if it has more-than one voltage-area-regions then one specific voltage-area-region should be used as a start/end object. The side-numbers will then correspond to the chosen voltage-area-region.

**What Next**

Use a voltage-area-region as the start/end object.

Feedback

## NDMUI-320

(Error) Site row '%s' belongs to site array '%s' and can't be removed independently.

### Description

The site row to be removed is part of a site array. Constituent site rows of site array can't be manipulated independently. Site array takes care of handling its constituent site rows.

### What Next

The site row can't be removed. If it is part of a collection specified for removal then remove this site row from the collection so that other site rows can be removed.

## NDMUI-321

(warning) The requested module name %s is not available. The new module's name is %s.

### Description

The module name requested by *group_cells -module_name* is not available, so the tool used an automatically-generated name.

### What Next

Specify a module name that is not in use or omit the *-module_name* option to the *group_cells* command.

### See Also

- group_cells

## NDMUI-322

(warning) The requested cell name %s is not available. The new cell's name is %s.

### Description

The cell name requested by *group_cells -cell_name* is not available in the parent module, so the tool used an automatically-generated name.

### What Next

Specify a cell name that is not in use or omit the *-cell_name* option to the *group_cells* command.

Feedback

**See Also**

- group_cells

---

## NDMUI-323

(Error) Specified pin '%s' does not have physical context or belong to current block.

**Description**

This error message is printed during commands *set_via_ladder_constraints*, *remove_via_ladder_constraints* and *remove_via_ladder_constraints*, when a pin specified does not have block context or belong to current block.

**What Next**

Use "get_pins -physical_context -design [current_block]" to get list of valid pins.

**See Also**

- set_via_ladder_constraints
- remove_via_ladder_constraints
- report_via_ladder_constraints

---

## NDMUI-324

(Error) Specified via ladder '%s' does not exist in technology file. Specify from:\n\t%s

**Description**

This error message is printed when a via ladder template name is specified that is not present in technology file. Along with this message, valid list of names are printed out.

**What Next**

Specify valid via ladder template names.

**See Also**

- set_via_ladder_constraints
- remove_via_ladder_constraints
- report_via_ladder_constraints

Feedback

## NDMUI-325

(Warning) Specified pin '%s' does not have via ladder constraint set.

### Description

This warning message is printed during commands "*remove_via_ladder_constraints* and *report_via_ladder_constraints* when no via ladder constraint is set for specified pin.

### What Next

Please specify pin for which via ladder constraint exists.

### See Also

- set_via_ladder_constraints
- remove_via_ladder_constraints
- report_via_ladder_constraints

## NDMUI-326

(error) The via_def specified as the cell reference must be of type 'through_silicon_via_def'.

### Description

When specifying a via_def as the 'reference' argument of the create_cell command, the via_def must be of type 'through_silicon_via_def'.

### What Next

Please specify a via_def of the correct type.

## NDMUI-327

(error) The specified %s '%s' can not be added to relative placement group '%s', because its site_height is different.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add a cell or a hierarchical relative placement group to another relative placement group which has a different site_height. The site_height of the relative placement group is the site_height of its cells.

Feedback

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group
- create_bound

---

## NDMUI-328

(error) Value '%s' is an invalid layer mask shift list.

**Description**

The layer mask shift list is invalid. It must be a list, { { layer_name shift } ... }, in which layer_name must be a valid layer name and shift must be 0 or 1. 0 indicates no shift on the layer. 1 indicates shift by 1 on the layer.

**What Next**

Call *set_attribute* with the corrected layer mask shift list.

---

## NDMUI-329

(error) Layer mask shift specification '%s' is invalid; %s.

**Description**

The layer mask shift specification is invalid. It must be a string "layer_name shift" in which layer_name must be a valid layer name and shift must be 0 or 1. 0 indicates no shift on the layer. 1 indicates shift by 1 on the layer.

**What Next**

Call *set_attribute* with the corrected layer mask shift specification.

---

## NDMUI-330

(error) Cell instances of block '%s' are not mask shiftable.

**Description**

The cell *mask_shift attribute cannot be set, because its reference block is not mask shiftable. The block is not mask shiftable if its is_mask_shiftable attribute value is false or if its parent library's is_mask_shiftable attribute value is false.*

Feedback

### What Next

Check the reference block's and its parent library's *is_mask_shiftable* attribute value. If not correct, correct the values. Then set the cell's *mask_shift* attribute.

---

## NDMUI-331

(warning) Shift value on layer '%s' has no effect, because the layer number_of_masks attribute value is '%d'.

### Description

The specified shift will have no effect on the indicated layer, because the layer's number_of_masks attribute is less than 2. For shifting to have any effect, the layer's number_of_masks attribute must be 2 or greater.

### What Next

Correct the layer's number_of_masks attribute value so it is at least 2.

---

## NDMUI-332

(warning) The option '%s' has been deprecated and is scheduled to be removed in a future release. %s

### Description

The given command option has been deprecated. Please see the man-page of the command for migration assistance.

---

## NDMUI-333

(error) Value '%s' for option %s is invalid; %s.

### Description

This option requires a list in the reported format.

If layer_name is expected in the reported format, it must correspond to a routing layer defined in the technology file. The mask_name must be one of the acceptable values. If the mask is fixed, then the keyword, fixed, must be specified. If the mask is not fixed, do not specify the keyword.

### What Next

Provide the correct value to the option.

Feedback

## NDMUI-334

(error) All values in '%s' must be greater than zero.

**Description**

This option requires a list of values, all greater than zero.

**What Next**

Provide the correct value to the option.

## NDMUI-335

(error) Value for '%s' must be less than sum of all values for '%s'.

**Description**

First option requires value which is less than sum of all the values provided in second option.

**What Next**

Provide the correct value to the option.

## NDMUI-336

(warning) Specification of a {name_value_pair list} without either the '%s' or '%s' option has been deprecated and is scheduled to be removed in a future release. %s

**Description**

The given command option has been deprecated. Please see the man-page of the command for the new syntax.

## NDMUI-337

(Error) Empty or invalid geometry specified for the '%s' argument of the command.

**Description**

The specified argument of the command requires a valid geometrical region with positive area.

## NDMUI-338

(error) Antenna rule with the given name '%s' does not exist in the library '%s'.

Feedback

**Description**

The specified antenna rule does not exist in the given library.

**What Next**

Use get_antenna_rule_names(2) to list the rule-names in a given library.

---

## NDMUI-339

(error) Layer '%s' of routing blockage '%s' is not a via cut layer.

**Description**

The 'is_design_rule_blockage' attribute is settable only if the blockage's layer type is VIA_CUT or LOCAL_VIA_CUT.

---

## NDMUI-340

(information) Setting 'is_design_rule_blockage' to false. Layer '%s' of routing blockage '%s' is not a via cut layer.

**Description**

The 'is_design_rule_blockage' attribute can be true only if the layer type is VIA_CUT or LOCAL_VIA_CUT.

---

## NDMUI-341

(Error) Cannot specify the '%s' argument without the '%s' or '%s' arguments.

**Description**

The specified argument of the command requires one of the two other specified arguments.

---

## NDMUI-342

(Error) Must specify either the '%s' argument or the '%s' argument.

**Description**

The command requires that one of the specified arguments is provided.

---

## NDMUI-343

(Error) Multiple polygons specified for the '%s' argument of the command.

Feedback

**Description**

The specified argument of the command requires an input geometry equivalent to a single, connected polygon. However, the specified geometry resulted in multiple, non-connected polygons.

---

## NDMUI-344

(Error) Cannot set target library subset on %s '%s'; %s.

**Description**

The target library subset cannot be set on the object. Target library subsets may only be assigned to objects in the current block. Additionally cells must reference hierarchies within the current block (i.e., they cannot reference other blocks).

**What Next**

Remove the specified object from the *-objects* option list.

---

## NDMUI-345

(Warning) Skipping %s '%s'; %s.

**Description**

The target library subset cannot be removed or reported from the specified object. The object is skipped. Target library subsets are assigned only to objects in the current block.

**What Next**

Remove the specified object from the *-objects* option list.

---

## NDMUI-346

(Error) Library '%s' is not a valid target library; %s.

**Description**

The specified library is not a valid target library. Target libraries must be lib_cell libraries.

**What Next**

Remove or replace the specified library in the *target_libs* option list.

---

## NDMUI-347

(Error) No valid target libraries or lib_cells were specified.

Feedback

**Description**

The specified target libraries and lib_cells are not valid.

**What Next**

Specify valid values for the *target_libs*, *-dont_use*, or *-only_here* options.

---

## NDMUI-348

(error) The working design is not from frame view.

**Description**

The block does not have indicated view.

**What Next**

The command is only for frame view.

---

## NDMUI-349

(error) via_def '%s' is invalid. via_def must be a simple via definition when -size is not {1 1} or -pitch is specified.

**Description**

The input via_def must be a simple via definition when -size is not {1 1} or -pitch is specified.

**What Next**

Provide a valid simple via definition.

---

## NDMUI-350

(error) input via_list contains %d custom vias, '%s'. Vias must be simple via or simple array via when -size is not {1 1} or -pitch is specified.

**Description**

The input vias must be simple via or simple array via when -size is not {1 1} or -pitch is specified.

**What Next**

Provide valid input via_list containing simple vias and simple array vias only.

Feedback

## NDMUI-351

(warning) Invalid reference design name(%s) for power constraints.

**Description**

The format of reference design name is invalid for Power constraints.

**What Next**

Provide provide the design name as libName:designName.view.

## NDMUI-352

(error) at lease one of -via_def, -pitch, and -size options must be specified.

**Description**

At least one of -via_def, -pitch, and -size options must be specified.

**What Next**

Provide at lease one of -via_def, -pitch, and -size options.

## NDMUI-353

(error) Exactly one via def must be specified as input.

**Description**

This command accepts exactly one via def.

**What Next**

Please provide the correct input.

## NDMUI-354

(error) cannot change %s of via '%s' to %s.

**Description**

This command cannot change via def from simple via def to custom via def or from custom via def to simple via def. To change via def type, please use set_via_def.

**What Next**

Please provide the correct input.

Feedback

## NDMUI-355

(error) cannot change array size of %s '%s'%s.

**Description**

This command cannot change array size of the specified via. Via must be simple array via, and simple array via cannot be changed to simple via with array size {1 1}.

**What Next**

Please provide the correct input. To change simple via to simple array via or simple array via to simplevia, please use tcl command set_via_def.

## NDMUI-356

(error) invalid array size value '%s' in list. It must be {number_of_rows number_of_columns}.

**Description**

Invalid array size input. It must be {number_of_rows number_of_columns}.

**What Next**

Please provide the correct array size.

## NDMUI-357

(error) power domains '%s' and '%s' do not share equivalent default pwell and nwell supply net(s).

**Description**

When associating multiple power domains to a voltage area, the default pwell and nwell supplies of the power domains must be electrically equivalent, meaning that their supply nets must either be the same, or connected via supply ports.

## NDMUI-358

(error) power domains '%s' and '%s' do not share equivalent available supply nets.

**Description**

When associating multiple power domains to a voltage area, the available supply nets of the power domains must be electrically equivalent, meaning that their supply nets must either be the same, or connected via supply ports.

Feedback

## NDMUI-359

(warning) Unable to obtain mask value for surround on lower metal layer of via '%s'.

**Description**

This warning message is issued since the surround on lower metal layer of the via cannot touch any pin in the design. This could be a via that only connects two layers but is not on a pin.

**What Next**

Please check the via and the design data if needed.

## NDMUI-360

(warning) The view type current block is not 'frame'. Via regions should exist only in frame views.

**Description**

The view type current block should be frame view.

**What Next**

The command is only for frame view.

## NDMUI-361

(error) '-incremental' option can only be specified when '-automatic' option is also specified.

**Description**

'-incremental' option can only be specified when '-automatic' option is also specified.

**What Next**

Run connect_pg_net with both '-incremental' and '-automatic' options or remove '-incremental' option.

## NDMUI-362

(error) Invalid 'base_lib'. Specified base library must be %s.

**Description**

Specified library cannot be used as the base for Sparse View library.

Feedback

**What Next**

Please specify a valid design library on-disk as the base of a Sparse View library.

---

## NDMUI-363

(error) Number of Sparse View libraries in the daisy chain of base library '%s' is '%d' that exceeds the maximum limit '%d'.

**Description**

Specified library cannot be used as the base for Sparse View library.

**What Next**

Please specify a different design library as the base library.

---

## NDMUI-364

(error) Design %s is open. It must be closed before %s.

**Description**

Reported design prevents the intended operation in Sparse View library because it is open.

**What Next**

Please close the reported design to proceed.

---

## NDMUI-365

(info) Reverted design '%s' and removed it from disk.

**Description**

This is a message indicating that the reported design has been reverted the in Sparse View library and its on-disk content has been removed.

---

## NDMUI-366

(error) %s failed. Library '%s' is %sSparse View library.

**Description**

Reported operation is not permitted in the specified library.

Feedback

**What Next**

Please operate on correct library.

---

## NDMUI-367

(error) %s failed. Design '%s' is %sremote design.

**Description**

Reported operation is not permitted in the specified design.

**What Next**

Please operate on correct design.

---

## NDMUI-368

(error) Via region %s is a system via region.

**Description**

System via region should not be editable, but user via region is editable.

---

## NDMUI-369

(error) Invalid input layer. Input layers must be metal layers.

**Description**

When a min area type routing guide is created, all input layers must be metal layers.

**What Next**

Provide all metal layer input.

---

## NDMUI-370

(error) '%s' option not specified and no default %s to use.

**Description**

This command requires a specific kind of object to operate on. However, neither an option specifying the object is provided nor a default object exists.

**What Next**

Either provide an object explicitly, or make sure that a default object exists.

Feedback

## NDMUI-371

(error) A track pattern for %s '%s' and layer '%s' already exists.

**Description**

A track pattern with the specified site_def/row_pattern and layer already exists.

**What Next**

Please provide the correct inputs. To change an existing track pattern, please remove the existing one using the 'remove_track_patterns' command first, then create new one.

## NDMUI-372

(warning) The direction '%s' specified by '%s' option is different from the preferred routing direction '%s' of the layer '%s'.

**Description**

The specified direction is different from the preferred routing direction of the layer. The tool will use the specified direction.

**What Next**

Please check the direction specified is correct.

## NDMUI-373

(error) '%s' option not specified and preferred routing direction '%s' of the layer '%s' is not supported.

**Description**

This command requires a direction input. However, neither the direction explicitly provided nor a valid preferred routing direction for this command exists.

**What Next**

Either provide a direction explicitly, or make sure that the preferred routing direction is valid for this command.

## NDMUI-374

(error) Cannot specify option '%s' when %s.

Feedback

**Description**

Cannot specify the option in given condition.

**What Next**

Please provide correct input.

---

## NDMUI-375

(error) '%s' not specified and pitch %s of the layer '%s' is not valid.

**Description**

This command requires a spacing input. However, neither an option explicitly provided, nor the pitch value of the layer is valid.

**What Next**

Please provide a spacing input, or make sure that the pitch of the layer is valid.

---

## NDMUI-376

(error) Must specify option '%s' when %s.

**Description**

The option is a mandatory option in given condition.

**What Next**

Please provide correct input.

---

## NDMUI-377

(error) Width %s specified for '%s' option is less than the minimum width %s of the layer '%s'.

**Description**

The width value specified is invalid, because it is less than the layer minimum width.

**What Next**

Change the indicated width value, so that it is at least the layer minimum width.

---

## NDMUI-378

(error) '%s' option should have size %s when %s.

Feedback

**Description**

The specified list option should have specified size, or same size as another option in given condition.

**What Next**

Provide correct input.

---

## NDMUI-379

(warning) '%s' option not specified. Using %s %s.

**Description**

You receive this warning because an option is not provided. The tool uses the indicated value.

**What Next**

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

---

## NDMUI-380

(error) All values in '%s' must be %s than %s.

**Description**

This option requires values with indicated constraint.

**What Next**

Provide the correct value to the option.

---

## NDMUI-381

(error) More than one module can't be specified with '-instance_names' option.

**Description**

Generally many modules can be created simultaneously. But when instances are created, they can be created for one module at a time.

**What Next**

Please specify a single module whose instances are to be created.

Feedback

## NDMUI-382

(error) No valid '%s' commands in specified file '%s'.

**Description**

The specified file must contain at least one valid command as indicated.

**What Next**

Check the specified file to make sure it has valid content.

## NDMUI-383

(error) Exactly one net must be specified for topology_edges and topology_nodes.

**Description**

This command accepts exactly one net to associate with the specified topology object.

**What Next**

Please specify one net.

## NDMUI-384

(error) No more than one object may be specified for a topology_edge endpoint.

**Description**

Only one object of type topology_node may be specified as a topology_edge endpoint.

**What Next**

Please specify one endpoint object.

## NDMUI-385

(error) Invalid object type specified for a topology_edge endpoint.

**Description**

Only one object of type topology_node may be specified as a topology_edge endpoint.

**What Next**

Please specify an endpoint object of type topology_node.

Feedback

## NDMUI-386

(error) unable to determine PST-equivalence for %s supply nets of power_domains '%s' and '%s' before power intent has been committed successfully.

### Description

When associating multiple power domains to a voltage area, the primary supplies of power domains should be equivalent. However, until the power intent has been finalized and committed successfully, the tool cannot determine the supply nets are equivalent based on the power state tables.

### What Next

Invoke 'commit_upf' command and make sure power intent is committed successfully.

### See Also

- commit_upf

## NDMUI-387

(error) Cannot set both topology_edge endpoints to the same object.

### Description

Topology_edge endpoints must be distinct.

### What Next

Please specify different values for topology_edge endpoints.

## NDMUI-388

(Error) -library option is not supported in library shell.

### Description

-library option is not supported in library shell.

### What Next

Remove -library option and the operation will be done on current open library.

## NDMUI-389

(warning) List of cells missing antenna property.

Feedback

**Description**

This message is for reporting missing antenna property for cells in physical library. All the cells that are missing antenna property will be reported in this table. In this table, it lists cell names and pin names missing the antenna property and the missing property type. If an input pin is missing the gate size, it is counted as missing the property. If an output pin is missing diode protection, it is counted as missing the property. If a macro is missing the hierarchical antenna property, then it is counted as missing the property. It is considered good practice to specify hierarchical antenna properties for macros.

**What Next**

Please check and load the antenna properties within workspace.

---

## NDMUI-390

(error) Translation was not completed successfully.

**Description**

The tool has failed to translate the given drc error file.

**What Next**

Please check to make sure that the input file matches the format that was given by the -drc_type option.

---

## NDMUI-391

(error) Failed to create error cell from drc error file.

**Description**

The tool encountered an error while trying to create an error cell from the given drc error file.

**What Next**

Please check to make sure that the input file matches the format that was given by the -drc_type option.

---

## NDMUI-392

(error) The specified drc type is not supported.

**Description**

The value specified for -drc_type is not valid. Valid values are: cal- ibre

Feedback

**What Next**

Rerun the command with a valid drc type.

---

## NDMUI-393

(error) Specified view name not supported.

**Description**

The specified error cell name contains a '.' character and does not end with ".err".

**What Next**

Rerun the command without specifying a view for the error cell.

---

## NDMUI-394

(error) '.' cannot be the first character in the error cell. name.

**Description**

The specified error cell name is invalid, it does not contain a design name.

**What Next**

Rerun the command with a valid error cell name.

---

## NDMUI-395

(error) Value for option -mask_contact_selections is invalid; %s.

**Description**

This option requires a list in the format {{layerName maskConstraint {contactCodeName ...}} ...}.

The contactCodeName must correspond to a ContactCode in technology file.

**What Next**

Provide the correct value to the option.

---

## NDMUI-396

(warning) Options -mask_contact_selections and -port_contact_selections are both set. The port_contact_selections setting will have higher priority when both setting are applicable for a terminal.

Feedback

**Description**

When the setting of -mask_contact_selections and -port_contact_selections are both applicable for creating via region for a terminal, tool will use the setting of -mask_contact_selections to create via region.

**What Next**

Check if the settings are correct.

---

## NDMUI-397

(warning) Exactly two pins must be specified for each cell. Skipping cell '%s'.

**Description**

The "-pins" option for command "set_supernet_exceptions" accepts a collection of pins, however, the collection must have exactly two pins for each cell the pins belong to. A pair of in & out pins must be identified for each cell for the command to work correctly for that cell. The cell with 1 or more than 2 pins is skipped.

**What Next**

Please provide the correct input. If you're using a collection, make sure the collection has exactly two pins for each cell.

---

## NDMUI-398

(warning) One input and one output pin must be specified for each cell. Skipping cell '%s'.

**Description**

The "-pins" option for command "set_supernet_exceptions" accepts a collection of pins, however, the collection must have exactly two pins for each cell the pins belong to. A pair of in & out pins must be identified for each cell for the command to work correctly for that cell. Pins with direction "inout" are not accepted.

**What Next**

Please provide the correct input. If you're using a collection, make sure the collection has exactly two pins for each cell.

---

## NDMUI-399

(error) The specified number of %s (%d) exceeds the supported maximum (%d).

Feedback

**Description**

The specified number of rows or columns exceeds the maximum supported by the via array. In each dimension, the number of cuts must be less than the supported maximum.

**What Next**

Specify the number of rows and columns, such that each is less than the supported maximum.

---

## NDMUI-400

(error) Cannot create shape with shape_use other than area_fill, in a fill cell.

**Description**

Fill cells can only have fill shapes, which means the shape_use, if specified must be area_fill. If shape is being created in a fill cell and shape_use is not specified, the shape_use will be set as area_fill.

**What Next**

Please provide the correct input. There's no need to specify shape_use if shape is being created in a fill cell

---

## NDMUI-401

(error) Cannot find a fill cell to create fill shape in.

**Description**

Fill shapes will be created in fill cells. No fill cell was specified and the top level fill cell does not exist in the design.

**What Next**

Please provide the correct input. Please specify the fill cell to create the shape in or create fill cells first.

---

## NDMUI-402

(error) Unable to uniquify the specified fill cell '%s'.

**Description**

The reference of the specified fill cell is multiply instantiated but it cannot be uniquified. Therefore, a new shape cannot be added to it. This can happen if the reference for the fill cell is a external reference.

Feedback

**What Next**

Please provide the correct input. If possible, uniquify the reference and run the command again.

---

## NDMUI-403

(error) Layer name specified is invalid.

**Description**

The layer name provided as input cannot be found in the associated tech.

**What Next**

Please provide the correct input and run the command again.

---

## NDMUI-404

(Error) Library has no associated tech.

**Description**

This command needs a library with a valid tech to run correctly. The specified library does not have a associated tech.

**What Next**

Please provide the correct input and run the command again.

---

## NDMUI-405

(Error) A tech object is not available.

**Description**

This command needs a valid tech object to run correctly. No tech object is available at this point.

**What Next**

Please load the tech object and run the command again.

---

## NDMUI-406

(warning) %s.frame does not exist.

Feedback

**Description**

This message is for missing frame cells in physical library when reporting pin information.

**What Next**

Please check the designs in the library.

---

## NDMUI-407

(warning) Failed to set property '%s' for DensityRule

**Description**

The specified property could not be set for the density rule because it does not meet the requirements

**What Next**

Please provide correct value for the property

---

## NDMUI-408

(error) Duplicate via-def '%s' can't override a via-def of same name that already has %u via usages.

**Description**

A via-def having via usages can't be overridden.

**What Next**

Please provide a different name for the via-def.

---

## NDMUI-409

(error) Only one '%s' can be specified at a time.

**Description**

This command can only process one object at a time.

**What Next**

Please provide one input at a time.

---

## NDMUI-410

(error) input bus name must be in bus_name[start:end] format.

Feedback

**Description**

Input bus name must be in bus_name[start:end] format.

**What Next**

Fix input bus name and try again.

---

## NDMUI-411

(error) bus members '%s' do not exist.

**Description**

All bus members must exist without -create_ports option.

**What Next**

Create port bus members before running this command or use -create_ports option.

---

## NDMUI-412

(error) cannot create port bus '%s'. Port bus name is already taken.

**Description**

Input bus port name is taken.

**What Next**

Use a different name or remove existing port or port bus.

---

## NDMUI-413

(error) Options -power or -ground is not allowed for primary Voltage Area.

**Description**

Options -power or -ground can't be specified for primary Voltage Area.

**What Next**

Please don't give options -power or -ground for primary Voltage Area.

---

## NDMUI-414

(error) Option -name is not allowed for primary Voltage Area with single power domain.

Feedback

**Description**

In case of single power domain, option -name can't be specified for primary Voltage Area.

**What Next**

Please don't specify option -name for primary Voltage Area with single power domain.

---

## NDMUI-415

(error) Options -guard_band or -target_utilization is not allowed for gas-station Voltage Area.

**Description**

Options -guard_band or -target_utilization can't be specified for gas-station Voltage Area.

**What Next**

Please don't specify options -guard_band or -target_utilization for gas-station Voltage Area.

---

## NDMUI-416

(error) Options -power or -ground is required for gas-station Voltage Area.

**Description**

Options -power or -ground should be specified for gas-station Voltage Area.

**What Next**

Please do specify options -power or -ground for gas-station Voltage Area.

---

## NDMUI-417

(error) Options -region is required for gas-station Voltage Area.

**Description**

Options -region should be specified for gas-station Voltage Area.

**What Next**

Please do specify options -region for gas-station Voltage Area.

Feedback

## NDMUI-418

(error) Replacement of '%s' via_def '%s' by a duplicate '%s' via-def of same name is not supported.

**Description**

Replacement via-def must be of the same type as the original via_def.

**What Next**

Please provide a different name for the via-def or create a via_def of different type.

## NDMUI-419

(error) %s '%s' cannot be assigned to terminal '%s'; it is currently assigned to terminal '%s'.

**Description**

The specified shape or via is owned by another terminal as indicated in the message. Each shape or via may belong to at most one terminal.

The command exited without modifying any data.

**What Next**

Remove the shape from its current terminal using *remove_terminals*, then call this command again.

## NDMUI-420

(error) Port bus name '%s' is invalid. Name must be the concatenation of the bus name '%s' and bus delimiter enclosed index.

**Description**

The specified port is a bus, so its name must adhere to the bus port naming convention. Port bus names must be the concatenation of the bus name, opening bus delimiter, bus index, and closing bus delimiter. The bus delimiters are specified by the app_option, design.bus_delimiters.

**What Next**

Provide a valid name for the bus port.

Feedback

## NDMUI-421

(warning) %s object '%s' is in input %s list. It is ignored.

**Description**

There is a net object in input pin/port list or there is a pin/port object in input net list. It is ignored when searching for all connected.

**What Next**

Provide input object list containing all nets or all pins/ports.

## NDMUI-422

(info) No internal database errors were detected in module '%s'.

**Description**

This message indicates that the data-model integrity checker didn't find any internal database errors for the reported module.

## NDMUI-423

(error) The database has internal errors. You must revert to an earlier version of this database to proceed. Please contact your Synopsys representative to report this issue.

**Description**

This message indicates that the data-model integrity checker has found internal database errors.

**What Next**

It is recommended that you revert to an earlier version of this database to proceed.

## NDMUI-424

(warning) Removal of %s '%s' invalidates voltage_area_routing_rule '%s'. The rule has been removed.

**Description**

The removed voltage_area or voltage_area_shape was associated with the specified voltage_area_routing_rule. After the object was remove, the voltage_area_routing_rule was left in an invalid state (i.e., the rule was left without any starting, ending, or pass-through objects). So the rule was removed from the design.

Feedback

### What Next

Undo the remove command if you did not intend to remove these objects.

---

## NDMUI-425

(error) %s '%s' is an invalid %s object of the voltage_area_routing_rule; %s.

### Description

The starting and ending objects of a voltage_area_routing_rule must be a voltage_area, macro cell, pad cell, or macro cell pin. No other object types are allowed.

### What Next

Check the object types that are being set as the starting objects of the voltage_area_routing_rule. Remove any objects from your list which are not an allowable type.

---

## NDMUI-426

(error) Cannot append to existing rule '%s', because the specified start and end objects do not match the existing rule's start and end objects.

### Description

When a rule already exists in the design with the given name, the create_voltage_area_routing_rule command appends the specified options onto the existing rule if and only if the start and end objects matching the existing rule's start and end objects.

### What Next

Specified another rule name when calling the create_voltage_area_routing_rule command. Or if you want to append to the existing rule, specify the same start and end objects as the existing rule's start and end objects in the -from and -to command options.

---

## NDMUI-427

(warning) %s '%s' does not belong to current block. It is ignored.

### Description

This message indicates that input object does not belong to current block. It is ignored.

### What Next

Please only input object belonging to current block.

Feedback

## NDMUI-428

(warning) %s '%s' does not have corresponding physical net. It is ignored.

**Description**

This message indicates that input net does not have corresponding physical net. It is ignored.

**What Next**

Please only input net with corresponding physical net.

## NDMUI-429

(error) one of -shapes and -nets options is required for this command.

**Description**

This message indicates that none of -shapes and -nets options is specified.

**What Next**

Please input at least one of -shapes and -nets options.

## NDMUI-430

(error) shielding shape '%s' must be PG related.

**Description**

This message indicates that input shielding shape is not PG related.

**What Next**

Please input only shielding shape that is PG related.

## NDMUI-431

(error) shielded net '%s' must not be PG net.

**Description**

This message indicates that input shielded net is PG net.

**What Next**

Please input only net that is not PG net.

Feedback

## NDMUI-432

(error) shielding shape '%s' shape_use must be route_shield and physical_status must be minor_change.

**Description**

This message indicates that input shielding shape shape_use is not route_shield or physical_status is not minor_change.

**What Next**

Please input only appropriate shapes.

## NDMUI-433

(error) Command '%s' is not supported on %s view.

**Description**

This message indicates that specified command is unsupported on the reported view.

**What Next**

Please use different view for the specified command.

## NDMUI-434

(warning) Name %s is reserved for auto generated names. Ignored -name.

**Description**

This message indicates that given name is reserved for auto generated name for unnamed blockages. -name is ignored so system will generate the name.

**What Next**

Provide the name which is not reserved for auto generated names.

## NDMUI-435

(error) The specified supply_net '%s' is not available on sub-block '%s'.

**Description**

This error shows up when creating a voltage_area in a sub-block through the -cell option, when the specified supply_net exists only on the top-level block but not on the sub-block.

Feedback

### What Next

Verify the the supply_net is available on the sub-block.

---

## NDMUI-436

(error) Cell '%s' cannot be assigned to the voltage_area; it is in a different block than the voltage_area

### Description

The specified object is in a different block than the voltage_area. The voltage_area and its containing cells must be in the same physical block.

### What Next

Specify cells that are in the same block as the voltage_area.

---

## NDMUI-437

(Error) Unable to assign routing_rule '%s' to net '%s' because a different routing_rule with the name '%s' already exists in the net's block '%s'.

### Description

The specified routing_rule and net are in different blocks. In order to assign the routing_rule to the ent, the routing_rule and net must be in the same block. The command attempted to copy the routing_rule into the block of the net. However because a routing_rule already exists with the same name but different rules in the net's block, the copy was unsuccessful. The routing_rule is not assigned to the net.

### What Next

Make sure the routing_rule definitions are consistent in each block and call this command again.

---

## NDMUI-438

(Error) The specified reference design is of type 'tsv' but is not a valid TSV reference design: %s

### Description

A design of type 'tsv' was specified as the cell reference in the command, however the design fails to meet one or more requirements for use as a TSV reference design. Please see the *create_cell* man page's documentation on its *reference* argument for more information on TSV reference design criteria.

Feedback

### What Next

Please correct the design or use a different, valid TSV design as the reference.

---

## NDMUI-439

(Error) application option <%s> is obsolete. See the man page for this app_option for migration assistance.

### Description

The specific application option has been made obsolete and hence the user script needs to be migrated. The man page of the particular application option will have details about the required migration activity.

### What Next

See the man page for this application option for migration assistance.

---

## NDMUI-440

(error) Cannot change_link for cell '%s' because the port interface of design '%s' does not match port interface of current lib_cell '%s'.

### Description

The *change_link* command was unable to change the lib_cell bound to the specified cell. The order in which ports occur in the new lib_cell must be identical to the order of ports in the lib_cell the cell is currently bound to.

### What Next

Try using a different design when change_link for this cell.

---

## NDMUI-441

(warning) application option <%s> is deprecated and scheduled for removal in a future release. See the man page for this application option for migration assistance.

### Description

The specific application option has been made deprecated and will hence be removed in a future release. The man page of the particular application option will have details about the required migration activity.

### What Next

See the man page for this application option for migration assistance.

Feedback

## NDMUI-442

(Error) The application option <%s> is obsolete.

**Description**

The specific application option has been made obsolete and hence the user script needs to be migrated to use alternative application option.

**What Next**

This application option has been made obsolete. The user script will have to be replaced with the alternative application option.

## NDMUI-443

(warning) The application option <%s> is deprecated and scheduled for removal in a future release.

**Description**

The specific application option has been made deprecated and will hence be removed in a future release. Hence the user script needs to be migrated to use alternative application option.

**What Next**

This application option has been made deprecated. The user script will have to be migrated to use the alternative application option.

## NDMUI-444

(error) The %s of the default voltage_area cannot be changed.

**Description**

The default voltage_area (DEFAULT_VA) is auto-generated. Its name or supply nets cannot be changed.

## NDMUI-445

(error) Option '-class' can't be specified when all input objects are collections.

**Description**

When objects specified for get_attribute and set_attribute are collections only then -class option can't be used. Objects in the collections are already of a certain class type and so using -class option on top of it is improper.

Feedback

### What Next

Don't use -class option when input objects to get_attribute and set_attribute are through collections. Use -class option only when input object is specified as string that can't be implicitly found.

---

## NDMUI-446

(error) Option '%s' cannot be specified when creating a single-cut via.

### Description

The indicated option is allowed only on array vias. It cannot be specified if the via has only one cut.

### What Next

Remove the indicated option or specify more than one cut in the *-size* option.

---

## NDMUI-447

(error) Pattern cannot be an empty string.

### Description

The pattern cannot be an empty string. The pattern must be a space delimited string of equal length substrings (e.g., "1010 0101 1011" is a 3x4 pattern). Each substring must consist of only 1s and 0s, representing a row in the MxN pattern, starting with the bottom row in the pattern.

### What Next

Specify a non-empty pattern string.

---

## NDMUI-448

(error) Substrings in pattern '%s' do not have equal lengths.

### Description

The pattern substrings must have equal lengths. The substring length is equal to the number of columns (i.e., N) in the MxN pattern.

The pattern is a space delimited string of equal length substrings (e.g., "1010 0101 1011" is a 3x4 pattern). Each substring must consist of only 1s and 0s, representing a row in the MxN pattern, starting with the bottom row in the pattern.

Feedback

**What Next**

Correct the substrings in the pattern so that they all have the same length.

---

## NDMUI-449

(error) Pattern substring '%s' contains invalid characters.

**Description**

The pattern substring must contain only 1s and 0s. No other characters are allowed.

The pattern is a space delimited string of equal length substrings (e.g., "1010 0101 1011" is a 3x4 pattern). Each substring must consist of only 1s and 0s, representing a row in the MxN pattern, starting with the bottom row in the pattern.

**What Next**

Correct the specified pattern substring so that it contains only 1s and 0s.

---

## NDMUI-450

(error) Option '%s' cannot be used if option '%s' is specified with a non-zero value.

**Description**

Via distance thresholds cannot be used with taper rules. All taper rule options must be unspecified or set to zero.

**What Next**

Remove the taper option or set the taper option value to zero.

---

## NDMUI-451

(error) Layer '%s' is not defined with the rectangle only rule in the technology file and therefore cannot be used in option '%s'.

**Description**

The via distance thresholds can be specified only on layers which are restricted to rectangle only shapes. These layers are defined in the technology file with the 'hasRectangleOnly = 1' statement.

**What Next**

Remove the layer from the *-via_distance_thresholds* option or update the technology to include the rectangle only rule on the layer.

Feedback

## NDMUI-452

(error) Via pattern '%s' cannot be used with the specified via distance thresholds; %s.

**Description**

The via pattern cannot be used with the via distance thresholds specified through the *-via_distance_thresholds* option. When the *-via_distance_thresholds* option is used, the via pattern must meet these requirements:

1) The via_def name must correspond to a simple via_def.

2) If either of the via_def enclosure layers are assigned a via distance threshold, the via_def must be symmetric.

3) If the via_def lower enclosure layer is assigned a via distance threshold, the layer must be defined with 'hasRectangleOnly = 1' in the technology file, and the lower enclosure must be smaller than or equal to the routing_rule width.

4) If the via_def upper enclosure layer is assigned a via distance threshold, the layer must be defined with 'hasRectangleOnly = 1' in the technology file, and the upper enclosure must be smaller than or equal to the routing_rule width.

**What Next**

Remove the via pattern from the *-vias* option, or update the options to meet the above requirements.

## NDMUI-453

(warning) Name %s is reserved for auto generated names. Ignored -name.

**Description**

This message indicates that given name is reserved for auto generated name for unnamed groups. -name is ignored so system will generate the name.

**What Next**

Provide the name which is not reserved for auto generated names.

## NDMUI-454

(error) Group '%s' already exists in the design.

**Description**

A group with the specified name already exists in the design.

Feedback

**What Next**

Specify a different group name, or use the remove_groups command to remove the existing group. Alternatively either you may omit the name option, and the system will automatically select a unique name for the group or remove the existing group and create both the group with -allow_duplicate_name option.

---

## NDMUI-455

(warning) %s can not be used without %s. Ignored %s.

**Description**

This message indicates that specified option must be used with other missing option. Specified option is ignored.

**What Next**

Specify missing option along with the specified option.

---

## NDMUI-456

(error) Group %s created successfully but error occurred during member addition.

**Description**

This message indicates that group is created but error occued during object addition.

**What Next**

Multiple time addition of same object in a "set" type group is not allowed. Check if any object is being added multiple times.

---

## NDMUI-457

(error) Member %s failed in group %s.

**Description**

This message indicates that error occued during member addition or removal.

**What Next**

Multiple time addition of same object in a "set" type group is not allowed. Check if any object is being added multiple times. Check if the member belong to the same design as of group. Make sure that member addition does not form any cycle. Removal of non-member object from a group is not allowed. Make sure that object being removed is part of the group.

Feedback

## NDMUI-458

(error) Cannot create new shape in arrayed fill cell '%s'.

**Description**

The specified fill cell is arrayed. New shapes cannot be created in arrayed fill cells.

**What Next**

Please provide the correct input.

## NDMUI-459

(error) The minimum and maximum routing layer cannot be the same layer '%s'.

**Description**

The minimum and maximum routing layers must be set to two different routing layers.

**What Next**

Correct the layer specified to the *-min_routing_layer* or *-max_routing_layer* option.

## NDMUI-460

(error) Cannot specify mask value to the shape of layer '%s', because the layer number_of_masks attribute value is '%d'.

**Description**

The mask value can be specified only when the layer's number_of_masks attribute is 2 or greater.

**What Next**

Correct the layer's number_of_masks attribute value so it is at least 2.

## NDMUI-461

(error) The application option <%s> is for R&D debug and can't be used outside Synopsys.

**Description**

The specific application option is for R&D debug. It cannot be used outside Synopsys and will not be retrieved or set.

Feedback

### What Next

The user script should be modified to remove the internal app option.

---

## NDMUI-462

(Warning) The given value for '%s' is not being set for hard macro '%s'.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to set an option or attribute which is not supported on hard macro cell. Currently pin alignment and cell orientation features are not supported for hard macros cells.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## NDMUI-463

(error) Options -net_types or -zero_spacing or -blockage_group_id or -auto_blockage_group_id are not allowed for block boundary blockages.

### Description

Options -net_types or -zero_spacing or -blockage_group_id or -auto_blockage_group_id can't be specified for block boundary blockages, as indicated with use of -boundary_internal or -boundary_external options.

### What Next

Please don't specify options -net_types or -zero_spacing or -blockage_group_id or -auto_blockage_group_id for block boundary blockages.

---

## NDMUI-464

(error) Source view '%s' is not same as specified destination view '%s'.

### Description

The source block view and destination block view must match while copying, moving or renaming a block. Any particular view can't be changed to any other view as content wise it will be incorrect.

Feedback

**What Next**

Maintain the same view for both source and destination blocks.

---

## NDMUI-465

(error) Same port can not be %s more than one port bus.

**Description**

Each port bus contains unique ports. Same port can not be added to more than one port bus.

**What Next**

Maintain the uniqueness of ports.

---

## NDMUI-466

(error) Multiple ports can not be %s the port bus at a time.

**Description**

Port bus updation is allowed one by one.

**What Next**

Remove the multiple ports and do it sequentially.

---

## NDMUI-467

(error) Port can be added to parent module's port bus only.

**Description**

Port's and port bus are in different module.

**What Next**

Port's and port bus should be in same module.

---

## NDMUI-468

(error) Port bus does not have the port to be removed.

**Description**

Only existing port can be removed from the port bus.

Feedback

**What Next**

Make sure that port to be removed is part of the port bus.

---

## NDMUI-469

(error) %s cannot be less than the corresponding minimum cut spacings %s for x_pitch and %s for y_pitch.

**Description**

A base pitch cannot be less than the corresponding minimum cut spacings.

**What Next**

Please provide the correct base pitch not less than the corresponding via_def minimum cut spacings.

---

## NDMUI-470

(error) The base_x_pitch and base_y_pitch values of '%s' cannot be less than the corresponding minimum cut spacings of %s and %s on the cut layer specified by the given via_def.

**Description**

A via_def has been specified on which the cut layer has a minimum cut spacing that is larger than the cut spacing specified for the cuts of this array via.

**What Next**

Check the cut spacing of this array via and provide a value greater than or equal to the minimum cut spacing of the cut layer specified in the via_def.

---

## NDMUI-471

(error) Value '%s' for %s option. The mask_constraints is invalid; %s.

**Description**

This option requires a list in the format {{row column mask_name [fixed]} ...}.

The mask_name must be mask_one, mask_two, or same_mask for upper/lower masks, in addition to these mask names, the cut masks can be no_mask, mask_three, mask_four, mask_five, mask_six, mask_seven, mask_eight, mask_nine, mask_ten, mask_eleven, mask_twelve, mask_thirteen, mask_fourteen, mask_fifteen. If the mask is fixed, then the keyword, fixed, must be specified. If the mask is not fixed, do not specify the keyword.

Feedback

**What Next**

Provide the correct value to the option.

---

## NDMUI-472

(error) Port is already a member of port bus %s.

**Description**

Port is already a member of the port bus.

**What Next**

Verify that you specified the correct port and port bus.

---

## NDMUI-473

(error) %s.

**Description**

Log file for individual commands within parallel_execute is not specified correctly. If -commands_only option is used, then no log file should be specified for individual commands. Similarly a log file must be specified when not using -commands_only. Also log file for an individual command can't be multiple strings.

**What Next**

Verify that if a log file is specified, when not using -commands_only, then it is a single string. If -commands_only option is used, then log file must not be used.

---

## NDMUI-474

(error) %s.

**Description**

Individual command specified within parallel_execute is either unknown or not a read-only command or parallel_execute itself.

**What Next**

Verify that each command specified within parallel_execute is a valid ICC2 command and also a read-only command like, for example, reporting commands. Any command that modifies design data like, for example, create commands are not allowed to be executed within parallel_execute. Also nested parallel_execute is not allowed.

Feedback

## NDMUI-475

(warning) The design '%s' is read only.

**Description**

*create_terminal* command needs to modify the library %s. If the design is read only, *create_terminal* command cannot be completed.

**What Next**

The design may be a read only lib cell. Otherwise, the write permission of the design is needed to be enabled.

## NDMUI-476

(warning) The shape '%s' is not a net shape.

**Description**

*create_terminal* command needs the layer shapes and vias belonging to nets to be duplicated as terminals of the port.

**What Next**

The command create_terminal needs net shapes to be provided as input for the "-of_objects" option.

## NDMUI-477

(warning) The option '%s' is ignored when specified with option '%s'.

**Description**

*create_terminal* command ignores the specified option when this is used with the option "-of_objects".

**What Next**

The above option is ignored when specified with "-of_objects".

## NDMUI-478

(warning) The shape '%s' already belongs to a terminal.

Feedback

### Description

*create_terminal* command needs the layer shapes and vias belonging to nets to be duplicated as terminals of the port. The input shapes already is associated with a terminal. The shape will be ignored.

### What Next

The command create_terminal needs net shapes to be provided as input for the "-of_objects" option.

---

## NDMUI-479

(warning) The shape '%s' is physically overlapping with multiple ports. The shape will be ignored.

### Description

*create_terminal* command needs the layer shapes and vias belonging to nets to be not physically overlapping with multiple ports. These shapes cannot be used for further processing and will be ignored.

### What Next

The command create_terminal needs net shapes to be physically overlapping with atmost one port.

---

## NDMUI-480

(error) Cell '%s' is bound to non-design view '%s' which, if modified, can lead to inconsistencies.

### Description

The design view is primarily the source of all other view derivation and for example, design view itself can't be extracted from say, abstract or frame view. If a non-design view is modified by *change_names* then it will cause this non-design view to be out of sync with its design view leading to issues like inconsistency in design data with its associated timing constraints. On the other hand if a design view is modified then other views can be derived from this modified design view and all views will be in sync.

### What Next

This situation can happen only when *change_names* is applied hierarchically across multiple physical hierarchy including sub-blocks. Make sure that only design view is used for sub-blocks to link the top block before applying *change_names* or re-link with design views in order to consistently rename all the design data and associated timing constraints.

Feedback

## NDMUI-481

(error) Same net can not be %s more than one net bus.

**Description**

Each net bus contains unique nets. Same net can not be added to more than one net bus.

**What Next**

Maintain the uniqueness of nets.

## NDMUI-482

(error) Multiple nets can not be %s the net bus at a time.

**Description**

Port bus updation is allowed one by one.

**What Next**

Remove the multiple nets and do it sequentially.

## NDMUI-483

(error) Net can be added to parent module's net bus only.

**Description**

Net and net bus are in different module.

**What Next**

Net and net bus should be in same module.

## NDMUI-484

(error) Net bus does not have the net to be removed.

**Description**

Only existing net can be removed from the net bus.

**What Next**

Make sure that net to be removed is part of the net bus.

Feedback

## NDMUI-485

(error) Net is already a member of net bus %s.

**Description**

Net is already a member of the net bus.

**What Next**

Verify that you specified the correct net and net bus.

## NDMUI-486

(error) bus members '%s' do not exist.

**Description**

All bus members must exist without -create_nets option.

**What Next**

Create net bus members before running this command or use -create_nets option.

## NDMUI-487

(error) cannot create net bus '%s'. Net bus name is already taken.

**Description**

Input bus net name is taken.

**What Next**

Use a different name or remove existing net bus.

## NDMUI-488

(error) Heterogeneous bundles are not allowed. Bundle components should be of same type.

**Description**

Bundles should be homogeneous. They can only consist of same type of objects but not a mix of different types.

**What Next**

Make sure that the object list consists of only one type of objects.

Feedback

## NDMUI-489

(warning) Skipping bundle '%s' consisting of supernets which is not supported for some applications.

### Description

Currently some applications don't support bundles of supernets. Till the time the applications are ready to support bundles of supernets, such bundles can't be used in those applications.

### What Next

Consider creating a bundle of nets that are part of the supernets.

## NDMUI-490

(warning) Ignoring the -base_pitch option because the base via is a single cut via.

### Description

When the base via is defined as single cut, the value specified by -base_pitch doesn't take effect.

### What Next

Delete the "-base_pitch" option to create a via matrix with a single cut base via or Consider creating a via matrix with multiple cut base via.

### See Also

- create_via_matrix

## NDMUI-491

(information) No net shape or via geomtries is added as a terminal shape.

### Description

The command 'create_terminal' didnot add any net shape or via as terminals. This may be because there is no physical overlap between the input net shapes and the existing terminal shapes.

## NDMUI-492

(error) The specified net %s isn't power/ground. A %s can connect with a power/ground net only.

Feedback

**Description**

Only a power/ground net can connect with the reported object_class.

**What Next**

Specify a power/ground net to connect with the reported object_class.

---

## NDMUI-493

(information) The specified %s mask pattern is uniform, only the responsible mask constraint of lower left base via can be honored.

**Description**

The specified mask_pattern is uniform, only the responsible mask constraint of lower left base via can be honored. specify the mask pattern to arbitrary to honor every mask constraint.

---

## NDMUI-494

(warning) Cannot delete auto-generated port terminal '%s'; its shape is owned by a pad cell.

**Description**

The terminal was auto-generated by the application, because its port is connected to a pad pin. The terminal attribute, *is_owned_by_pad*, is true. Its shape is really owned by the pad pin. The terminal cannot be removed by this command.

**What Next**

This terminal cannot be directly removed. However if you manually create a terminal on the port or disconnect the port from the pad pin, this terminal will be removed automatically.

---

## NDMUI-495

(warning) ignore option “-base_pitch”, because the base via is defined as single cut one.

**Description**

When the base via is defined as single cut, the value specified by -base_pitch doesn't take effect.

Feedback

**What Next**

Delete the "-base_pitch" option to create a via matrix with a single cut base via or Consider creating a via matrix with multiploe cut base via.

---

## NDMUI-496

(warning) The mask_pattern is set to uniform. Only mask constrain in lower left base via is honored. Others will be omitted.

**Description**

Mask constrains other than lower left base via will be honored only when the mask_pattern isn't uniform.

**What Next**

Consider mask pattern other than uniform to honor all maks constrains.

---

## NDMUI-497

(error) Rule type '%s' cannot be set on %s '%s' because %s.

**Description**

When setting the rule_type attribute to "net_non_default", the object must be owned by a net and the net must be constrained by a routing rule.

**What Next**

Assign the object to a net or assign a routing rule to the net as necessary. Then set the rule_type attribute.

---

## NDMUI-498

(error) Voltage area '%s' is not in the same block '%s' as the voltage area rule being created.

**Description**

The specified voltage area is not in the same block as the voltage area rule. The voltage area and its assigned rule must be in the same block.

**What Next**

Create the voltage area rule in the same block as the voltage area.

Feedback

## NDMUI-499

(error) Failed to create %s voltage area rule. Design contains %s rules created through the %s command. Design cannot contain both new and deprecated rules.

### Description

Voltage area rules may be created with either the new *create_voltage_area_rule* or deprecated *create_voltage_area_routing_rule* command, but not both. The design cannot contain both new and deprecated rules at the same time.

### What Next

Remove all existing voltage area rules from the design, and then create the voltage area rules.

## NDMUI-500

(error) Failed to create the default rule, because %s.

### Description

The command failed to create the default voltage area rule for the indicated reason. Only one default rule may exist in each design. The tool automatically names the default rule as "DEFAULT_RULE".

### What Next

If the default rule already exists and you want to modify it, use the *set_attribute* command to modify its attributes.

## NDMUI-501

(error) Physical feedthrough cannot be allowed when pass through is disallowed.

### Description

Physical feedthrough cannot be allowed when pass through is disallowed. If you want to allow physical feedthrough, you must also allow pass through.

Only these option combinations are supported:

```
-allow_pass_through false -allow_physical_feedthrough false
-allow_pass_through true -allow_physical_feedthrough false
-allow_pass_through true -allow_physical_feedthrough true
```

### What Next

Change the *-allow_pass_through* and *-allow_physical_feedthrough* option values to one of the supported combinations.

---

## NDMUI-502

(error) Cannot update existing voltage area rule '%s', because the specified -allow_pass_through, -allow_physical_feedthrough, and -allow_logical_feedthrough option values do not match the existing rule.

### Description

When a rule already exists in the design with the given name, the create_voltage_area_rule command adds the specified voltage areas to the existing rule if and only if the constraints match.

### What Next

Specified another rule name when calling the create_voltage_area_rule command.
Or if you want to append to the existing rule, specify the same *-allow_pass_through*, *-allow_physical_feedthrough*, and *-allow_logical_feedthrough* option values as the existing rule.

---

## NDMUI-503

(warning) Removing voltage area "%s" from currently assigned voltage area rule "%s". It will be constrained by the new rule.

### Description

A voltage area may be assigned to at most one voltage area rule. The voltage area has been removed from its existing rule and reassigned to the new rule.

### What Next

Verify that you intended to reassign the voltage area to the new rule.

---

## NDMUI-504

(warning) Removing voltage area rule "%s" because it is no longer constraining any voltage area.

### Description

Voltage area rules cannot exist in the design without any voltage areas to constrain. When creating a new rule on voltage areas, the voltage areas are removed from their existing

Feedback

rules first. This process may cause rules to be orphaned, left behind without any voltage areas to constrain. Such rules are removed automatically by the tool.

**What Next**

Verify that you intended to reassign the voltage areas to the new rule, causing their original rules to be orphaned and removed.

---

## NDMUI-505

(error) Length of list values specified for options '%s' must be same.

**Description**

Length of list values sepecified for these options must be same.

**What Next**

Make sure that length of each option value is same.

---

## NDMUI-506

(error) Unable to create %s as the specified input %s have different %s.

**Description**

The specified input objects must have matching attributes for conversion to the composite object of the reported output object_class.

**What Next**

Please remove the input objects with different attributes.

---

## NDMUI-507

(warning) Net shape '%s' has no port .

**Description**

The command 'create_terminal' didnot add any terminal for this net shape. This is because there is no port been detected for this terminal shape.

---

## NDMUI-508

(error) All cells must have the same 'is_tsv' attribute value.

Feedback

**Description**

Either all or none of the cells specified in the set_reference command may be TSV cells - a mixture of TSVs and non-TSVs is not permitted.

**What Next**

Please specify a cell list that is homogeneous with respect to their is_tsv attribute values.

---

## NDMUI-509

(warn) Creating synonym '%s',%s

SH DESCRIPTION The pin name synonym is not setting correctly.

**See Also**

- remove_pin_name_synonym
- report_pin_name_synonym

---

## NDMUI-510

(error) Creating synonym: '%s',%s

**Description**

The printed constraint value is not a valid value.

**See Also**

- remove_pin_name_synonym
- report_pin_name_synonym

---

## NDMUI-511

(error) Owner %s '%s' is not in the same block as the topological constraint.

**Description**

The owner net or bundle must be in the same block as the topological constraint being created. The topological constraint cannot be owned by objects in other physical blocks.

**What Next**

Specify an owner net or bundle that is in the same block as the topological constraint.

Feedback

## NDMUI-512

(error) Pitch specified is not enough to create required sadp_tracks (minimum pitch is '%s').

### Description

The command 'generate_sadp_tracks' will create sadp_tracks only if specified pitch is enough to create required sadp_tracks.

## NDMUI-513

(error) Track rule '%s' doesn't exist in current library.

### Description

The command 'generate_sadp_tracks' will create sadp_tracks based on track rule only if track rule exist.

## NDMUI-514

(information) Start Point of sadp_tracks is shifted to %s = %s.

### Description

The command 'generate_sadp_tracks' will try to find friendly start point when *-exact* is not specified.

## NDMUI-515

(error) Space between start point and end point is not enough to create required sadp_tracks.

### Description

When *-exact* is specified sadp_tracks should start from specified start point and should end before the specified specified end point but there is no enough space between start and end point to create required sadp_tracks.

### What Next

Option *-exact* can be removed so the command *generate_sadp_tracks* can find the friendly nearest start point for the required sadp_tracks.

Feedback

## NDMUI-516

(information) Tracks '%s' and '%s' overlap at point %s = %s.

**Description**

Sadp_tracks should not be overlapping with each other.

## NDMUI-517

(information) Track '%s' doesn't meet sadp spacing requirement.

**Description**

Every sadp_track should meet sadp spacing requirement.

## NDMUI-518

(error) Net '%s' doesn't exist in the current design.

**Description**

The command 'create_sadp_track_rule' will create track rule with net constrainst on track only if net exists before the creation of track rule.

## NDMUI-519

(error) Unsupported track pattern.

**Description**

The command 'create_sadp_track_rule' will create track rule only if pattern format is correct.

## NDMUI-520

(error) Unable to create required sadp_tracks as there is no enough free space on the specified layer.

**Description**

The command 'generate_sadp_tracks' will create sadp_tracks only if there is enough space on the layer.

Feedback

## NDMUI-521

(error) Cannot specify '-pitch' when count is less than two.

**Description**

Pitch is required only when count is two or more than two.

## NDMUI-522

(error) Mask value '%s' for '%s' is not valid. The value is valid only for custom vias.

**Description**

The mask value, inherit_mask, may be specified only for the mask constraint attributes on custom vias. It is not used for simple vias.

**What Next**

Specify a valid mask (i.e., a value other than inherit_mask) for the simple via.

## NDMUI-523

(error) '%s' is not a valid name, because it is reserved for the default rule.

**Description**

The specified name is not valid when creating a voltage area specific rule. "The name is reserved for the default rule and cannot be used for any other voltage area rule.

**What Next**

Specify another name for the voltage area rule.

## NDMUI-524

(Warning) The command '%s' is not supported when Golden UPF mode is not turned on.

**Description**

Name map only works with golden upf mode.

**What Next**

Ensure to turn on golden upf mode if want to use name map.

Feedback

**See Also**

- read_name_map
- mv.upf.enable_golden_upf

---

## NDMUI-525

(error) A '%s' floorplan rule by name '%s' already exists.

**Description**

While trying to create a floorplan rule using any of the *set_floorplan_** commands, the name specified for the new rule matches one of the existing floorplan rule's name.

**What Next**

Either provide a different name for new floorplan rule to be created or remove existing floorplan rule with conflicting name if seems appropriate.

---

## NDMUI-526

(error) Minimum value '%d' can not be greater than maximum value '%d' specified in '%s'.

**Description**

While trying to create a floorplan rule using any of the *set_floorplan_** commands, either values specified with *-min/-max* or *-forbidden_range* or *-valid_range* doesn't follow the min less than max criterion.

**What Next**

Please provide values such that min less than max criterion is satisfied.

---

## NDMUI-527

(error) Please only specify one layer for the -min_pin_layer option.

**Description**

The option *-min_pin_layer* is to set the minmum layer to have terminals on it. Please only specify one layer for this option.

**What Next**

Please see the man page of *report_lib* command for more infomation. report_lib(2)

Feedback

## NDMUI-528

(Error) The command '%s' is not supported when name map version is version 1.0 in Golden UPF mode.

### Description

This message occurs when reading a name map file with name map version v1.0 and related command is not supported.

### What Next

Set the name map version to 2.0 if want to use the name mapping defined by this command.

### See Also

- read_name_map
- mv.upf.enable_golden_upf

## NDMUI-529

(information) Open block '%s' is marked unbound.

### Description

The open block of this library has been marked unbound.

## NDMUI-530

(error) Unable to open reference block '%s'.

### Description

The block specified as the new reference cannot be opened and therefore cannot be used as reference.

### What Next

Please check the previous error messages and specify a compatible reference block.

## NDMUI-531

(warning) Could not set the via_def on one or more non-TSV cells.

Feedback

**Description**

Cells passed to the set_via_def command using the '-cells' argument must all have their 'is_tsv' attribute equal to 'true'. Only TSV cells may reference a via_def, and the via_def must be of type 'through_silicon_via_def'.

**What Next**

Please pass exclusively TSV cells to the '-cells' argument of the set_via_def command.

---

## NDMUI-532

(error) Only TSV cells can reference designs of type 'tsv'.

**Description**

When using the set_reference command to set the reference to a design of type 'tsv', the specified cells must all be TSV cells - that is, they must all have their 'is_tsv' attribute equal to 'true'.

**What Next**

Please pass TSV cells exclusively to the command when setting the reference to TSV designs.

---

## NDMUI-533

(error) TSV cells may only reference designs of type 'tsv'.

**Description**

When using the set_reference command to set the reference of TSV cells - that is, cells with their 'is_tsv' attribute equal to 'true' - the reference design must be of type 'tsv'.

**What Next**

Please specify a valid TSV design when setting the reference of TSV cells.

---

## NDMUI-534

(error) Logical feedthrough cannot be allowed when pass through is disallowed.

**Description**

Logical feedthrough cannot be allowed when pass through is disallowed. If you want to allow logical feedthrough, you must also allow pass through.

Feedback

Only these option combinations are supported:

```
-allow_pass_through false -allow_logical_feedthrough false
-allow_pass_through true -allow_logical_feedthrough false
-allow_pass_through true -allow_logical_feedthrough true
```

**What Next**

Change the *-allow_pass_through* and *-allow_logical_feedthrough* option values to one of the supported combinations.

---

## NDMUI-535

(information) The port die_side attribute has changed from '%s' to '%s' to match the specified preferred pin.

**Description**

When the preferred pin is set, the die side attribute is updated to match the preferred pin's location on the die.

**What Next**

Check the port die_side attribute.

---

## NDMUI-536

(error) Command argument '%s' must be a collection of %s of type %s.

**Description**

The value of the specified command argument must be a collection with the specified size and type.

**What Next**

Provide an argument value of the specified collection size and type.

---

## NDMUI-537

(error) Neither frame nor design view present for '%s'

**Description**

Frame view is preferred for lib cells specified in floorplan rules. For soft macro, the design view can be specified if frame view doesn't exist. But either frame or design view is needed.

Feedback

**What Next**

Please make sure that either frame or design view exists for specified lib cells in floorplan rules.

---

## NDMUI-538

(warning) The origin of topology_node '%s' could not be computed: %s.

**Description**

The origin of the specified topology_node could not be computed and set due to the specified reason.

**What Next**

Please adjust the topology_node's constraint attributes to a legal and unambiguous configuration.

---

## NDMUI-539

(error) Bounds may not be created in lib cells.

**Description**

Lib cells blocks may not contain bounds.

**What Next**

Please specify a valid block in which to create the bound.

---

## NDMUI-540

(error) One voltage area must be specified through the option '%s' if option '%s' is specified.

**Description**

When creating a voltage area rule on specific logical hierarchies, exactly one voltage area must be specified in the *-voltage_areas* command option. The voltage area must be associated with the power domain of the logical hierarchies.

**What Next**

Specify exactly one voltage area in the *-voltage_areas* command option.

Feedback

## NDMUI-541

(error) Cannot update existing voltage area rule '%s', because %s.

### Description

When a rule already exists in the design with the given name, the create_voltage _area_rule command cannot update the existing rule for the stated reason. If logical hierarchies are specified for a specific voltage area, but the existing rule constrains a different voltage area, the existing rule cannot be updated. If multiple voltage areas or a different voltage area is specified, but the existing rule constrains specific logical hierarchies of its associated voltage area, the existing rule cannot be updated.

### What Next

Remove the existing rule with *remove_voltage_area_rules* command option, and then create a new rule.

## NDMUI-542

(error) The '.' character is specified but the top hierarchy is not in the power domain of the specified voltage area '%s'.

### Description

When creating a voltage area rule controlling whether logical feedthrough buffering is allowed on the top hierarchy, the top hierarchy must be a root of the specified voltage area's power domain.

### What Next

Correct the *-voltage_areas* option value, so that it specifies the correct voltage area.

## NDMUI-543

(error) Cell '%s' is not a level of logical hierarchy in the top block.

### Description

When creating a voltage area rule controlling whether logical feedthrough buffering is allowed on specific logical hierarchies, the specified cells must indicate logical hierarchies in the same block as the rule.

### What Next

Correct the list of cells, so that they are logical hierarchies within the same block as the rule.

Feedback

## NDMUI-544

(error) Cell '%s' is not a power domain root cell of the specified voltage area '%s'.

**Description**

When creating a voltage area rule that controls whether logical feedthrough buffering is allowed on specific logical hierarchies, the specified cells must be root cells of the specified voltage area's power domain.

**What Next**

Correct the *-voltage_areas* option value, so that it specifies the correct voltage area. Or correct the list of cells, so that they are root cells of the voltage area's power domain.

## NDMUI-545

(error) Attributes '%s' and '%s' must be cleared before setting attribute '%s'.

**Description**

A voltage area rule may contain a list of included hierarchies or a list of excluded hierarchies, but not both at the same time. To switch from one to another, the indicated attributes must be cleared before setting the new attribute.

**What Next**

Clear the indicated attributes with the *remove_attributes*command, then set the new attribute.

## NDMUI-546

(error) Top hierarchy is not in the power domain of the rule's voltage area '%s'.

**Description**

When setting a voltage area rule to control logical feedthrough buffering on the top hierarchy, the top hierarchy must be a root of the rule's voltage area's power domain.

**What Next**

Specify the correct voltage area rule or create a new one on the appropriate voltage area.

## NDMUI-547

(warning) Couldn't include %s object '%s' when setting the '%s' collection.

Feedback

**Description**

The specified object couldn't be included when setting the specified collection of the topology object.

**What Next**

Check that the object is of the correct type, and that its handle has a hierarchical context consistent with the current block.

---

## NDMUI-548

(error) No topology_plan specified and no current topology_plan.

**Description**

The command requires that either a topology_plan be specified using the '-plan' argument, or that a current topology_plan exists.

**What Next**

Please specify a topology_plan or set the current topology_plan.

---

## NDMUI-549

(warning) The shape_layers of the topology_edge could not be set: %s.

**Description**

The shape_layers of the topology_edge could not be set, due to the specified reason.

**What Next**

Please provide a valid value for the topology_edge's shape_layers.

---

## NDMUI-550

(error) Cannot map from the selected via to the provided custom via.

**Description**

Command failed to map from the selected via to the custom via because mapping to custom via is not allowed unless the target MxN dimensions are 1x1.

**What Next**

Map to a custom via with dimension 1x1

Feedback

## NDMUI-551

(error) Cannot map from custom via.

**Description**

Mapping from custom vias is not allowed.

**What Next**

Map from simple vias or array vias

## NDMUI-552

(Error) Cannot %s site row '%s' as it is %s%s

**Description**

Site rows belonging to a site array can neither be deleted nor modified independently while unbound site rows can be deleted but not modified. Modification of a site row requires parameters of its site definition which is missing in case of an unbound site row.

**What Next**

Site rows belonging to a site array can be modified by modifying the site array parameters.

## NDMUI-553

(error) The reference design %s and the owner design %s are same.

**Description**

The reference design and the owner design are same. This will create a self reference.

## NDMUI-554

(warning) The input tech layer '%s' is not a marker layer.

**Description**

The layer passed to the command 'create_marker_layers' is not a marker layer and hence will be ignored.

## NDMUI-555

(warning) The input tech layer with name '%s' is not defined.

Feedback

### Description

The layer passed to the command 'create_marker_layers' is not a valid tech layer and hence will be ignored.

---

## NDMUI-556

(warning) Removing reference library '%s' from target library subset, because it is not in the reference library list of the destination library.

### Description

The block has a target library subset containing a reference library which does not exist in the destination library's reference library list. The target library subset must be a subset of the library's reference library list. The reference library has been removed from the block's target library subset in the destination library.

### What Next

If the reference library needs to be in the target library subset, call *set_ref_libs* to add it to the reference library list and then call *set_target_library_subset* to add it to the target library subset.

---

## NDMUI-557

(error) Cannot create cell '%s' due to overlapping cell '%s'.

### Description

The *create_relative_cell* command was unable to create the cell because *-check_placement* was specified and an overlapping cell was found.

### What Next

Try using a different offset for the cell creation. Or try removing the *-check_placement* option.

---

## NDMUI-558

(warning) Removing existing instance specific mask constraints from cell '%s', because they do not correspond to the current geometry in the reference block.

### Description

The indicated cell has existing instance specific mask constraints in the design. However these mask constraints do not correspond to the current geometries in the cell's reference block/lib_cell. This happens if the reference block/lib_cell has been modified or if the

Feedback

reference library has been swapped out with versions that have different geometries. In order to proceed, this command must remove the existing mask constraints and then assign new mask constraints.

**What Next**

Verify that the reference block/lib_cell modification was intentional.

---

## NDMUI-559

(warning) Could not color %s '%s' without violating spacing margin.

**Description**

The command could not set the specified object's mask_constraint or cut_mask_constraint to an allowable color that does not violate the specified spacing margin. The reason could be that there are other objects on the same layer nearby that span the allowable set of colors, leaving no color left for this object.

**What Next**

Correct the color congestion around the specified object, or decrease the spacing margin to avoid this warning.

---

## NDMUI-560

(warning) Setting DB file name from '%s' to '%s' is unsuccessful.

**Description**

While trying to set the DB file name from source file name to destination file name, the operation is unsuccessful.

**What Next**

Please check if the input DB file name exists in the lib-cell library provided. If the library is design library, check if the reference libraries has the DB file information.

---

## NDMUI-561

(error) Cannot set_reference on lib-cell because the design '%s' not compatible with current lib_cell '%s'.

**Description**

The *set_reference* command was unable to change the lib_cell used for the specified cell. The new lib_cell either has a different port interface, or a different function from the current lib_cell.

Feedback

The *set_reference* command cannot be used to change the functionality or the connectivity of the net list.

**What Next**

Try using a different design when set_reference for this cell.

---

## NDMUI-562

(error) The '-pattern' argument of the command cannot be empty.

**Description**

The value specified for the *-pattern* argument of the command must contain at least one mask_constraint value.

**What Next**

Specify at least one mask_constraint value for the *-pattern* argument of the command.

---

## NDMUI-563

(error) Syntax error in '-pattern' argument of the command.

**Description**

There was a syntax error in the *-pattern* argument of the command. Each list element of the argument value must one of two forms: <mask_constraint_name> or {<layer_name> {<mask_constraint_name0> <mask_constraint_name1> ...}}.

**What Next**

Edit the argument value to be a list of elements with the correct format.

---

## NDMUI-564

(error) Invalid mask_constraint name '%s' specified - valid values are: %s

**Description**

An invalid mask_constraint name was specified in the *-pattern* argument of the command.

**What Next**

Use a valid mask_constraint name.

Feedback

## NDMUI-565

(error) mask_constraint value of mask_four must be specified explicitly via cut layers only.

### Description

The mask_constraint value of mask_four can only be specified for via cut layers using the layer-specific format of the command's "-pattern" argument.

### What Next

Only specify mask_four as a mask_constraint value explicitly for via cut layers.

## NDMUI-566

(warning) The shape use type will set to detail_route

### Description

When the shape purpose is metal_cut, special_router_extension or active_fill , the shape use type should be set. If not specified, the default will be detail_route.

### What Next

Please set the shape use type when specifying metal_cut as the shape purpose.

## NDMUI-567

(warning) The command 'link_block -force' needs to be called after all the invocation of commmand "%s" are executed.

### Description

The command 'link_block -force' needs to be called after all the invocation of "%s" is executed.

### What Next

Please call command 'link_block -force'

### See Also

- link_block

## NDMUI-568

(error) XPitch and YPitch cannot be zero at the same time.

Feedback

### Description

A via matrix cannot have XPitch and YPitch both be zero at the same time. Please create a general via when the both XPitch and YPitch are expected to zero.

### What Next

Please set the right pitch value. They should not less than zero and cannot both be zero at the same time.

### See Also

- create_via_matrix

---

## NDMUI-569

(error) The -effort argument may only be specified for soft group bounds and soft move bounds.

### Description

The effort setting of a bound only applies for group bounds and soft move bounds. When creating any other type of bound (e.g. repelling, diamond, exclusive, type hard, etc), the effort level does not apply so trying to set it is an error.

### What Next

Do not specify an effort unless creating a group bound or soft move bound.

---

## NDMUI-570

(Error) Cannot specify '-remove' with '-return_as_collection'.

### Description

When 'check_duplicates' specify '-remove' with '-return_as_collection'.

### What Next

Please use -remove and -return_as_collection separately.

---

## NDMUI-571

(Warning) Active fill is older than design data in "%s".

### Description

Active fill is outdated, since the design was already updated.

Feedback

**What Next**

Please use signoff commands to update the active fill data.

---

## NDMUI-572

(error) Reference library '%s' of source library '%s' must also be part of reference library of destination library '%s'.

**Description**

While copying module from a design to another design that belongs to a different library than the source design's, the set of reference libraries of source library must be a subset of reference libraries of destination library. This is to ensure that copied module in destination design can have its leaf instances referring correctly.

**What Next**

Please make sure source library's reference libraries is a subset of destination library's reference libraries.

---

## NDMUI-573

(error) Duplicate layer number '%d' and purpose number '%d'

**Description**

Tech layer with layer number and purpose number is already existing in the tech.

**What Next**

Please specify correct values for layer number/purpose number.

---

## NDMUI-574

(error) max_layer '%s' should not be lesser than min_layer '%s'.

**Description**

While creating object, max_layer's layer_number should not be lesser than min_layer's layer_number. If any of the min_layer/max_layer option is not specified then it picks the default values and checks for the rule validity.

**What Next**

Please specify valid values for min_layer/max_layer.

Feedback

## NDMUI-575

(error) '%s' objects can only be set on layers of type '%s'.

**Description**

Certain objects are restricted in the layers to which they apply. For example, a track constraint can only be set on an INTERCONNECT layer as tracks do not exist on other layers of other types.

**What Next**

Select a valid layer based on the type of object being set.

## NDMUI-576

(error) Track constraint offset list must be given in increasing order.

**Description**

The list of offset values for a track constraint should be given in increasing order.

**What Next**

Order the offset values to be set in increasing order.

## NDMUI-577

(error) Label '%s' already defines track constraints.

**Description**

Once a given label has been assigned to a track constraint definition it cannot be re-used.

**What Next**

In order to set a new track constraint definition, choose a label that does not exist in the design. In order to re-use the label, first call unset_track_constraint to remove the existing constraint definition with the desired label.

## NDMUI-578

(error) Cannot set track constraint on block '%s'. Block boundary is not defined.

**Description**

Track constraints require block boundary data as they are defined in reference to either the block boundary or the block core area.

Feedback

**What Next**

Set the boundary data for the block and then set the desired track constraints.

---

## NDMUI-579

(error) Duplicate layer name '%s' and purpose name '%s'

**Description**

Tech layer with layer name and purpose name is already existing in the tech.

**What Next**

Please specify correct values for layer name/purpose name.

---

## NDMUI-580

(error) Cannot change reference to '%s' as it creates a self reference or cycle in the hierarchy.

**Description**

The target reference been provided to the command introduces a self refernce or cycle. This is not allowed.

**What Next**

Check the target reference been provided in the command and correct it.

---

## NDMUI-581

(error) Cannot change module reference to '%s' as the cell been passed is an unbound instance.

**Description**

The target module been provided to the command through '-to_module' option cannot be used to change the reference of the cell because the cell is initailly unbound

**What Next**

Check the unbound cell been input to the command and correct it.

---

## NDMUI-582

(error) Unable to get fill_cells. Size of fill_cells exceeds database capacity.

Feedback

**Description**

The tool is not able to collect fill_cells in the design as the number of fill_cells exceeds database capacity.

**What Next**

Please contact Synopsys for techincal help in resolving this issue.

---

## NDMUI-583

(warning) Couldn't join edges of topology_node %s.

**Description**

While removing the specified topology_node, the topology_edges with the node as an endpoint could not be joined.

**What Next**

When the "-join_edges" argument of the remove_topology_nodes command is used, the topology_nodes specified for removal must have exactly one driving edge, such that the node is the end_node of the edge, and all remaining edges the node is an endpoint of must be driven by the node, such that the node is the start_node for the edges. This restriction ensures that the join operation is well-defined.

---

## NDMUI-584

(warning) The topology_nodes must reside in the same topology_plan as the edges.

**Description**

When using the "-nodes" argument of the create_topology_edge command, the specified topology_nodes must be owned by the same topology_plan as is specified in the command, or by the current topology_plan if no plan is specified.

**What Next**

Please specify a node list of nodes in the target topology_plan.

---

## NDMUI-585

(information) -incremental option will be deprecated in future releases.

**Description**

Make the operation incremental. The driver pin must be connected to a net otherwise the option does not have any effect. Any existing loads on the net connected to the driver pin

Feedback

are preserved. Please note that connect_pins behavior defaults to -incremental usage, therefore explicit use of -incremental is not required.

**See Also**

- connect_pins

---

## NDMUI-586

(error) Value '%s' specified for option -%s is invalid; %s.

**Description**

This option requires a list in the format {min_layer max_layer area_threshold}. Max_layer's layer_number should not be lesser than min_layer's layer_mumber. area_threshold should be a valid area.

**What Next**

Provide the correct value to the option.

---

## NDMUI-587

(warning) Could not set the ref_node.

**Description**

When creating the new topology_node or setting the ref_node attribute of an existing node, its ref_node could not be set.

**What Next**

Check that the specified ref_node reside in the new node's design hierarchy, and that it will not result in a reference cycle.

---

## NDMUI-588

(error) The current %s must be in the current block.

**Description**

The current typed object may only be set to an object within the current block.

**What Next**

Specify an object in the current block.

Feedback

## NDMUI-589

Error: Design Rule '%s' already exist between layers '%s' and '%s'.

**Description**

Design rule already exist between layers. User can set new properties or update existing properties in existing desing rule.

## NDMUI-590

(warning) The option "-design" or "-library" or "-tech" is not specified. The via rule will be created in block scope instead of tech scope.

**Description**

The command creates the via rule in the block scope by default . The options "-design" or "-library" or "-tech" can be chosen to create the via rule in the correct scope.

**What Next**

Please use the option "-design" or "-library" or "-tech" to create it in correct scope.

## NDMUI-591

(information) The via_rule '%s' is created in the block. Please use '-tech' or '-library' if you intend to create this via rule into the library tech data.

**Description**

The command creates the via rule in the block scope by default or when '-design' is specified. The options "-library" or "-tech" can be chosen to create the via rule in the tech scope.

**What Next**

Please use '-tech' or '-library' if you intend to create this via rule into the library tech data.

## NDMUI-592

(warning) The '%s' command cannot be used on synthetic library cell '%s'.

**Description**

The command is valid only for non-synthetic library cells with a logical/timing model from .lib/.db.

Feedback

## NDMUI-593

(error) Cannot change net_type from %s to %s on net '%s'.

### Description

Nets "*Logic0*" and "*Logic1*" are reserved by Synopsys for the tie-low and tie-high constant nets. Their types cannot be changed.

### What Next

No action is required.

## NDMUI-594

(warning) No cells found to ungroup.

### Description

The *ungroup_cells* command is not able to find any cells to ungroup. If start_level *option was used, it implies that there are no hierarchical cells at a level deeper than the lvel specified.*

### What Next

Check that hierarchical cells exist at the level specified or use a different value.

### See Also

- ungroup_cells

## NDMUI-595

(error) Only the following position-related option combinations are valid for topology_node constraint_type '%s': %s

### Description

The specified constraint_type of the topology_node only supports the specified combinations of position-related options.

### What Next

Specify a valid set of options for the command.

Feedback

## NDMUI-596

(error) The '%s' option of the command cannot be specified unless the '%s' option is specified and set to %s

### Description

The legality of specifying the option depends on the value of another option.

### What Next

Specify a valid set of options for the command.

## NDMUI-597

(warning) Could not include internal pin '%s' in the collection.

### Description

Internal pins cannot be included in this collection because they do not have a physical aspect.

### What Next

To avoid this message, please specify a collection that does not include internal pins.

## NDMUI-598

(error) Pin rebinding is not supported for cells with synthetic library cells as reference.

### Description

Pin rebinding is not supported for cells with synthetic library cells as reference. The pins of the new reference must match exactly and *-pin_rebind none* must be used for *set_reference* to continue.

### See Also

- set_reference

## NDMUI-599

(error) Cell has physical status disallowing changes.

### Description

The physical status of the cell does not allow any changes to be made.

Feedback

**What Next**

If the physical status is *fixed*, you can use *-ignore_fixed* option to override. Otherwise, please change the physical status of the cell before running the command.

---

## NDMUI-600

(warning) The directions donot match. The direction of reference port '%s' do not match block port '%s'.

**Description**

The direction of the port of the reference design doesnot matches with the target design.

**What Next**

Please verify that the target design provided to the command are correct.

---

## NDMUI-601

(warning) The port type donot match. The port type of reference port '%s' do not match block port '%s'.

**Description**

The port type of the port of the reference design doesnot matches with the target design.

**What Next**

Please verify that the target design provided to the command are correct.

---

## NDMUI-602

(warning) The port '%s' of new design is missing in the reference design '%s'.

**Description**

The port of the new target design is missing in the old reference design.

**What Next**

Please verify that the target design provided to the command are correct.

---

## NDMUI-603

(warning) layer '%s' referenced by '%s' is undefined. This rule will be ignored.

Feedback

**Description**

The referenced layer hasn't been defined. The rule will be ignored.

**What Next**

Add the missing layer or remove the reference.

---

## NDMUI-604

(error) due to property '%s' not yet defined, property '%s' has unknown table size and will be ignored.

**Description**

The property is a table but its table size is not yet defined. The property will be ignored.

**What Next**

Add related table size property before this property.

---

## NDMUI-605

(error) the table size defined by property '%s' is '%d'. However, the actual table size of property '%s' is '%d'. This property update will be ignored.

**Description**

The property table size differs from the value of the property that defines this table size. The property will be ignored.

**What Next**

Correct the table size.

---

## NDMUI-606

(error) '%s' is not a valid value for property '%s'. It must be '%s'.

**Description**

The input value is not valid for the property.

**What Next**

Input a valid value.

Feedback

## NDMUI-607

(warning) %s '%s' '%s' and '%s' coexist.

### Description

This message occurs when two conflicting rules/attributes coexist.

For example, if uShapeMinSpacing attribute and uShapeExcludedLengthRange coexist, router does not know which rule to apply.

The following is an example of the warning message:

```
Warning: Layer 'M1' 'uShapeExcludedLengthRange' and 'uShapeMinSpacing'
 coexist. (TECH-607)
```

### What Next

It is recommended that you choose the rule/attribute that you want and remove the other.

## NDMUI-608

(warning) %s '%s' is missing the attribute '%s'.

### Description

This warning message occurs when the specified object of the specified section is missing an important optional attribute, or partial attributes of a rule are specified. If the attribute is not specified in the technology file, the attribute has a default value of 0 or an empty string.

The following is an example of the warning message:

```
Warning : Layer 'M1' is missing the attribute
 'uShapeMinLength'.(TECH-608)
```

### What Next

This is only a warning message. No action is required.

However, if you do not want to the use the default for the attribute, add the attribute with the desired value to the specified section of the technology file and then rerun the command.

## NDMUI-609

(warning) %s '%s' has invalid table values '%s'.

Feedback

### Description

This warning message occurs when the specified section contains an invalid table value list, e.g. thresholds. The value list must meet the following requirements:

- The number of the values must match the table dimension.
- All values must be nonnegative numbers and listed in ascending order.
- The first threshold value must be between 0 and minWidth inclusively.
- The second threshold value must be greater than the layer minWidth. • The first spacing value must not be smaller than minSpacing, and the first maxSpacingCheckRange value must not be smaller than minSpacing * 2 + minWidth.
- In 2-D spacing table between the same layer, the values must be symmetrical.

  In minCutsTbl, if area is specified, extension should be specified. In enclosureTbl, if no lower/upper width is specified or an equivalent ContactCode to the specified enclosures is not found, this message will occur.

In generalized cut spacing rule with parallel length, if minSpacingDiagonalCheckTbl[i][j] = 1, at least one of minSpacingXParallelLengthThresholdTbl[i][j] and minSpacingYParallelLengthThresholdTbl[i][j] should be < 0; otherwise, TECH-609 will be issued to ignore minSpacingDiagonalCheckTbl[i][j]. If minSpacingXParallelLengthThresholdTbl or minSpacingYParallelLengthThresholdTbl is defined, orthoSpacingExcludeCornerTbl[i][j] should be 1; otherwise, TECH-609 will be issued to warn users that the corners will be checked by x/y spacing.

For the table of fatTblExtensionRange, if fatTblExtensionRangeDimension defined, the value list must meet the following requirements:

- The number of the values must match the dimension.
- All values must be larger than 0 and listed in ascending order.

  For fatWireViaEnc rule, fatWireViaEncMinWidthThresholdTbl is recommended to be in ascending order. However, the tool accepts this table even it is not in ascending order as long as the min and max thresholds are paired in fatWireViaEncMinWidthThresholdTbl and fatWireViaEncMaxWidthThresholdTbl. Furthermore, if missing a width range between fatWireViaEncMinWidthThresholdTbl and fatWireViaEncMaxWidthThresholdTbl, this message will be issued.

  For maxStackLevel rule, the value in maxStackLevelCutAsViaArrayTbl for the smallest squared cut should be 0.

  For separatedCut spacing rule, if defined between the same cut layer, the following should hold: 1) separatedCut1NameTbl=separatedCut2NameTbl 2) separatedCut1ToUpperMetalExcludedSpacingTbl=separatedCut2ToUpperMetalExcludedSpacingTbl

Feedback

3) the 2D spacing tables separatedCutXMinSpacingTbl and separatedCutYMinSpacingTbl should be symmetrical.

x|yLegalDimensionTbl table values should be in ascending order. voltageAreaThresholdTbl values should be in ascending order.

For fatTblSpacing Layer property, each of its values must be greater than or equal to minSpacing value.

The following is an example of the warning message:

```
Warning : Layer 'METAL1' has invalid table values '(0, 0,
1.505, 3.005, 4.505, 7.505)'.(TECH-609)
```

**What Next**

Please change the value list of the specified section to meet the above requirements. After making your changes, run the command again.

---

## NDMUI-610

(warning) DesignRule is defined with non-consecutive layers '%s' and '%s'.

**Description**

This warning message occurs when the specified DesignRule section contains two metal layers or two via layers that do not have consecutive mask names. For example, the mask names via1 and via2 are valid consecutive mask names. The mask names via2 and via4 are not consecutive and cause the warning message to occur and the design rule to be ignored. For cut to metal spacing rule with minSpacingUpperMetalWidthThresholdTbl, the rule should be defined in DesignRule section between cut and lower metal layers (via_x and metal_x). For forbiddenCut and separatedCut spacing rule, the attributes should be defined in DesignRule section between same cut layer; otherwise, TECH-610 will be issued.

The following is an example of the warning message:

```
Warning : DesignRule is defined with non-consecutive layers 'VIA2'
and 'VIA4'.
```

**What Next**

This is only a warning message. No action is required.

However, to avoid this warning message, change the layers of the DesignRule section so that the mask names of the layers are consecutive. After making your changes, run the command again.

Feedback

## NDMUI-611

(warning) DesignRule is defined with invalid metal-to-via enclosure layers '%s' and '%s'.

### Description

This warning message occurs when the DesignRule section specifies either a minimum or an end-of-line enclosure rule, for which one layer is not a via layer and/or the other layer is not a metal layer. The application ignores the design rule. Enclosure rules are only valid between a metal and via layer.

The following is an example of the warning message:

```
Warning : DesignRule is defined with invalid metal-to-via
enclosure layers 'via2' and 'via1'. (TECH-611)
```

### What Next

This is only a warning message. No action is required.

However, if the result is not what you intended, change the layers of the DesignRule section so that one is a via layer and the other is a metal layer.

## NDMUI-612

(error) Layers '%s' and '%s' are not adjacent.

### Description

The error message indicates that layer1 and layer2 of a DesignRule section that can only be defined between two adjacent layers are not adjacent.

### What Next

Correct the erroneous layer specifications in the tech file and run the command again.

## NDMUI-613

(warning) Valid SAV%s is missing in viaRule section for via layer '%s' of DesignRule '%s'.

Feedback

### Description

This warning message occurs when a SAV/SAV cluster is missing in the viaRule section meets one of following criteria:

- DesignRule defined attribute 'diffNetNonSavCenterMinSpacingTbl' or 'nonSelfAlignedViaCenterMinSpacingTbl', valid SAV via on layer1 should be defined in ViaRule section.
- DesignRule defined attribute 'selfAlignedViaClusterCenterMinSpacingTbl', valid SAV cluster via on layer1 should be defined in ViaRule section.

Reference example:

```
ViaRule SAV1 {
 cutLayerNameTblSize = 1
 cutLayerNameTbl = (V1) # via layer name
 cutNameTbl = (Vsm) # cut name
 selfAlignedViaUpperLayerEncTblSize = 2 # N
 selfAlignedViaUpperLayerEncTbl = (0.00, 0.01)
}
DesignRule {
  layer1 = "V1"
  layer2 = "V1"
  cut1TblSize = 1
  cut2TblSize = 1
  cut1NameTbl = (Vsm)
  cut2NameTbl = (Vsm)
  nonSelfAlignedViaCenterMinSpacingTbl = (S)
}
```

If the 'SAV1' SAV via is not defined in viaRule section, the tool issues a warning message NDMUI-613 will be issued for designRule 'V1-V1'.

The following is an example of the warning message:

```
Warning: Valid SAV is missing in viaRule section for via layer 'V1' of
DesignRule 'V1-V1'. (NDMUI-613)
```

### What Next

Define or correct the invalid SAV/SAV cluster in viaRule section for the specified via layer of the DesignRule and then run the command again.

---

## NDMUI-614

(warning) Cut name %s in DesignRule cut name table %s is not in the cut name table of layer %s.

Feedback

### Description

Cut names specified in the cut1NameTbl attribute of a DesignRule must be defined in cutNameTbl of the cut layer that is specified by the layer1 attribute of the DesignRule and similarly cut names specified in cut2NameTbl of the DesignRule must be in cutNameTbl of the cut layer specified by layer2.

### What Next

Correct the problematic cut name in the tech file and then run the command again.

---

## NDMUI-615

(warning) DesignRule is defined with different %s layers '%s' and '%s'.

### Description

This warning message occurs when the specified DesignRule section must contain the same via layers or the same metal layers.

The following is an example of the warning message:

```
Warning : DesignRule is defined with different via layers 'VIA2'
and 'VIA4'. (TECH-615)
```

### What Next

If the result is not what you intended, Change the layers of the DesignRule section to make them the same.

---

## NDMUI-616

(error) Layer2 of the DesignRule is not lower than Layer1.

### Description

This message indicates that the layer specified by layer2 of the DesignRule section that generated this message must be lower than the layer specified by layer1. However, the definition of this DesignRule does not satisfy this condition.

### What Next

Correct the error in the tech file and then run the command again.

---

## NDMUI-617

(error) Attribute %s is not specified in a DesignRule section whose metal layer is a "hasRectangleOnly" layer.

Feedback

**Description**

This message indicates that the attribute named in the message can only be specified in metal-to-cut DesignRule sections and the "hasRectangleOnly" attribute of the metal layer must be 1. However, the definition of the DesignRule does not satisfy the condition.

**What Next**

Correct the error in the tech file and then run the command again.

---

## NDMUI-618

(error) Attribute %s is specified in a DesignRule section that is not defined for two consecutive via layers.

**Description**

This message indicates that the attribute named in the message can only be specified in DesignRule sections that are defined for two consecutive via layers. However, the definition of the DesignRule that contains the attribute does not satisfy the condition.

**What Next**

Correct the error in the tech file and then run the command again.

---

## NDMUI-619

(error) Diode mode 19 for antenna rules is supported only from 2017.09.

**Description**

The well dependent antenna rules associated with diode mode 19 is supported only from 2017.09.

**What Next**

Diode mode 19 can't be used. Use a different diode mode.

---

## NDMUI-620

(warning) The runtime of the command can increase significantly if the "-include_blockage_shapes" option is specified.

**Description**

Using the "-include_blockage_shapes" option may increase the runtime of the "set_instance_pg_via_mask_constraints" command.

Feedback

### What Next

To improve runtime, avoid using the option by representing FRAME via routing blockages as via shapes on the PG terminals.

---

## NDMUI-621

(Information) Setting block '%s' %s, this conflicts with existing %s setting of its instances: %s.

### Description

This message indicates that there are multiple instantiations of the concerned block at different levels and at some level its instance already has an edit-control that conflicts with the newly specified value. The editability of all instances has been changed to the specified value and user should review this change. The hierarchical edit-controls apply on the reference block in the current_block top-level context and all instances of the same block share the same editability.

### What Next

The *-blocks* option of *set_editability* command may be used to specify the correct editability value of a reference block. The specified hierarchical edit-controls apply to all instances of the specified reference blocks.

The following example sets the hierarchical edit control of multiple reference blocks to mark them as uneditable (read-only):

```
prompt> set_editability -blocks [get_blocks {blk1 blk2 blk3}] -value
 false -verbose
Block lib:blk1.design is set uneditable (read-only) in the top-level
 context of top.
Block lib:blk2.design is set uneditable (read-only) in the top-level
 context of top.
Block lib:blk3.design is set uneditable (read-only) in the top-level
 context of top.
3
```

### See Also

- set_editability
- get_editability
- report_editability

Feedback

## NDMUI-622

(information) The application option <%s> is an alias and is either been deprecated or has been made obsolete and the Primary application option for this is <%s>.

**Description**

The specific application option is an alias and is either been deprecated or has been made obsolete.

**What Next**

The user script should be modified to remove the deprecated or obsolete application option.

## NDMUI-623

(information) In design '%s', renaming module '%s' to '%s'.

**Description**

A module has been renamed.

## NDMUI-624

(error) Cannot specify more than 1 module in 'module_list' when using 'target_name'.

**Description**

When specifying a 'target_name', only one module is allowed.

**What Next**

If the intent is to rename one module, please ensure that only 1 module is in 'module_list'

## NDMUI-625

(error) Routing blockage cannot be created on layer '%s' because %s.

**Description**

Routing blockages cannot be created on operated layers. These are layers defined in the tech file with attribute "isOperatedLayer = 1" and are considered to be virtual layers. No geometry may be created on these layers.

**What Next**

Specify a valid layer to the command.

Feedback

## NDMUI-626

(error) %s feedthrough buffering cannot be allowed when buffering is disallowed.

### Description

Logical and physical feedthrough buffering cannot be allowed when buffering is disallowed. If you want to allow logical or physical feedthrough buffering, you must allow buffering.

Only these option combinations are supported:

```
-allow_buffering false -allow_logical_feedthrough false
    -allow_physical_feedthrough false
-allow_buffering true -allow_logical_feedthrough true
    -allow_physical_feedthrough false
-allow_buffering true -allow_logical_feedthrough false
    -allow_physical_feedthrough true
-allow_buffering true -allow_logical_feedthrough true
    -allow_physical_feedthrough true
```

### What Next

Change the *-allow_buffering*, *-allow_logical_feedthrough*, and *-allow_physical_feedthrough* option values to one of the supported combinations.

## NDMUI-627

(error) Could not set the specified group_master of the topology_edge: %s

### Description

The topology_edge's group_master attribute could not be set to the specified topology_edge for the specified reason.

### What Next

Adjust the topology_edge's attributes so that it is compatible with those of the group_master, or choose a different group_master edge.

## NDMUI-628

(error) The "-nodes" option of the create_topology_edge command cannot contain more than two topology_nodes when the "-group_master" option is specified.

Feedback

**Description**

Since a topology_edge must have the same endpoints as its group_master edge, it is not possible to create topology_edges over a span of node endpoints that all have the same group_master edge.

**What Next**

Specify only two nodes in the "-nodes" option that match those of the specified group_master edge when using the "-group_master" option. Alternatively, you may leave the "-nodes" option unspecified, in which case the new edge will get the same node endpoints as the group_master edge.

---

## NDMUI-629

(error) When the topology_node has constraint_type '%s', its 'objects' collection %s

**Description**

The 'objects' collection of the topology_node must meet the specified conditions when it has the specified constraint_type.

**What Next**

Specify a valid objects collection for the constraint_type.

---

## NDMUI-630

(error) Cannot specify argument(s) '%s' when creating shaping constraints of type '%s'.

**Description**

The shaping_constraint object models all types of shaping constraints, but each specific type only uses a certain subset of the data that pertains to it. Therefore, the value given to the '-type' argument determines which of the data value arguments may be specified.

**What Next**

Select the appropriate data value arguments for the desired type. For more information on which data value arguments correspond to which type please see the create_shaping_constraint man page.

---

## NDMUI-631

(error) Must specify at least one of arguments '%s' when creating shaping constraints of type '%s'.

Feedback

**Description**

The shaping_constraint object models all types of shaping constraints, and each different type requires some data value(s) upon creation.

**What Next**

Provide one of the necessary data value arguments for the given type of shaping constraint. For more information on which data value arguments correspond to which type please see the create_shaping_constraint man page.

---

## NDMUI-632

(error) Must specify all of arguments '%s' when creating shaping constraints of type '%s'.

**Description**

The shaping_constraint object models all types of shaping constraints, and some types require multiple data values upon creation.

**What Next**

Provide all the necessary data value arguments for the given type of shaping constraint. For more information on which data value arguments correspond to which type please see the create_shaping_constraint man page.

---

## NDMUI-633

(error) Attribute '%s' does not apply for shaping_constraint of type '%s'.

**Description**

The shaping_constraint object models all types of shaping constraints, but each type of shaping constraint only uses a certain subset of all the data values. Therefore, given a constraint of a certain type, some attributes cannot be set because they do not apply to that type.

**What Next**

For more information on which attributes correspond to which type of shaping constraint please see the shaping_constraint object man page.

---

## NDMUI-634

(error) Shaping channel '%s' already assigned to shaping constraint object.

Feedback

**Description**

A given shaping channel may belong to at most one shaping constraint object.

**What Next**

Either remove the existing shaping channel association by removing the assigned to shaping constraint or create a new shaping channel to use.

---

## NDMUI-635

(warning) Cannot remove derived shaping constraint object '%s'.

**Description**

Shaping constraint objects of type boundary_status may not be explicitly created or removed. The boundary_status constraint is derived from the constrained object's physical status and is_rigid_boundary constraint, and is created/removed as necessary to reflect the current status of the object.

**What Next**

Please see the shaping_constraint man page for more information about the boundary_status constraint type.

---

## NDMUI-636

(warning) Setting value '%s' for '%s' is '%s' than value '%s' for '%s'. Value should be '%s' than or equal to value for '%s'.

**Description**

Some attribute values define bounds for a value range. For example an object may have attributes for its minimum width (lower bound) and maximum width (upper bound). Some objects do not enforce strict range adherance for these attributes, meaning that an attribute defining a lower range may be set to a value above another attribute defining a higher range (i.e. a "min" may be set to larger than a "max").

---

## NDMUI-637

(Error) Setting value '%s' for '%s' is '%s' than value for '%s'.

**Description**

Some attribute values define bounds for a value range. For example an object may have attributes for its minimum width (lower bound) and maximum width (upper bound). These range boundary values must be consistent, meaning that each given boundary value must

Feedback

be greater than or equal to the next "lower" boundary value and less than or equal to the next "higher" boundary value. So an object with minimum and maximum width attributes cannot have a minimum width setting greater than its maximum width.

---

## NDMUI-638

(Error) The reference object for a parent_object shaping constraint may only be voltage area or move bound.

### Description

The parent_object constraint further restricts the reference object type to only allow voltage area and move bound objects.

### What Next

Provide a voltage area or move bound when specifying a parent_object constraint.

---

## NDMUI-639

(error) The '%s' attribute of the topology_edge cannot be set when in a topology edge group.

### Description

Certain attributes of topology_edge cannot be set when the edge is in an edge group, as those attribute values are tied to those of the group_master edge. A topology_edge is in an edge group is its 'group_master' attribute is set.

### What Next

To change this attribute, either set the same attribute on the group_master edge, or remove this edge from the edge group by removing its group_master attribute.

---

## NDMUI-640

(error) Cannot replace existing reference library '%s' with the new reference library '%s' because there are references to block '%s' in the existing reference library.

### Description

The new reference library has the same name as an existing reference library and will replace the existing reference library. However doing so will cause cells, which are still referencing the existing reference library, to become unbound. All references to the existing reference library must be changed simultaneously by specifying them to the *-references* option.

Feedback

**What Next**

Specify the names of all reference blocks, which are in the existing reference library, to the *-reference* option.

---

## NDMUI-641

(error) %s cannot be allowed when new cells are disallowed.

**Description**

Buffering is allowed if and only if new cells are allowed, since buffering requires the addition of new cells in the voltage area. If you want to allow buffering through the *-allow_buffering*, *-allow_logical_feedthrough*, or *-allow_physical_feedthrough* option, you must allow new cells through the *-allow_new_cells* option.

**What Next**

If you want to allow buffering, change the *-allow_new_cells* option value to true.

---

## NDMUI-642

(information) Disallowing new cells and all buffering in voltage_area_rule '%s'.

**Description**

Disallowing new cells also disallows all buffering, because buffering requires the ability to add new cells. So since you are setting the *is_new_cell_allowed* attribute to false, the *is_buffering_allowed*, *is_logical_feedthrough_allowed*, and *is_physical_feedthrough_allowed* attributes are automatically set to false as well.

**What Next**

If you mistakenly disallowed buffering, change the *is_buffering_allowed*, *is_logical_feedthrough_allowed*, and/or *is_physical_feedthrough_allowed* attributes back to true. Note that this action will automatically set the *is_new_cell_allowed* attribute to true.

---

## NDMUI-643

(error) Cannot set multiple objects on %s's '%s' attribute.

**Description**

The specified attribute must be a collection of no more than one object.

**What Next**

Please set the attribute value to a collection of a single attribute.

Feedback

## NDMUI-644

(error) Cannot set the anchor_object of an annotation_point of type '%s'

**Description**

Only annotation_points of type 'anchor' may have their anchor_object set.

**What Next**

Please set the anchor_object of annotation_points of type 'anchor' exclusively.

## NDMUI-645

(error) Cannot set the %s of an annotation_point of type '%s'

**Description**

Only annotation_points of type 'absolute' may have their location directly set, otherwise the location is automatically computed. Likewise, annotation_point attributes 'offset' and 'position_type' are only applicable when the annotation_point type is 'anchor'.

**What Next**

Please only attempt to modify attribute values that apply to that annotation_point's type.

## NDMUI-646

(error) Annotation_shape '%s' already exists.

**Description**

An annotation_shape with the specified name already exists. Annotation_shape names must be unique in the block.

**What Next**

Please specify a unique name, or let the tool assign an auto-generated name by leaving the "-name" option unspecified.

## NDMUI-647

(error) May only set the annotation_points of a single annotation_shape at a time

**Description**

Multiple annotation_shapes were specified in the command, but the command may only set the annotation_points of a single annotation_shape.

Feedback

### What Next

Please specify a single annotation_shape to set the annotation_points of.

---

## NDMUI-648

(error) Invalid annotation_points list: %s.

### Description

The specified list input for the "-annotation_points" option is invalid for the specified reason. The format of the input for the "-annotation_points" option is a list, where each list element represents an annotation_point to be added to the annotation_shape and must have one of the following formats:

```
(1) <coord_x> <coord_y>
- a fixed, absolute {x y} point

(2) <anchor>
- a point that follows an anchor object

(3) <anchor> <position> <offset_x> <offset_y>
- a point that follows an anchor object at the specified position and
 offset

(4) <offset_x><'+'/'-'> <offset_y><'+'/'-'>
- a point that follows the location of the previous point in the list, at
 the specified offset
```

### Data Types

```
coord_x    distance
coord_y    distance
anchor     collection of 1 object
position   string - same valid values as annotation_point's position_type
 attribute
offset_x   distance or percentage (when '%' is appended)
offset_y   distance or percentage (when '%' is appended)
'+'/'-'    the literal character '+' or '-'
```

### Notes

```
- The number of annotation_points required by an annotation_shape depends
 on the annotation_shape's type:

tab(;) allbox;
l,al.
Type;Number of annotation_points
symbol, text; 1
rectangle, circle; 2
ruler, line; 2+
```

Feedback

```
polygon; 3+

- Format (1) creates an annotation_point of type "absolute", the others
 of type "anchor"

- Anchor object must have physical extent and must reside at or below the
 current hierarchical level

- Format (4) may not be used for the first annotation_point in the list,
 as there's no "previous" point in that case

- When a percentage value is used for offset_x or offset_y, it is a
 percentage of the anchor object's bounding box dimensions in that
 direction
```

### What Next

Please correct the option input to match the valid format.

---

## NDMUI-649

(info) Active collections are potentially impacting runtime of your scripts.

### Description

Active collections are potentially impacting runtime of your scripts. Any active collection needs to be managed to make sure the objects in the collection are valid. Having big collections active, can add to the runtime of scripts.

### What Next

Please review your scripts to see if there are any TCL variables pointing to collections. If those collections are not needed anymore, you can remove them by unsetting the TCL variables. For example, the following command will unset a TCL variable named A

prompt> unset A

You can also use a TCL procedure like this, to find all TCL variables pointing to collections.

proc getClctVars {} { set clct {} foreach v [info globals] { upvar #0 $v var if {![catch {set var} val]} { # Skip array... if {[as_collection -check -- $val]} { lappend clct $v } } } return $clct }

Additionally, bigger collections are likely to have a bigger impact on runtime. You can check the size of collections by using the sizeof_collection command. For example, the following command returns the size of collection A.

prompt> sizeof_collection $A

Feedback

## NDMUI-650

(error) Cannot specify more than one reference.

**Description**

Members of *cell_bus* should have same reference.

**What Next**

Specify only one reference.

## NDMUI-651

(error) Inappropriate reference specifed.

**Description**

Members of *cell_bus* cannot have reference same as that *-block*, *-cell* or *-design*.

**What Next**

Specify appropriate reference.

## NDMUI-652

(error) cannot create cell bus '%s'.Cell bus name is already taken.

**Description**

Input bus cell name is taken.

**What Next**

Use a different name or remove existing cell bus/cell.

## NDMUI-653

(error) Members '%s' of cell bus have different reference.

**Description**

Members of *cell_bus* should have same reference.

**What Next**

Make sure all cell members of cell_bus have same reference.

Feedback

## NDMUI-654

(error) bus members '%s' do not exist.

**Description**

All bus members must exist without -create_cells option.

**What Next**

Create cell bus members before running this command or use -create_cells option.

## NDMUI-655

(error) Pin '%s' on cells '%s' have different direction.

**Description**

Members of *pin_bus* should have same direction.

**What Next**

Make sure all pin members of pin_bus have same direction.

## NDMUI-656

(error) Pin '%s/ on cells '%s' do not exist.

**Description**

All bus members must exist without -create_pins option.

**What Next**

Create pin bus members on cell bus members before running this command or use -create_pins option.

## NDMUI-657

(error) input bus name doesn't support hierarchical name.

**Description**

Input bus name shouldn't contain hierarchical seperator.

**What Next**

Use -cell option to create bus inside a cell.

Feedback

## NDMUI-658

(error) input bus name doesn't support hierarchical name.

**Description**

pin bus can be created on cell bus only.

**What Next**

To create pin bus on hierarchical cell bus, provide hierarchical cell bus name to -cell_bus option.

## NDMUI-659

(error) Cannot provide range for the creation of pin bus.

**Description**

pin bus can be created on cell bus only. There cannot be width mismatch between cell bus and pin bus.

**What Next**

Provide only pin bus name without range.

## NDMUI-660

(error) cannot create pin bus '%s'.Pin bus name is already taken.

**Description**

Input bus pin name is taken.

**What Next**

Use a different name or remove existing pin bus.

## NDMUI-661

(error) Cannot set shaping constraint '%s' because it violates rule '%s'.

**Description**

Some shaping constraints have certain rules governing the cases in which they may be set. The list of shaping constraint rules is as follows: 1) Members of a shaping group that has a set array_layout constraint may not have set target_location and/or alignment_point constraints.

Feedback

### What Next

Change the design state to correct the rule violation.

---

## NDMUI-662

(error) Cannot change reference to '%s' as the cell passed has an unresolved reference.

### Description

The target reference provided to the command cannot be used because the cell passed has an unresolved reference.

### What Next

Check the cell passed to the command and resolve its reference.

---

## NDMUI-663

(information) Allowing %s and new cells in voltage_area_rule '%s'.

### Description

Allowing buffering also allows new cells, because buffering requires the ability to add new cells. So since you are setting the *is_buffering_allowed*, *is_logical_feedthrough_allowed*, or *is_physical_feedthrough_allowed* attribute to true, the *is_new_cell_allowed* attribute is automatically set to true as well.

### What Next

If you mistakenly allowed new cells, change the *is_new_cell_allowed* attribute back to false. Note that this action will automatically set the *is_buffering_allowed*, *is_logical_feedthrough_allowed*, and *is_physical_feedthrough_allowed* attributes to false.

---

## NDMUI-664

(warning) Attribute '%s' already exists for the %s object class with different data type so unable to get/set or remove attribute.

### Description

In a session, there can not be more than one user defined attribute with same name and on same class with different data type. User can undefine one of the attribute type by using 'undefine_user_attribute' command.

Feedback

**What Next**

Please change the attribute name or type in one of the library or use 'undefine_user_attribute' command to undefine one of the attribute type.

---

## NDMUI-665

(error) Sum of values in %s must be %s than %s.

**Description**

This option requires values with indicated constraint.

**What Next**

Provide the correct value to the option.

---

## NDMUI-666

(warning) All domains specified as part of this create_voltage_area command are AO Block Domains and no regular domain is specified.

**Description**

All the power domains specified as part of this voltage are AO Block domains. No regular domain (with primary supply equal to the main_rail supply of the AO Block Domain(s)) is specified.

**What Next**

Please add the regular power-domain(s) that are intended to share their voltage area with the AO Block domain(s) to this create_voltage_area command.

---

## NDMUI-667

(error) Specified reference does not exist in the current design or reference library.

**Description**

The specified reference does not exist. The command failed because a cell could not be created without a valid reference.

**What Next**

Please provide the correct inputs.

Feedback

## NDMUI-668

(error) Specified reference does not have any ports.

**Description**

Reference should have atleast one port to create valid cell bus.

**What Next**

Please provide the correct inputs.

## NDMUI-669

(warning) All user-defined attributes are persistent by default from 2018.06 release. Please use the '-non_persistent' if non-persistent user attribute is preferred.

**Description**

Earlier user-defined attributes were non-persistent by default, user had to specify -persistent option to make them persistent. But from 2018.06 release, all user-defined attributes are persistent by default.

**What Next**

New option '-non_persistent' has been added in next 2018.06 release. The user script should be modified if user-defined attribute has to be non-persistent only.

## NDMUI-670

(error) Invalid '%s' object. For object class '%s', this argument requires an object type of '%s'.

**Description**

Certain commands take a database object as an argument. Often these arguments are limited to a subset of TCL object classes. In some cases however, the argument requires that objects be of a certain type as well as a certain class. For example, an argument that takes a move bound will require an object with the TCL class 'bound' and ...

**What Next**

Select an object of the appropriate type for the given argument.

## NDMUI-671

(error) Constraint '%s' is not valid for constrained object of type '%s'.

Feedback

**Description**

Each constrainable object has a particular set of shaping constraints that are valid for it. If an invalid constraint is set then this error is reported.

**What Next**

Select a valid constraint to set on the object.

---

## NDMUI-672

(error) Constraint '%s' cannot be set because one of '%s' is already set on this object.

**Description**

Some constraints form mutually exclusive groups. If any constraint in a mutually exclusive group is set then no other constraints in that group may also be set.

**What Next**

If the constraint should be set try unsetting the mutually exclusive constraint first.

---

## NDMUI-673

(error) Cannot set shaping constraint '%s' because '%s'.

**Description**

Most shaping constraints have some restrictions placed on their allowed values. If the current set operation violates one of these restrictions then this error is reported.

**What Next**

Choose valid value for the given shaping constraint.

---

## NDMUI-674

(error) Object '%s' cannot be added to shaping group '%s' because '%s'.

**Description**

Shaping groups require that any object-to-be-added meets the following requirements. 1) All objects being added to a shaping group must be shapeable, 2) all objects being added to a shaping group must share the same physical (block) context as the group, 3) all objects being added to a shaping group must not already be members of another shaping group, 4) if any of the objects are shaping groups, then they must not introduce a circular membership loop in the group membership structure, 5) Members of a shaping group that

Feedback

has a set array_layout constraint may not have set target_location and/or alignment_point constraints.

**What Next**

Select an object that meets the requirements of the shaping group.

---

## NDMUI-675

(warning) application option <%s> has been replaced with <%s>, please update your run script accordingly.

**Description**

The specific application option has been replaced with a new application option and will hence be removed in a future release.

**What Next**

Update the Tcl script to replace the application option with the new application option.

---

## NDMUI-676

(error) Cannot re-order shaping group '%s' because '%s'.

**Description**

Re-ordering operations must result in a valid group. If the specified re-ordering operation would lead to an invalid group then this error is reported.

**What Next**

Correct the operation to result in a valid group.

---

## NDMUI-677

(error) Argument '%s' requires both argument '%s' and argument '%s'.

**Description**

Some commands have arguments that are optional unless a certain other argument is given in which case they become required.

**What Next**

Provide the required argument.

Feedback

## NDMUI-678

(information) Ignoring argument '%s', not used when argument '%s' is given.

**Description**

Some arguments are only used in conjunction with others. In the absence of their "dependent" argument, these arguments are ignored.

**What Next**

Nothing.

## NDMUI-679

(error) Specified lib_pin '%s' is from lib_cell '%s'. It must be from lib_cell '%s'.

**Description**

The specified lib_pin is not from the lib_cell. The via_ladder_pin_order attribute must be a collection of lib_pins from the lib_cell.

**What Next**

Specify a collection of lib_pins from the lib_cell.

## NDMUI-680

(error) Maximum number of lib_pins (%d) in the via ladder pin order has been exceeded.

**Description**

The via_ladder_pin_order attribute must be a collection of 31 or less lib_pins. It is not possible to order more than 31 lib_pins per lib_cell.

**What Next**

Specify a collection of 31 or less lib_pins.

## NDMUI-681

(error) The '-create_marker_layers' argument of the command cannot be empty.

**Description**

The value specified for the *-create_marker_layers* argument of the command must contain at least one layer name, and must match the contents of the *-pattern* argument of the

Feedback

command such that the there is a clear correspondence between the specified colors and the layers that should get the marker shapes for those colors.

**What Next**

Specify at least one layer name for the *-create_marker_layers* argument of the command.

---

## NDMUI-682

(error) Syntax error in '-create_marker_layers' argument of the command.

**Description**

There was a syntax error in the *-create_marker_layers* argument of the command. Each list element of the argument value must one of two forms: <layer_name> or {<layer_name> {<layer_name0> <layer_name1> ...}}. The argument value must match the contents of the *-pattern* argument of the command such that the there is a clear correspondence between the specified colors and the layers that should get the marker shapes for those colors.

**What Next**

Edit the argument value to be a list of elements with the correct format.

---

## NDMUI-683

(error) Cannot set constraint '%s' as it is mutually exclusive with '%s'.

**Description**

Certain groups of shaping constraints may not be set on a given object at the same time. Specifying a set of constraints which violates one of these mutually exclusive groups results in this error.

**What Next**

Select a different set of constraints to set that do not violate any mutual exclusion requirements.

---

## NDMUI-684

(warning) The application option <%s> is disabled and will be ignored.

**Description**

The specific application option has been made disabled and hence will be ignored.

Feedback

**What Next**

See the man page for this application option for details.

---

## NDMUI-685

(warning)The name of the object '%s' of type '%s' already exists in destination design '%s'. This will be skipped.

**Description**

The name of the object is conflicting with existing same name object in command "copy_floorplan". The copy for the same will be skipped.

**What Next**

The option "-force" can be used to overide this.

---

## NDMUI-686

(Information) The name of the object '%s' of type '%s' will be renamed to '%s' in destination design '%s'.

**Description**

The name of the object is conflicting with existing same name object in command "copy_floorplan". The object will be renamed with another name.

**What Next**

The option "-force" shouldn't be used to prevent this.

---

## NDMUI-687

(error) The specified design label '%s' is not found.

**Description**

The specified design label name specified by the user is not found.

**What Next**

Specify the correct design label name.

---

## NDMUI-688

(error) The specified design lavel '%s' does not have a design view.

Feedback

**Description**

The specified design label name specified by the user doesn't have a design view.

**What Next**

Specify the correct design label name.

---

## NDMUI-689

(error) The current design '%s' is not a design view.

**Description**

The current design is not a design view.

**What Next**

The user can change the current design using "current_block" and execute the "copy_floorplan" command.

---

## NDMUI-690

(error) Cannot pack cell library '%s'.

**Description**

write_lib_package can't package on standard/lib-cell library or another write_lib_package is active.

**What Next**

Use write_lib_package on appropriate library only.

---

## NDMUI-691

(error) Unable to pack library '%s'.

**Description**

The tool could not create the temporary file used to package the library. Without the temporary file, *write_lib_package* command fails.

This is most likely caused by a file permission problem, but there are a number of other reasons why the tool would not be able to create the temporary file: the path name might be invalid; there might be a file with the same name that could not be overwritten; you might not have permission to write to that directory; you might have exceeded your disk quota on that file system; the file system might be read-only; or the file system might be full.

Feedback

### What Next

Verify that you can create that file in that directory and that text can be written to that file. Verify that there is sufficient free space on the disk.

To see the size of a file system, use the UNIX *df* command:

```
unix% df /tmp/.
```

Change the *shell.common.tmp_dir_path* application option setting to use a different path or file system to store store the temporary file. To change the temporary directory to /SCRATCH, use the *set_app_options* command:

```
prompt> set_app_options -list { shell.common.tmp_dir_path /SCRATCH }
```

### See Also

- expand_outline
- set_app_options
- shell.common.tmp_dir_path

---

## NDMUI-692

(error) Unable to exclude design views for specified ref_libs.

### Description

The ref_libs might not available to exclude its design views.

### What Next

Mask sure that specified ref_libs exists.

---

## NDMUI-693

(error) %s.

### Description

This message occurs when a process was unable to be forked or forked process has failed/errored-out.

---

## NDMUI-694

(error) Unable to unpack library package '%s'.

Feedback

### Description

The tool could not create/find the temporary file used to unpack the library package. Without the temporary file, *read_lib_package* command fails.

This is most likely caused by a file permission problem, but there are a number of other reasons why the tool would not be able to create the temporary file: the path name might be invalid; there might be a file with the same name that could not be overwritten; you might not have permission to write to that directory; you might have exceeded your disk quota on that file system; the file system might be read-only; the file system might be full; or library package might invalid as well.

### What Next

Verify that you can create that file in that directory and that text can be written to that file. Verify that there is sufficient free space on the disk.

To see the size of a file system, use the UNIX *df* command:

```
unix% df /tmp/.
```

Change the *shell.common.tmp_dir_path* application option setting to use a different path or file system to store store the temporary file. To change the temporary directory to /SCRATCH, use the *set_app_options* command:

```
prompt> set_app_options -list { shell.common.tmp_dir_path /SCRATCH }
```

### See Also

- expand_outline
- set_app_options
- shell.common.tmp_dir_path

---

## NDMUI-695

(error) Unable to unpack library package '%s'. Library '%s' already exists in the current directory. Please try again with the -overwrite option.

### Description

*read_lib_package* unable to create/open unpacked library in the destination directory (default is current directory).

### What Next

This error is mainly because the destination directory already has an library with the same name as the one being unpacked. Use *-overwrite* to overwrite unpacked library in the destination directory. If command still fails, it means previous unpacked

Feedback

library package has non-removable (i.e, no write permission) files so manually remove the previous unpacked directory after providing write access ( using chmod u+w -R <unpacked_directory> ) or change destination directory through *-destination* option. This error is mainly because the destination directory already has a library with the same name as the one being unpacked.

---

## NDMUI-696

(error) Reference library '%s' of the library package already opened.

**Description**

*read_lib_package* failed as reference library of the library package is already opened.

**What Next**

Try specifying *-overwrite* to open reference library from the library package by closing opened reference library.

---

## NDMUI-697

(error) Unable to open library '%s'.

**Description**

read_lib_package unable to open library.

**What Next**

Try changing destination directory through *-destination*.

---

## NDMUI-698

(error) z-offset value specified is not valid.

**Description**

z-offset can be greater than or eqal to zero but less than 32767.

---

## NDMUI-699

(error) Cannot set z-offset on cell '%s' which is not from top-level of 3d design.

**Description**

z-offset can be set only on cells of top-level 3d design.

Feedback

## NDMUI-700

(error) Persistency for user-defined attributes of types %s are not supported for all object types.

### Description

Persistency for user-defined attributes of types one_of/range_min/range_max are not supported for all object types. Earlier user-defined attributes were non-persistent by default, user had to specify -persistent option to make them persistent. But from 2018.06 release, all user-defined attributes are persistent by default.

### What Next

Please use '-non_persistent' option with user-defined attributes of types one_of/ range_min/range_max for class objects which don't have support of persistency.

## NDMUI-701

(error) Value '%s' specified for option -blocks is invalid; %s.

### Description

This option requires a list in the format { { die1[:num_layers] die2[:num_layers] } ...}.

The die names must correspond to cell names in the design. The number of layers must be equal or less than the number of layers in the die block.

### What Next

Provide the correct value to the option.

## NDMUI-702

(error) Failed to remove virtual interface block; %s.

### Description

The command failed to remove the virtual interface block for the given reason. If a single block is specified, it must be a virtual interface block. If a single cell is specified, it must be the instance of the virtual interface block. If two cells are specified, they must be the two dies used to create the virtual interface block.

### What Next

Call the command with either the virtual interface block, the cell instance of the virtual interface block, or the pair of dies used to create the virtual interface block.

Feedback

## NDMUI-703

(information) Created virtual interface block '%s' between dies '%s' and '%s'.

**Description**

The command created the indicated virtual interface block.

**What Next**

This is an informational message only.

## NDMUI-704

(information) Removed virtual interface block '%s'.

**Description**

The command removed the indicated virtual interface block.

**What Next**

This is an informational message only.

## NDMUI-705

(error) The layer specified in the '%s' argument of the command is invalid for the requested via_def type.

**Description**

The specified layer is incompatible with the type of via_def being created. For simple via_defs, the lower and upper layers must be the nearest routable upper and lower metal layers to the specified cut_layer. For custom via_defs, the lower and upper layers must correspond to the lowest and highest layers, respectively, of the specified custom shapes.

**What Next**

Please specify compatible lower and upper layers, or simply omit the layer arguments for simple and custom via_defs, in which case they will be set automatically to the correct layers.

## NDMUI-706

(error) Net %s is already a part of bus %s.

Feedback

**Description**

The specified net is already part of the existing bus. If bus base name and net name are different then it may be due to inconsistent DB.

**What Next**

Try again after running "change_names -hierarchy -rules verilog " to fix the net/bus association.

---

## NDMUI-707

(Error) Only bounds of type repelling may contain group members.

**Description**

Currently group objects (more specifically repelling bound group objects) are only valid in repelling bounds.

**What Next**

Try running the command with a repelling bound.

---

## NDMUI-708

(warning) Group '%s' cannot be added to bound because '%s'.

**Description**

Group membership in bounds must follow certain criteria. Currently only repelling bound groups are allowed in bounds, and only repelling bounds may contain repelling bound groups. Furthermore repelling bound groups may not be in multiple repelling bounds.

**What Next**

Correct any violations to the rules described above and re-try.

---

## NDMUI-709

(warning) Object '%s' cannot be added to repelling bound group because '%s'.

**Description**

The membership rules for objects in a repelling bound group follow the membership rules for repelling bounds, with the exception of repelling bounds groups (groups may not be members of repelling bounds groups). Valid members are cells and ports.

Feedback

**What Next**

Correct any violations to the rules described above and re-try.

---

## NDMUI-710

(information) The object '%s' of type '%s' is copied to the destination design '%s'.

**Description**

The object is copied to the destination design in the command "copy_floorplan".

**What Next**

This is an informational message only.

---

## NDMUI-711

(Error) %s group %s can't be modified or removed.

**Description**

HDL or FSM groups can't be removed or edited and even members can't be added or removed from the HDL groups.

---

## NDMUI-712

(Information) Skipping group %s as it is non-HDL group.

**Description**

Can't specify non-HDL groups with -module option.

---

## NDMUI-713

(Error) Hierarchical patterns are not supported for non-HDL group.

**Description**

Hierarchical pattern are supported for HDL groups to limit the scope of query.

---

## NDMUI-714

(warning) Skipping given clip region as it is not rectilinear.

Feedback

**Description**

Clip regions must be rectilinear polygons.

---

## NDMUI-715

(error) Given clip region overlaps another.

**Description**

All active clip regions must be non-overlapping.

---

## NDMUI-716

(error) Specified clip block '%s' invalid because '%s'.

**Description**

Clip blocks may only merge back into their source blocks from a given clip library.

---

## NDMUI-717

(Error) Cannot create an empty repelling bound group.

**Description**

Repelling bound groups may not be empty. If the command receives no valid objects then it will error.

**What Next**

Try running the command with at least one valid bound member.

---

## NDMUI-718

(Error) Repelling bounds have a hard limit of at most 16 members.

**Description**

Repelling bounds repel all objects within them. The intended use case involves repelling a small number of cells or groups (cores) away from one another (or one or more ports). To help guide and support the intended use the membership limit caps at 16.

**What Next**

Try restricting the number of objects being added to the bound.

Feedback

## NDMUI-719

(Error) Repelling bounds cannot contain both groups and cell/ports.

**Description**

Repelling bounds allow two membership categories. The original use case with cells (leaf and hierarchical) and ports, and the new use case with groups. Mixing the two membership categories is an error.

**What Next**

Adjust the object list to match one of the two membership categories.

## NDMUI-720

(error) Failed to create virtual interface block because design '%s' contains unresolved cell references.

**Description**

Virtual interface blocks cannot be created in a design containing unresolved cell references. Check the link_block results, specifically the LNK-081 errors, to understand and resolve the problem before running *create_3d_virtual_blocks*.

**What Next**

Configure the design correctly.

## NDMUI-721

(error) bond_pad terminal already exist with the name '%s'.

**Description**

Name of the bond_pad terminal should be unique in the specified block/port.

**What Next**

Specify a different name for bond_pad terminal.

## NDMUI-722

(warning) Via ladder %s has a shape with physical status locked or fixed, hence we cannot remove this via ladder from the design.

Feedback

**Description**

This via ladder has a shape with physical status locked or fixed, hence we cannot remove this via ladder from the design.

**What Next**

Change the physical status of the locked or fixed shape and try again.

---

## NDMUI-723

(warning) Name changes are not performed on %s bus "%s", as it converts regular bus to irregular.

**Description**

change_names does not allow conversion from regular bus to irregular bus.

**What Next**

Ensure definition of name rule does not imply generation of irregular bus.

---

## NDMUI-724

(error) '.' as current_design is not supported anymore in file_name "%s".

**Description**

Support of '.' as current_design is obsolete.

**What Next**

Revise run script to specify current_design properly.

---

## NDMUI-725

(warning) %s name change from '%s' to '%s' %s.

**Description**

Name change cannot be performed as explained in the specified reason at end of message. Following are possible reasons:

in design "designName" not performed, given new cell name repeated in design "designName" not performed, given new net name repeated in design "designName" not performed, given new port name repeated

Feedback

not performed, given cell not present in design "designName" not performed, given net not present in design "designName" not performed, given port not presented in design "designName"

not performed, given new cell name already present in design "designName" not performed, given new net name already present in design "designName" not performed, given new port name already present in design "designName"

not performed not performed due to duplicate entry in names file

**What Next**

Check name rule definition and names file.

---

## NDMUI-726

(warning) %s '%s' provided in the names file is not valid.

**Description**

Name specified in the names file is not valid.

**What Next**

Check reported name against the design data to ensure it is valid.

---

## NDMUI-727

(warning) Invalid type '%s' in name_file '%s'; The type must be port, cell, or net.

**Description**

Invalid object type found in name_file.

**What Next**

Ensure object type is one of port, cell, or net.

---

## NDMUI-728

(warning) No change in %s bus '%s'%s.

**Description**

Net/Port bus is not changed since there is another bus with the same name in the design already.

Feedback

**What Next**

Validate the reported collision with design.

---

## NDMUI-729

(warning) %s bus '%s' is bit blasted.

**Description**

Net/Port bus is bit blasted.

**What Next**

Check result design to ensure the bit blasted is intended.

---

## NDMUI-730

(info) In module '%s', net '%s' was renamed to '%s' as required to meet rule -equal_ports_nets.

**Description**

NDMUI-730 is a specific case where suppose net n1 is to be renamed to abc as it is connected to port abc but a different net by name abc already exists. Then we try to rename abc to abc_0 so that n1 can be renamed to abc and that is when we issue NDMUI-730 for abc and not for n1.

---

## NDMUI-731

(warning) While applying rule max_length, tool could not find a unique name for %s %s.

**Description**

While applying rule max_length, tool could not find a unique name for one of the following types: cell, port, bus port, net, and bus net.

**What Next**

Ensure name rule is valid with the max_length

---

## NDMUI-732

(info) The first restricted character list conflicts with the name prefix(%s). The name prefix will still be used in change names.

Feedback

**Description**

The first restricted character list conflicts with the reported name prefix. The name prefix will still be used in change names.

---

## NDMUI-733

(warning) Could not change name for feedthrough net '%s' to '%s'.

**Description**

Could not change name for feedthrough net. The failure in name change may be due to collision of names in the name space.

**What Next**

Check for collision in names.

---

## NDMUI-734

(error) The %s '%s' cannot be anchored - it is in edit_group '%s'.

**Description**

The specified object is in an edit_group, however an object in an edit_group may not be the dependent_object of an anchor.

**What Next**

Remove the object from the edit_group, or choose a different object to be anchored.

---

## NDMUI-735

(warning) To change names in module '%s' use -hierarchy option.

**Description**

Needs to use -hierarchy option if changing names of non-top level modules. Note that this message is only issued when option -names_file is used.

**What Next**

Use -hierarchy option if changing names of non-top level modules is intended.

---

## NDMUI-736

(info) The specified replacement character %s is conflicting with the specified restricted character.

Feedback

**Description**

In change_names, the specified replacement character is conflicting with the specified restricted character.

---

## NDMUI-737

(warning) All %s in the %s bus '%s' are not present in the names file.

**Description**

All members of net/port bus are not in the names file.

**What Next**

Ensure names file to verify members of net/port bus are presented in the names file.

---

## NDMUI-738

(error) Shape '%s' is a part of an existing via ladder object.

**Description**

A shape can only be a part of exactly one via ladder object.

**What Next**

Please remove this shape from the list of shapes for the current via ladder.

---

## NDMUI-739

(error) Cannot add %s '%s' to via ladder because it is not in the current design.

**Description**

The specified object cannot be added to the via ladder because it belongs to another design or lib_cell. This command may only add objects to the via ladder from the current design.

**What Next**

Set current_design to the design that contains the object, and then add it to the via ladder.

---

## NDMUI-740

(error) Cannot add shape '%s' to via ladder because it is connected to a different net than other shapes in this via ladder.

Feedback

**Description**

The specified shape cannot be added to the via ladder because it is connetced to a different net than other shapes in this via ladder. All the shapes in a via ladder should be connected to the same net.

**What Next**

Pass a collection of shapes to the create_via_ladder command which belong to the same net and try again.

---

## NDMUI-741

(error) Tech purpose with name 'drawing' and/or number '0' can not be created.

**Description**

Tech purpose with number '0' is system default purpose and reserved for 'drawing'.

**What Next**

Please change option values and try again.

---

## NDMUI-742

(warning) Tech purpose with name 'drawing' and number '0' can not be removed.

**Description**

'drawing' is system default tech purpose. It can not be removed.

**What Next**

Specify tech purpose(s) other than 'drawing'.

---

## NDMUI-743

(error) Failed to remove tech purpose %s.

**Description**

Failed to remove the tech_purpose.

**What Next**

Specfied tech purpose can not be removed.

Feedback

## NDMUI-744

(error) %s can not be created on non-default purpose.

### Description

The object can be created only on default purposes 'drawing'.

### What Next

Specify correct layer.

## NDMUI-745

(error) Cannot modify mutable lib-cell %s data in this shell.

### Description

It is not currently possible to change the named lib-cell data from inside this shell. There are three types of lib-cell data. Some cannot be changed after the lib-cell library is built. Others cannot be changed outside of the Library Manager shell, because the checks which make sure the value is changed properly only exist within the Library Manager. Still others can be changed from inside this shell, but only when the app option design.enable_lib_cell_editing is set to "mutable".

### What Next

If the data must be changed, set the app option design.enable_lib_cell_editing to "mutable". Optionally, you can return to the Library Manager and use the edit flow to change this data. Additionally, you can return to the original setup used to create the library and change the data before the workspace is checked and committed.

## NDMUI-746

(information) Removing library '%s' from the target library subsets in block '%s', because the library is no longer in the reference library list.

### Description

The specified block has one or more target library subsets containing a library which is no longer in the reference library list. Since every target library subset must be a subset of the libraries in the reference library list, the specified library has been removed from the specified target library subsets.

### What Next

If the library needs to remain in the target library subsets, add the library back into the reference library list and target library subsets.

Feedback

**See Also**

- set_target_library_subset
- report_target_library_subset

---

## NDMUI-747

(warning) Cannot modify read-only application option '%s'.

**Description**

This application option is read-only. You cannot change its value.

**What Next**

Some application options can be set only in the .synopsys_icc2.setup file, and become read-only after the file has been read. Determine if that is the case for this option.

---

## NDMUI-748

(warning) Invalid value '%s' specified for app option '%s'.

**Description**

This message indicates that the specified value for app option is invalid.

**What Next**

Provided a correct value for the app option.

---

## NDMUI-749

(error) The %s '%s' cannot be added to the edit_group - it is anchored by anchor '%s'.

**Description**

The specified object is the dependent_object of an anchor, however anchored objects may not be members of edit_groups.

**What Next**

Un-anchor the object, or choose a different object to add to the edit_group.

---

## NDMUI-750

(warning) Port count of the new %s is not same as that of the existing %s

Feedback

**Description**

The reference or view of cells can be changed only with a reference or view with a identical port interface.

**What Next**

Specify a reference or view with a port interface identical to the current one.

---

## NDMUI-751

(warning) Port name '%s' of the old reference '%s' is not found in the new reference '%s'.

**Description**

The reference or view of cells can be changed only with a reference or view with a identical port interface.

**What Next**

Specify a reference or view with a port interface identical to the current one.

---

## NDMUI-752

(error) Pin '%s' is not a physical pin.

**Description**

The pin which has a via ladder must be always be a physical pin.

**What Next**

Please use a physical pin and try again.

---

## NDMUI-753

(error) Pin group id '%u' cannot be specified in the %s option, because %s.

**Description**

The specified pin group id cannot be specified for the indicated reason. The pin group id must have been assigned to a pin, shape, or via in the net's block prior to calling this command. Additionally the specified pin group id cannot be 0, because it is the default pin group's id. Pins in the default pin group are always routed using the default rule.

**What Next**

Remove the specified pin group id from the command call.

Feedback

## NDMUI-754

(error) Pin '%s' cannot be assigned to pin group id '%u', because the pin is unconnected.

**Description**

The pin must be connected to a net before being added to a pin group.

**What Next**

Connect the pin to a net and then set the pin group id.

## NDMUI-755

(information) The object '%s' of type '%s' of design '%s' is skipped.

**Description**

The object is skipped in the command "copy_floorplan".

**What Next**

This is an informational message only.

## NDMUI-756

(error) '-new_name' is not allowed for multiple cells.

**Description**

The option '-new_name' is not allowed when multiple cells are specified in the cell_list argument.

**What Next**

Please specify single cell in the cell_list argument.

**See Also**

- uniquify

## NDMUI-757

(error) The value of the '%s' option or attribute must be a list of one or more positive distance values.

Feedback

**Description**

The specified option or attribute value must be a list of one or more distance values, all of which must be greater than zero.

**What Next**

Please specify a list of positive distances for the specified value.

---

## NDMUI-758

(error) The value of the '%s' option or attribute must be a %s distance value.

**Description**

The specified option or attribute value must be a distance value in the specified range.

**What Next**

Please specify a valid distance for the specified value.

---

## NDMUI-759

(warning) Could not remove bump_region_pattern '%s' - it is referenced by one or more bump_regions.

**Description**

A bump_region_pattern cannot be removed if it is referenced by one or more bump_regions - that is, one or more bump_regions has the bump_region_pattern as their *pattern* attribute. You can query which bump_regions these are using the *get_bump_regions -of_objects <collection of the bump_region_pattern>* command.

**What Next**

To remove the bump_region_pattern, first remove the referencing bump_regions, or change the bump_regions' *pattern* attributes to reference other bump_region_patterns.

---

## NDMUI-760

(error) module '%s' has no HDL Groups

**Description**

Module has no HDL Groups defined.

Feedback

**See Also**

- group_cells

---

## NDMUI-761

(error) No HDL Groups matched pattern '%s' for module '%s'

**Description**

The pattern which you specified did not match any HDL Groups for the module.

**See Also**

- group_cells

---

## NDMUI-762

(error) No cells found in HDL Groups

**Description**

No valid cells found in HDL Groups

**See Also**

- group_cells

---

## NDMUI-763

(error) value specified for '-new_name' is an empty string

**Description**

Argument of -new_name should be a non-empty string.

**What Next**

Please specify a non-empty string value

**See Also**

- uniquify

Feedback

## NDMUI-764

(info) Target bus naming style '%s' is applied to all modules of design '%s' even though -hierarchy is not specified.

**Description**

Value of -target_bus_naming_style is always applied to all modules in the design, regardless of the value of option -hierarchy for change_names.

## NDMUI-765

(error) Design '%s' Technology has fewer routing layers than the specified number of layers.

**Description**

Technology has fewer routing layers than the specified number of layers.

**What Next**

Make sure that the technology has sufficient routing layers.

## NDMUI-766

(error) %s.

**Description**

Individual command specified within redirect -bg is either unknown or a command that is not allowed with redirect -bg or redirect -bg itself.

**What Next**

Verify that each command specified within redirect -bg is a valid ICCII or Descartes command and also one of the supported commands within redirect -bg, for example, reporting commands. Most of the command that modifies design data like, for example, create commands are not allowed to be executed within redirect -bg. Also nested redirect -bg is not allowed.

## NDMUI-767

(warning) Parallel_execute within redirect -bg will run with %d cores instead of %d cores.

**Description**

The maximum cores allowed in parallel_execute when invoked within redirect -bg will be limited by the max_cores specified within redirect -bg.

Feedback

**What Next**

If you want run parallel_execute with more cores, please increase the value of max_cores specified to redirect -bg.

---

## NDMUI-768

(warning) redirect -bg will run with a max cores of %d instead of %d.

**Description**

The maximum cores allowed in redirect -bg will be limited by the maximum cores available in the parent.

**What Next**

In the main process, always specify max_cores to be atleast one more than what you want to make use of in redirect -bg.

---

## NDMUI-769

(error) redirect -bg cannot be used in single core.

**Description**

The main process should specify a max core value which is greater than 1.

**What Next**

Use set_host_options -max_cores to change the maximum allowed cores in main process.

---

## NDMUI-770

(error) '%s' is not a valid library package. Please run md5sum to confirm the checksum after transfer from customer site.

**Description**

*read_lib_package* cannot read library package generated by the *write_lib_package command.*

**What Next**

The lib package file provided isn't in the proper format. If you are transferring this data from customer site, please run md5sum on the lib_package file before and after file transfer to confirm the checksum remains the same.

Feedback

## NDMUI-771

(error) Specified output library package name '%s' is not writable in the current working directory.

**Description**

*write_lib_package* can create a library package only if the specified output library package name is writable in the current working directory.

**What Next**

Please provide the valid library package name

## NDMUI-772

(error) Cannot raise or lower cells in z level when multiple specified cells are distributed in different z levels as well as different stacks.

**Description**

Cells can be reordered by one position in z level only when all specified cells are in a same z level or same stack.

## NDMUI-773

(error) Cannot raise or lower cells in z level when specify multiple cells whose z_offsets are not consecutive in a stack.

**Description**

Cells in a stack can be reordered when all specified cells' z_offsets are consecutive.

## NDMUI-774

(error) The specified preferred pins are invalid for port '%s' because %s.

**Description**

The preferred pins must be all frontside pins or all backside pins. A mix of frontside and backside pins is not supported on a single port. The preferred pins' die side is used to determine the port's die side, which is either front or back but not both.

**What Next**

Specify preferred pins that are all on the same die side.

Feedback

## NDMUI-775

(warning) Could not add topology_plan '%s' to the new topology_group - the plan must be in the same block as the group

**Description**

Could not add the specified topology_plan to the newly-created topology_group - the plans of a group must reside in the same block as the group.

**What Next**

Specify plans exclusively from the groups's block.

## NDMUI-776

(error) Invalid sequential_repeaters value specified

**Description**

The value specified for the topology_plan 'sequential_repeaters' attribute is invalid - must be a string of the form "<operator> <operand>". '<operator>' must be one of the following values: <, <=, =, >=, >, less, less_or_equal, equal, greater_or_equal, or greater. '<operand>' must be either the name of a topology_plan, which may include wildcards, or a non-negative integer.

**What Next**

Please specify a valid sequential_repeaters value.

## NDMUI-777

(warning) Could not remove default topology_group '%s' - it contains topology_plans.

**Description**

The default topology_group cannot be removed if it contains topology_plans, unless the '-remove_plans' argument is specified.

**What Next**

To remove the default topology_group, please remove the plans first, or use the '-remove_plans' argument of the remove_topology_groups command.

## NDMUI-778

(error) Could not set the group of the topology_plan.

Feedback

**Description**

Could not set the topology_plan's group to the specified topology_group - the group must be in the same block as the plan.

**What Next**

Specify a valid topology_group from the plan's block.

---

## NDMUI-779

(error) Invalid color value specified

**Description**

The specified color value is not valid. Please specify a hexadecimal 24-bit rgb value preceded by '#', where the digits correspond to the format #rrggbb or #aarrggbb, for example: "#543cb1".

**What Next**

Please specify a valid color value.

---

## NDMUI-780

(warning) The core area cannot be set.

**Description**

The setting of the core area is skipped in the command "copy_floorplan".

**What Next**

The core area cannot be set because there may be existing site array or site row in the design.

---

## NDMUI-781

(warning) The boundary cannot be set.

**Description**

The setting of the boundary is skipped in the command "copy_floorplan".

**What Next**

The boundary cannot be set because it may be invalid.

Feedback

## NDMUI-782

(info) %s for first site row of site_array: %s.

**Description**

It is not necessary that first row of site array will have first value of cycle and offset provided by user in *create_site_array* command. Cycle and Offset will be aligned on the basis of virtual grid.

If user wants to have cycle and offset provided as part of *create_site_array* command to be aligned with first site row of site array then user can can create un-aligned site array.

## NDMUI-783

(error) '%s' already has reliability verification constraint '%s' with layer %s. It can't have both layer lines and layer widths.

**Description**

One object can't have reliability verification constraints with both layer lines and layer widths. It can either have reliability verification constraints with layer lines or reliability verification constraints with layer widths.

**What Next**

Review the objects listed in error message and decide which reliability verification constraints is needed for that object and then apply constraints accordingly.

## NDMUI-784

(error) Could not set the anchor's %s to '%s' - the object must be in the same or lower level of hierarchy as the dependent object.

**Description**

Could not set the specified object as an anchor object of the anchor, because it resides in an incompatible level of hierarchy.

**What Next**

Specify an object from the same or a directly descendant hierarchy as the dependent_object.

## NDMUI-785

(error) Cannot add hierarchical %s object '%s' to the edit_group: %s

Feedback

**Description**

Could not add the specified hierarchical object to the edit_group: only hierarchical objects of class edit_group may be added to an edit_group, and only those that are from a unique block, and that don't already belong to another edit_group in the top edit_group's block.

**What Next**

When adding a hierarchical object to a top edit_group, ensure that the hierarchical object is an edit_group that does not already belong to another edit_group in the top edit_group's block, and that the top edit_group does not already contain a hier_member from the same block as the hierarchial object.

---

## NDMUI-786

(error) %s.

**Description**

redirect with -bg option is not allowed within redirect -bg.

**What Next**

Verify that you do not use -bg option to redirect when using within redirect -bg option.

---

## NDMUI-787

(error) Value '%s' for option '%s' must form a rectangle.

**Description**

The reported option must specify points which form a rectangle.

**What Next**

Provide the correct value to the reported option.

---

## NDMUI-788

(warning) Duplicate label '%s' specified in label list.

**Description**

The label list argument of this command must be a list of unique label names.

**What Next**

Remove the duplicate label names from the view label list argument.

Feedback

## NDMUI-789

(warning) Empty reference list specified.

**Description**

The reference list argument of this command must be a non empty list of unique reference names.

**What Next**

Indicate one or more references to add a label link map to.

## NDMUI-790

(warning) Could not remove pseudo_tsv_def '%s' - it is referenced by one or more pseudo_tsvs or bump_regions.

**Description**

A pseudo_tsv_def cannot be removed if it is referenced by one or more pseudo_tsvs - that is, one or more pseudo_tsvs has the pseudo_tsv_def as their *tsv_def* attribute. Additionally, a pseudo_tsv_def cannot be removed if one or more bump_regions has this pseudo_tsv_def specified in its *tsv_pattern* attribute.

**What Next**

To remove the pseudo_tsv_def, ensure that it is not referenced by any pseudo_tsv or bump_region.

## NDMUI-791

(error) Block boundary is not defined for block '%s'.

**Description**

Block boundary is not defined so track cannot be reported with respect to block boundary.

**What Next**

Set the boundary data for the block and then report track relative to block boundary.

## NDMUI-792

(error) Core area is not defined for block '%s'.

Feedback

**Description**

Core area is not defined so track cannot be reported with respect to core area.

**What Next**

Define core area for block and then report track relative to core area.

---

## NDMUI-793

(error) Start coordinate provided is outside block boundary. Please provide '%s' or '%s' also.

**Description**

Start coordinate of track is outside block bounadry so user must provide '%s' or '%s' so that track can be created in a definite range.

**What Next**

Please provide '%s' or '%s'.

---

## NDMUI-794

(error) Exactly one pin or port must be specified as input of '%s' option.

**Description**

This command accepts exactly one pin or port as part of '%s' option.

**What Next**

Please provide the correct input.

---

## NDMUI-795

(warning) Command 'report_utilization' doesn't support Hybrid site-array i.e. '%s'.

**Description**

For now, command 'report_utilization' doesn't support Hybrid site-array. In future, it may be supported. Hybrid site-array is a site-array which has site-rows of multiple site names or site-defs.

---

## NDMUI-796

(error) The column and row counts for the '%s' option must be positive values.

Feedback

**Description**

The value of the specified option or attribute must be a pair of positive integer values, specifying the desired pseudo_bump array size of the bump_region. If you want to unconstrain the array size of the bump_region, you may change the bump_region's 'boundary_mode' attribute to 'boundary', or setting the 'boundary' attribute directly will also change the 'boundary_mode'.

**What Next**

Please specify a valid value.

---

## NDMUI-797

(error) The name '%s' is not in correct format.

**Description**

The name of the internal design is not in correct format.

**What Next**

Please specify the name in correct format

---

## NDMUI-798

(error) The library containing the internal design is not open.

**Description**

The library containing the internal design is not open.

**What Next**

Please open the library and run the command again.

---

## NDMUI-799

(error) The specified internal design cannot be found.

**Description**

The specified internal design cannot be found.

**What Next**

Please specify a valid internal design as input.

Feedback

## NDMUI-800

(error) Cannot specify name '%s' as it overlaps with the system-generated names for '%s' objects.

### Description

Many objects have optional names the user may set. In the absence of a user specified name the objects have a system defined name, which is usually the name of the object type followed by a number. User names may not match the syntax of a system-generated name.

### What Next

Try choosing a different name that does not conflict with a system-generated name for the object.

## NDMUI-801

(error) Name '%s' is not unique among '%s' objects.

### Description

Many objects of the same type require unique naming. If a given name already exists for another object of the same type it may not be used again.

### What Next

Try choosing a different name for the object that does not match the name of an existing object of the same type.

## NDMUI-802

(error) Cell '%s' is not in the same hierarchy as the placement attraction.

### Description

Placement attractions only allow cells that exist in the same hierarchy. The cells that the user may add must exist in the same design context as the placement attraction.

### What Next

Try selecting a different set of cells, all of which have the same design context as the placement attraction.

## NDMUI-803

(error) Cell '%s' is not at the same level of physical hierarchy as the placement attraction.

Feedback

**Description**

Placement attractions only allow cells that exist at the same level of physical hierarchy.

**What Next**

Try selecting a different set of cells, all of which exist at the placement attraction's level of hierarchy.

---

## NDMUI-804

(error) Placement attraction regions may only be defined by at most two unique coordinates.

**Description**

A placement attraction's region may be one of a point, (axis-parallel) line, or rectangle. Therefore any desired region may be specified with no more than 2 unique coordinates.

**What Next**

Identify the desired region. If the region is a point, provide the same coordinate value twice. If the region is a line, provide the start and end coordinates. If the region if a rectangle, provide the coordinates of the lower-left and upper-right corners.

---

## NDMUI-805

(warning) Cell '%s' is already a member of placement_attraction '%s', skipping.

**Description**

A placement attraction may only contain one instance of a given cell.

**What Next**

The cell is already in the placement attraction.

---

## NDMUI-806

(warning) Cell '%s' is not a member of placement_attraction '%s', skipping.

**Description**

A cell cannot be removed from a placement attraction of which it is not a member.

**What Next**

The cell is already not a member of the placement attraction.

Feedback

## NDMUI-807

(error) Cell '%s' is not a physical cell.

**Description**

Only physical cells may be members of placement attractions.

**What Next**

Remove cells that do not have physical implementation from the cell list.

## NDMUI-808

(error) Invalid mask constraint list '%s'; %s.

**Description**

A mask constraint list argument is expected to contain a list of mask constraints. The specified list is not a valid mask constraint list for the specified reason.

**What Next**

Fix the offending list.

## NDMUI-809

(error) Invalid %s '%s' specified for delta displacement.

**Description**

The distance specified for delta displacement cannot be negative. The supported directions are east, north, west, south, northeast, northwest, southwest, southeast.

**What Next**

Correct the delta displacement.

## NDMUI-810

(error) Invalid delta '%s'.

**Description**

The format of delta is "distance:direction | {x-distance:x-direction y-distance:y-direction}". In the first form, any value of direction suffix from the set {east north west south northeast northwest southwest southeast} may be added to the numeric distance to specify the delta spacing for the horizontal, vertical, or 45-degree diagonal displacement, eg.

Feedback

100.5000:east. In the second form, a general {x y} displacement may be specified for any arbitrary direction using a pair of deltas where the first delta must have either :east or :west direction suffix and the second delta must have either :north or :south direction suffix. Eg. {100.5000:east 200.5000:south}.

**What Next**

Correct the errors in delta displacement(s).

---

## NDMUI-811

(error) %s specified for%s the displacement.

**Description**

At-least one delta must be specified for the first form of delta. At-most a pair of deltas may be specified for the second form of delta also known as g-delta with the horizontal and vertical components of the displacement for any arbitrary direction. The distance specified for delta displacement cannot be negative. The supported directions are east, north, west, south, northeast, northwest, southwest, southeast.

**What Next**

Correct the delta displacement.

---

## NDMUI-812

(error) Must specify %s in the specified delta displacement '%s'.

**Description**

The distance and direction both must be specified in the input delta. The distance specified for delta displacement cannot be negative. The supported directions are east, north, west, south, northeast, northwest, southwest, southeast.

**What Next**

Correct the delta displacement.

---

## NDMUI-813

(error) The %s delta must be %s with %s.

**Description**

The format of second form of delta also known as g-delta is "{x-distance:x-direction y-distance:y-direction}". In this form, a general {x y} displacement may be specified for any arbitrary direction using a pair of deltas where the first delta must have either :east

Feedback

or :west direction suffix and the second delta must have either :north or :south direction suffix. Eg. {100.5000:east 200.5000:south}.

**What Next**

Correct the errors in g-delta displacement(s).

---

## NDMUI-814

(error) Invalid items in the delta_list '%s'.

**Description**

The delta_list must be of the form "{ delta1 delta2 ... }". The format of delta is "distance:direction | {x-distance:x-direction y-distance:y-direction}". In the first form, any value of direction suffix from the set {east north west south northeast northwest southwest southeast} may be added to the numeric distance to specify the delta spacing for the horizontal, vertical, or 45-degree diagonal displacement, eg. 100.5000:east. In the second form, a general {x y} displacement may be specified for any arbitrary direction using a pair of deltas where the first delta must have either :east or :west direction suffix and the second delta must have either :north or :south direction suffix. Eg. {100.5000:east 200.5000:south}. The delta_list comprises of any arbitrary spequence of deltas in first or second form. Eg. { 200.5000:north {100.5000:east 200.5000:north} 100.5000:south ...}.

**What Next**

Correct the errors in the reported items of the delta_list.

---

## NDMUI-815

(error) The %s cannot be %s when %s.

**Description**

This error is reported when there is a dependency amongst multiple attributes.

**What Next**

Correct the reported attribute(s).

---

## NDMUI-816

(error) The specified %s must have exactly %u delta spacing values.

**Description**

In case of shape_pattern with non-uniform spacing exactly (m_dimension * n_dimension - 1) spacings must be specified in the input delta_list.

Feedback

**What Next**

Correct the number of deltas in the specified delta_list.

---

## NDMUI-817

(error) The '%s' and '%s' of %s cannot be both less than %u.

**Description**

This error is reported when there is a dependency amongst multiple attributes.

**What Next**

Correct the reported attribute(s).

---

## NDMUI-818

(warning) The edit_group '%s' cannot be modified because it is locked.

**Description**

The specified edit_group either has its 'is_locked' attribute set to true or is itself a member of a locked edit_group, so it cannot be modified or removed, nor can any of the member objects in its objects collection be modified or removed.

**What Next**

To edit the edit_group or any of its member objects, the edit_group must be unlocked by setting its 'is_locked' attribute to 'false', and it must also not be a member of a locked edit_group.

---

## NDMUI-819

(warning) The %s '%s' cannot be modified or removed, because it is a member of a locked edit_group.

**Description**

The specified object is a member of a locked edit_group, which is an edit_group with its 'is_locked' attribute set to 'true'. When in a locked edit_group, an object can neither be modified nor removed.

**What Next**

To modify or remove the object, the edit_group that contains the object must be unlocked by setting its 'is_locked' attribute to 'false'.

Feedback

## NDMUI-820

(warning) Cannot consider %s '%s' since it is %s.

### Description

The specified cell, lib_cell or pin cannot be considered as it is not valid. This could happen when command is expecting a cell of type register and you have specified a non-register, or vice-versa. Another possibility is that the cell or pin is not from the same block as current block. In case of lib_cell, this could happen when command is expecting a fault-tolerant lib_cell and you have specified a module, or vice-versa.

In case of safety cores, this could happen when command is expecting a logical hierarchical cell and user has specified a leaf level cell or cell with physical view or cell in different hierarchy. The same is applicable for setting an SPFM target on a cell.

### What Next

Ensure that the object is from the current block and is of the correct type.

## NDMUI-821

(warning) The %s '%s' is not of type '%s', but will still consider it

### Description

The specified cell, lib_cell or pin is not of the correct design type. But the command will still accept it. This could happen when a cell or lib_cell is specified but its design type is not well_tap.

### What Next

Ensure that the tap cell or lib_cell is of the correct design type

## NDMUI-822

(warning) Changing the register_type value might make the safety_register_rule data inconsistent.

### Description

The different attributes of a safety_register_rule must be consistent with each other. Otherwise the safety_register_rule is not valid. For example, if you change the register_type from fault_tolerant to group, you must also change the map_ref_name to specify a module instead of the earlier lib-cell.

Feedback

**What Next**

Please change the other attribute values accordingly.

---

## NDMUI-823

(error) Could not find %s with name '%s'.

**Description**

There is no module or lib_cell existing with the given name. Lib cell name must be specified in the form of lib_name/libcell_name. If you are specifying a module name, that module must exist in the current design.

**What Next**

Provide a valid module/lib_cell name

---

## NDMUI-824

(error) No argument specified.

**Description**

There is no argument specified.

**What Next**

Provide argument in command.

---

## NDMUI-825

(warning) The number of registers in the group (%d) does not match the redundancy mode (%d) of the rule.

**Description**

When creating a safety register group, or modifying the grouped registers via attribute, it must be ensured that the group has the same number of registers as specified by the redundancy mode of the rule which is applied on the group. This could also happen if one or more registered specified is not a valid candidate for being a part of the group.

**What Next**

Provide the corrent number of valid registers for the safety register group

Feedback

## NDMUI-826

(warning) Could not remove %s '%s'.

**Description**

There is some problem in remove. This could happen when object is getting used by some other object, or does not exists or not specified the valid value in command.

**What Next**

Provide valid argument in command.

## NDMUI-827

(error) Value provided with %s is either too large or too small.

**Description**

Value provided with argument is either too large or too small. It must be a positive value and also lesser than the block dimensions.

**What Next**

Provide the argument value in range.

## NDMUI-828

(error) %s values can be provided with %s.

**Description**

The list has too many or too few elements.

**What Next**

Provide a valid number of elements.

## NDMUI-829

(error) Invalid value %s for %s.

**Description**

Values provided with argument is not valid.

**What Next**

Provide the valid value for argument.

Feedback

## NDMUI-830

(warning) %s cannot be added in '%s' list.

**Description**

This message indicates that input objects provided cannot be added in the list.

**What Next**

Please exclude these objects from the input.

## NDMUI-831

(error) Cannot create a group as the rule is of type 'fault_tolerant'.

**Description**

The specified safety register group could not be created via create_safety_register_group command because the rule specified is of type 'fault_tolerant' instead of 'group'.

**What Next**

Please specify another rule with the type 'group'.

## NDMUI-832

(error) Cannot associate cell %s with rule %s as this cell is already associated with rule %s .

**Description**

The specified cell is already associated with some other rule.

**What Next**

Please specify another cell with the this rule.

## NDMUI-833

(warning) The %s output is not specified in the safety logic port map for '%s'.

**Description**

The safety logic port map for the specified module or lib-cell has not been set up correctly. For rules of type dual_mode, the error output must be specified prior to running this command. Similarly, for rules of type triple_mode, the voting outout must be specified before hand.

Feedback

**What Next**

Use set_safety_logic_port_map command to set the port mappings correctly for the given module or lib-cell.

---

## NDMUI-834

(error) Argument %s doesn't have any valid object.

**Description**

No valid objects could be found in the specified objects. This might be because of objects are ignored as they are not valid for that argument. There must be at least one valid object for the argument.

**What Next**

Please provide the correct inputs.

---

## NDMUI-835

(warning) Attribute 'max_num_stagger_tracks_table' cannot be set for via_rule %s. Value must be between 0 and 9.

**Description**

Value for the 'max_num_stagger_tracks_table' attribute must be between 0 and 9.

---

## NDMUI-836

(error) The customized-mask base via ratio is greater than 20 percent.

**Description**

The customized-mask base via ratio is greater than 20 percent. The capacity is worst than the situation in arbitray mask_pattern.

**What Next**

Update the mask_pattern as arbitray, then set the mask.

---

## NDMUI-837

(error) '%s' option is not supported when RTL restructuring mode is enabled.

**Description**

Command option specified is not supported when RTL restructuring mode in enabled.

Feedback

**What Next**

Verify that each option specified with command in RTL restructuring mode *set_app_options -list {rtlfp.flow.rtl_restructuring_mode true}* is supported. for example, *-hdl_block*|*-hdl_bussed*|*-hdl_all_blocks* options of *group_cells* and *-flatten*|*-force*|*-start_level* options of *ungroup_cells* are not supported.

---

## NDMUI-838

(error) '%s' command is disabled when RTL restructuring mode is enabled.

**Description**

Command specified is not allowed when RTL restructuring mode in enabled.

**What Next**

Verify that each command specified after enabling RTL restructuring mode *set_app_options -list {rtlfp.flow.rtl_restructuring_mode true}* is one of the supported commands within RTL restructuring mode. for example, restructuring commands *group_cells, ungroup_cells, write_restructured_rtl* etc. Most of the commands that modifies design data like, for example, *create*|*change*|*set*|*rename*|*remove*|*edit* commands are not allowed to be executed within RTL restructuring mode.

---

## NDMUI-839

(error) The number of cores in the group (%d) does not match the number of cores (%d) in the rule.

**Description**

When creating a safety core group, or modifying the cores via attribute, it must be ensured that the group has the same number of cores as specified by the number of cores of the rule which is applied on the group. This could also happen if one or more core specified is not a valid candidate for being a part of the group.

**What Next**

Provide the correct number of valid cores for the safety core group

---

## NDMUI-840

(warning) Cannot %s macro group move bound : %s

Feedback

**Description**

Bound shapes can only be added to a macro group move bound while creating the move bound using *create_bound* command.

Bound shapes can not be added or removed from a macro group move bound using *create_bound_shape* or *remove_bound_shapes*.

**What Next**

For adding or removing the bound shapes to a macro group move bound, use *remove_bounds* command to delete the macro group move bound and then use *create_bound* to create the bound with the desired bound shapes.

**See Also**

- create_bound
- remove_bounds
- create_bound_shape
- remove_bound_shapes

---

## NDMUI-841

(warning) macro_group move bound 'type' cannot be changed

**Description**

The type of the macro_group cannot be changed.

---

## NDMUI-842

(info) Skipped pin_pair {%s %s} as it already exists in supernet exceptions.

**Description**

The specified pin_pair already exists in supernet exceptions.

---

## NDMUI-843

(error) Specified start and stop anchors are not on same physical hierarchy.

**Description**

Specify start and stop anchors from same physical hierarchy only.

Feedback

## NDMUI-844

(error) No path exists between specified start and stop anchors.

**Description**

No path exists between start and stop anchors.

## NDMUI-845

(warning) %s must be provided if number of valid cores is 2

**Description**

When creating a safety core group or setting cores in safety core rule, error signal must be provided if number of valid cores is 2 to handle the error.

**What Next**

Provide the correct number of valid cores for the safety core group or rule.

## NDMUI-846

(error) Different specification formats for placement separation and routing separation.

**Description**

When creating a safety core group, the routing guardband and distance must be specified in the same format. Either both should be a single radial value {r}, or both should be in terms of {x,y} pairs.

**What Next**

Provide routing_guardband in the same format as distance.

## NDMUI-847

(error) Cannot create failsafe fsm group as specified register %s is duplicated or there is overlap between state, parity and sync registers.

**Description**

Register(s) specified as state, parity and sync should be mutually exclusive. There should not be any overlap between state, parity and sync registers.

Feedback

### What Next

Ensure that the register(s) specified as part of state, parity and sync are mutually exclusive.

---

## NDMUI-848

(error) Cannot create safety core group as specified %s '%s' is already part of safety core group '%s'.

### Description

One of the specified voting / logic cell is already part of another safety core group as voting / logic cell or one of the specified safety cores is already part of another safety core group as safety core or One of the specified delay cell is already part of another safety core group as delay cell. Overlapping of safety core / voting / logic cell(s) is not allowed.

### What Next

Ensure that the safety core / voting / logic / delay cell is part of one safety core group only.

---

## NDMUI-849

(error) The topology_node's 'origin' attribute cannot be modified unless its constraint_type is 'origin'.

### Description

The topology_node's 'origin' attribute cannot be directly modified unless its 'constraint_type' attribute value is 'origin', because the value of 'origin' is automatically calculated for all other constraint modes.

### What Next

Only set the 'origin' attribute value directly when the topology_node's 'constraint_type' attribute value is 'origin'.

---

## NDMUI-850

(error) Unable to set 'offset' relative to core area as 'cycle' is not set for site-row '%s'.

### Description

'cycle' must be set before setting 'offset' for a site-row while setting offset relative to core area. Setting offset relative to core area uses cycle value so it must be set before setting offset.

Feedback

### What Next

Set the cycle first and then try to set offset relative to core area.

---

## NDMUI-851

(error) Unable to create via rule as -cut_rows and -cuts_per_row are inconsistent to each other.

### Description

The options -cut_rows and -cuts_per_row are expected to be consitent with each other. The correct format for -cut_rows is {A1 A2 …. An 1} and for -cuts_per_row is {1 A1 A2 … An}. Any format other than this will lead to a corrupted via rule and creation of via rule will be aborted.

### What Next

Make sure options -cut_rows and -cuts_per_row are in a proper format to create the via rule.

---

## NDMUI-852

(information) Setting the bump_region's pattern attribute to the default bump_region_pattern '%s'.

### Description

The bump_region you are creating will have its *pattern* attribute automatically set to the specified bump_region_pattern, which is the current default bump_region_pattern in the block. The default bump_region_pattern is automatically used when the *-pattern* option of the command is unspecified.

### What Next

No action needed.

### See Also

- create_bump_region
- create_bump_region_pattern

---

## NDMUI-853

(error) Missing '-pattern' option and no default pattern exists.

Feedback

**Description**

Could not create the bump_region object - a bump_region_pattern object is required as the reference pattern, however there was none specified, and no default bump_region_pattern exists in the block.

**What Next**

Please specify a bump_region_pattern using the command's *-pattern* option, or set an existing bump_region_pattern as the default pattern by setting its *is_default* attribute to true, or create a new bump_region_pattern object using the *-default* option of the create command.

---

## NDMUI-854

(error) Problem reading %s: %s.

**Description**

Could not read the attribute value for the specified reason.

**What Next**

Please specify a valid attribute value. A description of the attribute format can be found in the man page of the *create_bump_region* command.

**See Also**

- create_bump_region

---

## NDMUI-855

(error) Problem resolving %s '%s': %s.

**Description**

Could not find or use the object with the specified name for the specified reason.

**What Next**

Please specify the name of an existing object in the correct block.

---

## NDMUI-856

(error) The '%s' option value must be a distance list of length 2.

Feedback

**Description**

The specified option requires a value that is a distance list of length 2, where the first element is the x offset and the second element is the y offset.

**What Next**

Please specify a distance vector of length 2.

---

## NDMUI-857

(error) Could not set the %s's %s to '%s' - the %s must be in the same block.

**Description**

Could not set the specified option or attribute to the specified object, because the object is in a different block.

**What Next**

Specify an object from the same block.

---

## NDMUI-858

(error) The bump_region's '%s' option value must be a distance list of length 1, 2, or 4.

**Description**

The specified option requires a value that is a distance list of length 1, 2, or 4. This option specifies a margin between the bump_region's boundary and the pseudo_bumps it contains. If the length is 1, then the value imposes that margin on all sides. If the length is 2, then the first value is the margin for the left and right, and the second value is the margin for the top and bottom. If the length is 4, then the values are the margins for the left, bottom, right, and top, respectively.

**What Next**

Please specify a distance vector of length 1, 2, or 4.

---

## NDMUI-859

(error) Invalid value for '-index_range' option

Feedback

### Description

An invalid value was specified for the '-index_range' option of the 'get_pseudo_bumps' command. The value must have one of the following two formats:

"{<column_index> <row_index>}" to specify a single index value, where <column_index> and <row_index> are integer values within the range of 16-bit signed integer values, or

"{{<column_index_ll> <row_index_ll>} {<column_index_ur> <row_index_ur>}}" to specify an inclusive range of indices, where <column_index_ll>, <row_index_ll>, <column_index_ur>, and <row_index_ur> are integer values within the range of 16-bit signed integer values, and the following relationships are true: <column_index_ll> <= <column_index_ur> and <row_index_ll> <= <row_index_ur>

### What Next

Specify a value index range value.

---

## NDMUI-860

(warning) The '%s' option or attribute is deprecated - please use the 'anchor' object to implement bump_region anchoring.

### Description

The specified anchoring-related command option or attribute is deprecated and non-functional. Please use the "anchor" object to anchor the bump_region to another object.

### What Next

Use the "anchor" object for anchoring.

### See Also

- create_anchor

---

## NDMUI-861

(error) Could not set the anchor's dependent object to '%s' - it is already the dependent object of anchor '%s'.

### Description

Could not set the specified object as the dependent object of the anchor, because the object is already the dependent object of another anchor. An object may only be the dependent object of up to one anchor.

Feedback

**What Next**

Specify a different dependent object, or remove the object as the dependent object of the other anchor.

---

## NDMUI-862

(error) Could not set the anchor's dependent object to '%s' - the object must be in the same block as the anchor.

**Description**

Could not set the specified object as the dependent object of the anchor, because the object is in a different block.

**What Next**

Specify an object from the anchor's block.

---

## NDMUI-863

(error) Anchor's %s command option must be set when its type is '%s'.

**Description**

Certain anchor command options are required based on the anchor's 'type' attribute value.

**What Next**

Please specify the command options required for the anchor's type.

---

## NDMUI-864

(error) Anchor's '%s' %s cannot be set unless its type is '%s'.

**Description**

The settability of certain anchor attributes or command options depends on the anchor's 'type' attribute value. In this case, you attempted to set the specified attribute or command option even though the anchor has the wrong type for that attribute or command option.

**What Next**

Only set anchor attributes and command options appropriate to the anchor's type.

Feedback

## NDMUI-865

(warning) Could not implement pseudo_bumps for bump_region '%s' - the number of pseudo_bumps would exceed the system limit of %s.

### Description

The current configuration of the specified bump_region and the bump_region_pattern it references results in a pseudo_bump count that exceeds the specified system limit, therefore the application could not populate the bump_region with pseudo_bumps.

### What Next

Change the configuration of the bump_region and/or its bump_region_pattern such that a reasonable number of pseudo_bumps would be created, or modify the system limit by increasing the value of the *design.bump_region_pseudo_bump_count_limit* app option. Note that increasing the system limit may result in a significant increase in runtime and memory usage.

## NDMUI-866

(error) The topology_node's intrinsic_delay must be a list with no more than two values

### Description

The 'intrinsic_delay' attribute of the topology_node must be a list of one or two values, where each value can be either a distance or a percentage. Percentage values must be appended with the '%%' symbol.

### What Next

Specify a list of values no longer than two.

## NDMUI-867

(error) Could not create TSV cell '%s': %s

### Description

Could not create the TSV cell due to the specified reason(s).

### What Next

Please correct the specified problem(s).

Feedback

## NDMUI-868

(error) %s %s are in un-editable hierarchy and hence the command is not executed, few of which are %s.

**Description**

Unable to make modification in un-editable hierarchy.

## NDMUI-869

(error) %s %s is un-editable and hence the command is not executed.

**Description**

Design is in un-editable hierarchy.

## NDMUI-870

(error) Auto-saving is already in active state.

**Description**

This indicates auto-saving has already enabled and to suspend auto-saving please use stop_auto_save

**What Next**

To change auto-save settings, please do stop_auto_save and then do start_auto_save with the desired settings.

**See Also**

- start_auto_save
- stop_auto_save

## NDMUI-871

(error) Frequency must be initialized.

**Description**

Frequency must be set atleast once and doesn't required to be set again if auto-saving is stopped and restarted unless the frequency needs to be changed.

Feedback

### See Also

- start_auto_save

---

## NDMUI-872

(error) Frequency must more than or equal to "%s" seconds.

### Description

Minimum time interval between two auto-saves must more than or equal to 1800 seconds (30 minutes).

### See Also

- start_auto_save

---

## NDMUI-873

(error) Unable to create "%s" specified auto-save directory.

### Description

Check whether specified directory already exists and doesn't have sufficient permission to both read and write to the directory.

### WHAT'S NEXT

Try specifying another directory path.

### See Also

- start_auto_save

---

## NDMUI-874

(error) Size specification "%s" didn't match supported specification.

### Description

Units for "-allowed_disk_space" option is GigaBytes or MegaBytes. Size specification should have size (integral-part) followed by tags G, g, GB, Gb, gb, M, m, MB, Mb or mb.

### WHAT'S NEXT

Specify valid size specification.

Feedback

**See Also**

- start_auto_save

---

## NDMUI-875

(error) Specified size should be more than zero.

**Description**

Size should more than zero but make sure atleast it is more than current library size.

**See Also**

- start_auto_save

---

## NDMUI-876

(error) Number of auto-save snapshots should be more than one.

**Description**

Number of the auto-save snapshots should be more than one if auto-saving is being started.

**See Also**

- start_auto_save

---

## NDMUI-877

(information) Auto-saving started for the current session.

**Description**

Any modifications to the current library beyond this point will be auto-saved given all the prerequisite auto-save settings has met like frequency etc.

**See Also**

- start_auto_save

---

## NDMUI-878

(error) Auto-saving is not in active state.

Feedback

### Description

Auto-saving can be stopped only if auto-saving is active previously.

### See Also

- stop_auto_save
- start_auto_save

---

## NDMUI-879

(information) Auto-saving stopped for the current session.

### Description

Any modifications to the current library beyond this point wont be auto-saved.

### See Also

- stop_auto_save

---

## NDMUI-880

(error) Current library must be defined or "-library" must be specified.

### Description

Set current library or specify library name (for opened library)/ full library path (for unopened library) using -library option.

### See Also

- report_auto_save
- remove_auto_save

---

## NDMUI-881

(error) Specified library '%s' doesn't exist.

### Description

Set current library or specify library name (for opened library)/ full library path (for unopened library). using -library option.

### See Also

- report_auto_save
- remove_auto_save

---

## NDMUI-882

(error) The command %s was not executed because of an ECO policy violation.

### Description

The design.eco_restrictions app_option controls the behavior of the reported command. The app-option when true checks if a netlist change is safe before performing it. when the app-option is true command violating eco policy cannot be performed.

### What Next

If you are sure that the netlist change is safe, you need to set the app_option design.eco_restrictions to false.

### See Also

- disconnect_net
- remove_nets
- create_pin
- remove_pins
- connect_pins
- change_reference
- set_reference
- connect_net
- create_port
- create_net
- remove_cells
- change_link
- design.eco_restrictions

Feedback

## NDMUI-883

(error) In command %s, Custom via def %s cannot be used to create a routing rule. Only simple via defs may be specified.

### Description

This error message indicates that the specified NDR via is an special via.The current NDR engine in the router can only handle NDR vias with only one via enclosure on each layer.Zroute NDR routing doesn't support special via(vias with more than one via enclosures on one metal layer) as NDR vias.

### What Next

Please specify the NDR via using simple_via_def.

### See Also

- create_routing_rule

## NDMUI-884

(information) Attribute is applicable to objects of type %s.

### Description

The given attribute is applicable to objects of reported type created by the command create_pin_constraint. Please ensure that the attribute is being set for the correct object type.

### What Next

Please specify objects of reported type.

### See Also

- create_pin_constraint
- get_pin_constraints

## NDMUI-885

(information) No %s option specified. Constraints will not be set for any object.

### Description

Any individual pin constraint must be set for either a pin, port, or net. The given pin constraint doesn't have any of these options set.

Feedback

**What Next**

Please ensure you provide a pin, port, or net option.

**See Also**

- create_pin_constraint

---

## NDMUI-886

(error) Pin constraint %s should have only one side set.

**Description**

Trying to set pin placement offset for a pin constrait that has more than one side set.

**What Next**

Please ensure only one side is set before trying to set offset.

**See Also**

- create_pin_constraint

---

## NDMUI-887

(warning) No physical data defined.

**Description**

The tool cannot find the physical data from the database. Please check the design input.

**What Next**

Please check the design input and make sure that the physical data exists before running this command.

**See Also**

- create_pin_constraint
- write_pin_constraints

---

## NDMUI-888

(error) Cannot parse the value

Feedback

### Description

The value specified for the argument is not in the correct format.

### What Next

Please check that the values are specified in the correct format. The attribute expects either a single size value (eg., 10) or white space seperated layer-name and size pairs (eg., {METAL5 10}), possibly surrounded by {}.

### See Also

- create_pin_constraint

---

## NDMUI-889

(error) Offset range number must be in same sign.

### Description

The offset range specified should be both +ve or both -ve.

### What Next

Please ensure that the value specified have the same sign. Run the command again with both values either +ve or -ve.

### See Also

- create_pin_constraint
- get_attribute
- set_attribute

---

## NDMUI-890

(error) Range specified must be different.

### Description

The values specified for range must be different.

### What Next

Please ensure that the value specified are different. Run the command again with both values different specifying a range.

Feedback

**See Also**

- create_pin_constraint

---

## NDMUI-891

(warning) The object %s is not appropriate for option %s.

**Description**

This option requires objects of a certain type, but the given object is not that type. This object will be ignored.

**What Next**

Check the command man page to see correct objects types for option.

**See Also**

- create_pin_constraint

---

## NDMUI-892

(error) Object %s not in the top-level physical hierarchy of the current design.

**Description**

The object should be in the top-level physical hierarchy of the current design. This command cannot manipulate constraints on objects in sub-blocks.

**What Next**

Change the current_design to the physical hierarchy directly enclosing the object.

**See Also**

- create_pin_constraint

---

## NDMUI-893

(warning) Duplicate reference module %s detected in option %s. Instance %s ignored.

**Description**

This command option requires unique reference modules. In other words, you can specify only 1 cell instance from an MIB (multiply instantiated block) group. You have specified 2 or more cell instances with the stated reference module. The stated instance will be ignored.

Feedback

### What Next

Specify only 1 cell instance in an MIB group. It does not matter which one.

### See Also

- create_pin_constraint

---

## NDMUI-894

(warning) Skipping power or ground net %s. Power or ground nets are excluded for %s.

### Description

Creation of pin constraint on nets which are power or ground is not allowed.

### What Next

Runn the command again without power or ground nets.

### See Also

- create_pin_constraint

---

## NDMUI-895

(warning) Net %s is tied to power or ground net. The individual pin constraint is applied to the connected %s %s instead %s.

### Description

The reported net is a power or ground net. Individual pin constraints cannot be applied to power or ground net. Therefore, the tool is applying the same constraint to the applicable pins or ports instead.

### What Next

Check if the signal net tied to power or ground is user's intention.

### See Also

- create_pin_constraint

---

## NDMUI-896

(warning) Pin offset/range or start/end specified for side %d of cell %s is outside the block boundary.

Feedback

### Description

Offset/range or start/end values specified for pins/port lies outside the block boundary and hence will be ignored.

### What Next

Input a valid offset/range or start/end value which is within the limits of the associated block edge's perimeter.

### See Also

- create_pin_constraint

---

## NDMUI-897

(warning) Constraints modified on an uneditable(read-only) block %s and it will be ignored.

### Description

This message is issued when a read-only block is being modified.

### What Next

Check to see if this block is reasonable to be modified.

### See Also

- create_pin_constraint

---

## NDMUI-898

(warning) The value specified for range is incorrect.

### Description

The values specified for range must represent a span across which the pins can be placed.

### What Next

Provide two distinct values representing the range indicating a span across a side.

### See Also

- create_pin_constraint

Feedback

## NDMUI-899

(warning) Side number %d is larger than number of sides for block %s, side constraint will be ignored.

### Description

A side number is specified for side or exclude_side constraints, but this number is larger than the total number of side on selected block.

### What Next

Correct the side number then reset the constraint again.

### See Also

- create_pin_constraint

## NDMUI-900

(warning) %s. MIM grouping is disabled, continuing with group_cells only.

### Description

The tool cannot continue with *MIM grouping* because of the reason(s) specified in this message. *MIM grouping* is disabled, it will continue with normal grouping.

### What Next

Fix the reported issue that caused disabling of *MIM grouping* and try again.

### See Also

- group_cells

## NDMUI-901

(error) MIM grouping failed because '%s'.

### Description

*MIM grouping* can fail for various reasons. This error message points out one of the possible reasons why *MIM grouping* failed.

### What Next

Fix the reported issue that caused failure of *MIM grouping*.

Feedback

**See Also**

- group_cells

---

## NDMUI-902

(warning) Exclude-side constraint set for %s %s includes all the sides of it's parent block.

**Description**

All sides of the block are disallowed for pin placement. This could have bad consequences on place_pins outcome and resulting QoR.

**What Next**

Update the exclude sides constraints.

**See Also**

- remove_pin_constraints

---

## NDMUI-903

(error) Pin location coordinate for %s %s is outside of block cell boundary and will be ignored.

**Description**

If pin location is not inside block boundary, the set_pin_constraints will ignore all setting and error out.

**What Next**

Please check pin location coordinate and make it inside block boundary

---

## NDMUI-904

(warning) Net %s does not connect to cell %s. The constraint is skipped. %sPlease consider using topological constraints.

**Description**

The net and cell are not connected. The constraint is skipped. This case should be constrainted with topological constraints instead of physical pin constraints.

**What Next**

Please consider using topological constraints to constrain this case.

Feedback

**See Also**

- read_pin_constraints
- create_topological_constraint

---

## NDMUI-905

(information) The following blocks are disabled for planning:%s.

**Description**

This message reports the blocks that are disabled for planning in the current design.

**What Next**

Please ensure that you run set_editability for the block to allow changes to the block.

**See Also**

- set_editability

---

## NDMUI-906

(information) %s pin constraints associated with %s are removed from block %s.

**Description**

This message displays information about individual pin constraints that are removed from blocks.

**See Also**

- remove_pin_constraints

---

## NDMUI-907

(information) The following blocks do not have associated technology files:%s.

**Description**

This message reports blocks that do not have associated technology files. If a block does not have a technology file with it, the tool cannot know physical data needed, e.g. minimum width allowed on a certain layer. Therefore, any operations or checks that are related to physical data cannot be performed.

Feedback

### What Next

Check that the technology file is correctly set.

### See Also

- create_lib
- set_ref_libs

---

## NDMUI-908

(warning) Exclude side is set for the pin constraint.

### Description

The pin constraint has exclude side set. You cannot have both side and exclude side attribute set for a pin constraint.

### See Also

- create_pin_constraint

---

## NDMUI-909

(error) Pin constraint %s has exclude side set.

### Description

Trying to set pin placement offset for a constraint that has exclude side set.

### What Next

Please ensure that the pin constraint has no sides excluded before setting offset.

### See Also

- create_pin_constraint

---

## NDMUI-910

(warning) Specified width/length for layer %s is less than the layer minimum width/length %s.

Feedback

### Description

The user defined pin width or length constraint, or the non default routing rule width associated with net on the pin, is less than the minimum value defined by the technology rule. As a result, the user defined constraint is ignored for pin placement or pin check.

### What Next

Please double check the technology rule to make sure that user defined width or length constraint, or the non default routing rule, does not violate those defined in technology rule.

---

## NDMUI-911

(warning) %s constraint applied on net %s will be ignored.

### Description

Location/off_edge constraints are not allowed on nets. Therefore, such constraints specified by the user for a net will be ignored.

### What Next

Instead, apply the location/off-edge constraint on the pin that connects to the corresponding net.

### See Also

- create_pin_constraint

---

## NDMUI-912

(warning) Command %s can't find a logical hierarchy for reference block %s.

### Description

During a hierarchical command, the command failed to find a logical hierarchy for a physical reference block. Sometimes, when there is a problem with linking, the ICC2 database may not get correctly updated to include this logical hierachy to physical reference block mapping.

### What Next

Make sure that your design includes all necessary reference libraries in the library search path.

Feedback

## NDMUI-913

(information) %s not set for given constraint.

**Description**

The mentioned attribute is not set for the given pin constraint.

**What Next**

Please ensure the mentioned attribute is set. To set the value of a settable attribute please use the set_attribute command to set it before querying it.

**See Also**

- create_pin_constraint
- get_attribute
- set_attribute

## NDMUI-914

(Error) Cannot set attribute '%s' for rows belonging to an array.

**Description**

Site rows belonging to a site array cannot be modified independently w.r.t attributes-'name', 'orientation', 'origin', 'site_count', 'site_orientation', 'site_space'.

**What Next**

Derived site rows can be modified by modifying site array attributes.

## NDMUI-915

(information) cell %s is unmapped.

**Description**

The cell is unmapped in the design.

**What Next**

If the design has not undergone synthesis, this information can be ignored. Otherwise, you should examine the cell that is reported to see why it is still unmapped.

Feedback

## NDMUI-916

(warning) Object '%s' is not connected to net '%s'.

**Description**

The object is not conneted to the net.

**What Next**

This is only a warning message. No action is required.

## NDMUI-917

(error) cannot create port bus '%s' as existing port '%s' has different direction from other existing ports which can be part of port bus.

**Description**

Existing ports which will be part of port bus are not having same direction so unable to create port bus. All ports of port bus should have same direction. Please use command *get_attribute [get_ports portBusName*] direction* to check direction of ports.

**What Next**

Change direction of existing ports which can be part of port bus and make it same for all ports.

## NDMUI-918

(error) cannot create port bus '%s' as existing port(s) don't have same direction as provided in command option.

**Description**

Existing ports which will be part of port bus are not having same direction as requested in command option so unable to create port bus. All ports of port bus should have same direction. Please use command *get_attribute [get_ports portBusName*] direction* to check direction of ports.

**What Next**

Change direction of existing ports which can be part of port bus or change command option value.

## NDMUI-919

(warning) The requested array_size for the bump_region could not be achieved.

Feedback

**Description**

Due to the geometry of the bump_region's boundary or other configurations, the requested pseudo_bump array_size could not be implemented. Note that the actual array_size is computed based on the highest column and row indicies over all existing pseudo_bumps. This message will appear if a particular array_size was requested, but the resulting pseudo_bumps do not span that array_size range.

**What Next**

Adjustments to the bump_region's boundary, pattern configuration, or other attributes should allow the requested array_size to be achieved.

---

## NDMUI-920

(Warning) Cannot change net_type from '%s' to '%s' on net '%s' as it is overridden.

**Description**

If the net type of a net is overridden by some other segment of that net of type power or ground or constant, then the type of the net can't be modified using the command "set_attribute". "set_net_type" command can be used to change the type.

**What Next**

Use the command "set_net_type" to change the type of the net.

---

## NDMUI-921

(error) site-def '%s' doesn't exist.

**Description**

site-def with name provided as input doesn't exist tech file.

**What Next**

Rectify the input data as per details in error message.

---

## NDMUI-922

(error) incorrect input format for option '%s', should be {composite_site_def_A {elementary_site_def_1 elementary_site_def_2 ...} composite_site_def_B {elementary_site_def_3 elementary_site_def_4 ...} ...}

Feedback

**Description**

Input should have one or more pair of composite site_def, followed by two or more elementary site_defs.

**What Next**

Please correct the input format.

---

## NDMUI-923

(error) Incorrect value specified. Value range is [0-15] inclusive.

**Description**

Input should be within the range 0 to 15 inclusive.

**What Next**

Please specify a valid range for the mentioned value.

---

## NDMUI-924

(error) Invalid check %s.

**Description**

This check is not valid because it is not in the list of supported checks.

**What Next**

Execute the *report_early_data_checks -policy -hierarchical* command to get a list of valid checks. Specify a check from this list.

---

## NDMUI-925

(error) Configuration not set.

**Description**

The early data checks configuration is not set.

**What Next**

Set the early data checks configuration using the *set_early_data_check_policy -policy <policy_name>* command.

Feedback

## NDMUI-926

(error) Invalid strategy %s.

**Description**

This strategy is not valid because it is not in the list of supported strategies.

**What Next**

Execute the *report_early_data_checks -checks <check_name>* command to get a list of valid strategies for the checks. Specify a strategy from this list.

## NDMUI-927

(warning) Cell %s does not exist.

**Description**

Cells are moved in the same order as specified in the command. There are chances that due to movement of the previous cells, current cell does not exist.

**What Next**

Please check for cell being moved and also the order of the cells being moved if there are more than one cells.

## NDMUI-928

(warning) No cell to be moved.

**Description**

There are no cells to be moved. This may be due to restriction of the command or incorrect argument.

**What Next**

Please check the warning messages before this one from the command.

## NDMUI-929

(warning) %s %s cannot be uniquified.

**Description**

Hierarchical cell needs to be uniquified for reparenting of the specified cell. But due to some restriction it cannot be uniquified.

Feedback

### What Next

Please check for restriction on uniquification.

---

## NDMUI-930

(warning) Unable to ungroup cells.

### Description

The *ungroup_cells* command is unable to ungroup the specified cells due to problems that were detected while checking the cell list. These problems are reported separately.

### What Next

Examine the log file and correct any reported errors, then try the command again.

### See Also

- ungroup_cells

---

## NDMUI-931

(warning) %s %s not in current design %s.

### Description

Reparenting is allowed only in the current design. Cell being moved and the new specified parent should be in the current design.

### What Next

Please check if the cell being moved and the new parent are in current design.

---

## NDMUI-932

(warning) Cell %s cannot move to %s.

### Description

Cell being moved is either parent cell or ancestor cell of the new specified parent.

### What Next

Please check cell being moved and the new specified parent.

Feedback

## NDMUI-933

(Error) Current block does not have the physical information for %s '%s'.

**Description**

The physical representation of the scan-in and scan-out pin should exist in the current block. Element's scan-in and scan-out pins cannot be created across physical hierarchies.

## NDMUI-934

(Error) The scan-in pin '%s' and scan-out pin '%s' must be from the same scan cell.

**Description**

The scan-in and scan-out pin of each triplet must be from the same scan cell.

## NDMUI-935

(Error) %s pin '%s' is part of an existing stub chain '%s'.

**Description**

Neither scan-in nor scan-out pin of any stub chain element can refer to an existing stub chain element.

## NDMUI-936

(error) Scan Chain with name '%s' already exists.

**Description**

A Scan Chain with the given name already exists. Scan Chain name must be unique.

**What Next**

Please specify another value which is unique for the scan chain.

## NDMUI-937

(error) Stub Chain with name '%s' already exists.

**Description**

A Stub Chain with the given name already exists. Stub Chain name must be unique.

Feedback

**What Next**

Specify unique value for the stub chain name.

---

## NDMUI-938

(error) Term '%s' is already part of an existing stub chain '%s'.

**Description**

Startpoint or Endpoint term cannot be part of an existing Stub Chain. unique.

**What Next**

Remove the term from the existing stub chain or provide another term.

---

## NDMUI-939

(error) The element list must be of the form {{{scan_in_pin_name scan_out_pin_name bit_length} ...} ...}

**Description**

Required list format for floating/ordered elements is {{{scan_in_pin_name scan_out_pin_name bit_length} ...} ...}

**What Next**

Provide element list in the specified format.

---

## NDMUI-940

(warning) Failed to add stub chain '%s' to scan chain '%s'.

**Description**

Stub Chain addition to the scan chain failed.

**What Next**

Provide appropriate value in -at option.

---

## NDMUI-941

(error) -at option value is out of range for stub chain '%s' having length '%s'.

Feedback

**Description**

Value provided in -at option cannot be greater or equal to the length of any stub chain to be updated with -remove option or greater than the length of any stub_chain to be updated with -add_floating_elements/ -add_ordered_elements options.

**What Next**

Provide appropriate value in -at option.

---

## NDMUI-942

(warning) Cannot remove stub chain '%s' from scan chain '%s'.

**Description**

Stub Chain removal from the scan chain failed. A stub chain must be part of scan chain to be removed successfully.

---

## NDMUI-943

(error) Option %s cannot be empty.

**Description**

Value specified for the option is empty. Non empty value is required.

**What Next**

Specify non-empty value.

---

## NDMUI-944

(warning) Cannot remove %s '%s'.

**Description**

Delete operation failed.

---

## NDMUI-945

(info) Removed %s '%s'.

**Description**

Delete operation performed successfully.

Feedback

## NDMUI-946

(error) Failed to create stub chain element '{%s %s %s}'.

**Description**

Stub chain element creation failed.

## NDMUI-947

(error) Bit length of element '{%s %s %d}' is out of range [0, %d].

**Description**

Each stub chain element must have a bit length within the specified range.

**What Next**

Specify a valid bit length for the stub chain element.

## NDMUI-948

(error) -at option value is out of range for scan chain '%s' having length '%s'.

**Description**

Value provided in -at option value must be less than the length of the scan chain.

**What Next**

Provide appropriate value in -at option.

## NDMUI-949

(error) %s i.e. '%s' provided as part of option %s is not valid. %s

**Description**

One of the value in specified option is not valid or doesn't exist. Specified option takes list of element_extension where one element_extension is index (unsigned integer), direction and distance (separated by space) as one value like below

{{0 bottom 1.1} {1 horizontal 11.1}}

In this index should be less than number of object types or lib_cells specified. Direction should be valid direction and distance should be greater than equal to 0.

Feedback

**What Next**

Please check the option value specified is correct.

---

## NDMUI-950

(error) The option '%s' value '%s' is not in correct format.

**Description**

The specified option value is not in correct format. User has to provide direction and distance (separated by space) as one value i.e. direction_extension. User can provide list of direction_extension values like below {{bottom 1.1} {horizontal 11.1}}

**What Next**

Please check the option value specified is correct.

---

## NDMUI-951

(Error) Attribute 'row_offsets' can not be set as 'row_cycles' doesn't exist for site-array '%s'.

**Description**

This message indicates that site-array doesn't have row_cycles set. For setting row_offset, row_cycles must be set on site-array as without cycle attribute, offset doesn't have any significance.

**What Next**

Please set the row_cycles attribute on site-array first.

---

## NDMUI-952

(warning) Design %s is linked and will be packed even though provided in exclusion list for labels or views.

**Description**

Input design is linked and will be packaged.

---

## NDMUI-953

(warning) The associated object '%s' of type '%s' to '%s' of type '%s', is not presetn in design '%s' and association skipped.

Feedback

**Description**

The associated object is not present in destination design and association skipped in the command "copy_floorplan".

**What Next**

Include associated object type in copy_floorplan to copy if suppurted by copy_floorplan. check help of copy_floorplan

---

## NDMUI-954

(warning) The force option not applicable for '%s'.

**Description**

The object can not be copied forcefully in destination design.

**What Next**

This is an informational message only.

---

## NDMUI-955

(warning) The associated object '%s' of type '%s' to '%s' of type '%s', is not presetn in design '%s' and object copy skipped.

**Description**

The associated object is not present in destination design and object creation not possible.

**What Next**

Include associated object type in copy_floorplan to copy if supported by copy_floorplan. check help of copy_floorplan

---

## NDMUI-956

(warning) Design '%s' is not present in Lib '%s'

**Description**

Source design is not present in destination Lib.

**What Next**

Copy design in current Lib.

Feedback

## NDMUI-957

(warning) The via def '%s' specified is of type custom via def.

**Description**

The via def specified should be of type simple via def and specifying custom via def is not allowed.

**What Next**

Please specify a valid via def of type simple via def.

## NDMUI-958

(Error) Layer '%s' is not from the tech of the current lib '%s'.

**Description**

The specified layer is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a layer object from the current Lib.

## NDMUI-959

(information) Auto-saving of lib is still under process in background.

**Description**

Auto-saving of lib is still under process in background.

## NDMUI-960

(information) No Auto-saved library is present for the library '%s'.

**Description**

No auto-saved library is present for the library, original library will be opened.

## NDMUI-961

(warning) CLIB flow is not recommended for %s. It is preffered to switch to Cache-free flow.

Feedback

**Description**

CLIB does not hold enough information to execute the specified command.

**What Next**

Use create_ref_libs to generate reference liibraries.

---

## NDMUI-962

(error) One of the value in option '%s' i.e. '%s' is not in correct format.

**Description**

The specified option value is not in correct format. User has to provide object type or lib-cell with 'lib_cell' keyword like below. {object_type {lib_cell A} {lib_cell B} object_type}

**What Next**

Please check the option value specified is correct.

---

## NDMUI-963

(error) Could not open file %s for writing.

**Description**

Could not open the specified file for writing. This could be because of one of the following reasons:

- The file path is invalid.
- You do not have read and write permissions for the specified file and directory.

**What Next**

Ensure the following:

- The file path is valid.
- You have read and write permissions for the specified file and directory.

---

## NDMUI-964

(error) Policy %s is not supported for all checks.

**Description**

The specified policy is not supported for all checks.

Feedback

**What Next**

If you specify both the -checks and the -policies options, the configuration supports strict, error, tolerate, repair and lenient policies. If you specify only the -policy option and not the -checks option, the configuration supports only the strict and lenient policies. Ensure that you specify a supported policy.

---

## NDMUI-965

(error) %s is not specified in the command.

**Description**

A valid argument is not specified in the command.

.SH WHAT NEXT Specify a valid argument in the command.

---

## NDMUI-966

(error) Incorrect usage of the -references option. Setting of the current block configuration using the -references option is not allowed.

**Description**

Incorrect usage of the -references option. Setting of the current block configuration using the -references option is not allowed.

**What Next**

Specify only reference blocks in the -references option.

---

## NDMUI-967

(error) Specified policy or strategy is not supported for this check.

**Description**

Specified policy or strategy is not supported for this check.

**What Next**

Execute the *report_early_data_checks -checks <check_name>* command to get a list of supported policies and strategies. Specify a policy or strategy from this list.

---

## NDMUI-968

(warning) The option '%s' value %s is different from %s %s of the layer '%s'.

Feedback

**Description**

The specified option value is different from the value defined in technology file. The tool will use the specified option value.

**What Next**

Please check the option value specified is correct.

---

## NDMUI-973

(error) Library cell '%s' is not mask shiftable.

**Description**

The *mask_shift_layers* attribute cannot be set or removed because the specified lib_cell is not mask shiftable. The lib_cell is not mask shiftable if its *is_mask_shiftable* attribute value is false.

**What Next**

Check the lib_cell's *is_mask_shiftable* attribute value. If not correct, correct the value. Then set the lib_cell's *mask_shift_layers* attribute.

---

## NDMUI-974

(Error) Purpose '%s' is not from the tech of the current lib '%s'.

**Description**

The specified purpose is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a purpose object from the current Lib.

---

## NDMUI-975

(Error) Site_def '%s' is not from the tech of the current lib '%s'.

**Description**

The specified site_def is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a site_def object from the current Lib.

Feedback

## NDMUI-976

(Error) Via_def '%s' is not from the tech of the current lib '%s'.

**Description**

The specified via_def is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a via_def object from the current Lib.

## NDMUI-977

(Error) Via_rule '%s' is not from the tech of the current lib '%s'.

**Description**

The specified via_rule is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a via_rule object from the current Lib.

## NDMUI-978

(Error) Density_rule '%s' is not from the tech of the current lib '%s'.

**Description**

The specified density_rule is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a density_rule object from the current Lib.

## NDMUI-979

(Error) Design_rule '%s' is not from the tech of the current lib '%s'.

**Description**

The specified design_rule is not from the tech database of the library containing the block in which the shape is being created.

Feedback

**What Next**

Use a design_rule object from the current Lib.

---

## NDMUI-980

(Error) PR_rule '%s' is not from the tech of the current lib '%s'.

**Description**

The specified pr_rule is not from the tech database of the library containing the block in which the shape is being created.

**What Next**

Use a pr_rule object from the current Lib.

---

## NDMUI-981

(error) Values provided for the -references option are either not linked or do not exist.

**Description**

Values provided for the -references option are either not linked or do not exist.

**What Next**

Specify valid values for the -references option. Ensure that the specified designs are linked. Execute the *link_block -force* command to link the design.

---

## NDMUI-982

(error) The option '%s' value '%s' is not in correct format.

**Description**

The specified option value is not in correct format. User has to provide index (unsigned integer), direction and distance (separated by space) as one value i.e. element_extension. User can provide list of element_extension values like below {{0 bottom 1.1} {1 horizontal 11.1}}

**What Next**

Please check the option value specified is correct.

Feedback

## NDMUI-983

(error) Cannot specify tech-scoped via def '%s' when block-scoped via def of the same name exists.

### Description

Block-scoped via defs take precedence over tech-scoped via defs. In the case where a block-scoped and a tech-scoped via def share the same name, only the block-scoped via def is "visible". In such cases, the tech-scoped via def cannot be used for via def setting.

### What Next

If the block-scoped via def is applicable then use it for via def setting. If the tech-scoped via def is desired then first remove the block-scoped via def of the same name. After the block-scoped via def is removed the tech-scoped via def may be used for via def setting.

## NDMUI-984

(error) Check %s not applicable to this design.

### Description

This check is valid, but is not applicable to this design.

### What Next

Execute the *report_early_data_checks -checks -hierarchical* command to get a list of checks that are applicable to the design. Specify a check from this list.

## NDMUI-985

(information) Total %d mismatches are found on block '%s'.

### Description

If there exists any inconsistency between design and reference data, they are regarded as a mismatch in the flow. These mismatches can be related to a missing reference, port name case, missing routing direction on a metal layer etc.

When such a mismatch is detected, it is collected and recorded on design. These mismatches are captured during specific flows like linking and routability checks.

### What Next

Check output of report_early_data_checks to find more details about mismatches.

Feedback

**See Also**

- report_early_data_checks

---

## NDMUI-986

(warning) Port name '%s' of the new reference '%s' is not found in the old reference '%s'.

**Description**

The reference or view of cells can be changed only with a reference or view with a identical port interface.

**What Next**

Specify a reference or view with a port interface identical to the current one.

---

## NDMUI-987

(error) Type of rvalue is invalid.

**Description**

Rvalue should be of type "rtlVariable, rtlExpression, rtlLiteral, rtlFunction, rtlList, port, net, busPort or busNet".

**What Next**

provide the valid statement.

**See Also**

- create_assignment_statement

---

## NDMUI-988

(error) Sensitivity list must be of expression type.

**Description**

The sensitivity list is expecting the rtl statement of expression type.

**What Next**

provide the statement of expression type as a sensitivity list.

**See Also**

- create_always_statement

Feedback

## NDMUI-989

(error) All passed statements must be in the current hier.

### Description

This command requires that all of the statements being passed are in the same hier in which you are working.

### What Next

Specify statements that are all in the current hier.

### See Also

- create_always_statement
- create_assignment_statement

## NDMUI-990

(error) All statements to be used in creation of a new statement, must belong to the same '%s' scope

### Description

This command requires that all of the objects being passed are in the same required scope in which you are working or if you have passed a particular scope , then all objects must exist in the same given scope.

### What Next

Specify objects that are all in the same required scope.

### See Also

- create_always_statement
- create_assignment_statement
- create_for_statement
- create_foreach_statement
- create_if_statement
- create_while_statement
- create_repeat_statement

Feedback

- create_parameter_statement
- create_case_statement

## NDMUI-991

(error) Type of lvalue is invalid.

**Description**

Lvalue should be of type "rtlVariable, port, busPort , net , busNet and rtlList".

**What Next**

provide the valid statement.

**See Also**

- create_assignment_statement

## NDMUI-992

(error) start is not an driver term.

**Description**

Specify a driver term in -start.

## NDMUI-993

(error) stop is not an load term.

**Description**

Specify a load term in -stop.

## NDMUI-994

(error) next statement must be of assignment type.

**Description**

The next statement is expecting the rtl statement of assignment type.

**What Next**

provide the statement of assignment type as a next statement .

Feedback

**See Also**

- create_for_statement

---

## NDMUI-995

(error) count_expression must be of expression type.

**Description**

The count_expression is expecting the rtl statement of expression type.

**What Next**

provide the statement of expression type as count_expression .

**See Also**

- create_repeat_statement

---

## NDMUI-996

(error) Cannot set failsafe fsm rule or create failsafe fsm group as no existing fsm found with specified registers.

**Description**

Failsafe fsm rule can be set or failsafe fsm group can be created with specified registers only if there is an existing fsm found with similar registers.

**What Next**

Try selecting a list of registers as specified in one of the fsm.

---

## NDMUI-997

(error) Cannot create failsafe fsm group as specified %s is already part of failsafe fsm group '%s'.

**Description**

One of the register specified as state, parity or sync register(s) is already part of an existing failsafe fsm group. Registers specified in any of the failsafe fsm group should be mutually exclusive with registers specified in other failsafe fsm groups.

**What Next**

Ensure that the register(s) are mutually exclusive with other failsafe fsm group(s).

Feedback

## NDMUI-998

(error) Variable statement with name '%s' already exists.

### Description

A variable statement with the given name already exists. Variable statement name must be unique.

### What Next

Specify unique value for the variable statement name.

## NDMUI-999

(error) invalid type of expression.

### Description

This command requires that expression must be one of the type: variable, expression,literal, function, list, port, net, port_bus or net_bus.

### What Next

Specify valid type of expression.

### See Also

- create_case_statement
- create_while_statement
- create_for_statement
- create_if_statement
- create_assignment_statement

## NDMUI-1000

(warning) %s name change cannot be performed on '%s', as it is included in don't touch.

### Description

As the object is in the dont_touch list, change_names is not operational on this object. If a part of bus is included in dont_touch the bus and bus member’s name won't be changed.

Feedback

## NDMUI-1001

(error) Cannot set failsafe fsm rule as rule '%s' is already applied on set of registers specified.

### Description

Failsafe fsm rule can be set on set of registers if there is no rule specified on those set of registers.

### What Next

Try selecting a list of registers as specified in one of the fsm and don't have any rule applied on that.

## NDMUI-1002

(error) %s statement must be of %s type.

### Description

This command requires that the statement being passed must be of required type.

### What Next

Specify object of required type.

### See Also

- create_package_statement
- create_begin_statement

## NDMUI-1003

(error) %s statement already present inside %s statement.

### Description

This command requires that the statement being passed must be present inside the begin or package statement.

### What Next

Specify statement which will present inside the current begin or package statement.

Feedback

**See Also**

- create_package_statement
- create_begin_statement

---

## NDMUI-1004

(warning) Ignoring -as_user_default option since application option <%s> is global scoped.

**Description**

The specific application option is global scoped. The global scoped application option only has one value that can be set by user.

---

## NDMUI-1005

(error) %s Statement must be present inside %s statement

**Description**

This command requires that the statement being passed must be present inside the begin or package statement.

**What Next**

Specify statement which will present inside the current begin or package statement.

**See Also**

- create_package_statement
- create_begin_statement

---

## NDMUI-1006

(error) initialization statement must be of assignment type.

**Description**

The initialization statement is expecting the rtl statement of assignment type.

**What Next**

provide the statement of assignment type as an initialization statement .

**See Also**

- create_for_statement

Feedback

## NDMUI-1007

(error) Case statement already contains this expression.

### Description

This command requires that the expression statement being passed must not be present in any case condition of the given case statement.

### What Next

Specify expression which is not already present.

### See Also

- add_to_case_statement

## NDMUI-1008

(warning) Failed to remove statement '%s'.

### Description

The specified statement(s) could not be removed. Some statements are required part of other statements in the design and therefore cannot be removed directly. To remove these statements, the statement containing them must be removed instead. For example, the if-else statement has an expression as part of the statement. So, removing only the expression of the if-else statement is not allowed.

### What Next

Modify the input to the command to contain only statements that can be removed.

### See Also

- get_statements

## NDMUI-1009

(error) Cannot remove btp_pattern '%s'.

### Description

The *remove_btp_pattern* command was unable to remove the specified btp_pattern.

Feedback

**What Next**

Please make sure that the specified btp_pattern belongs to the current_block. If all arguments are correct and the command still fails, it indicates an internal error. Please report to Synopsys.

---

## NDMUI-1010

(error) Cannot remove btc_region '%s'.

**Description**

The *remove_btc_region* command was unable to remove the specified btc_region.

**What Next**

Please make sure that the specified btc_region belongs to the current_block. If all arguments are correct and the command still fails, it indicates an internal error. Please report to Synopsys.

---

## NDMUI-1011

(warning) All values in '%s' must be %s than %s.

**Description**

This option requires values with indicated constraint.

**What Next**

Provide the correct value to the option.

---

## NDMUI-1012

(error) Unable to connect net across hierarchies.

**Description**

The connect_net command was not able to connect the net with the specified pin(s). This happens because one or more of the specified pins belong to a internally generated module, which does not allow new ports to be created on them. These modules are generated during compile.

**What Next**

The operation can be performed once compile is finished and a fully mapped netlist is created. You can also make local connections within the internally generated modules, as long as the port interface is not modified.

Feedback

## NDMUI-1013

(error) Cannot create safety error code as specified pin or port %s is duplicated or there is overlap between data and checkbits pin(s) or port(s).

### Description

Pin(s) or port(s) specified as data and checkbits should be mutually exclusive. There should not be any overlap between data and checkbits pins or ports.

### What Next

Ensure that the pin(s) or port(s) specified as part of data and checkbits are mutually exclusive.

## NDMUI-1014

(error) Cannot create safety error code group as specified %s : '%s' is already part of safety error code group '%s'.

### Description

One of the pin or port specified as data or checkbits pin(s) or port(s) is already part of an existing safety error code group. Data and checkbits pins or ports specified in any of the safety error code group should be mutually exclusive with data and checkbits pins or ports specified in other safety error code groups.

### What Next

Ensure that the data and checkbits pin(s) or port(s) are mutually exclusive with other safety error code group(s).

## NDMUI-1015

(error) Cannot set safety error code rule as specified %s : '%s' is already part of safety error code rule setting.

### Description

One of the pin or port specified as data or checkbits pin(s) or port(s) is already part of a safety error code rule setting. Data and checkbits pins or ports specified in any of the previously called 'set_safety_error_code_rule' command should be mutually exclusive with data and checkbits pins or ports specified in other calls of the command.

### What Next

Ensure that the data and checkbits pin(s) or port(s) are mutually exclusive with other safety error code rules setting.

Feedback

## NDMUI-1016

(error) Invalid %s pin or port : '%s' provided.

**Description**

If pin or port is of data or checkbits, the specified pin(s) or port(s) is already part of an existing safety error code group or safety error code rule setting as one of the following type: clock, enable, correction or error_signal.

Data and checkbits pins or ports specified in any of the safety error code group or safety error code rule setting should be mutually exclusive with clock, enable, correction, error_signal pin or port specified in other safety error code groups or safety error code rule setting.

If pin or port is one of the type: clock, enable, correction, error_signal, the specified pin(s) or port(s) is already part of an existing safety error code group or safety error code rule setting as different type of pin or port. Example: Pin or port of clock is already part of existing group or rule setting as pin or port of error_signal.

Clock, enable, correction, error_signal pin or port type specified in any of the safety error code group or safety error code rule setting should be mutually exclusive with clock, enable, correction, error_signal pin or port types specified in other safety error code groups or safety error code rule setting.

**What Next**

Ensure that the data and checkbits pin(s) or port(s) are mutually exclusive with other safety error code group's or safety error code rule setting's clock, enable, correction, error_signal pins or ports.

Ensure that the Clock, enable, correction, error_signal pin or port type are mutually exclusive with other safety error code group's or safety error code rule setting's clock, enable, correction, error_signal pin or port types.

## NDMUI-1017

(error) Cannot update rule '%s' since it is being referenced by group '%s'.

**Description**

The rule is referenced by group, hence its contents cannot be updated.

**What Next**

First remove the rule from group then update the rule.

Feedback

## NDMUI-1018

(error) Attribute 'port' on terminal '%s' cannot be updated because %s.

**Description**

The terminal's port attribute cannot be updated for the indicated reason. The port attribute may be updated only on bond pad terminals. The specified port must be a physical port in the same block as the terminal.

**What Next**

Correct the indicated problem and try the command again.

## NDMUI-1019

(error) Low disk space. projected disk space required: '%s' bytes, available space: '%s' bytes.

**Description**

Disk space may not be sufficient to unpack library.

**What Next**

Unpack library to other location, which has sufficient space.

## NDMUI-1020

(Error) %s statement is already present inside %s scope.

**Description**

The specified statement is already present inside the specified scope statement.

**What Next**

Use another statement which is not present in any scope.

## NDMUI-1021

(error) Input must be of variable type.

**Description**

This command requires that the inputs being passed must be of variable type.

Feedback

**What Next**

provide the statement of variable type as input.

**See Also**

- create_function

---

## NDMUI-1022

(information) Unable to %s for fusion library %s.

**Description**

Currently "-exclude_design_view" and "-exclude_unused_libcells" option are not supported for fusion libraries.

---

## NDMUI-1023

(error) The route guide boudary is not valid.

**Description**

The route guide boundary is not a rectangle or not covering whole chip in the preferred direction.

**What Next**

Check man page of create_routing_guide to understand requirement's of boundary for -rectangle_only option

---

## NDMUI-1024

(error) The layer do not have valid routing direction.

**Description**

The layer can have either horizontal or vertical routing direction for -rectangle_only route guide.

**What Next**

Check man page of create_routing_guide for -rectangle_only option

---

## NDMUI-1025

(error) All layers must have same routing direction.

Feedback

**Description**

All layers must have same routing direction.

**What Next**

Check the man page of create_routing_guide for more detail of -rectangle_only option

---

## NDMUI-1026

(error) Cannot specify a mix of different object types for option %s.

**Description**

The collection of the objects specified must have the same object type. For example, all of them must be either pins or ports. A collection of mixed object types cannot be specified.

**What Next**

Ensure that all objects are of the same object type.

---

## NDMUI-1027

(warning) Could not determine output pin of register %s.

**Description**

The positive unate output pin of the specified register cell could not be determined. This could happen if the cell does not have a timing view or if it is not a sequential cell.

**What Next**

Please specify a valid flop or a latch and ensure that correct reference libraries were successfully used during linking of the design.

---

## NDMUI-1028

(information) Copying db files for the ref lib '%s'.

**Description**

db files are copied for ref libs when '-include_db_files' option is used.

---

## NDMUI-1029

(warning) Cannot copy db file for the ref lib '%s'.

Feedback

**Description**

Unable to copy db file, possibly db files not present at specified path.

---

## NDMUI-1030

(error) Cannot update rule '%s' since it is associated with pin(s) or port(s).

**Description**

The rule is associated with pin(s) or port(s) of data bits and check bits, hence its contents cannot be updated.

**What Next**

First remove the association of the rule with pin(s) or port(s) then update the rule.

---

## NDMUI-1031

(warning) RTL name does not exist for cell %s.

**Description**

The RTL name for the specified cell instance does not exist or is blank. Tool cannot process the safety related intent for this case.

**What Next**

This particular cell will be skipped.

---

## NDMUI-1032

(warning) %s is not an integral multiple of %s.

**Description**

The first value is not an integral multiple of the second value. In case of safety error codes for functional safety implementation, the number of data bits must be an integral multiple of the slice size of the specified rule. If this is not followed, there might be issues with the safety error code implementation by the tool.

**What Next**

In case of safety error codes for functional safety implementation, choose the data bits and slice size so that the size of the former is an integral multiple of the latter.

Feedback

## NDMUI-1033

(error) '%s' shouldnot be a negative integer value.

**Description**

The value specified is a negative integer value. The value provided should be a positive integer value.

**What Next**

The user should provide a positive integer value.

## NDMUI-1034

(error) Invalid input layer. Input layers must be %s layers.

**Description**

Option -layer_area_threshold in command define_antenna_rule only accept metal layers.
Option -via_layer_area_threshold in command define_antenna_rule only accept via layers.

**What Next**

Provide correct metal/via layer input.

## NDMUI-1035

(error) Required argument %s not specified.

**Description**

The listed argument is required argument for the condition specified in the message.

**What Next**

Specify the required argument.

## NDMUI-1036

(error) '%s' shouldnot be a less than '%s' value.

**Description**

The value specified is a positive integer value. The value provided should be a greater positive integer value.

Feedback

### What Next

The user should provide a positive integer value greater than the specified value .

---

## NDMUI-1037

(warning) Value '%s' for command option '%s' is too small.

### Description

The SPFM value specified is too small. Please note that the tool expects the value in percentage, and the valid range is from 0.0 to 100.0

### What Next

Please check whether the specified SPFM value is correct. If you have specified the value as a fraction, please multiply it by 100 to get the percentage before passing it to the command.

---

## NDMUI-1038

(warning) Duplicate track is detected for option '%s' with value '%s'.

### Description

The value provided for option offset could lead to duplicate track. Tool will caculate the effective pitch for 1) Vertical track: effective pitch = std::ceil (max_offset / siteWidth) * siteWidth) 2) Horizontal track: effective pitch = std::ceil (max_offset / siteHeight) * siteHeight) Note: max_offset is max value specified in offset option. Then subtract the n *effective pitch from the value provided by user and make sure the value is larger than effective pitch. for Exmaple, If the effctive pitch is 0.35 and offsets(0.0, 0.2, 0.35, 0.5, 0.55) For 0.35, 0.35-0.35 = 0.0 which is equal to the first value in the offsets 0.0 For 0.55, 0.55-0.35 = 0.2 which is equal to the second value in the offsets 0.2. So the warning message will be issued.

### What Next

The user should correct the value.

---

## NDMUI-1039

(error) Duplicate %s name '%s' specified.

### Description

Objects with name specified as the values of command options should be unique. There should not be any overlap.

Feedback

**What Next**

Ensure that the objects specified as command options values are mutually exclusive.

---

## NDMUI-1040

(information) Some tcl variables and app options are not packed and unpacked during write_lib_package/read_lib_package.

**Description**

Following tcl variables will not be packed and restored :- env auto_index auto_path tcl_platform tk_platform cmd errorInfo errorCode err sh_arch sh_product_version sh_dev_null sh_tcllib_app_dirname tclDefaultLibrary tcl_patchLevel tcl_library tcl_pkgPath tcl_version tcl_interactive tcl_traceExec tkDefaultLibrary tk_patchLevel tk_library tk_pkgPath tk_version tk_interactive tk_traceExec link_path link_library synopsys_program_name synopsys_root tix _d_u_m_m_y_ sh_command_log_file sh_output_log_file

Following app options will not be packed and restored :- gui.batch_x_display

**What Next**

This is only a information message. No action is required.

---

## NDMUI-1041

(error) The option '%s' has invalid value or has invalid radius specified.

**Description**

The value specified for the curved poly rect is invalid. The radius of the center from the start or end may not be same or may be Zero.

**What Next**

The user should check the point list specified for the curved poly rect.

---

## NDMUI-1042

(error) Cannot set the %s of an annotation_shape of type '%s'

**Description**

The specified attribute does not belong to the reported type of annotation_shape.

**What Next**

Please only attempt to modify attribute values that apply to that annotation_shape's type.

Feedback

## NDMUI-1043

(error) Cannot set the %s of an annotation_shape of type '%s' with annotation_point of type '%s'.

**Description**

annotation_point of an annotation_shape should not be a reported type to set reported attribute

**What Next**

Please only attempt to modify attribute values that apply to that annotation_shape's type and it's annotation_point's type.

## NDMUI-1044

(error) The specified %s '%s' is not in the same block '%s' as the scan signal.

**Description**

The user specified port or hookup pin is in a different block from the scan signal. The scan signal and its port and hookup pin must be from the same block.

**What Next**

Specify a port or hookup pin from the same block as the scan signal.

## NDMUI-1045

(error) The element '%s' specified for option '%s' is not in the scan_chain '%s'.

**Description**

The option *-before* or *-after* was specified with an element that does not exist in the specified scan_chain. In order to create the new element after or before a specific element in the scan_chain, the specified element must already exist in the scan_chain.

**What Next**

Specify an element that is in the scan_chain, or omit the options *-before* and *-after* to create the new element at the end of the scan_chain.

## NDMUI-1046

(error) The pin '%s' specified for option '%s' is invalid because %s.

Feedback

**Description**

The specified pin is invalid for the indicated reason and cannot be used to create the scan chain element. All pins used to create a scan chain element must be on the same cell. That cell must be in the same block as the scan chain element being created. And the pins must not already be part of another scan chain element.

**What Next**

Specify a valid pin to the option.

---

## NDMUI-1047

(error) The specified %s scan_signal '%s' is invalid because %s.

**Description**

The specified scan_signal is invalid for the indicated reason and cannot be used for the scan chain element. A scan_signal used for a scan chain element must be from the same scan_test_mode as the scan chain element. If the scan chain element is in multiple scan_test_modes, then the scan_signal just needs to be from one of those scan_test_modes.

**What Next**

Specify a scan_signal that is from the scan chain element's scan_test_mode.

---

## NDMUI-1048

(error) The cell '%s' specified for option '%s' is invalid because %s.

**Description**

The specified cell is invalid for the indicated reason and cannot be used to create the scan chain element. The cell must be in the same block as the scan chain element being created. And the cell must not already be part of another scan chain element.

**What Next**

Specify a valid cell to the option.

---

## NDMUI-1049

(warning) Failed to add %s '%s' to scan_chain '%s' because %s.

Feedback

**Description**

The specified scan chain element cannot be added to the scan_chain. The scan chain element must be in the same block and scan_partition as the scan_chain.

**What Next**

Specify a valid scan chain element that is in the same block and scan_partition as the scan_chain.

---

## NDMUI-1050

(error) The %s '%s' cannot be the %s of the scan_chain because %s.

**Description**

The specified port or pin is invalid for the indicated reason and cannot be assigned to the scan_chain. The port or pin must be in the same block as the scan_chain. And it must not be assigned already as the scan input, scan output, scan clock A, or scan clock B of a scan_chain.

**What Next**

Specify a valid port or pin.

---

## NDMUI-1051

(error) A '%s' floorplan group by name '%s' already exists.

**Description**

While trying to create a floorplan group using any of the *create_floorplan_** commands, the name specified for the new group matches one of the existing floorplan group's name.

**What Next**

Either provide a different name for new floorplan group to be created or remove existing floorplan group with conflicting name if seems appropriate.

---

## NDMUI-1052

(error) A %s floorplan group by name '%s' does not exist.

**Description**

While trying to add / remove member(s) in floorplan group using any of the *add_to_floorplan_** or *remove_floorplan_group_elements* or setting project cell group on

Feedback

floorplan rules by *set_floorplan_*_rules* commands, the specified group with group type doesn't exist.

**What Next**

Provide name for existing floorplan group of same group type in which element(s) need to be added or existing floorplan group which need to be removed or need to be set on floorplan rule.

---

## NDMUI-1053

(error) A '%s' floorplan group rule by name '%s' already exists.

**Description**

While trying to create a floorplan group rule using any of the *create_floorplan_group** commands, the name specified for the new group rule matches one of the existing floorplan group rule's name.

**What Next**

Either provide a different name for new floorplan group rule to be created or remove existing floorplan group rule with conflicting name if seems appropriate.

---

## NDMUI-1054

(error) A %s floorplan group rule by name '%s' does not exist.

**Description**

While trying to set group rule on a group member using any of the *add_to_floorplan_** commands or trying to remove group rule by *remove_floorplan_group_rules*, the specified group rule doesn't exist.

**What Next**

Provide name for existing floorplan group rule which need to be set on member(s) or need to be removed.

---

## NDMUI-1055

(error) Cannot specify option '%s' or '%s' with edge_type '%s'.

**Description**

When creating an edge sealing group, user can provide core_sp_x or macro_sp_x with edge type *horizontal* or *all*. Similarly, core_sp_y or macro_sp_y can be provided with edge type *vertical* or *all* only.

Feedback

**What Next**

Provide option(s) with supported edge type value.

---

## NDMUI-1056

(error) Value for options '%s' cannot be negative.

**Description**

The value for these options must be greater than or equal to zero.

**What Next**

Enter the command again with a valid option value.

---

## NDMUI-1057

(warning) Library cell '%s' is not mask shiftable when the library is not mask shiftable.

**Description**

The lib_cell/library is not mask shiftable if its *is_mask_shiftable* attribute value is false. The *is_mask_shiftable* attribute for the library cell cannot be set to true when the library is not mask shiftable.

**What Next**

Check the library's *is_mask_shiftable* attribute value must be true. If not correct, correct the value. Then set the lib_cell's *is_mask_shiftable* attribute.

---

## NDMUI-1058

(error) Invalid block name specified in the '-to' option of the command.

**Description**

The block name specified in the '-to" option of the command must be non-empty, unique, and cannot be the name of an existing block. If you want to apply the mirror operation to an existing block in-place instead of making a copy of the block and applying the operation to the copy, please use the '-no_copy' option of the command.

**What Next**

Please specify a unique destination block name for the '-to' option, or use the '-no_copy' option instead.

Feedback

## NDMUI-1059

(information) Data map '%s' removed from mirrored block '%s'.

**Description**

Rotation is not supported for data_maps, therefore blocks containing data_maps may not be mirrored. This message is a notification that the specified data_map was removed from the specified block to allow it to be mirrored.

**What Next**

No action necessary.

## NDMUI-1060

(error) Data map '%s' could not be removed from mirrored block '%s'.

**Description**

Rotation is not supported for data_maps, therefore blocks containing data_maps may not be mirrored. However, the tool failed to remove the specified data_map.

**What Next**

Please check the permissions on the specified data_map and on the block, and correct the issue.

## NDMUI-1061

(error) Block '%s' could not be copied for the block mirroring operation.

**Description**

The mirror_block command attempted to copy the specified block, but could not complete the operation.

**What Next**

Please check that the block exists and can be opened.

## NDMUI-1062

(error) The scan_signal '%s' cannot be a scan enable signal of the scan_chain because %s.

Feedback

**Description**

The specified scan_signal is invalid for the indicated reason and cannot be assigned to the scan_chain. The scan_signal must be in the same scan_test_mode as the scan_chain.

**What Next**

Specify a valid scan_signal.

---

## NDMUI-1063

(warning)The attribute '%s' of attribute group '%s' will be skipped.

**Description**

The attribute has different attribute type at ddestination object. The copy for the same will be skipped.

**What Next**

To overwrite , remove the attribute from destination object.

---

## NDMUI-1064

(warning) Current design '%s' is invalid for report_supernet_exceptions command.

**Description**

report_supernet_exceptions command do not work on leaf/macro design.

**What Next**

Please check current design.

---

## NDMUI-1065

(error) Invalid mask constraint value %s is specified.

**Description**

Given mask constraint value cannot be set on shape, shape_pattern, via, via_matrix or routing blockage. Value of mask constraint can be no_mask only when the number_of_masks value on the layer is zero or one. When the number_of_masks is greater than one, mask constraint value must be less than number_of_masks and cannot be no_mask.

Feedback

**What Next**

Check the number_of_masks attribute value of layer and use correct mask constraint value.

---

## NDMUI-1066

(error) Position '%d' specified for the -at option is invalid. The position must be %s, because %s in the scan_test_mode.

**Description**

The position value specified for the -at option is invalid. The position, at which to create the scan_signal within the scan_test_mode, must be between 0 and the number of scan_signals already in the scan_test_mode. If 0 is specified, the scan_signal is created at the front of the scan_signal list in the scan_test_mode.

**What Next**

Specify a valid position value for the -at option.

---

## NDMUI-1067

(error) The %s of the default %s cannot be changed.

**Description**

The default scan_partition and default scan_test_modes are auto-generated. Their names cannot be changed.

---

## NDMUI-1068

(error) Mask value '%s' is invalid as number_of_masks attribute value of layer '%s' is '%d'.

**Description**

The mask value cannot be greater than the layer's number_of_masks attribute. If layer's number_of_masks attribute value is 0 or 1, "no_mask" is the only supported mask value. If layer's number_of_masks attribute value is 2 or greater, mask value must be less than or equal to the number_of_masks attribute value.

**What Next**

Correct the specified mask value to make it less than or equal to the layer's number_of_masks attribute value.

Feedback

## NDMUI-1069

(error) The 'is_bond_pad' attribute of terminal '%s' cannot be changed to false.

**Description**

The terminal 'is_bond_pad' attribute cannot be changed from true to false. In order to change this attribute from true to false, the terminal must be owned by a port and must not be in a matching type or bump pin constraint. These constraints require that their terminals must be bond pads. This only applies to constraints and terminals in the same block.

**What Next**

Ensure the terminal is owned by a port and is not in any matching type or bump pin constraint. Then modify the 'is_bond_pad' attribute.

## NDMUI-1070

(warning) Command '%s' reads and ignores the data.

**Description**

The specified command is a dummy command which reads and ignores the data provided.

The dummy command is added so that the tool does not throw error while loading the SSF script written by other tools.

**What Next**

Please note that the data will be lost, hence will not be written by the tool.

## NDMUI-1071

(warning) The ref_cell for supernet exception can not be set: %s.

**Description**

The ref_cell for supernet exception could not be set, due to the specified reason.

**What Next**

Please provide a valid value for the ref_cell.

## NDMUI-1072

(warning) The excluded characters for bump name can not be set: %s.

Feedback

**Description**

The excluded characters for bump name could not be set, due to the specified reason.

**What Next**

Please provide value in valid format for the excluded characters.

---

## NDMUI-1073

(Information) Trying to create a secondary Voltage Area.

**Description**

This message is reported whenever you are trying to create a secondary Voltage Area.

**What Next**

- Make sure the creation of a gas station is what you intent to do. If not, check if you already had created a primary Voltage Area for the specified Power Domain. Only a single primary Voltage Area could exist.

---

## NDMUI-1074

(warning) The port type(s) '%s' are relevant only for module type '%s'.

**Description**

The specified port type(s) are not relevant to the specified module type.

**What Next**

Please check the relevant module type for the specified port type(s).

---

## NDMUI-1075

(error) '%s' is not a valid library package. '%s' file missing.

**Description**

*read_lib_package* cannot read library package generated by the *write_lib_package command.*

**What Next**

The lib package file provided isn't in the proper format. If you are transferring this data from customer site, please check all the required files are copied properly.

Feedback

## NDMUI-1076

(warning) Terminal %s's boundary has been updated which may be different from bond_pad_def %s's boundary.

**Description**

The boundary attribute of the terminal mentioned has been changed which was set using the boundary of the bond_pad_def. The new boundary may be different from the bond_pad_def's boundary.

**What Next**

Please use the bond_pad_def's boundary in place of terminal boundary carefully.

## NDMUI-1077

(error) Port '%s' and pin '%s' are in different blocks.

**Description**

The specified port and pad pin are not in the same block. A pad pin can be used to create a terminal only on the port of the block that contains the pad pin.

To create a top port terminal so that it has the shape of this pad pin, call create_terminal with this pad pin and the port on the subblock containing this pad pin. Ensure that the subblock's port *is_pad* attribute is true. Then logically connect the subblock's port to the top port.

**What Next**

Specify a port and pad pin that in the same block.

## NDMUI-1078

(error) Pin '%s' is not a pad pin.

**Description**

The specified pin must be a pad pin in order to create a terminal using its pad pin shape. A pin is a pad pin if and only if its reference port *is_pad* attribute is true.

**What Next**

Update the specified pin's reference port *is_pad* attribute to true, or specify a different pin that is already marked as a pad pin.

Feedback

## NDMUI-1079

(error) Pin '%s' has a terminal with an unassigned name on layer '%s'.

**Description**

The specified pad pin contains a terminal with a system generated name on the specified layer. The pad pin's terminals must have explicitly assigned names in order to create terminal using its shapes.

**What Next**

Assign names to the pad pin's terminals.

## NDMUI-1080

(error) A non-hole pseudo_tsv must reference a pseudo_tsv_def.

**Description**

Every non-hole pseudo_tsv must reference a pseudo_tsv_def. Therefore a pseudo_tsv's *tsv_def* and *tsv_def_name* attributes must be non-empty when it is not a hole, specifically when its *is_hole* attribute is 'false'. Similarly, a pseudo_bump's *tsv_def_name* attribute must be non-empty when its corresponding pseudo_tsv is not a hole.

**What Next**

Please specify a valid pseudo_tsv_def for the pseudo_tsv, or set its *is_hole* attribute to 'true' to clear the pseudo_tsv_def.

## NDMUI-1082

(warning) forbidSignalRoute is defined for layer '%s' which is in between of min ('%s') and max ('%s') routing layer.

**Description**

Property 'forbidSignalRoute' has been defined for a layer which is in between of min and max routing layer (both inclusive). If min or max has not been specified, then it will consider min or max Interconnect routing layer as min or max.

## NDMUI-1083

(warning) Cell '%s' is not a physical cell.

**Description**

Only physical cells may have their location set.

Feedback

### What Next

Remove cells that do not have physical implementation from the cell list.

---

## NDMUI-1084

(error) There is no default drawing layer with layer number %d so it cannot be used with -purpose_number option.

### Description

Default drawing layer with given layer number must exist before using -purpose_number option.

### What Next

Create default layer with layer number mentioned to be able to create tech layerPurpose along with -purpose_number option.

---

## NDMUI-1085

(error) A control group by name '%s' already exists.

### Description

While trying to create a control group using any of the *create_control_group** commands, the name specified for the new group matches one of the existing control group name.

### What Next

Either provide a different name for new control group to be created or remove existing control group with conflicting name if seems appropriate.

---

## NDMUI-1086

(error) The specified purpose '%s' already exists and cannot be used with the -purpose_number option.

### Description

The design already contains the named purpose that has been specified using purpose option corresponding to purpose_number option. Each purpose number must have an unique purpose name associated with it.

### What Next

Specify unique name for purpose option which is not already present in the design.

Feedback

## NDMUI-1087

(error) Pin '%s' does not contain any terminals on layer '%s'.

**Description**

The specified pin does not have any terminals on the specified layer. The pin must contain at least one terminal on the specified layer in order to create terminals using its shapes.

**What Next**

Specify a layer that has terminals in the pin, or update the pin so that it has at least one terminal on the specified layer.

## NDMUI-1088

(error) Cannot update shape_use for shape '%s'

**Description**

Shapes with shape_use of type 'partial_parallel_route' can't be updated through UI OR shape_use for any shape can't be updated to 'partial_parallel_route'.

**What Next**

Please provide the correct input.

## NDMUI-1090

(warning) The user specified layer '%s' in '%s' does not match the auto-derived layer value '%s'.

**Description**

The specified layer is not recommended for the type of via_def being created. For simple via_defs, the lower and upper layers should be the nearest routable upper and lower metal layers to the specified cut layer. For custom via_defs, the lower and upper layers must correspond to the lowest and highest layers of the specified custom shapes.

**What Next**

The user specified layer will take precedence over the auto-derived layer determined by the tool. If the user wants to set a different layer than the tool's suggestion then no further action is needed.

Feedback

## NDMUI-1091

(information) Library '%s' was successfully recovered. Recovered library was created after '%s' command.

### Description

Library was successfully recovered.

### See Also

- report_auto_save
- remove_auto_save
- recover_auto_save
- stop_auto_save
- start_auto_save

## NDMUI-1092

(error) Special character '%s' can't be used in name for Lib package.

### Description

Special characters can't be used in name for Lib package.

### What Next

Please remove special characters from Lib package name.

## NDMUI-1093

(warning) Cannot change net_type from %s to %s on net '%s'.

### Description

One of the segment net is "*Logic0*" or "*Logic1*". These are reserved by Synopsys for the tie-low and tie-high constant nets. Their types cannot be changed. Verify segment nets of input net.

### What Next

No action is required.

Feedback

## NDMUI-1094

(error) Unable to generate row-based grid steps because %s.

### Description

The row-based grid steps cannot be generated from the specified *-row_end_grid_low_steps* and *-row_end_group_high_steps* options. To use these options, the block must have horizontal or vertical site rows but not both. Each site row must be bound to a site_def that is specified in these options.

### What Next

Check the *-row_end_grid_low_steps* and *-row_end_group_high_steps* option values and the corresponding site_rows and site_defs.

## NDMUI-1095

(error) Duplicate steps specified for site_def '%s' in the %s option.

### Description

The site_def was specified multiple times in the indicated command option. Only one list of steps may be specified for each site_def.

### What Next

Check the indicated option and specify only one list of steps for the site_def.

### See Also

- create_track

## NDMUI-1096

(error) The file format is not correct. Please specify a file output by command '%s'.

### Description

The file format is not correct. Command is unable to process given format. Please provide file in correct format or dump the output from corresponding write command and use that file.

### What Next

Please check corresponding write command if supported.

Feedback

## NDMUI-1097

(warning) Max core is set to 1. Command '%s' will run sequentially.

**Description**

Number of cores are set to 1. Reported command can not run with multiple threadeds

**What Next**

Change number of core setting to run command non sequencially.

## NDMUI-1098

(info) No connectivity errors were detected in module '%s'.

**Description**

This message indicates that the connectivity checker didn't find any connectivity errors for the reported module.

## NDMUI-1099

(error) The database has internal connectivity errors. You must revert to an earlier version of this database to proceed. Please contact your Synopsys representative to report this issue.

**Description**

This message indicates that the data-model connectivity checker has found internal connectivity errors.

**What Next**

It is recommended that you revert to an earlier version of this database to proceed.

## NDMUI-1100

(error) seal_ring or assembly_die keepout cannot be overlapped

**Description**

The -can_overlap option cannot be specified for seal_ring and assembly_die type keepout.

**What Next**

Dont use the -can_overlap option to create seal_ring or assembly_die keepout.

Feedback

## NDMUI-1101

(error) seal_ring or assembly_die keepout can only be set as outer keepout.

**Description**

seal_ring and assembly_die represent the external seal_ring and grinding margin outside of a die so it can only be set as outer keepout.

**What Next**

Specify -outer keepout for seal_ring and assembly_die

## NDMUI-1102

(error) seal_ring or assembly_die keepout can only be set on a block.

**Description**

You cannot specify seal_ring and assembly_die keepout on a cell. seal_ring and assembly_die represent the external seal_ring and grinding margin outside of a die so it can only be set as outer keepout on a block.

**What Next**

Specify seal_ring and assembly_die on a block.

## NDMUI-1103

(error) Cannot %s safety error code %s as inverted pin '%s' of specified pin '%s' is already part of safety error code %s.

**Description**

Either the inverted pin of one of the pin(s) specified as data or checkbits pin(s) is already part of an existing safety error code group, or else the inverted pin of one of the pin(s) specified as data or checkbits pin(s) is already part of a safety error code rule setting.

The inverted pin of data and checkbits pins specified in any of the safety error code group should be mutually exclusive with data and checkbits pins specified in other safety error code groups. Similarly, the inverted pin of data and checkbits pins specified in any of the previously called 'set_safety_error_code_rule' command should be mutually exclusive with data and checkbits pins specified in other calls of the command.

**What Next**

Ensure that the inverted pin of pin(s) specified as part of data and checkbits are mutually exclusive with other safety error code group(s) and safety error code rule setting(s).

Feedback

## NDMUI-1104

(error) Cannot %s safety error code %s as specified pin '%s' and its inverted pin have been specified together.

### Description

A pin and its inverter pin cannot be specified as data or checkbits together. There should not be any overlap between data and checkbits pins and their inverter pins as data or checkbits.

### What Next

Ensure that the inverter pin of the pin(s) specified as part of data and checkbits should not be specified in the command as data or checkbits pins.

## NDMUI-1105

(error) Must specify a combination of these options: -from_object_types/-from_lib_cells and -to_object_types/-to_lib_cells.

### Description

Must specify a combination of these options: -from_object_types/-from_lib_cells and -to_object_types/-to_lib_cells.

### What Next

Please specify a combination of these options: -from_object_types/-from_lib_cells and -to_object_types/-to_lib_cells.

## NDMUI-1106

(error) -from_object_types and -from_lib_cells or -to_object_types and -to_lib_cells cannot be specified together without -merge_object option.

### Description

-from_object_types and -from_lib_cells or -to_object_types and -to_lib_cells cannot be specified together without -merge_object option.

### What Next

Please specify -merge_object option to use -from_object_types and -from_lib_cells or -to_object_types and -to_lib_cells together.

Feedback

## NDMUI-1107

(error) -object_types and -lib_cells cannot be specified together without -merge_object.

**Description**

-object_types and -lib_cells cannot be specified together without -merge_object.

**What Next**

please specify -merge_object to use -object_types and -lib_cells together.

## NDMUI-1108

(error) Multiple subset names support for lib_cell is disabled.

**Description**

Attribute subset name doesn't allow multiple subset names as per current app-option setting.

**What Next**

Please specify single subset name. To enable the suppport for multiple subset names, enable app-option allow_multiple_subset_names as below. set_app_options -name design.allow_multiple_subset_names -value true

## NDMUI-1109

(error) Number of subset_name values provided is '%s' which is greater than the maximum allowed limit of '%s'.

**Description**

Specified subset_names size cannot exceed maximum allowed limit.

**What Next**

Please specify the attribute value with size less than or equal to the max allowed limit.

## NDMUI-1110

(error) Cannot use the '-id' option if multiple layers are specified using the '-layers' option, or if multiple shapes are specified.

Feedback

**Description**

The '-id' option cannot be used when the options specify that multiple blockages be created.

**What Next**

Only use the '-id' option if a single blockage will be created.

---

## NDMUI-1111

(error) Cannot create safety peer pin group which contains number of pins less than %s.

**Description**

Safety peer pin group cannot be created with the specified number of pins.

**What Next**

Ensure that the number of pins specified should be equal to or greater than the required number.

---

## NDMUI-1112

(error) Specified pin '%s' is part of an existing safety peer pin group.

**Description**

Specified pin is already part of an existing safety peer pin group. Pins should be mutually exclusive with other safety peer pin group pins.

**What Next**

Ensure that the pins are mutually exclusive with other safety peer pin group pins.

---

## NDMUI-1113

(error) %s '%s' and '%s' are not mutually exclusive in terms of hierarchy.

**Description**

Specified objects must be mutually exclusive, i.e. separated out in terms of their hierarchies. In other words, first object must not lie anywhere inside the hierarchy of the second object at any level, and vice versa.

**What Next**

Ensure that the objects specified are mutually exclusive and are in separate hierarchies.

Feedback

## NDMUI-1118

(error) The '%s' option or attribute of the bump_region may not be specified when the pattern is of type '%s'.

**Description**

The setting of certain option or attributes may be disallowed depending on the *type* attribute of the bump_region_pattern the bump_region references.

**What Next**

Only specify option or attribute values that are applicable given the referenced bump_region_pattern's type.

## NDMUI-1119

(error) The bump_region specified in the '-region' option must be freeform.

**Description**

Only pseudo_bumps that belong to freeform bump_regions may be created or destroyed.

**What Next**

When creating a new pseudo_bump, ensure that the specified bump_region has *is_freeform* attribute value "true".

## NDMUI-1120

(error) Cannot replace pattern of type '%s' with pattern of type '%s' - new pattern must have the same type.

**Description**

A bump_region must reference the same type of bump_region_pattern over its lifetime.

**What Next**

Ensure the specified bump_region_pattern has the same *type* attribute value as the pattern it is replacing in the bump_region's *pattern* attribute.

## NDMUI-1121

(error) Cannot remove pseudo_bump %s.

Feedback

**Description**

Only pseudo_bumps that belong to freeform bump_regions may be created or destroyed.

**What Next**

Ensure that the pseudo_bumps specified for removal belong to bump_regions with *is_freeform* attribute value "true".

---

## NDMUI-1122

(error) %s is not a valid cell.

**Description**

The specified cell is not a physical cell or not in the same physical hierarchy.

**What Next**

Please provide a valid physical cell.

---

## NDMUI-1123

(error) Cannot set 'pattern_must_join' attribute on port or lib_pin '%s' having input direction.

**Description**

The 'pattern_must_join' attribute requires port or lib_pin having output or inout direction.

**What Next**

Please specify port or lib_pin having output or inout direction.

---

## NDMUI-1124

(error) Cannot set 'pattern_must_join' attribute on port or lib_pin '%s' having less than two terminals on top-layer.

**Description**

The 'pattern_must_join' attribute requires port or lib_pin having at-least two terminals on top-layer.

**What Next**

Please specify port or lib_pin having at-least two terminals on top-layer.

Feedback

## NDMUI-1125

(error) The first contact_code in cut_layer_name_table of via ladder rule '%s' does not connect to top-layer of %s '%s'.

**Description**

The first contact_code in cut_layer_name_table of reported via ladder rule must connect to the top-layer of reported pin or lib_pin.

**What Next**

Please specify correct via ladder rule for the reported pin or lib_pin.

## NDMUI-1126

(error) The first value in num_cuts_per_row_table of via ladder rule '%s' is smaller than the number of top-layer terminals of “pattern_must_join” or “is_em_via_ladder_required” %s '%s'.

**Description**

The first value in num_cuts_per_row_table of reported via ladder rule must match the number of top-layer terminals of reported pin or lib_pin having either “pattern_must_join” or “is_em_via_ladder_required” attribute set true.

**What Next**

Please specify correct via ladder rule for the reported pin or lib_pin.

## NDMUI-1127

(warning) The first value in num_cuts_per_row_table of via ladder rule '%s' is smaller than the number of top-layer terminals of %s '%s'.

**Description**

The first value in num_cuts_per_row_table of reported via ladder rule must match the number of top-layer terminals of reported pin or lib_pin. This is a warning when the pin or lib_pin does not have either “pattern_must_join” or “is_em_via_ladder_required” attribute set true but user must review if a smaller via ladder is required on purpose.

**What Next**

Please review if a smaller via ladder is required on purpose else specify correct via ladder rule for the reported pin or lib_pin.

Feedback

## NDMUI-1128

(warning) Unknown or unsupported routing_direction or pitch in top-layer of %s '%s' prevents track count estimation and large via ladder rule sanity pre-check of '%s'.

**Description**

The routing_direction and pitch of top-layer of reported pin or lib-pin are required to estimate the number of tracks for large via ladder rule sanity pre-check of reported via ladder rule.

**What Next**

Please correct routing_direction and pitch of top-layer for the reported pin or lib_pin.

## NDMUI-1129

(error) The first value in num_cuts_per_row_table of via ladder rule '%s' is larger than the estimated number of tracks for top-layer terminals of %s '%s'.

**Description**

The first value in num_cuts_per_row_table of reported via ladder rule must match the estimated number of tracks for top-layer terminals of reported pin or lib_pin.

**What Next**

Please specify correct via ladder rule for the reported pin or lib_pin.

## NDMUI-1130

(error) The specified bump_region must be structured.

**Description**

The bump_region specified in the *-region* argument of the command must be a structured bump_region, meaning that the bump_region_pattern it references must be of type "structured". Equivalently, the bump_region's *is_freeform* attribute must be "false".

**What Next**

Please specify a structured bump_region as the *-region* argument value of the command.

## NDMUI-1131

(error) A bump_region_pattern with the name '%s' already exists.

Feedback

**Description**

The command must create a new bump_region_pattern of type "freeform" to replace the bump_region's existing "structured" bump_region_pattern. The *-freeform_pattern_name* argument of the command specifies the name of the new bump_region_pattern. However, a bump_region_pattern with the specified name already exists, preventing the command from creating the required new one.

**What Next**

Please specify a name for the new bump_region_pattern that does not conflict with the name of any existing bump_region_patterns. Alternatively, you may omit this argument and the system will generate a unique name for the new bump_region_pattern.

---

## NDMUI-1132

(error) The specified bump_region may not have pseudo_tsvs.

**Description**

The bump_region specified in the *-region* argument of the command may not have pseudo_tsvs. Equivalently, the bump_region's *has_pseudo_tsvs* attribute must be "false".

**What Next**

Please specify a bump_region without pseudo_tsvs as the *-region* argument value of the command.

---

## NDMUI-1135

(warning) One or more objects in the collection specified for the '%s' argument of the command lack a valid bounding box or geometrical area.

**Description**

The specified collection is intended to define a combined geometrical area, however one or more objects in the collection lack a valid geometrical area. These objects have no effect on the resulting geometry.

---

## NDMUI-1136

(error) '%s' is set to backside layer '%s'. This setting may be ignored by the router. Please use the '%s' option for backside routing control.

Feedback

**Description**

Old UI options i.e. -min_routing_layer and -max_routing_layer should be disallowed from specifying a layer range that spans both backside and frontside because this setting may be ignored by the router. Instead of that use new UI options.

**What Next**

Please use new UI options -backside_min_routing_layer and -backside_max_routing_layer for backside along with options -frontside_min_routing_layer and -frontside_max_routing_layer for frontside routing control.

---

## NDMUI-1137

(error) Must specify any one of these options: -to_object_types/-to_lib_cells.

**Description**

Must specify any one of these options: -to_object_types/-to_lib_cells.

**What Next**

Please specify any one of these options: -to_object_types/-to_lib_cells.

---

## NDMUI-1138

(error) Must specify a valid floorplan density rule with -rules option.

**Description**

Must specify a valid floorplan density rule with -rules option.

**What Next**

Please specify a valid floorplan density rule with -rules option.

---

## NDMUI-1141

(warning) Layer %s is not suitable for bond pads.

**Description**

Layer is not suitable for creating bond pads. It must be either a top-most metal layer for creating frontside terminals, or bottom-most layer for creating backside terminals.

**What Next**

Specify an HBL layer, or a top-most or bottom-most metal layer.

Feedback

# NDMX

## NDMX-001

(error) Failed to open the cell-rename map file '%s'.

### Description

This error message occurs when the cell-rename map file could not be opened. The cell-rename map file is instroduced in the man page of message NDMX-009, you can refer to it if necessary.

### What Next

Verify the file-permissions and retry.

## NDMX-002

(error) Required section '%s' was not found before section '%s' in the cell-rename map file '%s'.

### Description

This message occurs when the required section is missed or the required sections are not specified in the required order.

The mask-shifted cell-rename map file comprises three sections: MASKSHIFTLAYER, MASKSHIFTPATTERN and CELLMAP. You need to define the sections in the order above.

Here is an example about the map file.

```
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>
```

### What Next

Refer to the detail about cell-rename map file in the man page of message NDMX-009 and supply the required section.

Feedback

## NDMX-003

(error) Invalid mask shift layer '%s'%s in the cell-rename map file.

### Description

This error message occurs when the specified mask shift layer in the cell-rename map file is invalid, it must meet the following conditions. 1. If multiple cell mapping files are specified, the following type of files are valid: a) files have the same mask shift layer name and the order, e.g. file1: M1 M2; file2: M1 M2 b) each mask shift layer in each file is different, e.g. file1: M1 M2; file2: M3 M4 2. The layers must exist in the current library.

For example, assuming that the following map files are specified, and file1 has mask shift layers M1 and M2, but file2 has mask shift layers M1 and M3, they are partially different, will trigger this message.

```
file1:
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>

file2:
<MASKSHIFTLAYER>
M1 M3
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>
```

Multiple cell mapping files with completely different mask shift layers will be treat as followed

```
file1:                  file2:
<MASKSHIFTLAYER>        <MASKSHIFTLAYER>
M1                      M2
</MASKSHIFTLAYER>       </MASKSHIFTLAYER>
<MASKSHIFTPATTERN>      <MASKSHIFTPATTERN>
0 1                     0 1
</MASKSHIFTPATTERN>     </MASKSHIFTPATTERN>
<CELLMAP>               <CELLMAP>
A AM1B                  B BM2B
</CELLMAP>
```

Feedback

```
Treated as:

<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A NONE AM1B NONE
B BM2B NONE NONE
</CELLMAP>
```

The cell-rename map file is introduced in the man page of message NDMX-009, you can refer to it if necessary.

**What Next**

Please check and correct the mask shift layer, then try again.

---

## NDMX-004

(warning) Incorrect syntax '%s' specified for cell-rename entry. The entry will be ignored.

**Description**

This warning message occurs when the syntax for the cell-rename entry is not a valid one.

For example, assuming that the following map file is specified, and there is a HI section in the map file, which is not supported and will trigger this message.

```
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<HI>
00 01 10 11
</HI>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>
```

**What Next**

Please refer to the detail about the cell-rename map file in the man page of message NDMX-009 to correct it.

---

## NDMX-005

(error) Invalid mask shift pattern '%s'%s.

Feedback

### Description

This error message occurs when the specified mask shift pattern is invalid in the cell-rename map file.

The mask shift pattern must meet the following conditions. 1. If multiple cell mapping files have the same mask shift layers and order, they should have the same number of mask shift pattern. 2. The number of the mask shift combination is equal to or less than pow(m, n), where n is the number of layers specified in MASKSHIFTLAYER and m is the count of the shift values. For 2-mask layers, valid shift values are 0 and 1, so m is 2. For 3-mask layers, valid shift values are 0, 1, 3, 4 and 5, so m is 5. When the shift value is 3, 4 or 5, the shifted layer must have fixed mask 1, 2 or 3, repectively and its number_of_masks must be more than 2. 3. MASKSHIFTPATTERN must contain the mask shift combination for the cell without any mask shifting.

The cell-rename map file is instroduced in the man page of message NDMX-009, you can refer to it if necessary.

### What Next

Please check and correct the mask shift pattern, then try again.

---

## NDMX-006

(error) Invalid cell mapping value '%s' in the cell-rename map file.

### Description

This error message occurs when the number of the cell mapping value is not consistent with the number of the specified mask shift pattern.

For example, assuming that the following map file is specified, the number of the cell mapping values in CELLMAP section is 5, but the number of the mask shift pattern in MASKSHIFTPATTERN is 4, they are inconsistent, this is why it will trigger this message.

```
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B AM1B
</CELLMAP>
```

The cell-rename map file is instroduced in the man page of message NDMX-009, you can refer to it if necessary.

Feedback

### What Next

Please check and correct the cell mapping value, then try again.

---

## NDMX-007

(error) Mask shifted cell '%s' does not have its corresponding mapping in the cell-rename map file.

### Description

This error message occurs when there is not a corresponding mapping for the mask shifted cell in the cell-rename map file.

For example, assuming that the following map file is specified, and there is a cell in the database which references B and has mask shift 1 on layer M1, it will trigger this message, because B is not specified in the CELLMAP section.

```
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>
```

The cell-rename map file is introduced in the man page of message NDMX-009, you can refer to it if necessary.

### What Next

Please add the corresponding mapping to the map file and then try again.

---

## NDMX-008

(error) Mask shift property mismatch on cell '%s'.

### Description

This error message occurs when there is mask shift property mismatch between different cell-rename map files.

For example, assuming that the following map files are specified, the new names corresponding to the pattern 01 in CELLMAP section are inconsistent, which will trigger this message.

```
file1:
<MASKSHIFTLAYER>
```

Feedback

```
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>

file2:
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2BBC NONE AM1BM2B
</CELLMAP>
```

The cell-rename map file is instroduced in the man page of message NDMX-009, you can refer to it if necessary.

**What Next**

Please correct the mask shift property and then try again.

---

## NDMX-009

(error) Fail to find the mask shift pattern '%s' for cell '%s' in cell-rename map file(s).

**Description**

This error message occurs when the mask shift pattern is not specified in MASKSHIFTPATTERN section of the cell-rename map file(s).

For example, assuming the following map file to rename the cell A with mask shifting on layer M1 or/and M2 is specified.

```
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE
</CELLMAP>
```

Feedback

If there is a cell in the database which references A and has mask shift 1 on both layer M1 and layer M2, it will trigger this message, because 11 is not specified in MASKSHIFTPATTERN section of the map file above.

Normally, all the pattern should be specified in the map file.

The following information is the detail about the map file, you can ignore it if you have known it.

The cell-rename map file is to rename the mask shift cells and comprises three sections: MASKSHIFTLAYER, MASKSHIFTPATTERN and CELLMAP.

For example, to rename the cell A with mask shifting on layer M1 or/and M2, enter the following:

```
<MASKSHIFTLAYER>
M1 M2
</MASKSHIFTLAYER>
<MASKSHIFTPATTERN>
00 01 10 11
</MASKSHIFTPATTERN>
<CELLMAP>
A AM2B NONE AM1BM2B
</CELLMAP>
```

MASKSHIFTLAYER specifies the relevant metal layers, in order, on a single row.

MASKSHIFTPATTERN specifies the mask shift combinations to apply to the metal layers. The digits in each combination correspond to the metal layers listed in MASKSHIFTLAYER, respectively. For example, the 00 combination represents a shift value of 0 on layers M1 and M2; the 01 combination represents a shift value of 0 on layer M1 and 1 on layer M2; the 10 combination represents a shift value of 1 on layer M1 and 0 on layer M2; and so on.

The number of mask shift combinations is less than or equal to pow(m, n), where n is the number of layers specified in MASKSHIFTLAYER and m is the count of the shift values. For 2-mask layers, valid shift values are 0 and 1, so m is 2. In the example above, two metal layers are specified (M1 M2), so there are four mask shift combinations (00 01 10 11).

CELLMAP specifies the cell mappings that correspond to each mask shift pattern for a given cell. (Each row specifies the mappings for a single cell, so the number of mappings in each row corresponds to the number of MASKSHIFTPATTERN combinations.)

In the example above, cell A is mapped to A, AM2B, NONE, and AM1BM2B when its mask_shift attribute is set to 0 on both layers (00), set to 1 on layer M2 (01), set to 1 on layer M1 (10), and set to 1 on both layers (11), respectively. When a mask-shifted cell is not expected for a particular mask shift combination, the cell name is mapped to NONE.

Feedback

**What Next**

Please check and correct it, and then try again.

---

## NDMX-010

(error) Invalid value for "-write_overlap_shape_of_via".

**Description**

This message occurs when "-write_overlap_shape_of_via" is specified to write_gds/oasis and the value is not expected. The value must be of the form { { viaLayerName CRLayeName resizeValue } ...}

**What Next**

Please check and correct the option value.

---

## NDMX-011

(information) CBCM engine is running in single thread mode.

**Description**

CBCM engine has two modes: single thread mode and multiple thread mode, multiple thread mode will be automatically turned on when max cores is more than 2. e.g. set_host_options -max_cores 4

**What Next**

Please set max cores if you'd like to turn on multiple thread mode.

---

# NEX

---

## NEX-001

(warning) Technology layer '%s' setting '%s' is not valid

**Description**

The specified parameter of the technology layer is not valid, it is recommanded to check technology setup first.

**What Next**

Check technology data and design setup.

Feedback

## NEX-002

(warning) Global NDR rule '%s' setting '%s' is not valid

**Description**

The specified Global NDR rule is not valid, it is recommanded to check TCL script file.

**What Next**

Check Global NDR rule in TCL script and design setup.

## NEX-003

(info) parasitic model has %i cap and %i res corners

**Description**

Extraction is setup with multiple Parasitic tech libraries(tlu+), and with multi temperatures. Num of cap corners and different(or same) num of res corners was checked during extraction setup.

**What Next**

Multi corner Multi mode rc values.

## NEX-004

(info) HNSCALE = %1.3f

**Description**

HFN(Half Node process Scaling) factor, it is a geometry scaling factor that real silicon geoemtry size equals to layout size multiplied by HFN.

**What Next**

Half node process

## NEX-005

(warning) Ignore different TLUPLus HNSCALE = %1.3f in corner '%s'

**Description**

Extraction only support 1 HNSCALE (Half Node Scale) value, All MCMM parasitic tech lib should carry same HNSCALE. Different HNSCALE will be ignored.

Feedback

**What Next**

Check and compare HNSCALE in parasitic tech libraries.

---

## NEX-006

(error) Can not find tech layer '%s' in Parasitic Tech Library

**Description**

Extraction can not model RC for specified tech layer becasue parasitic tech library does not have specified tech layer.

**What Next**

Check technology file and parasitic tech lib(tlu+) for specified layer

---

## NEX-007

(warning) Parasitic Tech Library layer '%s' parameter '%s' = %2.3f does not match %2.3f of technology file

**Description**

There will be accuracy concern becasue specified parasitic tech library parameter doesnt match setting in techlogy file.

**What Next**

Check technology file and parasitic tech lib(tlu+) for specified layer and parameter

---

## NEX-008

(error) Parasitic tech lib via '%s' FROM '%s' To '%s' dont match technology '%s' or '%s'

**Description**

This is a setup error, parasitic tech lib via FROM/TO layer doesn't match technology setting

**What Next**

Check technology file and parasitic tech lib(tlu+) for specified via

---

## NEX-009

(info) r = %f ohm/um, c = %f ff/um, cc = %f ff/um (%s %s)

Feedback

**Description**

This is a information message of average rc value per um. Each metal layer and each routing direction may have seperate average rc value.

The average rc value is based on parasitic tech libraries and pre-defined default utilization rate.

The purpose of average rc is to check parasitic tech lib(tlu+) and to calculate per net rc roughly.

**What Next**

n/a

---

## NEX-010

(info) r = %f ohm, c = %f ff (%s)

**Description**

This is a information message of rc value per via. RC value is based on parasitic tech library.

The purpose of average rc is to check parasitic tech lib(tlu+) and to calculate per net rc roughly.

**What Next**

---

## NEX-017

(info) r = %f ohm/um, via_r = %f ohm/cut, c = %f ff/um, cc = %f ff/um (%s %s)

**Description**

This is a information message of average rc value per um. Each routing direction may have seperate average rc value.

The average rc value is based on parasitic tech libraries and current whole design congestion average rate.

The purpose of average rc is to check rc value roughly.

**What Next**

n/a

---

## NEX-018

(warning) no valid parasitic for %s corner(%s)

**Description**

There is no valid parasitic corner, usually because constraint corner has no parasitic tech setup.

**What Next**

Check constraint corner's parasitic tech setup in run script. Run report_parasitic_parameters to make sure all corners are correctly set.

---

## NEX-019

(error) rc scaling parameter %s %0.2f is beyond valid range

**Description**

the rc scaling parameter allowed range is 0~inf

Feedback

### What Next

Check rc scaling parameter in set_extraction_options command

---

## NEX-020

(warning) Net '%s' is exceeding threshold (over %d pins) and will be skipped.

### Description

This net has a very large number of pins so it will not be extracted. This net was probably not meant to be detail routed. There will be no parasitics and no back-annotated delay computed for this net. Timing analysis will use the wire load model with the high fanout threshold assumptions. The current default for the max number of pins is 1000. You can use the option *extract.high_fanout_threshold* to adjust it.

### What Next

Buffer this net and detail route it to be able to extract it.

---

## NEX-021

(warning) Net '%s' is not fully connected and will be estimated.

### Description

Two route segments that you specified are not connected and the tool will estimate the resistance and capacitance of the net.

The tool performs extraction only on completely routed nets. For partially routed nets, the tool uses virtual routing to estimate the resistance and capacitance values. The tool outputs the RC results for all the nets.

As default, only first 100 open nets will have detail info. And total number of open nets will be printed after the extraction done.

### What Next

Perform routing verification to identify all open nets.

---

## NEX-022

(information) The RC mode used is %s.

### Description

This message advises you of the RC model that the tool will use to compute RC value.

Feedback

The valid RC modes and their descriptions are shown below, starting with the highest priority and ending with the lowest priority based on design route status.

- DR(detail routed), if 60% of all nets are detail routed
- GR(global routed), if 60% of all nets are global or detail routed
- CTO(clock routed), if 1 or more nets are global or detail routed
- VR(virtual routed), can be done with/without routed net depending on timer's control
- RDE(route driven estimation), can be done with/without routed net depending on timer's control. Estimation is done thru captured data learned from routing.

---

## NEX-023

(information) The mixed mode parasitic extraction setting is ON.

**Description**

Some nets are routed and some nets are not. CTO/GR/DR extraction will be performed on the fully connected nets. For partially routed or unrouted nets, VR estimation will be performed.

---

## NEX-024

(info) Design %s has %i nets, %i global routed, %i detail routed.

**Description**

Message about route status, which will decide extraction mode.

**What Next**

NEX-022 will be issued based on the ratio of routed/totalNets.

---

## NEX-025

(warning) Design is not placed.

**Description**

Message about design is not placed, not suitable to do parasitic extraction

**What Next**

run placement and the problem will be solved

Feedback

## NEX-026

(warning) Ignore corner %s %s vr scaling, will use corner %s %s vr scaling

**Description**

extractor does not allow different vr scaling for same parasitic tech and temperature. App options extractor.corner_for_vr_scaling is used to control this feature.

**What Next**

Check corner vr scaling setup.

## NEX-027

(warning) Design core area is invalid.

**Description**

Message about design with invalid core area, not suitable to do parasitic extraction

**What Next**

check design and make sure block is correct.

## NEX-028

(info) %i nets are successfully extracted.

**Description**

Message about extraction status, extracted means the net has content in rcCache.

**What Next**

Timer/SPEF output can use RC in rcCache.

## NEX-029

(info) coupling capacitance is created explicitly.

**Description**

Message about coupling capacitance is extracted.

**What Next**

Timer SI can work with coupling capacitance.

Feedback

## NEX-030

(info) coupling capacitance is lumped to ground.

**Description**

Message about coupling capacitance is not extracted.

**What Next**

Timer SI does not work with non-CC extraction.

## NEX-031

(error) No reference direction set in either TLU+ or set_extraction_options

**Description**

TLU+ has orientation ETCH tables, but there is no reference direction setting in either TLU + or using *set_extraction_options*.

**What Next**

Please set reference direction using *set_extraction_options*.

## NEX-032

(information) Orientation ETCH is using reference direction: %s.

**Description**

This message advises you of the reference direction used in orientation ETCH. It can be from either TLU+ or *set_extraction_options*.

**What Next**

This is for your information only.

## NEX-033

(warning) Reference direction is not consistent among TLU+ files, will use direction set in set_extraction_options.

**Description**

This message advises you of the reference direction setting issue in orientation ETCH. ICC2 finds that reference direction is not consistent among TLU+ files. ICC will use the

Feedback

reference direction set in *set_extraction_options*. The final reference direction will be choosen by ICC2 and reported in the log.

**What Next**

Please set desired reference direction using *set_extraction_options*.

---

## NEX-034

(warning) Failed to write SPEF file.

**Description**

This message advises you of empty or incomplete SPEF file.

**What Next**

Please make sure that the SPEF file you specified has enough free disk space.

---

## NEX-035

(warning) Number of mask colors is different among TLU+ files.

**Description**

This message advises you that different number of mask colors has been specified in TLU + files. This will affect accuracy.

**What Next**

Please make sure that the same number of mask colors is specified in all TLU+ files.

---

## NEX-036

(error) read_parasitics failed: %s.

**Description**

This message advises you of the failure of read_parasitics command.

---

## NEX-037

(error) read_parasitics failed: %s.

**Description**

This message advises you of the failure of read_parasitics command when design and spef files are not matched.

Feedback

**What Next**

Please check the consistency among design and the input spef files.

---

## NEX-038

(warning) read_parasitics: %s.

**Description**

This message advises you of the warning of read_parasitics command.

**What Next**

Please check command input or the consistency among design and the input spef files.

---

## NEX-039

(warning) cut loop %s.

**Description**

This message advises you of the warning of some nets defined in spef file have the loop, and the loops have to be cut in reading in the spef files, due to ICC2 timer cannnot resolve the RC grap with loop. By cutting loop, the P2P resistance of this net is not consistent as the original input in spef files, and it would impact the result of timer commands and write_parasitics.

**What Next**

Please provide the input spef files without loops, in order to have accurate RC values annonated.

---

## NEX-040

(error) No rule match is found in RPV_VS_COVERAGE AND no RPV_VS_AREA is specified

**Description**

TLU+ has RPV_VS_COVERAGE table, but no coverage rule is found in the table that matches the layout via coverage. In this case, the tool will use RPV_VS_COVERAGE table to compute via resistance. However, if RPV_VS_AREA table is not specified, this error will be issued. No single RPV value will be used. This is to be consistent with RCXT.

**What Next**

Please specify RPV_VS_AREA table along with RPV_VS_COVERAGE.

Feedback

## NEX-041

(error) RPV_VS_COVERAGE cannot be applied to via array AND no RPV_VS_AREA is specified

**Description**

TLU+ has RPV_VS_COVERAGE table, but it doens't apply to via array. In this case, the tool will use RPV_VS_COVERAGE table to compute via resistance. However, if RPV_VS_AREA table is not specified, this error will be issued. No single RPV will used. This is to be consistent with RCXT.

**What Next**

Please specify RPV_VS_AREA table along with RPV_VS_COVERAGE.

## NEX-042

(error) Number of MASK in TLUPlus exceeds limit of 6.

**Description**

TLU+ has MASK defined and the nubmer of MASKs is over the set limit of 6.

**What Next**

Please correct ITF and regenerate TLUPlus.

## NEX-043

(warning) Both target utilization ratio and fill ratio are set. Target utilzation ration will be used.

**Description**

If both target utilization ratio and fill ratio are set, target utilzation ration will be used. Fill ration from TLUPlus will be ignored.

**What Next**

Please correct your settings.

## NEX-044

(warning) Target utilization ratio cannot be used in real metal fill extraction.

Feedback

**Description**

When real metal fill extraction is set, target utilization ratio will be ignored.

**What Next**

Please correct your settings.

---

## NEX-045

(warning) Missing layer mapping for VIA. Please check layer mapping file.

**Description**

Layer mapping for a via is missing, please check layer mapping file, ITF and TF.

**What Next**

Please correct layer mapping for via.

---

## NEX-046

(warning) Net '%s' has too many geometries for R-network builder and will be extracted with VR mode.

**Description**

Timer/detaly calculator have limitation to number of nodes/edges from R-network. It cannot use node/edge with id >= 65536. So R-tree builder will exit beforehand if there're already more geometries than expected.

**What Next**

VR extraction mode will be applied to this net.

---

## NEX-047

(Error) No valid design block.

**Description**

This message occurs when there is no valid design block for extraction.

**What Next**

Please check design setup.

Feedback

## NEX-048

(Error) Port shape or size is abnormal for port '%portName'.

**Description**

This message occurs when a port has abnormal size.

**What Next**

Please check design setup.

## NEX-049

(Error) Abnormal temperature setting for parasitic corner '%cornerName'.

**Description**

This message occurs when a parasitic corner temperature setting is out of range.

**What Next**

Invoke 'report_parasitic_parameters' command to check parasitic settings.

## NEX-050

(Error) Less than 1 net or 1 instance in design '%designName'.

**Description**

This message occurs when there is less than 1 net or 1 instance in design, extraction cannot continue.

**What Next**

Please check design setup.

## NEX-051

(Error) No valid parasitic corner in design '%designName'.

**Description**

This message occurs when there is no constraint corner with valid parasitic parameter.

**What Next**

Invoke 'set_parasitic_parameters' command to set parasitic tech.

Feedback

## NEX-052

(Warning) Layout width is smaller than TF minimum width. ICC2 will use TF minimum width instead.

**Description**

This message occurs when layout width is found to be smaller than Technology File defined minimum width for corresponding metal layers. This indicates a DRC violation found in the layout.

**What Next**

Please clean up your design.

## NEX-053

(information) read_parasitics: %s.

**Description**

This message advises you how many nets are annotated from spef file.

**What Next**

Please check the consistency among design and the input spef files.

## NEX-054

(Error) starrc_extract_rc failed: %s. This can be ignored if using fusion extraction.

**Description**

This message advises you of the failure in starrc_extract_rc when running StarRCInDesign or PT ECO fusion. It's used by fusion extraction too. The error about non-exist starRC executable image can be ignored if fusion extraction is used in later flow, as fusion extraction integrated StarRC API in FC image and no need to run StarRC.

**What Next**

Invoke 'set_starrc_in_design'

## NEX-055

(warning) starrc_extract_rc: %s.

Feedback

**Description**

This message advises you of the warning in starrc_extract_rc when running StarRCInDesign or PT ECO fusion.

**What Next**

Invoke 'set_starrc_in_design'

---

## NEX-056

(info) %s

**Description**

This message about StarRC in Design progress information

**What Next**

n/a

---

## NEX-057

(error) Net %s has non-TLU+ layer geometry from layer# %d.

**Description**

This message tells there's non-tluplus layer geometry from problem net. RC extraction may be inacccurate.

**What Next**

User need check TLU+/mapping setting to make sure the correct TLU+ is used. For non-TLU+ layer, user should set it as ignored layer before routing starts. Otherwise RC value from the non-TLU+ layer will be 0, which may not be expected.

---

## NEX-058

(warning) The %s block contains invalid active fill.

**Description**

This message occurs when RC extraction detects invalid active fill in a block. Invalid active fill can cause inaccurate RC extraction results.

**What Next**

None.

Feedback

## NEX-059

(error) Empty TLU+ table: %s.

**Description**

This message tells cap table in TLU+/mapping is incorrect. RC extractor cannot be initialized. The table's name will appear as: 8(1)_0_9;Mask#0_0, and the meaning of each number is: 8: ITF/TLU+ sequence number 1: metal1(in mapping file) as working layer 0: 1 layer below working layer(should be ground) 9: 10 layers above working layer(should be metal11) Last 2 numbers are mask ID.

**What Next**

User need check TLU+/mapping setting to make sure the correct TLU+ is used.

## NEX-060

(error) RDE is not enabled %s.

**Description**

This message tells RDE is not setup to be used

**What Next**

User need check opt.common.enable_rde is enabled.

## NEX-061

(error) No valid parasitic for %s.

**Description**

This message tells that there is no parasitic corner defined for a given module.

**What Next**

User needs check corners are well defined in a current module for RC extraction.

## NEX-062

(error) Core area is not valid %s.

**Description**

This message tells core are is not valid for a given design. It appears when core area itself is not valid or height is not larger than 0 or width is not larger than 0.

Feedback

## NEX-063

(warning) StarRCInDesign: %s.

**Description**

This message advises you of the warning of StarRCInDesign command to indicate some nets which terminal has the imcompleted RC network from StarRC.

**What Next**

Please check these terminals/pins in the input design, and these pins might not be placed. Or some issues in StarRC. Please use standalone StarRC to verify the design for these nets.

## NEX-064

(warning) RDE isn't sync up with an app option (extract.rde_via_model).

**Description**

This message tells RDE is not captured with current via model setup (extract.rde_via_model (2|3)).

**What Next**

RDE behavior will do based on captured via model enahancement but we recommend to run the flow from the beginning with RDE via model enhancement.

## NEX-065

(warning) RDE has via model enhancement(2|3) but app option is too old setup(extract.rde_via_model 0|1).

**Description**

This message tells RDE is captured with via model enhancement(2|3) which is OBD but extract.rde_via_model is 0|1 which is not sync up with RDE.

**What Next**

RDE bahavior will do with via model enhancement but we recommend to change RDE setup to turn on rde via enhancement by setting extract.rde_via_model to 2|3 to sync up with RDE.

Feedback

## NEX-066

(error) write_parasitics -attach_gpd failed: ndm design %s does not have permission to attach GPD .

**Description**

In order to attach GPD to ndm, the opened ndm lib and design need to have the written permission.

## NEX-067

(information) metal fill emulation.

**Description**

parasitics technology has metal fill emulation.

**What Next**

DO NOT DO RC correlation with StarRC with metal fill emulation.

## NEX-068

(information) StarRC-in-design is not invoked because no config file is specified in set_starrc_in_design. Native ICC2 extractor is used.

**Description**

StarRC-in-design is not invoked because no config file is specified in set_starrc_in_design. Native ICC2 extractor is used.

**What Next**

please setup set_starrc_in_design.

## NEX-069

(warning) StarRC-in-design is not invoked because no config file is specified in set_starrc_in_design. Native ICC2 extractor is used.

**Description**

StarRC-in-design is not invoked because no config file is specified in set_starrc_in_design. Native ICC2 extractor is used.

Feedback

**What Next**

please setup set_starrc_in_design.

---

## NEX-070

(warning) "Missing the StarRC command specified in COMMAND_FILE in config file for starrc_centric mode. icc2_centric mode is used."

**Description**

If set -mode starrc_centric in set_starrc_in_design to user the RC setting from StarRC, users need to specify StarRC command file in COMMAND_FILE in config file. Otherwise, icc2_centric mode is used in StarRCInDesign to set RC setting from ICC2 settting.

**What Next**

please refer to set_starrc_in_design -mode.

---

## NEX-071

(error) "RDE Data doesn't match with Design Technology. Layer mismatch RDE( %d ) Design( %d )"

**Description**

When importing RDE it errors out if layer number mismatch between RDE and Design.

---

## NEX-072

(error) "Virtual Metall Fill parameter file %s is not specified or does not exist, or cannot be open/read."

**Description**

Virtual metal fill application needs to specify the paramter file in the command set_extraction_options -virtual_metalfill_parameter_file fileName

**What Next**

Invoke 'set_extraction_options'

---

## NEX-073

(information) "Virtual Metall Fill parameter file uses the starrc metalfill parameter file %s."

Feedback

**Description**

If the parameter file is not specified in -virtual_metalfill_parameter_file of the command set_extraction_options and starrc virutal metalfill parameter file is specified in -virtual_metalfill_starrc_parameter_file , then the starrc virtual metalfill parameter file would be used.

**What Next**

Invoke 'set_extraction_options'

---

## NEX-074

(Error) "Virtual Metall Fill parameter file %s is not valid: %s."

**Description**

The virtual metalfill parameter file is specifed with fill width and fill space on the routing layers.

**What Next**

Invoke 'set_extraction_options'

---

## NEX-075

(warning) "RDE Data is not loaded because of design size change. Please re-generate RDE or it goes with VR."

**Description**

When design size changes as like by pin or port change, RDE is not loaded because congestion map mismatches by sizing change. Normally, RDE congestion Map is registered to RDE itself when it is generated. But RDE generated by old version is not handled.

**What Next**

User is supposed to re-generate RDE or it would go with VR.

---

## NEX-076

(information) "Virtual Metall Fill in fusion extraction to use the starrc metalfill options file %s."

Feedback

**Description**

If the options file is specified in -virtual_metalfill_starrc_options_file of the command set_extraction_options, then the starrc virtual metalfill options file would be used in Fusion extraction.

**What Next**

Invoke 'set_extraction_options'

---

## NEX-079

(warning) "Failed to to capture RDE for a design %s due to no routing shape."

**Description**

There is no routing shapes which are essential for RDE capturing.

Design is supposed to have routed shape with GR/DR for RDE and RDE calls a global router to generate routing shapes by default unless it is forced not to call a global router. LighRDE(FC) doesn't call a global router because it uses glinks from place_mode GR from previous stage.

But it seems RDE capturing is done on unrouted design forcing not to call a global router or global router failed to provide glinks to RDE for some reason.

**What Next**

User is supposed to re-generate RDE or it would go with VR.

---

## NEX-080

(Error) "IVM file parsing parameter failed. %s Table will be ignored."

**Description**

IVM file is specified with right to its own syntax.

**What Next**

Invoke 'read_ivm'

---

## NEX-081

(Error) "Via Variation setup failed. %s"

**Description**

There is associating process to bind ivm file to parasitic corners.

Feedback

**What Next**

Invoke 'read_ivm'

---

## NEX-082

(Error) "IVM file name needs to be specified."

**Description**

IVM file name needs to be specified for the command read_ivm / write_ivm

**What Next**

Please refer to 'read_ivm' and 'write_ivm'

---

## NEX-083

(Error) "No valid corner list."

**Description**

Given corner name should be valid for ivm file UI commands.

**What Next**

Invokd 'read_ivm', 'write_ivm', 'report_ivm'

---

## NEX-084

(Error) "No via variation table exists."

**Description**

There is no via variation table for a given corner ivm UI commands.

**What Next**

Invokd 'read_ivm'.

---

## NEX-085

(Warning) "NEX: fusion cannot accept: (%s) from StarRC command file, please use (set_starrc_in_design -reduction) to provide the REDUCTION setting."

Feedback

**Description**

REDUCTION setting from StarRC command file is ignored, user should use set_starrc_in_design -reduction to provide the REDUCTION setting used by fusion StarRC engine.

**What Next**

Invoke 'set_starrc_in_design'

---

## NEX-089

(information) "TLUPlus is fill emulated."

**Description**

TLUPlus is fill emulated

**What Next**

Invoke 'read_parasitic_tech'

---

## NEX-090

(error) Conducing layer %s doesn't have mask aware capacitance table.

**Description**

conducting layers doesn't have etch cap table during read_parasitic_tech it.

---

## NEX-091

(information) "NEXML %s"

**Description**

This message indicates the local customized ML train models are used.

---

## NEX-092

(Warning) "NEX: TLU+ file doesnot contain nxtgrd for fusion or some corner nxtgrd is not set, back to native extractor."

**Description**

To run fusion extraction needs nxtgrd mapping file in starrc config file. If there is no nxtgrd mapping file, then TLU+ is triggered and run.

Feedback

### NEX-093

(Error) "write_rde command failed, %s"

**Description**

write_rde failed due to no RDE exists.

**What Next**

Invoke 'create_rde' to create RDE before 'write_rde'.

## NLDM

### NLDM-001

(error) Discarded NLDM for %s on lib cell %s for arc:\n \t'%s'.\n \tReason: %s

**Description**

While reading a db file and converting NLDM data from timing arcs, an unsupported construct was found which caused the NLDM for this arc to be discarded. For example, if a rise delay table contains an invalid value (NaN, infinity, or -infinity) which could later cause a floating point exception, we discard the table. The message will indicate which arc is causing the problem. Note that Library Compiler does issue warnings for the use of such values. We not only discard the table with invalid value, but also discard it's complimentary table, so you wouldn't get NLDM-008 during *check_workspace*. For example, if cell_rise data was discarded, it's complimentary rise_transition data was also discarded.

**What Next**

Keep in mind that by removing NLDM data for part of an arc will likely cause additional errors during *check_workspace*. NLDM-008 will tell you that cell_rise is missing for the same arc you saw in this message, and NLDM-003 will summarize that there were irreparable NLDM attributes. Your only recourse within the application is to remove the offending lib cell with *remove_lib_cell*. Externally, you can look at the Liberty (.lib) file and fix the erroneous value(s).

**See Also**

- NLDM-008
- NLDM-003
- remove_lib_cell

Feedback

## NLDM-002

(warning) Missing %s_transition for the following arc: \t%s

### Description

The listed timing arc has a delay attribute without the complimentary transition (slew) attribute. For example, a cell_rise was found without rise_transition. Modern versions of Library Compiler do not allow this however this situation can be found in older DB libraries. Prior to this message you would see an indication of the library being checked, for example:

```
\&...verifying arcs for file1.db
```

That is the problem library. The arc description will show the cell, from and two pins, sense, when condition and sdf condition (if applicable) in order to make it as clear as possible which arc is at fault.

### What Next

This is a warning. The application will correct this for you by adding an identity transition table so that output transition time equals input transition. But if you have the source of the DB file, you should consider updating it.

## NLDM-003

(error) Found irreparable NLDM attributes.

### Description

Within a logic library, complimentary attributes (for example, rise delay and rise transition) for some arcs did not have identical breakpoints, and there was some issue preventing the breakpoints from being homogenized.

### What Next

This issue causes the *check_workspace* command to fail. You must run the *check_workspace* command with the *-details arcs_progress* option to determine the specific problem arcs. After identifying the problem arcs, update the logic library and redo library preparation.

## NLDM-004

(information) Found some variation in breakpoints between complementary\n \tattributes - %d can be repaired.

Feedback

### Description

Within a library, complementary attributes (for example, rise delay and rise transition) for some arcs did not have identical breakpoints, but had a type of variation which can be repaired. Currently, there are only automated repair methods. If the difference is that the attributes are a function of the same variables but have different indices, the union of the table indices will be used with no loss of accuracy.

In cases where one attribute has an extra variable, the lesser breakpoints will pick up the missing variable with no loss of accuracy.

In cases where one attribute is a function of one variable (like Tclk) and the other is a function of a different but paired variable (Tdat in this example), each breakpoints is expanded to include the missing variable, with no loss of accuracy.

In cases where the arc has a delay attribute but transition is missing, the application will correct this for you by adding an identity transition table so that output transition time equals input transition. This case should be very rare as the current Library Compiler does not allow creation of such an arc.

### What Next

At this time, there is no user intervention available. The *check_workspace* command will fix these issues.

---

## NLDM-005

(error) Different number of %s and %s attributes.

### Description

Delay arcs in the logic library must have both delay and slew attributes. To quickly verify that the library meets this requirement, the tool verifies that there are the same total number of each attribute, for example, rise delay and rise slew. The tool issues this message if the attribute counts do not match.

### What Next

Analyze the logic library source file to determine why some arcs are missing the delay or slew attribute.

---

## NLDM-006

(error) %s data missing for some of these libraries

Feedback

### Description

The data from Liberty needs to exist in all or none of the libraries in a scaling group. The libraries in your proposed scaling group do not fit that description. You cannot create a scaling group with these libraries.

---

## NLDM-007

(error) Failed to write to on-disk cache in directory %s. \tReverting to in-memory only.

### Description

NLDM data is cached on disk and is loaded on-demand, per-arc, when some part of the application requests the data. The path to this cache starts with the value of the application option *shell.tmp_dir_path*. This message is similar to NLDM-006, but slightly different. This one indicates that the application was able to create the disk cache, but sometime later, it was unable to write to it. The most likely causes are a full disk. In this situation, the application falls back to an in-memory only representation. This can dramatically increase memory usage.

### What Next

The application will function as before, albeit with a much larger memory footprint. You can also stop and restart after setting the application option *shell.tmp_dir_path* to a different disk with more space.

---

## NLDM-008

(error) Missing cell_%s \t'%s'

### Description

The listed timing arc has a transition (slew) attribute without the complimentary delay attribute. For example, a rise_transition was found without cell_rise. As modern versions of Library Compiler do not allow this, either the DB is an old version, or the source might be using rise/fall_propagation groups, which this application does not support. Prior to this message you would see an indication of the library being checked, for example:

```
\&...verifying arcs for file1.db
```

That is the problem library. The arc description will show the cell, from and two pins, sense, when condition (if applicable) in order to make it as clear as possible which arc is at fault.

It is also possible that the cell_rise/fall for this arc had invalid values. If this is the case, you would have seen NLDM-001 messages when you read the source file.

Feedback

### What Next

This is an error. If you have the Liberty source file, you need to express delay in terms of cell_rise and cell_fall, and these constructs must have valid numerical values. Otherwise, the only recourse is to remove the offending cell using *remove_lib_cell* on the contributing library.

### See Also

- NLDM-001
- remove_lib_cell

# NP

## NP-001

(Warning) No physical information exists for design '%s'. Zero interconnect delay is used in timing analysis.

### Description

Either the physical information for the design is not loaded or it is incorrectly initialized. The net parasitics can not be calculated and the timer will use the zero interconnect delay for net estimation.

### What Next

Check the set up for the design. Check if the design was placed correctly and has valid core box defined.

## NP-002

(Warning) The extractor can not be initialized for design '%s'. Zero interconnect delay is used in timing analysis.

### Description

Either the physical information for the design is not loaded or it is incorrectly initialized. The net parasitics can not be calculated and the timer will use the zero interconnect delay for net estimation.

### What Next

Check the set up for the design. Check constraint corner's parasitic tech setup in run script. Run report_parasitic_parameters to make sure all corners are correctly set.

Feedback

### NP-003

(Warning) The extractor can not be initialized for block '%s'.

**Description**

Either the physical information for the block is not loaded or it is incorrectly initialized. The extractor for the top block will be used to estimate the nets within the block.

**What Next**

Check the set up for the block. Check if the design was placed correctly and has valid core box defined.

### NP-004

(Information) Coupling caps annotated for %u nets in block '%s' (Mem = %.4f MB).

**Description**

Information about the coupling caps annotated from an abstract block for the nets retained in the abstract netlist. The annotated coupling caps are used in signal integrity (SI) analysis during the timing update. The message also prints the total memory requirement for the annotated coupling caps.

## NPLDRC

### NPLDRC-001

(info) Analyzing PG structure for %ld layers using %d cores.

**Description**

The tool is analyzing the PG and user route shapes and vias so it can check for DRC violations between placed lib_cells and the PG grid.

The result of the PG structure analysis will be saved with the design in its NDM library so it can be re-used in later runs.

In future runs if the PG structures have changed then the PG structure analysis will be re-run on the updated PG structures.

**What Next**

If the design has been freshly read and not yet been saved to an NDM library, there is no place for the analysis to be saved. The analysis will re-run each time PG DRC checking is done.

Feedback

Try saving the design to its NDM library after reading the design:

```
prompt> save_block
```

**See Also**

- legalize_placement
- save_block

## NPLDRC-002

(info) Saving PG structure for '%s'.

**Description**

The tool is saving the PG structure analysis in the design's NDM library so it can be re-used in later runs.

In future runs if the PG structures have changed then the PG structure analysis will be re-run on the updated PG structures.

**What Next**

The tool can now check for DRC violations between placed lib_cells and the PG grid.

**See Also**

- legalize_placement

## NPLDRC-003

(info) Reading PG structure for '%s'.

**Description**

The tool is reading the PG structure analysis saved in the design's NDM library from a previous run.

Since the power structures have not changed since the previous run the PG structure analysis results can be re-used.

**What Next**

The tool can now check for DRC violations between placed lib_cells and the PG grid.

**See Also**

- legalize_placement

Feedback

## NPLDRC-004

(info) Updating unknown PG structure for '%s'.

### Description

The tool could not read the saved PG structure analysis for this design from the NDM library because the file format was not recognized.

The tool will re-analyze the PG and user route shapes and vias so it can check for DRC violations between placed lib_cells and the PG grid.

The result of the PG structure analysis will be saved with the design in its NDM library so it can be re-used in later runs.

### What Next

The tool will automatically re-run the PG structure analysis for this design.

### See Also

- legalize_placement

## NPLDRC-005

(info) Updating PG structure for '%s'.

### Description

The tool could not re-use the saved PG structure analysis for this design from the NDM library because the PG structures have changed since that run.

Changing the PG grid or user route shapes causes the tool to re-run the PG structure analysis before checking for DRC violations.

The tool will re-analyze the PG and user route shapes and vias so it can check for DRC violations between placed lib_cells and the PG grid.

The result of the PG structure analysis will be saved with the design in its NDM library so it can be re-used in later runs.

### What Next

To avoid unneeded PG structure analysis, make all updates to the PG grid and setting clock tree and other user routes at once instead of incrementally.

The tool will automatically re-run the PG structure analysis for this design.

Feedback

---

## NPLDRC-006

(warning) Could not read PG structure for '%s'.

**Description**

The tool could not read the saved PG structure analysis for this design from the NDM library because the file contents were not recognized.

The tool will re-analyze the PG and user route shapes and vias so it can check for DRC violations between placed lib_cells and the PG grid.

The result of the PG structure analysis will be saved with the design in its NDM library so it can be re-used in later runs.

**What Next**

The tool will automatically re-run the PG structure analysis for this design.

**See Also**

- legalize_placement

---

## NPLDRC-007

(warning) Detected a sector %s on layer %s with %d metal and/or via shapes.

**Description**

Unusual PG grid definition consisting of combinations of small straps and inlaid vias or vias with abutting enclosures create huge sectors that are usually long and consist of many shapes. This might cause long runtime because the tool must merge these shapes to perform legality checks.

**What Next**

Check the PG grid definition and reformat if possible.

---

## NPLDRC-008

(warning) place.legalize.auto_adjust_drc_rules_for_short_pin disables %s rule in %s layer..

Feedback

**Description**

The tool detects short pins in the design and automatically disables color_based_end_of_line_alignment rule in M1.

**What Next**

The tool would not report Color-Based End-of-line Alignment rule on M1 short pins which can be patched or extended during detail_route.

**See Also**

- legalize_placement

---

## NPLDRC-009

(Warning) Net name changed from %s to %s in cache.

**Description**

Net name cached by tool has been changed.

**What Next**

This is legitimate. Nothing needs to be done.

**See Also**

- legalize_placement

---

## NPLDRC-010

(Warning) Net %s removed from cache.

**Description**

Net cached by tool has been removed.

**What Next**

This is legitimate. Nothing needs to be done.

**See Also**

- legalize_placement

Feedback

### NPLDRC-011

(Warning) Technology file error. Via layer %s cut definition properties, cutNameTbl(%d), cutWidthTbl(%d), cutHeightTbl(%d), do not match size. Skipping processing of via layer.

**Description**

Error in technology file via layer cut definition.

**What Next**

Fix technology file.

**See Also**

- legalize_placement

## OASIS

### OASIS-001

(error) Library %s is not Found.

**Description**

The Given library is not Found.

### OASIS-002

(error) Design %s with view type %s is not Found in the Library.

**Description**

The Given Design name with the specified viewtype is not Found in the Specified Library.

### OASIS-003

(error) Technology Defnition for Layer Number %d and Purpose %d not defined.

**Description**

The Given Design doesn't have a LAYER Definition for the Layer in question in the Associated Technology Library.

Feedback

## OASIS-004

(information) Text %s (%d, %d)is creating a short with already detected Pin %s.The current text will be ignored.

**Description**

The Text is having a coordinate which overlaps with a geometry with has been already detected as another pin. So this is creating a short and will be ignored.

## OASIS-005

(error) Current Design %s is not Found.

**Description**

The current Design is not Found.

## OASIS-006

(error) Current Design is not of LAYOUT type.

**Description**

The current Design loaded is not of Layout type.

## OASIS-007

(information) No Design has been Added or Modified in the current read_oasis. So no tracing will happen.

**Description**

The current read_oasis has not modified any Designs, so pin tracing won't happen as part of read_oasis.

## OASIS-008

(warn) Multiple Boundary definition found for Module %s, keeping the original definition.

**Description**

The current OASIS file has multiple boundary definition for a module.

Feedback

## OASIS-009

(error) Reading Directory is not supported. File %s is a directory.

**Description**

The input file is a directory.

## OASIS-010

(warn) Layer mapping rule for "%d:%d" is defined multiple times. Only the last instance will be effective.

**Description**

Multiple Layer Mapping rule is not supported in OASIS read/write utility.

## OASIS-011

(error) OASIS Parsing Error: %s

**Description**

OASIS file has problem.

## OASIS-012

(warn) Technology Defnition for Layer Number %d and Purpose %d not defined.

**Description**

The Given Design doesn't have a LAYER Definition for the Layer in question in the Associated Technology Library.

## OASIS-013

(warn) Layer Mapping for OASIS LAYER %d and DATATYPE %d not specified.

**Description**

For the OASIS LAYER and DATATYPE, layer mapping is not specified in the layer map file.

## OASIS-014

(error) Library name has spaces.

Feedback

**Description**

A library name had spaces.

**What Next**

Check that the given library name is valid simple path.

---

## OASIS-015

(error) Library name specified %s cannot be same as workspace library.

**Description**

The Given library name is not allowed.

---

## OASIS-016

(error) Wrong Block Map file Syntax.

**Description**

The syntax of Block Map file is not allowed.

---

## OASIS-017

(error) Wrong layer map file syntax at line %lu.

**Description**

The syntax of Layer Map file at the specified line number is not allowed.

**What Next**

Please check the man-page of the read_oasis(2), write_oasis(2) for the correct syntax.

---

## OASIS-018

(warning) FIXEDMASK defined, geometry without MASK will be set as same_mask type.

**Description**

The module has the fixed mask attribute set but the geometry doesn't have a mask attribute defined. The geometry will be set as same_mask type.

Feedback

## OASIS-019

(error) The mask number exceeds the number of masks defined for the tech layer %d.

**Description**

The Mask number should not exceed the number of masks defined in the Tech layer.

## OASIS-020

(error) Library '%s' is not a physical lib_cell library.

**Description**

The library specified for read OASIS must be a physical lib_cell library.

**What Next**

Choose a physical lib_cell library to read OASIS in.

## OASIS-021

(information) Read OASIS into %s library '%s'.

**Description**

This message reports the name of the library to accomodate OASIS data. It also indicates whether the library is an existing library or a new library.

**What Next**

No action required.

## OASIS-022

(warn) The Application option "oasis.port_type_map" is not defined before "read_oasis" command.

**Description**

The Application option "oasis.port_type_map" is not defined before "read_oasis" command. OASIS generated libraries will not generate any PG pins. This may create problem in final library generation. Please check your setup.

Feedback

## OASIS-023

(warn) The Module '%s' doesnot have any port matching the PG names provided by "oasis.port_type_map" application option

### Description

The Module doesnot have any port matching the PG names provided by "oasis.port_type_map" application option. OASIS generated Module will not have any PG pins. This may create problem in final library generation. Please check your setup.

## OASIS-024

(warn) Text '%s' is not on routing layer. Tracing for the given text may result in identification of wrong pins.

### Description

Text '%s' is not on routing layer. Tracing for this text has been enabled on all routing layers by setting the application option "oasis.trace_unmapped_text".Also, routing layer to text layer mapping is not specified using "oasis.text_layer_map" application option. Connectivity tracing for the text will be done on all layers. This may lead to errornous result. Please specify routing layer to text layer mapping using "oasis.text_layer_map". Please check your setup.

### What Next

```
oasis.port_type_map(3),
oasis.trace_unmapped_text(3),
```

## OASIS-025

(error) The %d is outside the alowed valid range for %s in layer map. Valid range is between %d and %d.

### Description

Value specified outside valid range.

## OASIS-026

(error) The special charecter %s is not allowed in %s field of layer map.

### Description

The special character is not allowed in layer map field.

Feedback

## OASIS-027

(error) The input OASIS file name and the output ascii file name can't be same.

**Description**

OASIS file name and Ascii file name are same.

## OASIS-028

(warning) The string '%s' is longer than %lu characters. Please use '-long_names' for proper output.

**Description**

The length of the string name to be written in the OASIS file is longer than the supported length. The name will trucated.

**What Next**

The command "write_oasis" needs to be run with "-long_names" option.

## OASIS-029

(Information) %s '%s' already exists (will %s).

**Description**

This message indicates that specified object already exists when reading a OASIS file into an existing library. The library manager shell, lm_shell, will take action according to the merge settings.

**What Next**

No action required.

## OASIS-030

(information) Change %s name '%s' from OASIS file to '%s' to resolve a conflict.

**Description**

When the object to be created by read OASIS conflict with an existing object, there is an attempt to change the name of the object to be created to a unique name to resolve the conflict.

Feedback

**What Next**

No action required.

---

## OASIS-031

(warning) Merge action in '%s' will be ignored when read OASIS into a new library.

**Description**

When read OASIS into a new library, merge settings will be ignored.

**What Next**

Do not specify merge related options when read OASIS into a new library.

---

## OASIS-032

(warning) The width of the boundary %d is more than width %d of site width.

**Description**

The width of the boundary is more than width of the site def.

**What Next**

May need to check the boundary or the site def of the lib-cell.

---

## OASIS-033

(warning) The height of the boundary %d is more than height %d of site def.

**Description**

The height of the boundary is more than height of the site def.

**What Next**

May need to check the boundary or the site def of the lib-cell.

---

## OASIS-034

(warning) The user specified view '%s' for lib-cell '%s' is not available.

**Description**

The user specified view for lib-cells is not available for this lib-cell design. The definition for the current lib-cell design will not be written to the OASIS file.

Feedback

### What Next

The user may need to change the view to be written to OASIS file for the lib-cell design using option "-lib_cell_view".

---

## OASIS-035

(warning) The design '%s' is found to have mismatches. Use allow_design_mismatch option to write OASIS file.

### Description

The design is found to have mismatches due to which allow_design_mismatch option needsto be used to write OASIS file. Please use report_design_mismatch user command initially to review all the mismatches. If the design mistmatches are found to be fine, use the option allow_design_miismatch to write the OASIS file.

### What Next

Use the command report_design_mismatch to review all the design mismatches. The user may then use allow_design_mismatch option to write the OASIS file.

---

## OASIS-036

(error) The mask number(%s) for the tech layer %d doesn't belong to a VIA Cut Layer.

### Description

The Mask number should be asscoiated with a VIA cut layer. The input layer number is not a VIA cut layer.

### What Next

Please check the OASIS layer map.

---

## OASIS-037

(warning) Unable to obtain mask value for surround on lower metal layer of via '%s'.

### Description

This warning message is issued since the surround on lower metal layer of the via cannot touch any pin in the design. This could be a via that only connects two layers but is not on a pin.

### What Next

Please check the via and the design data if needed.

Feedback

## OASIS-038

(warn) Zero width spur in the input point list {%s}.

**Description**

The Input point list has zero width spur. The polygon will not be added.

**What Next**

Please check the point list been passed.

## OASIS-039

(error) Invalid layer-name '%s' specified at line %lu in the input layer-map file.

**Description**

A layer by the specified name does not exist. Please check the layers present in the associated technology file.

## OASIS-040

(error) Invalid value '%s' specified for '%s', at line %lu in the input layer-map file.

**Description**

The value specified for the flag is not a valid value. Please check the man-page of read_oasis(2), write_oasis(2) for the allowed values. The stream file will still be written out but ignoring the line with invalid value in the layer mapping file. This error will be reported in several scenarios. For example, the input value cannot be recognized due to type error or the use_type in newer version of the tool is not supported in the older version.

**What Next**

Please modify the layer mapping file for the invalid value or use the latest version of the tool.

## OASIS-041

(warning) Ignoring the invalid layer map file syntax at line %lu.

**Description**

The syntax of Layer Map file at the specified line number is not allowed.

Feedback

**What Next**

Please check the man-page of the read_oasis(2), write_oasis(2) for the correct syntax.

---

## OASIS-042

(error) Line %lu: multi-pattern map entry with wild-card cannot co-exist with multi-pattern map entry with specified layer for same mask type.

**Description**

This message occurs when there is invalid line in the layer mapping file. Multi-pattern map entry with wildcard cannot co-exist with Multi-pattern map entry with specified layer for same mask type. For example, M1 * *:108 M1 12 12:108

**What Next**

Remove Multi-pattern map with wildcard or Multi-pattern map with specified layer.

---

## OASIS-043

(error) Line %lu: same OASISLayer:OASISDataType appears in both regular mapping and multi-pattern mapping.

**Description**

This message occurs when there are invalid lines in the layer mapping file. Same OASISLayer:OASISDataType cannot appear in both regular mapping and multi-pattern mapping. For Example, A 12 13:121 M1 12 13:121

**What Next**

If in multiple-pattern technology process, please remove the regular mapping. If not, remove the multi-pattern mapping.

---

## OASIS-044

(error) The ICC2 layer number '%d', specified at line %lu is not a valid value for %s layer map format.

**Description**

The ICC2 layer number specified should follow the limits below: icc2 : 0 - 32767 icc default : 0 - 255 icc extended : 0 - 4095

**What Next**

Use layer-numbers within the specified limits.

Feedback

## OASIS-045

(warning) Technology layer for layer number %d, does not exist. Ignoring the layer-map entry at line %lu.

**Description**

The technology file associated with the current library does not have a layer defined with the given layer-number.

## OASIS-046

(warning) The magnification %f is different than the default value of 1.0. This will be ignored.

**Description**

The magnification specified is different from 1.0 and hence is ignored. Only magnification of 1.0 is supported now.

## OASIS-047

(error) Invalid purpose-name '%s' specified at line %lu in the input layer-map file.

**Description**

A tech-layer purpose by the specified name does not exist. Please check the tech-layer purposes present in the associated technology file.

## OASIS-048

(error) The simple via def '%s' doesnot have the lower overhang metal layer set.

**Description**

A simple via def has both the lower and upper metal overhang defined. A simple via_def cannot have either of them not defined .

**What Next**

Use 'report_via_defs' to review the set of via_defs.

## OASIS-049

(error) The simple via def '%s' doesnot have the upper overhang metal layer set.

Feedback

**Description**

A simple via def has both the lower and upper metal overhang defined. A simple via_def cannot have either of them not defined .

**What Next**

Use 'report_via_defs' to review the set of via_defs.

---

## OASIS-050

(information) Translating cell '%s' as cell '%s/%s'.

**Description**

The OASIS cell being read is translated to the given cell name.

---

## OASIS-051

(error) Input file '%s' is neither a GDSII nor an OASIS file.

**Description**

The input file can be either a GDSII file or an OASIS file.

---

## OASIS-053

(error) Input file '%s' is not a flat structured OASIS file.

**Description**

Only flat structured OASIS file can be given as input file when merge_action is replace_layer and append.

---

## OASIS-054

(error) Input file '%s' is not a appropriate OASIS file.

**Description**

Illegal usage of the command.

---

## OASIS-055

(error) Reading of input OASIS file failed.

Feedback

**Description**

When reading of OASIS file fails, design will be restored to it's previous state.

---

## OASIS-056

(information) no mapping information for system purpose %s in layer mapping file. Mapped to default data type.

**Description**

When there is explicit mapping of system purpose (-1, -2, -3 and -4) in layer mapping file, the tool will use that mapping; for example, with the mapping "all 32:-1 32:55", the tool maps database layer "32:-1" to GDS layer 32:55; if no mapping for these system purposes, the tool will follow the mapping of the purpose 0 of the same layer. For example, if the mapping has "all 32:0 32:70", system purpose "-1" will be mapped to GDS layer 32:70. Please note that GDS datatype can't be any data less than 0, the usage like "all 32:-1 132:-1" is invalid for GDS language, and the datatype will be taken as 0 like "A 32:-1 132 0".

**What Next**

If the implicit mapping as described above does not meet the requirement, you can explicitly map the system purpose (-1, -2, -3 and -4) in layer mapping file.

---

## OASIS-057

(warning) Found child design '%s' for option "-bbox_list".

**Description**

Option "-bbox_list" is only for flatten design, otherwise, it might cause OASIS file inconsistency.

**What Next**

To flatten the design and try the option "-bbox_list" again.

---

## OASIS-058

(error) Block %s is not Found in the Library.

**Description**

The given VIB block name is not Found in the current design of the Specified Library.

Feedback

## OASIS-059

(information) Outputting hierarchy '%s' from '%s' view.

**Description**

write_oasis is generating the structure for the hierarchy.

## OASIS-060

(error) command failed at outputting structure '%s'.

**Description**

write_oasis failed at generating the content for the structure.

**What Next**

Please check what's the exact data caused the failure.

## OASIS-061

(warning) The user specified view '%s' for cell '%s' is not available.

**Description**

The user specified view for cells is not available for this cell. If all specified views cannot be found for the cell, design view will be output, if any. The definition for the cell will not be written to the GDSII file, if all specified views and design view cannot be found.

**What Next**

The user may need to change the view to be written to OASIS file for the cell using option "-switch_view_list".

## OASIS-062

(information) Cell instance '%s' referred to reference design '%s' is retained and will refer to designs in reference library.

**Description**

It means the block to which the cell instance referred is retained in block mapping file, and the CELL record in OASIS file is skipped, the cell instance will be bound to corresponding reference design in reference library.

Feedback

**What Next**

No action required.

---

## OASIS-064

(error) Input file '%s' is GDSII format file instead of OASIS.

**Description**

Command 'read_oasis' only support OASIS format file.

**What Next**

Please use 'read_gds' command to read in this file.

---

## OASIS-065

(error) Invalid value for option -mask_shift_layers.

**Description**

There can not be duplicated layers in the specified value.

---

## OASIS-066

(error) Mask shifted cell '%s' does not have its corresponding mapping in the map file.

**Description**

There is not a corresponding mapping for the mask shifted cell in the map file.

**What Next**

Please add the corresponding mapping to the map file and then try again.

---

## OASIS-067

(error) Mask shift property mismatch on cell '%s'.

**Description**

There is mask shift property mismatch between different map files.

**What Next**

Please correct the mask shift property and then try again.

Feedback

## OASIS-068

(error) Fail to remove the file '%s'.

**Description**

The oasis file is removed if failure occurs.

**What Next**

Please ignore the file.

## OASIS-069

(warning) Found uncolored multi-patterning shapes in the database which won't be output.

**Description**

This warning message occurs when there are some uncolored multi-patterning shapes in the database the check is controlled by the app option file.oasis.ignore_uncolored_shapes or the syntax forbidNoMaskConstraint in technology file. write_oasis will continue to write out all other shapes except the uncolored ones.

**What Next**

Please use command check_shapes -uncolored to find out all these shapes and color them, or turn off the app option mentioned above to output uncolored shapes. Note, if the syntax forbidNoMaskConstraint is 1, the value of the app option will be ignored.

## OASIS-070

(error) Unsupported option '%s' to new engine of write_oasis.

**Description**

It means the command option or app option isn't supported at current stage.

**What Next**

To achieve the option feature, turn off the file.oasis.enable_new_writer to output OASIS layout file.

## OASIS-071

(warning) The deprecated option '%s' is ignored when the new writer app option is enabled.

Feedback

**Description**

It means that the command option or app option is deprecated and ignored when turning on the app option "file.oasis.enable_new_writer".

**What Next**

Remove the option setting

---

## OASIS-075

(information) Output mask-shifted cell name according to rename files.

**Description**

This message occurs when -rename_cell is specified to write_oasis and the rename files are only for mask-shifted cells.

**What Next**

No action required.

---

## OASIS-077

(warning) Ignoring %s, because there is another design with the same name %s.

**Description**

This warning message occurs when app option "file.oasis.output_first_same_name_cell" is on, write_oasis only writes the first encountered cell.

**What Next**

Please turn off the app option "file.oasis.output_first_same_name_cell" if you expect that write_oasis renames the cells with the same name and writes them as different structures in the output oasis file.

---

## OASIS-078

(warning) Found uncolored shapes on multi-patterning layer in the database which won't be output.

**Description**

This warning message occurs when there are some uncolored shapes on multi-patterning layer in the database, the check is controlled by the app option file.oasis.check_mask_constraints, value "loose". write_oasis will continue to write out all other shapes except the uncolored ones.

Feedback

**What Next**

Please use command check_shapes to find out all these shapes and color them, or turn off the app option mentioned above to output uncolored shapes.

---

## OASIS-079

(warning) Found colored shapes on uni-patterning layer in the database.

**Description**

This warning message occurs when there are some colored shapes on uni-patterning layer in the database, the check is controlled by the app option file.oasis.check_mask_constraints, value "loose". write_oasis will continue to write out all shapes.

**What Next**

Please use command check_shapes to find out all these shapes.

---

## OASIS-080

(error) Found mismatch on shapes and layers for color check.

**Description**

This error message occurs when there is mismatch on shapes and layers for color check in the database, the check is controlled by the app option file.oasis.check_mask_constraints, value "strict".

**What Next**

Please use command check_shapes to find out all these shapes and fix them.

---

## OASIS-081

(error) The layer '%s' provided by "file.oasis.text_layer_map" application option was not found.

**Description**

A layer by the specified name in "file.oasis.text_layer_map" application option does not exist. Please check the layers present in the associated technology file.

**What Next**

```
file.oasis.text_layer_map(3)
```

Feedback

## OASIS-082

(warning) Ignoring invalid value '%s' provided for app option file.oasis.shape_use_for_pg_mesh.

**Description**

Value provided for app option file.oasis.shape_use_for_pg_mesh is invalid. Valid values are case-insensitive "stripe", "ring", "lib_cell_pin_connect" or "macro_pin_connect".

**What Next**

Specify correct values for app option.

## OASIS-083

(error) The design %s is not of the 3dic_top type.

**Description**

The design %s is not of the 3dic_top type

**What Next**

Make sure the design is 3dic_top type and run the command again

## OASIS-100

(warning) Ignoring unsupported magnification value '%f'.

**Description**

This message occurs when the input OASIS file contains magnification information and the magnification value is not equal to 1.0. Magnified cell instance is not supported, so ignore it and use the default value 1.0.

## OASIS-101

(Error) Fail to write out PLACEMENT record for cell instance %s at (%d %d).

**Description**

Fail to write out PLACEMENT record in OASIS file for the cell instance at specified location.

Feedback

## OASIS-102

(Error) Fail to write out RECTANGLE record.

**Description**

Fail to write out RECTANGLE record in OASIS file.

## OASIS-103

(Error) Fail to write out POLYGON record.

**Description**

Fail to write out POLYGON record in OASIS file.

## OASIS-104

(Error) Fail to write out PATH record.

**Description**

Fail to write out PATH record in OASIS file.

## OASIS-105

(Error) Fail to write out TEXT record.

**Description**

Fail to write out TEXT record in OASIS file.

## OASIS-106

(error) Failed to write out Path '%s'.

**Description**

The path is irregular, please check its coordinates.

## OASIS-107

(error) %s "%s" has an angle of %.3f degrees which is not supported currently.

Feedback

**Description**

This message occurs when sref or aref specified an unsupported ANGLE value. Supported values are: 0/90/180/270 degrees.

**What Next**

Check the OASIS file to find the "abnormal" object, change the ANGLE value of it, or delete the object.

---

## OASIS-108

(warning) Ignoring unsupported circle.

**Description**

This message occurs when the input OASIS file contains circle record.

---

## OASIS-109

(warning) Ignoring unsupported abstract for '%s'.

**Description**

This message occurs when the -abstract and -type die/interposer are specified together, read_oasis will create layout view when tracing is not enabled, otherwise, design view is created.

---

## OASIS-110

(warning) Unplaced cell '%s' is written to the OASIS file.

**Description**

This warning is displayed upto 20 times when unplaced cells are present in the design. By default unplaced cells will be outputted to OASIS file.

**What Next**

Please use option -skip_unplaced_cells if you do not need unplaced cells.

---

## OASIS-111

(warning) Ignoring line %d in file '%s' for the reason: '%s'.

Feedback

### Description

This warning message occurs when there is something wrong in the marker layer map file, which was instroduced to duplicate routing data in database to specified GDSII/OASIS marker layer.

There are 4 types (layer, region, net and cell) in the marker layer map file. Each line indicates a mapping, the mapping starts with marker and ends with ";", any text after a semicolon "#" in each line is a comment.

For all the types, -FBlayer, -cad_layer and -data_type are required options. When the type value is not cell, the -layer option is also required option. When the type value is region, the -bbox is also required option. When the type value is net, the -net is also required options. When the type value is cell, the -cell is also required option.

The following statements are the example for all kinds of type. marker -type layer -layer METAL -FBlayer FB9 -cad_layer 135 -data_type 1999 ; #layer based marker -type region -layer METAL -FBlayer FB9 -bbox {{1294 479} {1415 507}} -cad_layer 222 -data_type 1999 ; #region based marker -type net -net VDD -layer METAL3 -from U458/ZN -to H1/H3/B1 -FBlayer FB6 -cad_layer 333 -data_type 1999 ; #net based marker -type cell -cell inst2 -FBlayer FB7 -cad_layer 444 -data_type 1999 ; #cell based

### What Next

Please check and correct the marker layer map file according to the message about the warning reason.

# OCVM

## OCVM-001

(error) Unrecognized specifier '%s' at line %d of %s.

### Description

This message is issued when the *read_ocvm* command cannot find a valid specifier name.

### What Next

Please check the PrimeTime reference manual for the correct AOCVM syntax.

### See Also

- read_ocvm

Feedback

## OCVM-002

(error) Multiple entries for specifier '%s' at line %d of %s.

### Description

This message is issued when the *read_ocvm* command encounters the same specifier multiple times for a given table. The *version* should be specifed once per file.

### What Next

Please make sure that there is only one entry for a given specifier for a table. If it is an optional specifier (like *path_type*), please make sure that there is at least one required specifier (like *derate_type*) after this specifier for the given table.

### See Also

- read_ocvm

## OCVM-003

(error) '%s' at line %d of %s is not supported for the given file version.

### Description

This message is issued when the given specifier is not supported for the version given in the file.

### What Next

Please check the PrimeTime reference manual for the correct AOCVM syntax.

### See Also

- read_ocvm

## OCVM-004

(error) Unrecognized entry for '%s' at line %d of %s.

### Description

This message is issued when the parser cannot recognize the entries for the given specifier. This message is also issued if the number of entries specified is more or less than expected.

Feedback

### What Next

Please check the PrimeTime reference manual for the correct AOCVM syntax.

### See Also

- read_ocvm

---

## OCVM-005

(error) Unsupported specifier '%s' at line %d of %s.

### Description

This message is issued when the parser encounters a specifier that is not supported. The specifier *group_name* is not supported in the tool.

### What Next

Remove the unsupported specifier.

### See Also

- read_ocvm

---

## OCVM-006

(warning) Ignoring specifier '%s' at line %d of %s.

### Description

This message is issued when the parser encounters a specifier that is not supported. The specifier *voltage* is not supported in the tool. This line will be ignored and the rest of the table will be parsed.

### What Next

Ignoring the specifier may mean that the table may be overriding already specified table. For instance, a table for libcell A may have been already read when another table for libcell A with voltage 1.0 is read. In this case, the voltage line will be ignored and the new table will override the existing table. Please use the *report_ocvm* command to see the annotated tables.

### See Also

- read_ocvm
- report_ocvm

Feedback

## OCVM-007

(error) Multiple entries for '%s' at line %d of %s.

### Description

This message is issued when mutiple values are specifed for a specifier when only one entry is expected.

### What Next

Please check the PrimeTime reference manual for the correct AOCVM syntax.

### See Also

- read_ocvm

## OCVM-008

(Warning) Ignoring 'object_spec' as 'object_type' is 'design' (line: %d of file: %s).

### Description

The *object_spec* entry should be empty when *object_type* is *design*. The tool will ignore the object_spec and apply the table on top level design.

### What Next

Please check the PrimeTime reference manual for the correct AOCVM syntax.

### See Also

- read_ocvm

## OCVM-009

(error) 'object_type' is not known for the given 'object_spec' (line: %d of file: %s).

### Description

This error message is issued when the parser does not know the type of objects.

### What Next

Please make sure that there is an entry for *object_type* before *object_spec*.

### See Also

- read_ocvm

Feedback

## OCVM-010

(error) '%s' can only be '%s' or '%s'.

**Description**

This error message is issued when the entry for a specifier is not valid.

**What Next**

Please check the PrimeTime reference manual for the correct AOCVM syntax.

**See Also**

- read_ocvm

## OCVM-011

(error) Invalid float value at line %d of %s.

**Description**

This message is issued when the *read_ocvm* command cannot find a valid float value.

**What Next**

Please check the line for bad float entries.

**See Also**

- read_ocvm

## OCVM-012

(error) Incomplete table at line %d of %s.

**Description**

This message is issued when the *read_ocvm* command reaches end of file without getting a complete table.

**What Next**

Please add all the required specifiers for the table.

**See Also**

- read_ocvm

Feedback

## OCVM-013

(error) '%s' specification is not monotonic at index %d.

**Description**

The depth or distance specification is expected to be strictly monotonic.

**What Next**

Please make sure that the entries for depth or distance are strictly monotonic. Please note that the index starts at 0.

**See Also**

- read_ocvm

## OCVM-014

(error) 'table' is not monotonic for '%s' at index %d.

**Description**

The table specification is expected to be monotonic for depth or distance. It is expected that any row or column of the table is monotonic.

**What Next**

Please make sure that the entries in any row or columns are monotonic. Please note that the index starts at 0.

**See Also**

- read_ocvm

## OCVM-015

(error) Cannot specify '%s' when '%s' is '%s'.

**Description**

This message is reported when parser encounters an illegal combination of specifiers.

**What Next**

Please check the PrimeTime reference manual for the correct AOCVM syntax.

Feedback

**See Also**

- read_ocvm

---

## OCVM-016

(error) Sanity check failed for table at lines: %d-%d of %s.

**Description**

This message is reported when parser encounters an error in a table. An additional error message printed before this one would describe the actual problem.

**What Next**

Look at the error message printed just before this message to resolve the problem.

**See Also**

- read_ocvm

---

## OCVM-017

(error) Number of 'table' entries(%d) is not consistent with depth(%d) and distance(%d).

**Description**

The number of entries in the *table* specifier is expected be a product of number of entries in *depth* and *distance\FP specifications. An empty depth or distance specification is considered to have one entry.*

**What Next**

Check the specifications to make sure that the table has entry for all rows and columns.

**See Also**

- read_ocvm

---

## OCVM-018

(error) '%s' montonicity does not match table montonicity.

**Description**

This message is printed when the parser encounters inconsistency between the entries for *depth* or *distance* and *table* specifications. The *table* entries are expected to increase

Feedback

with depth and decrease with distance when the *derate_type* is *early*. The *table* entries are expected to decrease with depth and increase with distance when the *derate_type* is *late*.

**What Next**

Please check the tables for monotonicity.

**See Also**

- read_ocvm

---

## OCVM-019

(error) Derate value ('%f') is out of range.

**Description**

This message is printed when the parser encounters a derate value which is out of range. The expected range is 0 to 6.55.

**What Next**

Please check the derate values in the table.

**See Also**

- read_ocvm

---

## OCVM-020

(Warning) No object_spec specified (line: %d of file: %s).

**Description**

This message is emitted when the object_spec specification does not have any entry for libcell or cell objects.

**What Next**

Please fix the object_spec specification in the table.

**See Also**

- read_ocvm

---

## OCVM-021

(Warning) No OCV table specified for corner %s.

Feedback

**Description**

This message is emitted when there is no AOCV table specified for the given corner.

**What Next**

Please provide the table for the given corner if AOCV analysis is needed.

**See Also**

- read_ocvm

---

## OCVM-022

(error) Negative values are not allowed.

**Description**

Negative values are not allowed for the distance, depth arrays or in the 1D/2D tables.

**What Next**

Remove negative values from the table file.

**See Also**

- read_ocvm

---

## OCVM-023

(warning) Cannot associate table with leaf cell '%s'.

**Description**

AOCVM/POCVM does not support the association of AOCVM/POCVM data with leaf cells.

**What Next**

Associate AOCVM/POCVM tables with hierarchical cells, library cells and designs only.

---

## OCVM-030

(Error) Expected to find a valid field name but found '%s'.

**Description**

This error occurs when the parser cannot find a valid field name.

Feedback

**What Next**

Correct the COCV CPODE syntax by ensuring that each field is specified in the format name: data where name is one of version, table, distance, depth, object_spec, derate_type, delay_type, rf_type, object_type.

---

## OCVM-031

(error) The version '%s' is not valid. Allowable versions are '%s'

**Description**

An invalid version number has been specified.

**What Next**

Check the version number.

---

## OCVM-032

(error) The current table is missing one or more fields

**Description**

This error occurs when a table is found at the end of the AOCV file without the required number of fields.

**What Next**

Correct the AOCV syntax by adding the missing fields to the file.

---

## OCVM-033

(error) Incorrect table value.

**Description**

The bottom right value of the 2D COCV table must be zero.

**What Next**

Correct the table values.

---

## OCVM-037

(error) COCVM CPODE derate bin label "%s" already defined.

Feedback

**Description**

A COCVM CPODE derate bin label can be associated with only one bin.

**What Next**

Specify unique labels across derate bins.

---

## OCVM-038

(error) Number of bin values is different from number of derate columns.

**Description**

Number of derate values in every bin must be same as the number of entries specified as DERATE_COLUMNS field of COCVM CPODE derate side file.

**What Next**

Provide proper number of derate values.

---

## OCVM-039

(error) "default" bin must be specified and must be the last bin.

**Description**

Default bin definition missing in the COCVM CPODE dertate side file.

**What Next**

Include default bin definition.

---

## OCVM-040

(error) Could not find the specified AOCV file

**Description**

The AOCV file could not be found.

**What Next**

Correct the name and path of the AOCV file.

---

## OCVM-041

(warning) Unsupported derate type, %s skipped.

Feedback

**Description**

The derate type specified is not supported in cpode derate file. Corresponding derates are read and skipped.

**What Next**

Either correct the table derate type to correct type or ignore the warning if want to proceed with ignoring derate values.

---

## OCVM-042

(error) This command applies to hierarchical cells only, '%s' is a leaf cell.

**Description**

The specified cell is a leaf cell, and the command you executed applies only to hierarchical cells.

**What Next**

Run the command again, and ensure that you do not specify a leaf cell.

---

## OCVM-043

(warning) There is no aocvm named table '%s'.Ensure that it is loaded before update timing.

**Description**

This message is issued when a named table set is assigned to a design or hierarchy but no table set with this name has been read yet. Since set_ocvm_table_group is always before corresponding read_ocvm commands. this is only a warning because it is possible that the named table set will still be read after the set_ocvm_table_group command.

**What Next**

Either correct the table derate type to correct type or ignore the warning if want to proceed with ignoring derate values.

---

# ODB

---

## ODB-001

(error) Invalid library name '%s' specified in '%s' command option of read_odb.

Feedback

**Description**

The library name specified is invalid because it contains spaces.

**What Next**

Ensure that there are no spaces in library name specified.

---

## ODB-002

(error) Library '%s' specified in '%s' command option of read_odb already exists!

**Description**

There is/are existing librar(y/ies) with library name specified. Use a fresh library name to create a new library with design from ODB++ files.

**What Next**

Ensure that there are no existing libraries in the current session with the name specified.

---

## ODB-003

(warning) NDM expects only two solder mask layers. Skipping layer %s.

**Description**

NDM Technology expects only two solder mask layers - one with mask_name "solder_mask_top" and another with mask_name "solder_mask_bottom". Remaining solder mask layers are skipped.

**What Next**

Ensure that there are not more than two solder mask layers in ODB++ design being read.

---

## ODB-004

(warning) Unsupported ODB++ layer type. Skipping layer %s.

**Description**

NDM Technology only supports ODB++ layers of type SIGNAL, POWER_GROUND, MIXED, DIELECTRIC, DRILL and SOLDER_MASK. Remaining type of layers are skipped.

**What Next**

Not applicable.

Feedback

## ODB-005

(warning) Layer '%s' does not have a valid %s layer.

**Description**

The specified dielectric layer does not have a metal layer above/below it.

**What Next**

Confirm that the ODB++ layer stack is okay.

## ODB-006

(error) read_odb Automatic Technology Generation failed.

**Description**

The automatic technology generation feature of read_odb failed.

**What Next**

Check the previous error and warning messages to detect the issue.

## ODB-007

(warning) read_odb finds more than one steps in ODB++ design, will only read the first one.

**Description**

read_odb only support one step.

**What Next**

Check the ODB++ design whether has multiple steps or not.

## ODB-008

(info) Skip bumps in component layer %s with unsupported angle value(%d).

**Description**

Only support angle value 0/90/180/270 for bumps.

**What Next**

Check the ODB++ design, find another way to describe the feature shapes instead of unsupported angle value.

Feedback

## ODB-009

(warning) Syntax error for SURFACE records. First polygon in surface is a hole. Skip it.

**Description**

SURFACE must start with an island.

**What Next**

Check the ODB++ design and fix the error.

## ODB-010

(warning) Unsupported SURFACE records syntax: an island is contained in a hole. Skip it.

**Description**

For SURFACE records, read_odb only support an island contains multiple holes.

**What Next**

This is a limitation.

## ODB-011

(info) Design source is not from ODB++, cannot dump out components info.

**Description**

The current package design source is not from ODB++, that means it does not created by read_odb. In this situation, write_odb will be not able to dump out ODB++ specified info such as components.

**What Next**

Check the design source, if it is expected, ignore the info message.

## ODB-014

(error) The command '%s' failed because '%s'.

**Description**

The given command is failed to execute successfully.

**What Next**

Check the cause of error and take necessary course of action.

Feedback

### ODB-015

(info) %s.

**Description**

This is the information provided by the read_odb/write_odb command.

**What Next**

Validate that ODB++ file and the design created meet the requirements.

## OPT

### OPT-001

(error) There are undefined voltages in setup. Optimization aborted.

**Description**

The MV design has undefined voltages in setup optimization. As a result, optimization does not have sufficient information to correctly optimize the design. Therefore, optimization aborted upon detecting this situation.

**What Next**

Check the voltages defined for every supply net and make sure they are correct. Try using the report_supply_nets command to see the current settings.

### OPT-002

(error) Error: Design is MV design, but design is not MV ready. Perhaps, commit_upf has not been run.

**Description**

The design has been detected as an MV design, but the MV data is not ready. Most likely commit_upf command has not been run.

**What Next**

Check the commit_upf has been run. If not, please run it before running optimization.

Feedback

## OPT-003

(error) Design is MV design, but design is not ready for implementation. Please check UPF.

### Description

The design has been detected as an MV design, but the MV data is not ready for implementation. This indicates that there are errors in the UPF data.

### What Next

Check the UPF data is correct and fix it before running optimization.

## OPT-004

(error) The design of block "%s" is opened in read mode, failed to enable optimization on the block.

### Description

The specified operation failed to enable optimization on the block as the design of the block or the design library is opened in read mode.

There can be multiple reasons why a block design is opened in read mode. Few possible reasons:

- If the block is coming from a different library than Top library, then "-ref_libs_for_edit" should be used while opening the Top library/design; otherwise the block will be implicitly in read mode.
- If the block is linked to abstract view and the abstract was created with "-read_only" option, then it will be opened in read mode only. Check for "NDM-072" messages which tells if the block is being opened in read mode because of non-editable abstract.
- If the block is linked to design view and there exists an editable abstract view for it, then the block will be implicitly in read mode. Check for "NDM-074" messages which tells if the block is being opened in read mode due to the presense of editable abstract views.

### What Next

Please re-open design in edit mode and try again.

## OPT-005

(warning) Cell "%s" is bound to an abstract view, restricting optimization to interface logic only.

Feedback

**Description**

The specified operation tried to enable optimization on entire logic of the cell, but the cell is bound to an abstract view. Optimization is restricted to interface logic only.

**What Next**

Please use an optimizable design view for complete logic optimization.

---

## OPT-006

(warning) Design power is incorrectly set (%s) (0.0/inf/nan).

**Description**

The power for the design has invalid values for certain scenarios.

**What Next**

Check report_corner/report_supply_net.

---

## OPT-007

(warning) Net %s has MV violations. Buffering will be limited.

**Description**

The given net has MV violations. Examples including missing supply net information on the net pins, level shifter violations, etc. Please check the UPF to make sure that it is correct.

When a net has MV violations, buffering will be limited on this net.

**What Next**

Use check_mv_design to see the violations in the design.

---

## OPT-008

(warning) Libcell %s is dont-touch but is qualified for purpose: %s.

**Description**

When a dont-touch cell is introduced into the design, it cannot be altered later. However, dont-touch semantics do not forbid such cells from being used by specified purpose(s).

**What Next**

report_dont_touch(2), get_attribute(2), report_lib(2), set_lib_cell_purpose(2)

Feedback

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

## OPT-009

(Information) Net %s with %s violation is a dont_touch net.

**Description**

The net is violated with some design rule constraint. But it could not be fixed since the net is set as dont_touch.

**What Next**

User can check whether the setting is reasonable.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

## OPT-010

(Information) Net %s with %s violation is highly blocked.

**Description**

The net is violated with some design rule constraint. But It is hard to be fixed since the net is highly blocked.

**What Next**

User can check whether the placement constraint is too tight.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

## OPT-011

(Information) Net %s with %s violation is in high density areas.

**Description**

The net is violated with some design rule constraint. But It is hard to be fixed since the local density is too high.

**What Next**

User need to check whether the placement is reasonable.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

Feedback

## OPT-012

(Information) Net %s with %s violation is partially blocked.

**Description**

The net is violated with some design rule constraint. But It is hard to be fixed since there are some pins in the net are blocked.

**What Next**

User can check whether the placement constraint is too tight.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

## OPT-013

(Error) The library cell %s does not have site row definition.

**Description**

The library cell does not have site row definition.

**What Next**

User need to check if the library cell has site definition.

## OPT-014

(Warning) No default buffer/inverter available for voltage areas %s.

**Description**

There are no available buffers or inverters for the optimization inside voltage areas.

**What Next**

User need to check whether the target library setting and UPF setting is correct.

## OPT-015

(Error) No legal location can be found for new diode cell %s.

**Description**

The tool cannot find the legal locaiton for the new added diode cell.

Feedback

**What Next**

User need to check whether the design has avialable space for the new added diode cell first.

---

## OPT-016

(Warning) Can not find available buffer/inverter lib cells for the site %s.

**Description**

Tool can not find any valid library buffer or inverter that matches the specific site row. For each site row definition in the design, at least one valid library buffer or inverter are needed.

**What Next**

User need to add library that matches the site.

---

## OPT-017

(Warning) There are buffers/inverters library cells with dont_use attribute for the site %s.

**Description**

Tool finds library buffers or inverters with dont_use that match the specific site row.

**What Next**

User need check if the library buffers with dont_use can be reset so that tool can use them for optimization.

---

## OPT-018

(information) Long chain arithmetic units detected.

**Description**

Long chain of arithmetic units is found to be aligned with critical paths. Check the following line for the gate that is involved.

**What Next**

Check if the chain is still in the critical path in after place_opt/clock_opt netlist. If so, please review the architectures used for the corresponding operators in RTL design.

Feedback

## OPT-019

(Warning) Cannot find buffers. Net %s cannot be buffered.

### Description

This means that the tool cannot find any suitable buffers or inverters to use to correctly (power-state wise) buffer the net in all voltage areas. The UPF needs to be corrected before this net can be buffered.

### What Next

Use report_pst to see the state of the supply nets. The supply net of the driver needs to be at least as on as that of the load(s) it is driving, and the buffer to be inserted needs to be powered by a supply net that is no more on than the driver and no less on than the sinks it is driving. The user can use report_power_domains to see what supplies are available in each power domain. The user can also use check_bufferability to see the buffers, if any, that can be used to buffer the net in a given voltage area.

## OPT-020

(Information) %s (Reference: %s) is treated as %s

### Description

This message indicates whether sub-blocks/top-level design are modifiable or non-modifiable, along with reason, during Toplevel implementation flow.

## OPT-021

(Error) MV initialization during optimization failed. Optimization aborted.

### Description

The optimization tool was not able to initialize the MV information properly. As result, optimization cannot continue and will be aborted.

### What Next

User need to ensure that the MV information is correct. Please review the UPF for correctness with the help of check_mv_design command.

### See Also

- check_mv_design

Feedback

## OPT-022

(Error) No voltage area detected. Optimization aborted.

### Description

The optimization tool was not able to see any voltage area. In the case where the design is non-MV and does not have any UPF, then the tool automatically defines the default VA. However, if the user specifies an incomplete UPF but did not define any voltage, then the tool does not define a default VA. As result, optimization cannot continue and will be aborted.

### What Next

User need to ensure that the VA information is correct. Please review the UPF for correctness.

### See Also

- check_mv_design
- report_voltage_areas

## OPT-023

(Warning) Voltage Area %s does not have associated power domain.

### Description

The given voltage area does not have an associated power domain. Thus, there VA is not usuable.

### What Next

User need to ensure that the MV information is correct. Please review the UPF for correctness.

### See Also

- check_mv_design
- report_voltage_areas

## OPT-024

(Warning) Power Domain %s does not have a primary supply.

Feedback

### Description

The optimization tool detected that the given power domain did not have a primary supply.

### What Next

User need to ensure that the MV information is correct. Please review the UPF for correctness.

### See Also

- check_mv_design
- report_power_domains

---

## OPT-025

(Error) There are more than one default voltage area detected. Optimization aborted.

### Description

The optimization tool detected that there are more than one default voltage area in the design. As result, optimization cannot continue and will be aborted.

### What Next

User need to ensure that the MV information is correct. Please review the UPF for correctness.

### See Also

- check_mv_design
- report_voltage_areas

---

## OPT-026

(Warning) Found long segment of %d um for net %s between (%d, %d) and (%d, %d) that is not bufferable. This segment crosses the following VAs: %s.

### Description

The optimization tool detected that there are long segments that cannot be buffered. The reasons for non-bufferability may be due to 1) blockages, 2) macros, 3) lack of proper row sites, 4) required supply nets not available, 5) improper target library subset setting on module based movebounds, etc. Please check design to determine that none of the factors are affecting bufferability.

Feedback

### What Next

User need to the areas indicated by the message and make sure they are bufferable.

### See Also

- check_mv_design
- report_voltage_areas
- set_target_library_subset

---

## OPT-027

(Error) Support name synonym for ports with matching names.

### Description

Optimization cannot proceed because one or more port having matching name with other port.

### What Next

Run report_design_mismatch to find the port name which is having same matching name. Change the name of any of port which are causing this port_name_synonym case. Then run place_opt.

---

## OPT-028

(Error) Missing port %s in the design.

### Description

Optimization cannot proceed for an unbound pin found, unable to find it's corresponding port in the design master.

### What Next

Run report_design_mismatch to find the unbound pin. Then add the missing port or remove the pin for which port is missing.

---

## OPT-029

(Error) Port name case mismatch for block port %s in the design.

Feedback

### Description

Optimization cannot proceed for port name case mismatch happened, name of the port and the corresponding pin don't match.

### What Next

Run report_design_mismatch to find the block port for which port name case mismatch happened. Change the name of the block port for which port name case mismatch happened.

---

## OPT-030

(error) place_opt failed during trial CTS.

### Description

This message occurs when trial clock tree synthesis is enabled but is not successful inside place_opt. With this condition place_opt immediately exits.

### What Next

Make sure clock setups are correct.

### See Also

- place_opt
- place_opt.flow.trial_clock_tree

---

## OPT-031

(warning) optimize_icgs will optimize the ICGs in the current_block only, for this top-level place_opt invocation.

### Description

This message indicates that ICG optimization flow is turned on for top-level place_opt. ICG optimization will be limited to current_block. place_opt will immediately exit with an Error, unless all sub-blocks are read-only.

### See Also

- place_opt
- place_opt.flow.optimize_icgs

Feedback

## OPT-032

(error) optimize_icgs does not support top-level place_opt with modifiable sub-blocks.

### Description

This message indicates that ICG optimization flow is turned on for top-level place_opt, but modifiable sub-blocks are dectected. optimize_icgs does not support top-level place_opt with modifiable sub-blocks.

### What Next

Turn off optimize_icgs for place_opt or make all sub-blocks read-only

### See Also

- place_opt
- place_opt.flow.optimize_icgs

## OPT-033

(Information) Terminating the integrated optimization with useful skew.

### Description

This message indicates that the useful skew computation was unable to find predictable timing improvement, so the useful skew based optimization is terminating early. The last successful useful skew commitment is still effective, and tool can continue optimization.

### See Also

- place_opt
- clock_opt

## OPT-034

(Warning) The hierarchy port %s is defined as %s but used as %s.

### Description

The specified hierarchy port is either defined as input but used as output or defined as output but used as input. The mismatch can cause some internal data invalid. Sometimes it results in fatal.

Feedback

### What Next

User needs to correct the port definition.

---

## OPT-035

(warning) Power app option %s has been deprecated. Please remove it from your script.

### Description

App options opt.power.mode and opt.power.effort have been deprecated. Please remove them from your script.

### What Next

Switch to compile.flow.enable_power, place_opt.flow.enable_power and clock_opt.flow.enable_power.

### See Also

- set_qor_strategy
- place_opt.flow.enable_power
- clock_opt.flow.enable_power

---

## OPT-040

(warning) Net %s is skipped from optimization since it has an unplaced pin %s.

### Description

This message indicates that the nets with unplaced pin(s) are skipped during optimization.

### What Next

Make sure all optimizable nets have placed pins.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

---

## OPT-041

(error) Scenario Manager creation failed. Optimization aborted.

### Description

Without the scenario manager the optimization cannot proceed. Therefore, optimization aborted upon detecting this situation.

Feedback

**What Next**

1> Parasitics may be missing at the corners. Please check the parasitics setup.

---

## OPT-042

(Error) Failed to create routing topology for driver %s as one or more hierarchical pin placed outside it's block boundary.

**Description**

During topology creation tool expect all port and pin inside the block should remain inside the block bounding box. Topology generator found pin placed beyond block bounding box.

**What Next**

Run place_pin for the block. And make sure that succeed.

---

## OPT-043

(Warning) Cannot find default buffer/inverter for VA %s with Block Hierarchy %s.

**Description**

This means the tool cannot find any usable buffers/inverters for the combination of the specified voltage area and the block hierarchy. It can lead to nets lying under the block hierarchy to remain unbuffered inside this VA. The UPF needs to be corrected.

**What Next**

User needs to check whether the target library setting or UPF setting is correct. User can also check log file for OPT-019 messages to see which all nets are unbuffered in the design.

---

## OPT-044

(Warning) Block hierarchy %s is read-only hierarchy.

**Description**

This means the tool will not be able to optimize nets lying under this block hierarchy.

**What Next**

User needs to ensure if the design settings are correct for this block.

Feedback

## OPT-045

(Error) Cannot find usable buffers or inverters.

**Description**

This means that the tool cannot find any usable buffers or inverters for all the voltage areas in the design. This could be due to multiple reasons a) All blocks passed are non-modifiable in the design. b) Target library settins are not correct in the design. c) UPF setting are not correct for the design.

User needs to ensure that these settings are correct before passing the design for the optimization.

**What Next**

User should look for if all the blocks are set as non-modifiable by the user or UPF or target library settings are correct or nt. User should look for "OPT-043" and "OPT-044" messages in the log for the additional info.

## OPT-046

(Warning) Can not find available TIE lib cells for the site %s.

**Description**

Tool can not find any valid library TIE cell that matches the specific site. It will still add TIE cell with other lib cells. The TIE cell will be far away from its load.

**What Next**

User need to add library that matches the site.

## OPT-049

(error) Block %s has no physical data.\n

**Description**

There are physical hierarchical blocks which have no physical data defined. Optimization flow cannot run on such designs

**What Next**

Ensure that all blocks have physical data

Feedback

## OPT-050

(Error) Unbound via, site_row or site_array or instances in the block.

**Description**

Optimization cannot proceed because one or more objects in the block is unbound, i.e., is referencing a missing definition in the tech. For example, a via can reference a missing via_def, or a site_row can reference a missing site_def.

**What Next**

Run report_unbound to identify the unbound objects. Then remove the unbound objects from the block or add the missing definitions to the tech to resolve the problem.

## OPT-051

(Error) Incorrect setting of physical feedthrough option in create_voltage_area_rule.Optimization aborted.

**Description**

Option -allow_physical_feedthrough set to true in create_voltage_area_rule command is not supported yet for VA specific rule. As result, optimization cannot continue and will be aborted.

**What Next**

User need to ensure that the -allow_physical_feedthrough option is set to false for VA specific create_voltage_area_rule rules. Currently user can use the -all_voltage_areas option with value true for all voltage areas in the design.

## OPT-052

(Warning) Net %s will route through VA (name=%s,vaIndex=%d) even though the VA is passthrough disabled.

**Description**

Due to no other routing space, route topology generator is forced to route the net through this VA even it is passthrough disabled for the given net.

**What Next**

Consider updating the va-feedthru rule for this VA.

Feedback

## OPT-053

(Warning) VA (name=%s, vaIndex=%d) is made passthrough enabled for net %s due to its hierarchy %s.

### Description

This voltage area was originally passthrough disabled for this net. However, it is made passthrough enabled internally in order to allow routing of net as net has hierarchy in this voltage area.

### What Next

Consider updating the va-feedthru rule for this VA.

## OPT-054

(Warning) VA (name=%s, vaIndex=%d) is made passthrough enabled for net %s due to its pin %s.

### Description

This voltage area was originally passthrough disabled for this net. However, it is made passthrough enabled internally in order to allow routing of net as net has pin in this voltage area

### What Next

Consider updating the va-feedthru rule for this VA.

## OPT-055

(Information) Current block utilization is '%.5f', effective utilization is '%.5f'.

### Description

This message provides the current block utilization numbers during optimization. In some designs, density PG structure at low metal layer may block some sites for placement. Also, existence of multi-row or inbound cells can cause unusable sites adjacent to these cells. There are also color-based cell spacing rules that can cause unusable sites. The effective utilization number is calculated by treating these unusable sites as used area. Therefore, this is a more accurate representation of the cell density seen by placement and optimization engines.

The estimation for the number of unusable sites adjacent to multi-row or inbound cells is controlled by place.utilization.multi_row_penalty and place.utilization.inbound_penalty options.

Feedback

The estimation for the number of unusable sites under low metal layer PG nets is controlled by place.coarse.pnet_aware_layers, place.coarse.pnet_aware_min_width and place.coarse.pnet_aware_density options.

Keepout margins are not included in block utilization but the sites covered by keepout margins are not available for optimization usage. Therefore, keepout margins will also increase the effective utilization number.

**What Next**

If effective utilization is much larger than utilization, check the low metal layer PG structure or use "analyze_lib_cell_placement -lib_cells [all_lib_cells]" to see how many library cells became unusable due to PG structure. Also, check to see if the utilization penalty for multi-row and inbound cells are setup properly.

**See Also**

- report_utilization
- analyze_lib_cell_placement
- report_keepout_margins
- place.utilization.multi_row_penalty

---

## OPT-056

(Warning) opt.common.allow_physical_feedthrough is going to be retired in 18.06 release. Please plan to migrate to create_voltage_area_rule in order to set physical feedthrough option on different voltage areas.

**Description**

This message informs user that app option opt.common.allow_physical_feedthrough is going to be retired in 18.06 release. Please switch to the create_voltage_area_rule in order to set physical feedthrough on differnt voltage areas in the design. Please visit the man page of create_voltage_are_rule for details on how to create a voltage area rule.

---

## OPT-057

(Error) Timer is in Zero Interconnect Delay mode for optimization.

**Description**

This message informs user that timer is using Zero Interconnect Delay model while performing optimization. It can lead to incorrect timing delay optimization, hence shold be avoided. It could be due to either users has set time.delay_calculation_style or design has no physical data.

Feedback

## OPT-060

(Warning) Specified Object %s is not a tie-cell

**Description**

Non tie-cell objects will be skipped during tie-cell removal.

**What Next**

User needs to ensure that the list of tie-cells provided to remove_tie_cells are indeed tie-cells.

## OPT-061

(error) place_opt failed during multisource CTS.

**Description**

This message occurs when multisource clock tree synthesis is enabled but is not successful inside place_opt. With this condition place_opt immediately exits.

**What Next**

Make sure multisource clock setups are correct.

**See Also**

- place_opt
- place_opt.flow.enable_multisource_clock_trees

## OPT-062

(error) %s bailed out due to unplaced cells.

**Description**

This message occurs when physical optimization starts from a netlist with unplaced cells.

**What Next**

Make sure design is placed before running optimization.

**See Also**

- place_opt

Feedback

## OPT-063

(warning) Constant net %s is a dont_touch net.

**Description**

The constant/power/ground net is marked as dont_touch. Tie-cell insertion cannot be done for loads of this net.

**What Next**

User can check whether the dont_touch setting is reasonable.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

## OPT-064

(Error) all the specified ports are unplaced.

**Description**

All the specified ports are unplaced. The command only adds protection diode for the placed ports.

**What Next**

Place the ports first and then use the command for protection diode insertion.

## OPT-065

(Warning) Instance %s has invalid layer attribute.

**Description**

This message indicates that the layer attribute is missing or is illegal when attempting to get the port location of the instance, which might cause tool crash in the later stage.

**What Next**

Check the layer attribute of the instance, and make sure it is correct.

## OPT-066

(warning) High fanout net "%s" could be partially buffered because tool finds some unbufferable segments on it.

Feedback

**Description**

The high fanout net may be partially buffered because tool finds some segments are unbufferable. The reason of unbufferable could be dont_touch logical net, or some segments physically are blocked.

**What Next**

To remove dont_touch or placement blockages on the net.

---

## OPT-067

(info) Pin %s is on clock network. Skipping.

**Description**

The given pin is on a clock network, but the net connecting the pin is a signal net. So, buffering engine will skip this net during optimization.

**What Next**

Make sure the signal net is not on a clock network.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

---

## OPT-068

(info) Disabling tracking of voltage threshold-based lib-cells during tieopt

**Description**

Tracking of low_vt usage is not needed for tieopt engine as costing is not involved here.

**What Next**

There may be a change in low-vt libcell count usage post tieopt. These will be addressed in subsequent stages.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

---

## OPT-069

(warning) Skipping pin %s. Reason - %s.

**Description**

Tie-cell insertion is skipped for a pin due to specified reason.

Feedback

### What Next

User can check whether the reason mentioned is reasonable.

~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~

---

## OPT-070

(Warning) Cannot find any max transition constraint on the design.

### Description

Without max transition constraint on design active scenarios, nets on the critical timing path with large transitions might not be able to be selected for max transition fixing, and thus leave large transitions on the timing path after the flow. It could be helpful to have a proper max transition constraint set on the design for improving timing.

### What Next

It suggested to use *set_max_transition* command to set appropriate max transition constraints on design.

### See Also

- set_max_transition

---

## OPT-071

(Warning) Critical MV check failure on the design.

### Description

This message occurs when some critical MV setting is not ready for place_opt clock_opt and route_opt, such as data or voltage area setup, design's multi-voltage data, etc. That may lead to unpredictable effects on the subsequent flow.

### What Next

Please check whether the messages of *MV-510*,*MV-058a*,*MV-511*,*MV-511a*, and *MV-004* in the log and follow the instructions of theses man pages.

### See Also

- MV-510
- MV-058a
- MV-511

Feedback

- MV-511a
- MV-004

---

## OPT-072

(Error) Design has no active hold scenarios with CCD enabled.

**Description**

Place or route optimization cannot use designs without any hold analyses when CCD enabled. Please use report_scenarios to check that at least one active scenario has hold analysis enabled.

**What Next**

User can solve the error by setting hold analyses to true in one or more active scenarios using set_scenario_status {<scenario list>} -hold true.

**See Also**

- report_scenarios
- set_scenario_status
- place_opt
- clock_opt

---

## OPT-073

(error) Failed to find any usable buffers. Please check library and user setup.

**Description**

This message occurs when there is no usable buffers when running optimization.

**What Next**

Check library and user setup.

---

## OPT-074

(error) Failed to find any usable inverters. Please check library and user setup.

**Description**

This message occurs when there is no usable inverters when running optimization.

Feedback

### What Next

Check library and user setup.

---

## OPT-075

(error) Found %d buffers in design that are not dont_touch. Please clean up buffers or refer to the man page of flow.common.inverter_only for alternate solution.

### Description

This message occurs when there are buffers in designs that are not dont_touch in inverter only flow.

### What Next

Clean up buffers or refer to the man page of flow.common.inverter_only for alternate solution.

---

## OPT-076

(warning) There are %d available buffer libcells (including %d opto %d hold %d power %d cts purpose) incoming to inverter only flow.

### Description

This message occurs when there are usable buffer libcells in library in inverter only flow.

### What Next

Use set_lib_cell_purpose to disable all buffer libcells in the library in inverter-only flow.

### See Also

- set_lib_cell_purpose

---

## OPT-077

(warning) Unable to fix violating net %s because it is not optimizable.

### Description

The net with attribute such as dont_touch is not optimizable during buffering.

### What Next

Check whether the net has any unexpected restrictions.

Feedback

## OPT-080

(warning) Adjusted max transition constraint "%f" ns has been applied to "%s".

**Description**

Adjusted constraint specified has been appled to the pin (initially pin has had an infinite transiton constraint. The reason of unbufferable could be dont_touch logical net, or some segments physically are blocked.

## OPT-100

(Warning) Constraints are too tight for corner %s and libcell %s,expect over-buffering.

**Description**

The constraints for one of the corners is too tight that buffer can not even drive itself.

**What Next**

Consider lifting the constraints.

## OPT-200

(warning) No tie cell is available for constant fixing.

**Description**

There is no tie cell in the library that is available for constant (1'b0 or 1'b1) fixing. This could be because all tie cells have a *dont_touch* attribute, the library cell purposes for the tie cells do not include optimization, or the library cell is associated with a site that is not defined in the current design.

In some design styles, constant pins are directly tied to power or ground nets using the *connect_pg_net* command after optimization is done.

**What Next**

To insert tie cells during optimization, verify the site definitions and the tie cell settings for the *dont_touch* attribute and included library cell purposes. If necessary, update the *dont_touch* attributes using the *set_attribute* command and the library cell purposes using the *set_lib_cell_purpose* command. After making the fixes, restart the optimization.

Otherwise, tie the constant pins to power or ground nets using the *connect_pg_net* command after optimization.

Feedback

## OPT-201

(warning) Corner %s is similar to %s but has a different process label.

### Description

The two corners are similar in voltage, parasitics and derates, but differ in temperature and process label. It is likely that the two corners actually share the same process, but there is an error during library preparation. A common mistake is that multiple reference libraries were built for the same process but with different process labels. For example, two reference libraries for 'SS' process were built with process labels 'SS_125' and 'SS_m40'. This caused the timing information for different temperatures of the same process to be put in different panes and prvents synthetic corners from being created to achieve faster optimization runtime.

### What Next

If this is indeed a process label issue, the solution is to redo library preparation with the correct process label. If there is no other reference library with the same voltage and temperature for a different process, a workaround is to remove the process label restriction in the constraint corners using *set_process_label -clear.*

### See Also

- opt.mcmm.use_synthetic_corners
- report_pvt

## OPT-202

(warning) No legal tie cell is available to drive '%s' pin.

### Description

There is no tie cell in the library that is available for constant (1'b0 / 1'b1) fixing, given the constraints for the reported pin. This could be because of target library subset selection, power constraints etc.

### What Next

Check and update power constraints or targer library subset constraints or provide the library with additional cells.

## OPT-204

(Warning) The site row %s of lib cell %s/%s is illegal as it does not match any design site row.

Feedback

**Description**

The site row of given library cells does not match any site row of design.

**What Next**

User need to check if the site row definition in technique file is correct for the issue lib cell.

---

## OPT-205

(Warning) The site row %s of lib cell %s/%s is illegal as it is not integral multiple of design site.

**Description**

If the lib cell site row is not integral multiple design site row height, legalization will report error since it can not find legal location for this lib cell.

**What Next**

User need to check if the site row definition in technique file is correct for the issue lib cell.

---

## OPT-206

(Error) There is no default lib buffers/inverts found for the design %s.

**Description**

Tool can not find valid library buffers/inverters for optimization.

**What Next**

User need check design setting to ensure valid library buffers/inverters for optimization.

---

## OPT-207

(Error) VA %s has no Power Domain.

**Description**

Tool can not find power domain definition for VA.

**What Next**

User need to generate UPF power domain definition for each VA.

---

## OPT-208

(Error) Power domain %s has no primary supply net.

Feedback

**Description**

Tool can not find power supply definition for power domain.

**What Next**

User need to check UPF file to create power supply for each power domain.

---

## OPT-209

(Warning) Design includes unreasonable large hold violation(s).

**Description**

Unreasonable hold violation here means the hold violation is so large that it costs more than 20 max-delay buffers to fix. However, fixing such hold violations usually leads to density and QoR issues, so it is now skipped in the hold fixing engine by default.

**What Next**

Please check those large hold violations and try to resolve them in advance before rerunning the optimization flow. If you still want the tool to fix these large violations with current library setup, you can use *set_early_data_check_policy -policy tolerate -checks opt.sanity_check.large_hold -strategy report_only* , before clock_opt or route_opt.

**See Also**

- report_qor
- report_units

---

## OPT-210

(error) Scenario %s has an unreasonbly tight max transition constraint of %f.

**Description**

The indicated scenario has an unreasonbly tight max transition constraint that cannot be satisfied. This most likely will lead to area and Qor problems. This is usually because the same max transition constraint for fast corners/scenarios is also applied to slow corners/scenarios or it could be due to unit problem.

**What Next**

Please update the max transition constraint for this scenario and rerun optimization.

Feedback

**See Also**

- set_max_transition
- report_units

---

## OPT-211

(Warning) Input cell %s with library module %s is from wrong target library.

**Description**

The library module of the indicated cell in the input design is outside the scope of the permissible library cells allowed in accordance with the target library subset set on the cell's hierarchy.

**What Next**

Please correct the input design to have the correct library module for the indicated cell.

---

## OPT-212

(error) There are problems in end points specification. Optimization aborted.

**Description**

The list does not have any valid end points. Therefore, optimization aborted upon detecting this situation.

**What Next**

Check the end point list and make sure they are correct.

---

## OPT-213

(error) There are problems in nets specification. Optimization aborted.

**Description**

The list does not have any valid nets. Therefore, optimization aborted upon detecting this situation.

**What Next**

Check the net list and make sure they are correct.

Feedback

## OPT-214

(error) Exclusive flow and current command line argument cannot be honored at the same time. Optimization aborted.

### Description

The command line argument requires subset flow (i.e. -from or -to) or path_opt only flow (i.e. -end_points, -path_groups or -nets). However, there is an app option (i.e. refine_opt.flow.exclusive) requires exclusive flow, and the only supported combination is *hold* exclusive and *-end_points*. Therefore, optimization aborted upon detecting this situation.

### What Next

Check the command line and app options and make sure they are not conflicting.

### See Also

- refine_opt.flow.exclusive

## OPT-215

(Warning) the app option 'time.si_enable_analysis' should not be set to be true in pre-route stage, enforce it to be false temporarily.

### Description

The app option 'time.si_enable_analysis' is only supported in post route optimization stage now, and not in pre-route stage. It is now set to be true by the user in pre-route stage, and the tool sets it back to false temporarily in pre-route stage to avoid the potential issue.

### What Next

Please correct the app option setting and continue with the flow.

## OPT-216

(Error) Net %s with %d loads is not properly buffered.

### Description

The design has unbuffered high-fanout nets. Most likely *place_opt* has not been run, or has been run but failed to buffer this net. The *place_opt* initial_drc stage does HFS/DRC buffering, which is responsible for building the initial high fanout buffer trees.

Feedback

### What Next

Make sure that *place_opt* initial_drc was previously run. If it was run, check for reasons that the net may not have been buffered:

- Ensure the net does not have an MV violation, by looking in the *place_opt* logfile for OPT-007 errors, or by using *check_mv_design*
- Check for many bufferabilty problems by using the *check_bufferability* command. This command works on an individual net segment, and a high fanout net may consist of many segments, so use *check_bufferability* on each segment of the net to get a complete understanding.
- Floorplan issues like blockages, high cell density, and high congestion can also cause buffering problems. Use the GUI layout window to check for these issues.

### See Also

- check_bufferability
- check_mv_design
- place_opt
- OPT-007

---

## OPT-217

(error) There are problems in path group specification. Optimization aborted.

### Description

The list does not have any valid path groups. Therefore, optimization aborted upon detecting this situation.

### What Next

Check the path group list and make sure they are correct.

---

## OPT-218

(error) This is a top level design which is not supported by route-based refine_opt. Optimization aborted.

### Description

Refine_opt does not support top level designs in route-based optimization flow. Therefore, otimization aborted upon detecting this situation.

Feedback

**What Next**

Run the virtual routed based refine_opt.

---

## OPT-219

(warning) Library cell %s is useless due to zero input capacitance.

**Description**

This particular library buffer or inverter cell is with zero input capacitance, and cannot be used for optimization. If the number of this kind of library buffer or inverter cell is large, the QoR will be affected a lot due to few number of useful library buffer or inverter cell.

**What Next**

Check the library to provide enough usefull library buffer or inverter cells.

---

## OPT-220

(error) Worst hold violation exceeds 2000 times nominal buffer delay. This usually indicates a design setup issue. Hold optimization aborted.

**Description**

To prevent the hold fixing engine from working on unreasonable hold violations. The tool will bail out when the initial hold violation is too large.

**What Next**

Inpect the hold constraints and CTS result.

---

## OPT-221

(warning) Unplaced RP Groups detected.

**Description**

The design has unplaced RP Groups. Most likely place_opt has not been run. DTDP stage included in the place_opt mega-command is needed to process these RP Groups.

**What Next**

Please run place_opt first.

---

## OPT-222

(error) Extraction failed. place_opt is running with ZWD settings.

Feedback

### Description

Extraction failed. place_opt is running under ZWD settings, hence erring out.

### What Next

Please run place_opt with proper ZWD settings.

---

## OPT-223

(warning) Current design contains soft blockages, and optimization may add cells onto soft blockages.

### Description

Current design contains soft blockages, and optimization may add cells onto soft blockages. However, if users run stand-alone commands to do incremental placement after optimization, those cells will be forcefully moved out, because neither *place.coarse.fix_cells_on_soft_blockages* nor *place.coarse.enable_enhanced_soft_blockages* was set.

Incremental placement commands include '*create_placement -incremental*', '*create_placement -use_seed_locs*' and '*refine_placement*'.

### What Next

Setting *place.coarse.fix_cells_on_soft_blockages* to *true* will let incremental placement not move cells on soft blockages.

Setting *place.coarse.enable_enhanced_soft_blockages* to *true* will let incremental placement move cells on soft blockages only inside their soft blockages.

The two app options are mutually exclusive.

### See Also

- create_placement
- refine_placement
- place.coarse.fix_cells_on_soft_blockages
- place.coarse.enable_enhanced_soft_blockages

---

## OPT-224

(Warning) Removing buffer %s will lead to logical feedthrough.

Feedback

### Description

Removing this buffer will lead to logical feedthrough. A logical feedthrough occurs when a netlist logical module has a connection between two or more ports with no leaf logic in between. Logical feedthroughs result in assign statements in the exported Verilog netlist. While logical feedthroughs cause no problem for IC Compiler II, some verification tools cannot handle them.

### What Next

No action is needed if logical feedthroughs are acceptable in your flow. To prevent the creation of logical feedthroughs by remove_buffer_trees as well as all other commands in the ICC II flow, you can set the app option *opt.port.eliminate_verilog_assign* to the *true* value. The *add_feedthrough_buffers* command can also be used to insert buffers to break any existing logical feedthroughs in the design.

### See Also

- remove_buffer_trees
- add_feedthrough_buffers
- opt.port.eliminate_verilog_assign
- OPT-225

---

## OPT-225

(Warning) There are %d removed buffers which will lead to logical feedthroughs.

### Description

Buffer removal by the *remove_buffer_trees* command has introduced one or more logical feedthroughs in the netlist. A logical feedthrough occurs when a netlist logical module has a connection between two or more ports with no leaf logic in between. Logical feedthroughs result in assign statements in the exported Verilog netlist. While logical feedthroughs cause no problem for IC Compiler II, some verification tools cannot handle them.

### What Next

To see the specific buffer cells whose removal caused logical feedthroughs, specify the *-verbose* option to list them and look for *OPT-224* messages in the logfile.

No action is needed if logical feedthroughs are acceptable in your flow. To prevent the creation of logical feedthroughs by *remove_buffer_trees* as well as all other commands in the ICC II flow, you can set the app option *opt.port.eliminate_verilog_assign* to the *true* value. The *add_feedthrough_buffers* command can also be used to insert buffers to break any existing logical feedthroughs in the design.

Feedback

**See Also**

- remove_buffer_trees
- add_feedthrough_buffers
- opt.port.eliminate_verilog_assign
- OPT-224

---

## OPT-230

(Warning) There are cells placed illegally.

**Description**

The final path_opt stage expects input to be legalized. Please use *check_legality* to view details about these violations. Run *legalize_placement* and invoke final path_opt by *refine_opt -from final_path_opt* after legalization violations are cleaned.

**What Next**

Make sure the design is legalized before running the final path_opt stage.

- Check legalization violations by *check_legality*
- Run legalization by *legalize_placement*
- Run final path_opt stage by *refine_opt -from final_path_opt*

**See Also**

---

## OPT-231

(error) This is a detailed routed design which is not supported by %s command. Optimization aborted.

**Description**

The command does not support detailed routed designs in flow. Therefore, otimization aborted upon detecting this situation.

**What Next**

Run command before design is detailed routed.

Feedback

## OPT-232

(error) Cannot run %s on a design that has already run %s as they run different pre-route flows.

### Description

The place_clock_opt command runs a different pre-route flow than the traditional place_opt / clock_opt flow, with different assumptions, extraction models, etc. Taking the input from one flow into another can result in unexpected results and is not recommended.

### What Next

Use place_opt / clock_opt to continue with traditional pre-route flow, and only use place_clock_opt for the new pre-route flow.

### See Also

- place_opt
- clock_opt

## OPT-233

(Warning) true_footprint mode is not supported with CCD on -- turning off CCD.

### Description

CCD doesn't support true_footprint mode, therefore CCD must be off when running true footprint based size only. App options affected: route_opt.flow.enable_ccd set to false route_opt.flow.enable_ccd_clock_drc_fixing set to 'auto' route_opt.flow.enable_clock_power_recovery set to 'auto'

### What Next

User can either turn off CCD or set a different size only mode.

### See Also

- route_opt
- report_timing

## OPT-500

(Warning) Advanced HFN buffering will not be used for initial HFS and DRC step as global route based initial drc is turned on.

Feedback

### Description

Global route based initial drc does not work with advanced HFN buffering. Hence, when it is turned on, advanced HFN buffering will not be used.

### What Next

Make sure that the desired behavior is specified to *place_opt*

### See Also

- place_opt

---

## OPT-501

(Warning) Advanced HFN buffering will not be used for initial HFS and DRC step as GRLB is turned on.

### Description

GRLB does not work with advanced HFN buffering. Hence, when it is turned on, advanced HFN buffering will not be used.

### What Next

Make sure that the desired behavior is specified to *place_opt*

### See Also

- place_opt

---

## OPT-502

(Warning) Library cell %s has zero or negligible value specified for input capacitance.

### Description

Logical effort computation will not be possible for zero input capacitance of this library cell. Hence this cell will not be used for buffering. But if the cell is already in the netlist, then either a small value will be set if capacitance is specified as zero for all corners, or an average of the non-zero values from other corners will be set for the corner where it was specified as zero.

### What Next

Make sure that the library cell capacitance values are specified correctly.

Feedback

## OPT-503

(Warning) Routing blockage %s of block % is ignored because it has an invalid layer specification.

### Description

The virtual routing topology engine takes routing blockage into conisideration when building a map of blocked areas. This is done based on the layer to which the routing blockage is assigned to. In case this information is no valid the routing blockage cannot be mapped into the blockage map.

### What Next

Investigate the layer information of the reported routing blockage by checking the layer_name or layer attribute. If the routing blockage is required adjust the attributes accordingly.

### See Also

- get_routing_blockages
- report_attributes
- get_attribute
- set_attribute

## OPT-504

(information) It is recommended to use 'set_app_options -name opt.buffering.min_skinny_blockage_size -value %.4f'.

### Description

The design has several long but thin obstacles creating large number of extra detour points for the virtual routing engine. This can cause unnecessary high runtime. By using the recommended setting this penalty can be avoided. It may come with a slight QoR impact.

### What Next

Set the recommended app option and re-run. Check the QoR at the end of the run.

### See Also

- opt.buffering.check_for_skinny_blockages
- opt.buffering.min_skinny_blockage_size

Feedback

## OPT-505

(information) The VR topology generator is working as if 'set_app_options -name opt.buffering.min_skinny_blockage_size -value %.4f' had been set.

### Description

The evaluation of the obstacles found in the floorplan of the given design has found several long but skinny obstacles. Only a small number of non-fixed standard cells overlap with those obstacles. As a consequence these obstacles are ignored as objects for detouring. More details can be found in the man page for app option *opt.buffering.min_skinny_blockage_size*.

### What Next

If the QoR is not as expected re-run with setting app option *opt.buffering.check_for_skinny_blockages* to false.

### See Also

- opt.buffering.check_for_skinny_blockages
- opt.buffering.min_skinny_blockage_size

## OPT-700

(Error) Feedthrough buffer cannot be inserted on multiport net %s because no legal placement location within %d um of the net.

### Description

When the *opt.port.eliminate_verilog_assign* application option is set to *true,* optimization inserts feedthrough buffers on some nets to eliminate assign statements in the exported Verilog netlist. No nearby legal placement location could be found for a buffer on this net. As a result, optimization skipped insertion of a feedthrough buffer on this net to avoid possible QOR degradation.

### What Next

The floorplan may not permit a buffer to be inserted near this net, due to placement blockages, macros, site row availability, or other factors. Either modify the floorplan to correct this issue, or set the app option *opt.buffering.feedthrough_ignore_distance_threshold* to *true*. Setting the app option true will prevent the errors and force insertion of the feedthrough buffers, at a possible cost to timing or logical DRCs.

Feedback

**See Also**

- place_opt
- opt.port.eliminate_verilog_assign

---

## OPT-800

(Information) Design Fusion Restructuring targeted %u cells out of which %u are not optimizable.

**Description**

Logic restructuring cannot optimize cells with attribute such as size_only/dont_touch/fixed/locked. If majority of the cells are not optimizable, improvement from logic restructuring will be minimal.

**What Next**

User can check whether the data path cells have any unexpected restrictions.

---

## OPT-801

(Warning) Skipping Design Fusion Restructuring for total power because no dynamic/leakage power scenarios were found. Doing Design Fusion Restructuring for area instead.

**Description**

There is no scenario available for power optimization. Hence, we run area optimization.

**What Next**

User can check whether there is power scenario available.

---

## OPT-802

(Warning) No dynamic power scenarios were found. Doing Design Fusion Restructuring for leakage power only.

**Description**

There is no dynmaic scenario available for dynamic power optimization. Hence, we run leakage power optimization.

**What Next**

User can check whether there is dynamic power scenario available.

Feedback

## OPT-900

(Error) Secondary-PG constraints will not be honored for the Refine-Opt command

### Description

Secondary-PG constraints are only supported inside Place-opt/Clock-opt command. These constraints are not supported inside Refine-opt command and therefore will not be honored when Refine-opt command is run. This can lead to some QoR degradation.

### What Next

User need to check whether the design needs secondary-PG related constraints in Refine-opt command or if they need to run Refine-opt command anymore.

## OPT-901

(error) Power flow is enabled but neither leakage power nor dynamic power analysis is enabled.

### Description

With Power flow enabled, Pre-route optimization can use designs only if either leakage power or dynamic power or both are enabled. Please use report_scenarios to check that at least one active scenario has leakage analysis enabled when using power flow.

### What Next

User can solve the error by setting leakage analysis to true in one or more active scenarios using set_scenario_status {<scenario list>} -leakage true.

### See Also

- report_scenarios
- set_scenario_status
- place_opt
- clock_opt

## OPT-902

(warning) No clock routing rules were specified. Use set_clock_routing_rules to specify routing rules for accurate clock latency estimation.

Feedback

### Description

Clock latency estimation functionality was called without having specified non-default clock routing rules. Typically, this points to an incomplete setup of the clock tree synthesis (CTS) constraints. Clock latency estimation may be performed in pre-CTS stages of the flow to estimate the effect of clock tree topology on timing, e.g. for ICG enable timing paths. In order to have an accurate pre-CTS clock latency estimation, CTS constraints like CTS routing rules and CTS repeater selection should be setup before compile_fusion or place_opt.

### What Next

Specify the clock routing rules using set_clock_routing_rules before compile_fusion or place_opt.

### See Also

- set_clock_routing_rules
- place_opt

---

## OPT-903

(warning) No clock repeaters were configured. Use set_lib_cell_purpose to configure CTS repeaters for accurate clock latency estimation.

### Description

Clock latency estimation functionality was called without having specified the repeaters (buffers and/or inverters) to be used for clock tree synthesis (CTS). Typically, this points to an incomplete setup of the CTS constraints. Clock latency estimation may be performed in pre-CTS stages of the flow to estimate the effect of clock tree topology on timing, e.g. for ICG enable timing paths. In order to have an accurate pre-CTS clock latency estimation, CTS constraints like CTS routing rules and CTS repeater selection should be setup before compile_fusion or place_opt.

### What Next

Specify the repeaters that will be used during CTS using the set_lib_cell_purpose command.

### See Also

- set_lib_cell_purpose
- place_opt

Feedback

## OPT-904

(info) Created %d clock network latencies at the output of clock gates in scenario '%s'.

### Description

This message indicates that the tool created SDC set_clock_latency at the output of clock gates. This is to prepare for latency estimation at the input of the clock gates as imposed by app option 'place.coarse.clock_gate_latency_aware'. In order to avoid that estimated latencies at the input of a clock gate impact the ideal clock network latency in the fanout of the clock gate, the ideal clock network latency at the input is set to the output of the clock gate. This will only happen if the output of the clock gate does not have an existing SDC clock network latency specified.

Note that a clock gate in this context not only refers to integrated clock gates (ICGs) but also to discrete clock gates and clock dividers. Basically it refers to all clock cell that have a timing-checked data input.

### See Also

- place.coarse.clock_gate_latency_aware

## OPT-905

(info) Removed %d clock network latencies at clock gate inputs in scenario '%s'. New clock gate input latencies will be estimated.

### Description

This message indicates that user- or tool-specified latencies at clock gate inputs will be ignored (removed) and that new latencies will be applied based on internal clock tree latency estimation. This will happen if app option 'place.coarse.clock_gate_latency_aware' is set to 'true'. The message indicates how many latency settings are removed/ignored. Removing latencies at clock gate inputs may imply that latency settings have to be moved (copied) to the clock gate output to preserve the ideal latency in the fanout of the clock gate. If this is required, the tool will automatically take care of that.

Note that a clock gate in this context not only refers to integrated clock gates (ICGs) but also to discrete clock gates and clock dividers. Basically it refers to all clock cell that have a timing-checked data input.

### See Also

- place.coarse.clock_gate_latency_aware

Feedback

## OPT-906

(error) Design has atleast one corner with no Parasitic information.

### Description

Optimization cannot use designs with corners without Prasitic information. Please use report_parasitic_parameters to check the parasitic informatin for all the corners.

### What Next

User can solve the error by setting parasitic using set_parasitic_parameters or disabling the corresponding scenario of the corner without parasitics.

### See Also

- report_scenarios
- set_parasitic_parameters
- report_parasitic_parameters

## OPT-907

(error) '%s' failed during congestion-mode timing-driven placement.

### Description

Error is caused due to failure during congestion-mode timing-driven placement.

### See Also

- report_scenarios

## OPT-908

(error) place_opt failed during timing-driven placement.

### Description

Error is caused since, place_opt failed during timing-driven placement

### See Also

- report_scenarios

Feedback

## OPT-909

(info) Estimating clock gate latencies for scenario '%s'.

### Description

This informative message indicates that clock latencies are estimated for the specified scenario during pre-CTS optimization in the place_opt or compile_fusion flow. The estimated latencies are annotated on the design as an offset on top of user-annotated latencies using 'set_clock_latency -offset'. Note that these are not SDC constraints and will not be reported when 'write_sdc' is called. To inspect the latency offsets, please use the 'write_script' command.

### See Also

- write_sdc
- write_script
- create_placement
- place_opt

## OPT-910

(warning) Skipping clock gate latency estimation for scenario '%s' with propagated clocks.

### Description

Although clock gate latency estimation was called, it is skipped for the specified scenario because that scenario has at least one propagated clock. Clock gate latency estimation is only supported for scenarios where all clocks are in ideal mode, typically during pre-CTS stages of the flow.

### See Also

- place_opt
- create_placement

## OPT-911

(info) Skipped clock gate latency estimation for %d pin%s.

### Description

During clock gate latency estimation, a number of clock gate pins were excluded from estimation. Latency may not estimated for clock gate pins inside abstracts, for clock gate

Feedback

pins inside subtrees of a structural Multi-Source clock network or for pins that have the attribute *dont_estimate_clock_latency* on it.

**What Next**

To list all pins that were skipped and the reason why they were skipped, set application option *opt.clock_latency_estimation.report_skipped_pins* to *true* and rerun.

**See Also**

- opt.clock_latency_estimation.report_skipped_pins

---

## OPT-912

(warning) The design timing appears to be over-constrained (dirty). Optimization effort will be reduced to avoid excessive runtime.

**Description**

Based on analyzing various design timing metrics, the tool has determined that the design's timing is over-constrained, possibly because it is early in the design cycle. To avoid excessive runtime spent in fixing every setup timing violation, the tool will reduce the optimization effort and turn off runtime intensive features for the current session as well as future sessions that start from the same netlist.

**What Next**

If the design timing is dirty, reduced effort can still provide a reasonable estimate of power-performance-area (PPA) without significant runtime. However, if design is correctly constrained, the dirty timing detection can be disabled by setting the application option compile.physical.dirty_timing_handling to value “off” and rerunning compile_fusion.

---

## OPT-913

(info) Clock gate latency estimation for pin %s was skipped because the pin has attribute 'dont_estimate_clock_latency' on it.

**Description**

Automatic clock gate latency estimation skips clock pins that have the attribute 'dont_estimate_latency' on it.

The message is only generated if application option *opt.clock_latency_estimation.report_skipped_pins* was set to *true*.

**What Next**

Check whether this pin should really be excluded from clock gate latency estimation.

Feedback

### See Also

- opt.clock_latency_estimation.report_skipped_pins

---

## OPT-914

(info) Clock gate latency estimation for pin %s was skipped because the pin is inside an abstracted block.

### Description

Automatic clock gate latency estimation skips clock pins that are inside an abstracted block. Since the netlist inside an abstracted block is incomplete, no accurate latency estimation can be performed.

The message is only generated if application option *opt.clock_latency_estimation.report_skipped_pins* was set to *true*.

### See Also

- opt.clock_latency_estimation.report_skipped_pins

---

## OPT-915

(info) Clock gate latency estimation for pin %s was skipped because it is part of a structural Multi-Source clock network.

### Description

Automatic clock gate latency estimation may skip clock pins that are inside sub trees of a structural Multi-Source clock network. For these clock gates, a manual clock latency annotation should be done.

The message is only generated if application option *opt.clock_latency_estimation.report_skipped_pins* was set to *true*.

### What Next

Make sure that the clock gates inside these sub trees have a proper clock latency annotated.

### See Also

- opt.clock_latency_estimation.report_skipped_pins

Feedback

## OPT-916

(warning) Design timing is over-constrained. Turning off dirty timing handling will cause optimization to run with regular effort with potentially high runtime.

**Description**

This message is printed when compile.physical.dirty_timing_handling is set to off while the design is detected to have over-constrained timing. The default optimization will still be run despite over-constrained timing, and increased runtime may be expected.

## OPT-921

(warning) Skipping clock gate latency estimation because design setup is incomplete/invalid.

**Description**

Skipping clock gate latency estimation because design setup is incomplete/invalid.

## OPT-922

## OPT-5003

(error) Failure in hierarchy checks. Run check_hier_design -stage pre_compile for details

### Description

Reported some errors related to design checks in the top-level closure. Please fix the hierarchical checks which are reported as TL errors.

## OPT-6000

(warning) Physical status of unmapped cell %s is converted from fixed to unplaced.

### Description

Physical status of unmapped cell is marked as unplaced and it will be treated as regular standard cell. This cell will be part of optimization and might get gobbled. If the cell needs to be preserved then compile_fusion can change the status of this cell to legalize_only and allow mapping/limited replacement on this cell. Set app option compile.flow.legalize_unmapped_fixed to change fixed status to legalize_only.

Feedback

**See Also**

- set_app_options

---

## OPT-6001

(warning) Physical status of unmapped cell %s is converted from fixed to legalize_only.

**Description**

Physical status of unmapped cell is marked as legalize_only. This cell will be mapped in compile_fusion and will be part of optimization. Out of Unmapped Syntheic cells only SeqGen's and WordView Gtech's are converted to legalize_only, rest other type of synthetic cells will be marked unplaced. Set app option compile.flow.legalize_unmapped_fixed false to treat these unmapped cells as regular standard cells.

**See Also**

- set_app_options

---

## OPT-6003

(warning) New cell %s was added to module %s with no new cells allowed.

**Description**

New cell is added to module/cell having attribute is_new_cell_allowed false.

**What Next**

Either update the constraint using set_allow_new_cells or don't create the cell inside restricted module/cell. One should start by looking at the first occurring OPT-6003 or OPT-6006 messages in the flow. Subsequent messages might occur because of optimization of new cells added earlier in the flow and this is expected. If you think first warning message is application issue, then contact Synopsys.

---

## OPT-6004

(error) Can not be updated for %s %s.

**Description**

set_allow_new_cells/is_new_cell_allowed attribute updation is not allowed due to the given reason.

Feedback

**What Next**

Avoid updating set_allow_new_cells/is_new_cell_allowed attribute.

---

## OPT-6005

(warning) %s %s already contains leaf cells. New cell addition cannot be restricted.

**Description**

This hierarchy already contains leaf cell so various optimization can still create new cells in this hierarchy even if this is restricted. Soft/hard marco are not considered as leaf cell and this warning will not be issued for macros.

**What Next**

Either remove all leaf cells from this hierarchy else use other restrictions to disallow new cell creation.

---

## OPT-6006

(warning) New cell %s was added to voltage area %s with no new cells allowed.

**Description**

New cell is added to voltage area having attribute is_new_cell_allowed false.

**What Next**

Either update the constraint using create_voltage_area_rule -allow_new_cells or don't create the cell inside restricted VA. One should start by looking at the first occurring OPT-6003 or OPT-6006 messages in the flow. Subsequent messages might occur because of optimization of new cells added earlier in the flow and this is expected. If you think first warning message is application issue, then contact Synopsys.

One may also encounter OPT-6006 for transitional violations e.g. cell was temporarily created in restricted VA and then immediately moved to proper VA. One can ignore such violations safely as long as they are not present at the end of the command. These tranistional violations will not cause any real violations.

---

# PAC

## PAC-005

(error) Require app_option %s when %s.

Feedback

**Description**

The tool needs the prerequisite app_option.

**What Next**

Please add the prerequisite app_option.

---

## PAC-006

(error) -to stage cannot be eariler than -from stage. The stage order is prepare, place, report_place, route, report_route.

**Description**

The command option -from and -to must be in correct order. -from stage should be eariler than -to stage.

**What Next**

Please correct the value of command option -from and -to.

---

## PAC-007

(error) No libcell found. Please check pin_check.input.cells and pin_check.input.exclude_cells.

**Description**

No libcell found when preparing pin_check database.

**What Next**

Please check the pin_check.input.* and the libcell names in ref_libs.

---

## PAC-008

(error) Create cell_pin_access block failed.

**Description**

Something wrong when running for -mode analyze_lib_cell or analyze_lib_pin.

**What Next**

Please check the message.

Feedback

## PAC-009

(warning) Cannot find cell %s.frame in reference library. %s

**Description**

Cannot find the target cell (.frame) in reference library.

**What Next**

Please check the input cell name in corresponding options.

## PAC-010

(information) No against cells in pin_check.input.include_for_checking, automatically copy from pin_check.input.cells.

**Description**

The tool default uses input cells as against cells when the option is not set.

**What Next**

NA

## PAC-011

(warning) Cannot set pin threshold to 0 in %s mode by app_option pin_check.input.filter_cells_by_pin_count. Use default pin threshold 1 instead.

**Description**

The tool does not support 0 pin threshold in current checking mode. Use the default value instead.

**What Next**

Please set non zero value in pin_check.input.filter_cells_by_pin_count.

## PAC-012

(error) The pin threshold exceeds the maximum pin count %d. Please set app_option pin_check.input.filter_cells_by_pin_count with a smaller value.

**Description**

The pin threshold value is over the maximum pin count. No cell can be selected for checking.

Feedback

**What Next**

Please set a smaller value in pin_check.input.filter_cells_by_pin_count.

---

## PAC-013

(error) report_cell_pin_access failed; %s

**Description**

Something wrong in -mode analyze_lib_pin.

**What Next**

Please check the error message.

---

## PAC-014

(warning) Invalid layer value "%s" in option %s.

**Description**

The input option value has invalid layers.

**What Next**

Please correct the layer name.

---

## PAC-015

(warning) Cell %s is design_type %s, which is only supported by single_cell mode. Skip pin access checking for this cell in current -mode %s.

**Description**

The following design_type is only supported in single_cell mode: macro, pad, analog, black_box, flip_chip_pad, flip_chip_driver, abstract, pad_spacer, module.

**What Next**

Please check the reference library.

---

## PAC-016

(information) Directory %s is overwritten automatically.

**Description**

The tool overwrites the directory when it already exists.

Feedback

**What Next**

Please backup the file if you want to keep the old file.

---

## PAC-017

(warning) Skip placing %s because it is unprepared.

**Description**

The tool can only place a well prepared design.

**What Next**

Please run check_libcell_pin_access -from "prepare" in advance for the cell.

---

## PAC-018

(warning) Skip routing %s because it is unplaced.

**Description**

The tool can only route a well placed design.

**What Next**

Please run check_libcell_pin_access -to "route" in advance for the cell.

---

## PAC-019

(error) SiteDef information is not initialized.

**Description**

The tool needs site width / height information for the checking process.

**What Next**

Please check the site_def information in technology.

---

## PAC-020

(error) Fail to create %s.

**Description**

The block is required in the checking process.

Feedback

**What Next**

Please check the pin_check library.

---

## PAC-021

(error) Fail to create %s due to read_verilog %s failed.

**Description**

The tool cannot create the block due to read_verilog failed.

**What Next**

Please check the verilog file content.

---

## PAC-022

(warning) Cannot find legal location for %s. %s

**Description**

The tool cannot find legal location for the cell.

**What Next**

Please chech the place options.

---

## PAC-023

(warning) Cannot find target cells, please check the option setting. %s

**Description**

The tool cannot find target cells in current process.

**What Next**

Please check the input library or option setting.

---

## PAC-024

(warning) Cannot find against cells, please check the option setting. %s

**Description**

The tool cannot find agsint cells in current process.

Feedback

**What Next**

Please check the input library or option setting.

---

## PAC-025

(warning) Cannot find the ICV executable for signoff_check_drc.

**Description**

The tool cannot find the ICV executable and skip the signoff_check_drc process.

**What Next**

Please set correct path by app_option pin_check.report.icv_home_dir or env ICV_HOME_DIR.

---

## PAC-026

(warning) The preferred routing direction is not defined for layer {%s}. Please set routing_direction attribute as horizontal or vertical in the preplaced option file.

**Description**

The routing_direction attribute of the routing layer is unknown. Please set the attribute in the preplaced option file.

**What Next**

Please set routing_direction attribute in the file of pin_check.place.preplaced_option_file. For example: set_attribute -objects [get_layers M1] \\ -name routing_direction \\ -value horizontal|vertical

---

## PAC-027

(warning) Number of selected cells (%d) is less than the number of each run (%d). The command will still perform pin checking in single run.

**Description**

According to current multiple run setting, the target cells number is less than the required testing cell number of each run. The tool will not divide the pin checking into multiple runs.

**What Next**

Please check the setting in pin_check.common.num_cells_per_run or pin_check.common.num_jobs.

Feedback

## PAC-028

(warning) Something wrong in job %d, please check the log file %s for the core dump or other information.

**Description**

Something wrong in the job of multiple runs. Please check the log file for detail information.

**What Next**

Please check the log file for detail information.

## PAC-029

(error) Fail to submit job for file %s. %s

**Description**

Fail to submit job for multiple runs pin checking flow.

**What Next**

Please check the log file or correct the grd command.

## PAC-030

(warning) The main flow is terminated, but %d jobs may be still running in multiple runs. Please check and delete the jobs manually.

**Description**

The main flow is terminated, please check and delete the jobs in multiple runs if you don't need them.

**What Next**

Please terminate the jobs in multiple runs, and check the log for error information.

## PAC-031

(warning) Missing row_pattern specification in PRF when pin_check.place.row_pattern app_option is specified.

Feedback

**Description**

Can't find row_pattern specification in PRF. The design will be created with regular row. Please check PRF file.

**What Next**

Please check PRF file or specify correct row_pattern.

---

## PAC-032

(error) No test design found for current -mode %s. Please correct the -mode or run with "-from prepare".

**Description**

No test design found when preparing pin_check database. The checking mode may be inconsistent with previous checking.

**What Next**

Please correct the command -mode option or start from "prepare" step.

---

## PAC-033

(warning) Cell %s is design_type %s, which is not supported in current command. Skip the cell specified in option %s.

**Description**

The following design types are not supported in check_libcell_pin_access: macro, pad, analog, black_box, flip_chip_pad, flip_chip_driver, abstract, pad_spacer, module.

**What Next**

Please correct the related application option.

---

## PAC-034

(warning) Disable set_host_options command in the sub job of parallel flow.

**Description**

Disable set_host_options command in the sub job of parallel flow to prevent the threading resource issue.

The set_host_options command in the Tcl files sourced by pin accessibility checking will become invalid.

Feedback

### What Next

Please review the Tcl files used in the pin accessibility checking command.

---

## PAC-035

(warning) Cannot launch %d jobs in non-GRD mode, which exceeds pin_check.common.max_cores %d. The tool ignores multiple runs setting and performs pin accessibility checking in single run.

### Description

The max number of thread is not enough for the jobs in parallel flow. The tool will ignore pin_check.common.num_jobs or pin_check.common.num_cells_per_run and keep single run flow.

### What Next

Please review the number of thread setting in pin_check.common.max_cores.

Please set a smaller value for pin_check.common.num_jobs or a larger value for pin_check.common.num_cells_per_run. Or enable pin_check.common.grd to submit jobs in different machines.

---

## PAC-036

(information) Automatically set pin_check.common.max_cores as %d for each sub job in non-GRD parallel flow.

### Description

In non-GRD parallel flow, automatically calculate and set the max_cores for each sub job.

### What Next

Please review pin_check.common.max_cores and parallel flow options.

---

## PAC-037

(error) The reference library %s is not a libcell library, which is unsupported in create_pin_check_lib.

### Description

The tool perfoms pin access checking only for libcell type reference libraries.

### What Next

Please check the reference libraries.

Feedback

## PAC-038

(warning) There is no stage control in current checking mode (%s). Ignore option -from/-to and run full flow.

**Description**

There is no stage control in current pin access checking mode. The tool runs full checking flow.

## PAC-039

(warning) The value of both %s and %s are not empty, use %s for the composite_cell mode.

**Description**

In composite_cell mode, can only set either composite_inst_count or composite_cell_area_ratio.

**What Next**

Please set either composite_inst_count or composite_cell_area_ratio if you do not want to see the warning message.

## PAC-040

(error) Invalid %s value %f, please specify a number in um between 5 x placement_site_width to the length of shorter core side.

**Description**

In tool cannot support invalid value of this app_option.

**What Next**

Please specify a valid app_option value.

## PAC-041

(warning) Option %s is only for check_libcell_pin_access, which has no effect in check_macro_pin_access.

**Description**

The application option is only for command check_libcell_pin_access. The option setting has no effect when executing check_macro_pin_access.

Feedback

**What Next**

Please check the usage of the application option.

---

## PAC-042

(warning) Option %s is only for check_macro_pin_access, which has no effect in check_libcell_pin_access.

**Description**

The application option is only for command check_macro_pin_access. The option setting has no effect when executing check_libcell_pin_access.

**What Next**

Please check the usage of the application option.

---

## PAC-043

(error) The utilization rate is higher than 0.2. There may be no enough space to place all cells.

**Description**

In tool cannot support the design which utilization rate is too high. To consider hybrid rows, PG structure ..., it may need more space to place all cells.

**What Next**

Please specify a correct design or use less test cells.

---

# PARSE

---

## PARSE-1

(error) %s: %s on line %d at or near '%s'.

---

## PARSE-2

(error) %s on line %d at or near '%s'.

Feedback

# PDC

## PDC-001

(Warning) Reference '%s' pin '%s' has no via regions. Using pin shape.

**Description**

The pin specified does not contain via regions generated in the frame. Pin shape is used instead for legality checking.

**What Next**

Check your library preparation procedure for correctness.

## PDC-002

(Error) Design '%s' has no associated Technology.

**Description**

The design specified is missing Technology file information. Legalization is thus unable to proceed.

**What Next**

Check your data preparation procedure for correctness.

## PDC-003

(Warning) Routing direction of metal layer %s is neither "horizontal" nor "vertical". PDC checks will not be performed on this layer.

**Description**

This warning message indicates that no routing direction has been set on the metal layer. This may result in DRC violations due to illegal placement.

**What Next**

set_attribute [get_layer <layer>] routing_direction <horizontal/vertical>

## PDC-004

(Warning) Technology file error detected. Excluded Spacing Range defined but corresponding Min Spacing Table and/or Parallel Length Table is not.

Feedback

**Description**

This warning message indicates that a technology file error has been detected. This may result in DRC violations due to illegal placement.

**What Next**

Check and fix technology file.

---

## PDC-005

(Error) Power/Ground pin %s/%s shorts with unconnected metal shape %s.

**Description**

This error message indicates that a short between a cell's power/ground pin and an unconnected metal shape has been found which likely indicates a failure to properly connect the Power/Ground rails to their nets. This will result in legalization failure.

**What Next**

Fix Power/Ground rail connectivity.

---

## PDC-006

(Warning) Technology file via layer %s definition has conflicting sizes of cut name, width, height tables.

**Description**

This warning message indicates that technology file fields "cutNameTbl", "cutWidthTbl" and "cutHeightTbl" in the given via layer definition are inconsistent with each other. Via spacing checking on this layer will be skipped.

**What Next**

Fix technology file.

---

## PDC-007

(Warning) No tracks defined on metal layer %s. Pin access checking disabled for this layer.

**Description**

This warning message indicates that no track definition has been found in the NDM on the given metal layer. Pin access checking on this layer will be skipped.

Feedback

**What Next**

Fix floorplan.

---

## PDC-008

(Warning) Command set_legalizer_preroute_keepout encountered error in setting keepout on provided pins or lib_pins.

**Description**

This warning message indicates the keepout could not be set on one or more of the named pins/lib_pins.

**What Next**

Review the pin/lib_pin list.

---

## PDC-009

(Warning) Command set_legalizer_access_track_constraint encountered error in setting the constraint on provided pins or lib_pins.

**Description**

This warning message indicates the constraint could not be set on one or more of the named pins/lib_pins.

**What Next**

Review the pin/lib_pin list.

---

## PDC-010

(Error) No site_defs found in top block.

**Description**

This error message indicates that there are no site_defs defined in the design block. Pre-routed net checking is disabled.

Feedback

**What Next**

Review the floorplanning steps,

---

## PDC-011

(Warning) Technology file field cut%dNameTbl in Design Rule for layers %s, %s has undefined cut name %s.

**Description**

This warning message indicates that the technology file definition for given Design Rule lists a cut name that is not defined in the Via layer section. Legalization will not be able to honor the associated rules.

**What Next**

Fix the technology file.

---

## PDC-012

(Warning) Pin %s of RefLib %s has different direction from preferred track.

**Description**

Pin/track alignment requires pin and track are always in the same direction. This message indicates some pin direction do not follow this rule.

**What Next**

Check input design to see if pin/track direction is set correctly.

---

## PDC-013

(Warning) Grid %s is not found. Via0 alignment is disabled.

**Description**

The named via0 alignment grid is not found in NDM. User must provide valid via0 grid name to app_option "place.legalize.via0_alignment_grid_name" to enable the alignment to the via0 grid. The grid object is created by executing command "create_grid".

**What Next**

Check if command "create_grid" has been executed to create the via0 grid object.

Feedback

## PDC-014

(Warning) Pin-track color alignment checking skipped for layer %s.

**Description**

Pin-track color alignment is not defined for the named metal layer. Only metal layers with tech file field "hasRectangleOnly = 1" are appropriate for Pin-color alignment checking.

**What Next**

Check application options and technology file.

## PDC-015

(Error) One or more metal/via layer has been deleted. Pre-routed net checking is disabled.

**Description**

This error message indicates that there is at least one deleted metal or via layer from the database. Pre-routed net checking is disabled. Any legalization or check_legality results are unreliable.

**What Next**

Review the floorplanning steps,

## PDC-016

(Warning) On layer %s found %d identical %s %s at location %s. Check for duplicate power grid.

**Description**

Multiple identical vias or metal shapes were found at the same location. This could mean that this design's power grid was created or loaded multiple times. A duplicated power grid can greatly increase run-time, and should be corrected.

**What Next**

Check the vias or metal shapes at the location. If there are multiple identical shapes, the power grid has been duplicated. Remove the power grid from the affected layers and reload or recreate it once for those layers. Check your design loading script for duplication.

## PDC-017

(Warning) Cannot save PG structure analysis in block '%s' for reuse. Later runs must recompute PG data.

Feedback

### Description

After PG structure analysis the tool could not save the PG structure data to the block for reuse. Later runs of the tool cannot reuse the saved data, the PG structure analysis must be recomputed.

The PG structure analysis can take considerable time and memory. The tool saves the results in the block so that the PG structure can be quickly re-read and reused. If the data cannot be saved it must recomputed, sometimes several times in the same flow. This can take considerable time and memory.

### What Next

The most common reason why the PG structure analysis cannot be saved in the block is that the block has not yet been saved to disk. Either the block was just read in, or the block was copied but not yet saved to its library. Use *save_block* to save the current block to its library on disk.

Another reason why the PG structure analysis cannot be saved is that the current user does not have write permission to the library containing the block. Use *copy_block* to copy the block to a library with write permissions. Then use *save_block* to save the copied block to disk.

If the library Unix directories and files have lost write permissions, the permissions can be altered with the Unix *chmod* command. Use *chmod -R u+w /path/to/library* to add user write permissions to the library directories.

---

## PDC-018

(Warning) Cannot save %s cache to block '%s' for reuse. Later runs must recompute cache data.

### Description

After completing legalization design rule checking, the tool could not save the DRC caches to the block for reuse. Later runs of the tool cannot reuse the saved data, those checks must be re-run.

Feedback

There can be millions of design rule checks and each one takes time. The tool caches the result of each check so it does not have to re-run each check for each lib cell. At the end of a run, the DRC results are saved to the block. At the start of the next run the DRC cache is reloaded from the block to save the time of re-running those design rule checks.

**What Next**

The most common reason why the DRC cache cannot be saved in the block is that the block has not yet been saved to disk. Either the block was just read in, or the block was copied but not yet saved to its library. Use *save_block* to save the current block to its library on disk.

Another reason why the DRC cache cannot be saved is that the current user does not have write permission to the library containing the block. Use *copy_block* to copy the block to a library with write permissions. Then use *save_block* to save the copied block to disk.

If the library Unix directories and files have lost write permissions, the permissions can be altered with the Unix *chmod* command. Use *chmod -R u+w /path/to/library* to add user write permissions to the library directories.

**See Also**

- copy_block
- open_block
- save_block
- save_lib

---

## PDC-019

(warning) Using 'ignored_pnet_shape_layers' from the design library instead of from the reference library for lib-cell '%s'.

**Description**

The tool picks up the ignored_pnet_shape_layers rules (see PRF flow) first from the design library, and then from the reference libraries. This message indicates that the layer definitions were found in the design library as well as in the reference libary of the given lib-cell. The ones from the reference library are ignored.

Feedback

# PGR

## PGR-001

(error) The required option %s is not specified.

**Description**

This option is a required option.

**What Next**

Check the command man page and specify the required option.

## PGR-002

(error) For option %s, the specified value %s is invalid.

**Description**

This option value is invalid.

**What Next**

Check the command man page and specify the correct value.

## PGR-003

(error) Some variables have been defined multiple times.

**Description**

Variables should be only defined once in -parameters option which each variable can be used multiple times by other options.

**What Next**

Remove the redundant variables.

## PGR-004

(error) Some used parameters are not defined in -parameters option.

**Description**

Parameters used by any options need to be defined in -parameters option.

Feedback

**What Next**

Define the missing variables in -parameters option.

---

## PGR-005

(error) In option %s, the specified value %s for keyword %s is invalid.

**Description**

This value is invalid.

**What Next**

Check the command man page and specify the correct value.

---

## PGR-006

(error) In the pattern expression %s, the specified string %s is unknown.

**Description**

This string including keyword and data is unknown.

**What Next**

Check the command man page and specify the correct string.

---

## PGR-007

(error) In pattern expression %s, the required keyword %s is missing.

**Description**

Missing required keyword.

**What Next**

Check the command man page and specify the required keyword.

---

## PGR-008

(error) In pattern expression %s, the value for keyword %s is missing.

**Description**

This value is not specified.

Feedback

**What Next**

Check the command man page and specify the correct value.

---

## PGR-009

(error) In pattern expression %s, the following keywords %s have been specified more than once.

**Description**

Some keywords have been specified more than once in the pattern expression.

**What Next**

Remove the redundant keywords.

---

## PGR-010

(error) In composite pattern, some nets used in sub-pattern expressions are not defined in "-nets" option.

**Description**

Nets used in sub-patterns need be be defined in "-nets" options in a composite pattern;

**What Next**

Correct the "-nets" option or nets entry in sub-pattern expression.

---

## PGR-011

(error) In composite pattern, some sub patterns are neither wire nor composite pattern types.

**Description**

Composite pattern can only contain wire or composite patterns.

**What Next**

Correct the pattern expression in the composite pattern.

---

## PGR-012

(error) Parameter interface is inconsistent between the composite pattern and some child patterns.

Feedback

**Description**

The parameter interface need to be matched.

**What Next**

Correct the pattern expression in the composite pattern.

---

## PGR-013

(error) Composite pattern can only contain other composite patterns or wire patterns as child patterns.

**Description**

Composite pattern can only contain other composite patterns or wire patterns as child patterns.

**What Next**

Correct the pattern expression in the composite pattern.

---

## PGR-014

(error) Composite pattern cannot be defined recursively.

**Description**

Composite pattern cannot contain itself as a child or descendant pattern.

**What Next**

Correct the pattern expression in the composite pattern.

---

## PGR-015

(error) In via rule %s, the %s type rule has been specified several times.

**Description**

Some information such as intersection rule, filtering rule or via definition rule have been specified more than once or twice in one via rule.

**What Next**

Correct the via rule expression string, i.e. no more than one intersection rule, two filtering rules or one via definition rule in one via rule.

Feedback

## PGR-016

(error) In via rule %s, multiple types of rules have been group in one brace pair.

**Description**

Some information such as intersection rule, filtering rule or via definition rule have been group within one brace pair.

**What Next**

Correct the via rule expression string, i.e. the brace pair may not be wrong.

## PGR-017

(error) In the via filtering rule %s, the specified string %s is unknown.

**Description**

This string including keyword and data is unknown.

**What Next**

Check the command man page and specify the correct string.

## PGR-018

(error) In via filtering rule %s, the following keywords %s have been specified more than once.

**Description**

Some keywords have been specified more than once in the via rule.

**What Next**

Remove the redundant keywords.

## PGR-019

(error) In the strategy extension %s, the specified string %s is unknown.

**Description**

This string including keyword and data is unknown.

**What Next**

Check the command man page and specify the correct string.

Feedback

## PGR-020

(error) In the strategy blockage %s, the specified string %s is unknown.

**Description**

This string including keyword and data is unknown.

**What Next**

Check the command man page and specify the correct string.

## PGR-021

(error) Strategy %s is obsolete and needs to be redefined.

**Description**

Some pattern used by this strategy may be removed or redefined after the strategy is defined. The strategy needs to be redefined using the up-to-date patterns.

**What Next**

Redefine the strategy using set_pg_strategy command.

## PGR-022

(error) Name of %s is missing.

**Description**

To use -tcl option, the name of reported pattern/strategy/via_rule/mask_constraint needs to be specified.

**What Next**

Please specify the name of the reported pattern/strategy/via_rule/mask_constraint.

## PGR-023

(error) The region polygon is self-intersected.

**Description**

A self-intersected polygon can be divided into multiple polygons. PG router does not know PG area should include or exclude certain polygons.

Feedback

**What Next**

Please modify the region to non-self-intersected and specify blockage using the option -blockage of the command set_pg_strategy to guide PG router to exclude certain areas.

---

## PGR-024

(error) Failed to load technology library from the design.

**Description**

PG router cannot continue without routing layer and design rule info from technology file.

**What Next**

Please check if a valid tech file is loaded for the current block.

---

## PGR-025

(error) Fail to find PG objects in specified regions.

**Description**

PG router cannot find PG shapes of nets (specified by -nets) in the regions (specifed by -within_bbox).

**What Next**

Please check if -nets and -within_bbox are correctly specified.

---

## PGR-026

(error) Failed to create pin at %s for net %s because: %s

**Description**

Failed to create pins at the boundary.

**What Next**

Follow the error message instruction.

---

## PGR-027

(error) Failed to create directory %s to write.

**Description**

Failed to write PG constraint files to directory.

Feedback

**What Next**

Please grant write permission to the working directory.

---

## PGR-028

(error) Failed to extend %s end of wire at %s to %s due to DRC errors.

**Description**

Failed to extend wires.

**What Next**

Check the DRC issues. You may re-run the command with DRC checking turned off and then use check_pg_drc to find out details of DRC violations.

---

## PGR-029

(error) Strap with center %s and width %s is outside design boundary.

**Description**

Failed to create pg strap because it is outside design boundary.

**What Next**

Please check the center locations for PG strap to be created.

---

## PGR-030

(error) Failed to open file %s.

**Description**

Failed to open script/side/mapping files to read or write.

**What Next**

Please check if the file exist and grant read/write permission to the working directory.

---

## PGR-031

(error) Failed to find interconnect layer with %s direction.

**Description**

The command failed because there is no interconnect layer with vertical or horizontal direction in the tech file.

Feedback

**What Next**

Please examine the tech file to check interconnect layer settings.

---

## PGR-032

(error) Cannot find layer %s in the library.

**Description**

Cannot find routing layer in the design library

**What Next**

Please check if the layer name is correct.

---

## PGR-033

(error) %s is undefined.

**Description**

The keyword is not defined in the design.

**What Next**

Please define the required info.

---

## PGR-034

(error) %s is not specified in %s.

**Description**

The keyword is not specifed in user input.

**What Next**

Please specify the keyword.

---

## PGR-035

(error) Non-numerical value is specified for %s.

**Description**

The keyword is specifed with a non-numerical value.

Feedback

**What Next**

Please specify numerical value for the keyword.

---

## PGR-036

(error) Non-positive value is specified for %s.

**Description**

The keyword is specifed with a non-positive value.

**What Next**

Please specify positive value for the keyword.

---

## PGR-037

(error) Failed to load the design core area.

**Description**

Failed to load the design core area.

**What Next**

Please check if the core area is defined for the design

---

## PGR-038

(error) Failed to load the design boundary.

**Description**

Failed to load the design boundary.

**What Next**

Please check if the design boundary is defined

---

## PGR-039

(error) Invalid value %s is specified for %s.

**Description**

Invalid argument is specified for the keyword.

Feedback

**What Next**

Please check the man page to see acceptable value for the keyword

---

## PGR-040

(error) User specified routing layers are not adjacent.

**Description**

The error is issued when -from_layer and -to_layer are not adjacent for create_pg_stapling_vias. Currently, this command is limited to create stapling vias for parallel wires on adjacent metal layers

**What Next**

Please specify adjacent routing layers for -from_layer and -to_layer.

---

## PGR-041

(error) Specified contact code does not match specified metal layers.

**Description**

The error is issued when -contact_code does not match -from_layer and -to_layer for create_pg_stapling_vias.

**What Next**

Please specify matching -contact_code for -from_layer and -to_layer.

---

## PGR-042

(error) Failed to assign mask constraint for PG shape at %s, layer %s.

**Description**

The error is issued when the command failed to assign mask constraint for the shape. This error could be caused by the following reasons:

1. The shape is not center-aligned with any routing tracks. 2. The center-aligned routing track does not have mask constraint itself. 3. The shape is touching with other shapes which have conflict mask constraints.

**What Next**

Please check which reason causes the failure and fix accordingly.

Feedback

## PGR-043

(error) Keyword %s has been specified multiple times in %s.

**Description**

The keyword has been specified multiple times in the spec.

**What Next**

Please correct the spec.

## PGR-044

(error) Unknown string %s inside the specification %s.

**Description**

There are unknown keyword defined in the specification.

**What Next**

Please correct the specification.

## PGR-045

(error) Dummy net name

**Description**

The error is issued when users try to specify dummy net name for ring, rail, macro connection, or other special PG patterns.

**What Next**

Please specify valid net name for the pattern.

## PGR-046

(error) Cannot find net %s in the design.

**Description**

The error is issued when pg router cannot find the specified net in the current block.

**What Next**

Please check if the specified net exists.

Feedback

## PGR-047

(error) Cannot find contact code or via rule %s in the design.

**Description**

The error is issued when pg router cannot find the specified contact code in the tech file or the pg via rule defined for the current block.

**What Next**

Please specify correct contact code or via rule.

## PGR-048

(error) Layer %s is not a wire routing layer.

**Description**

This error is issued when user specified layer is not a wire routing layer

**What Next**

Please specify valid routing layer.

## PGR-049

(error) Failed to find intersecting PG objects for specified nets in specified regions.

**Description**

This error is issued when there is no intersecting PG shapes in the specified regions. As a result, no vias could be inserted for create_pg_vias command.

**What Next**

Please check if PG shapes are properly created in that region.

## PGR-050

(error) Existing vias prevented new vias to be inserted.

**Description**

This error is issued when there are existing vias at the intersections where new vias intended to be inserted by create_pg_vias command.

Feedback

**What Next**

Please check if extra vias are needed for intersections already having vias. User may specify option -insert_additional_vias to allow extra vias to be created.

---

## PGR-051

(error) DRC violations prevented new vias to be inserted.

**Description**

This error is issued when vias could not be created due to DRC violations for create_pg_vias command.

**What Next**

User may specify -drc no_check to skip DRC checking. After that, user may use check_pg_drc command to debug what DRC rules are preventing vias to be inserted.

---

## PGR-052

(error) Failed to apply via rule to insert vias or intersection ratio is smaller than via site threshold.

**Description**

This error is issued when create_pg_vias command failed to apply PG via rules specified by -via_masters options. The intersection ratio in vertical/horizontal is smaller via site threshold.

**What Next**

Please check if the specified via rule is applicable and via site thresold value.

---

## PGR-053

(error) Incorrect usage of snapping reference point.

**Description**

Snapping reference point should be used together with allow_multiple, but mutually exclusive with offset and offset start, as well as via site ratio. This error is issued when the usage is not correct.

Feedback

**What Next**

Please check man page of set_pg_via_master_rule command to understand the usage of snapping reference point. Specify it with allow_multiple option but not offset, offset_start, or via site ratio.

---

## PGR-054

(error) Failed to parse special pattern for %s.

**Description**

The error is issued when user specified special pattern string cannot be correctly parsed.

**What Next**

Please check man page of create_pg_special_pattern to correct the special pattern specification.

---

## PGR-055

(error) Fail to set pg via master rule: %s.

**Description**

The error is issued when user cannot create via master rule correctly. It can be incorrect input or lack of technology data.

**What Next**

Please check man page of set_pg_via_master_rule to correct the issue.

---

## PGR-056

(error) Cannot find via master rule %s in the design.

**Description**

The error is issued when pg router cannot find the specified pg via master rule for the current block.

**What Next**

Please define via master rule using set_pg_via_master_rule.

Feedback

## PGR-057

(error) Number of values specified for %s does not match number of values specified for -nets.

**Description**

The error is issued when the number of values specified for -start option is not equal to the number of nets specified by -nets option, or the number of values specified for -pitch option is more than the number of nets specified by -nets option.

**What Next**

Please specify equal number of arguments for -start and -nets, and no more arguments for -pitch than -nets.

## PGR-058

(error) Invalid pitch value for create_pg_stapling_vias.

**Description**

The error is issued when pitch value is not specified or cannot be derived automatically when the specified contact code is custom via def. Pitch value can be either specified using -pitch option, or obtained from specified pg via master rule or derived for a simple via def.

**What Next**

Please specify valid -pitch value for custom via def.

## PGR-059

(error) More than one %s are specified together with -locations for create_pg_vias .

**Description**

The error is issued when more than one net/from_layers/to_layers are specified together with -locations for create_pg_vias. Only one net, one from layer and one to layer is allowed for coordinate based via creation.

**What Next**

Please specify one value for -net/-from_layers/-to_layers.

## PGR-060

(error) One of -pins and -cells must be specified.

Feedback

**Description**

The error is issued when neither -pins nor -cells are specified for connect_pg_via_ladders command.

**What Next**

Please specify either -pins or -cells and -nets.

---

## PGR-061

(error) PG router doesn't support unbound %s.

**Description**

The error is issued when there is unbound data in design. For example, shape, via def, tech layer and etc.

**What Next**

Please check if any required information is removed or modified.

---

## PGR-062

(error) There are 2nd pins of %s in the specified region. Please set associate pattern to the net: %s

**Description**

The error happens when the 2nd pins should have associated pattern with net for wire creation.

**What Next**

Please set required pattern information for -pattern_net_list.

---

## PGR-063

(error) There is no PG region can be generated from create_secondary_pg_trunk.

**Description**

It can be no PG wire in user specified -horizontal_layer or -vertical_layer.

**What Next**

Check the command man page and specify the required options.

Feedback

## PGR-064

(error) Specified custom via def is not supported.

**Description**

The error is issued when user specified custom via def contains more than one cut layers.

**What Next**

Please specify via def which contains only upper/cut/lower layers.

## PGR-065

(error) There are no 2nd PG pins in the design.

**Description**

The error happens when there are no dual rail cells in the design or no backup type PG pin in dual rail cell which means there is no 2nd pins for connecting.

**What Next**

Please check the design.

## PGR-066

(error) The specified pattern %s is undefined.

**Description**

The specified PG pattern is not defined before the command.

**What Next**

Please check the specified pattern name is correct or create pg pattern first.

## PGR-067

(error) cannot create the specified directory.

**Description**

The error is issued when training data in the specified directory do not exist.

**What Next**

Please specify correct directory where the ML training data are located.

Feedback

## PGR-068

(error) %d output directories are specified. Only one output directory can be specified.

**Description**

Only one output data is allowed to store created training data.

**What Next**

Please specify only one output directory.

## PGR-069

(error) Invalid wire width %s. It is smaller than the minimum layer width %s.

**Description**

This message is issued when user specified wire width is smaller than the minimum width in the tech file for that layer.

**What Next**

Please specify width equal or greater than minimum layer width.

## PGR-070

(error) Invalid wire width %s. It is greater than the maximum layer width %s.

**Description**

This message is issued when user specified wire width is greater than the maximum width in the tech file for that layer.

**What Next**

Please specify width equal or smaller than maximum layer width.

## PGR-071

(error) %s is not defined in config %s.

**Description**

The required information is not defined.

**What Next**

Please define the required information.

Feedback

## PGR-072

(error) %s is not defined in layer %s of config %s.

**Description**

The required information is not defined.

**What Next**

Please define the required information.

## PGR-073

(error) incorrect file.

**Description**

The required information is not defined.

**What Next**

Please define the required information.

## PGR-074

(error) incorrect layer name %s is specified in config %s.

**Description**

The specified layer name does not existed.

**What Next**

Please specify correct layer name.

## PGR-075

(error) category %s in config %s is not supported.

**Description**

The specified category is not supported.

**What Next**

Please specify correct category.

Feedback

## PGR-076

(error) %s is not defined in via rule %s.

**Description**

The required information is not defined.

**What Next**

Please define the required information.

## PGR-077

(error) category %s in viaRule %s is not supported.

**Description**

The specified category is not supported.

**What Next**

Please specify correct category.

## PGR-078

(error) no viaRule defined in ViaConfig %s.

**Description**

viaRule is required in ViaConfig. The specified category is not supported.

**What Next**

Please define viaRule in ViaConfig.

## PGR-079

(error) pintype %s in config %s is not supported.

**Description**

The specified pintype is not supported.

**What Next**

Please specify correct pintype: ring_pin, long_pin, or scattered_pin.

Feedback

## PGR-080

(error) %s is not defined in layer %s of strapConfig %s.

**Description**

The required information is not defined.

**What Next**

Please define the required information.

## PGR-081

(error) Failed to get pin bbox from net %s for rail creation.

**Description**

Rail creation needs to get width information from standard cell PG pin. The error happens when 1. There are siterows with different heights in the creation region 2. There is no standard cell in the creation region

**What Next**

Please check if rail creation region is well-defined for rail creation.

## PGR-082

(error) Failed to perform undo since %s

**Description**

Compile_pg -undo fails so no shapes will be remove in the command. It fails when shapes are moved or deleted. It may also reach maximum undo step.

**What Next**

Please check log if there is any command cause undo fails.

## PGR-083

(error) Please specify only one of the following options: -core, -design_boundary, -voltage_area, -polygon, -macros, -blocks and -pg_regions.

**Description**

set_pg_strategy only accepts one option from the list above. User cannot combine it in one strategy.

Feedback

**What Next**

Please check if the region option is well-specified.

---

## PGR-084

(error) Distance required by number and pitch setting in %s cell alignment pattern exceeds pin width.

**Description**

The error is issued when distance required by number and pitch setting in switch/physical cell alignment pattern exceeds pin width.

**What Next**

Please check that the distance required by number and pitch setting in switch/physical cell alignment pattern must not exceeds pin width.

---

## PGR-085

(error) No legal mask can be assigned for PG via cut %s.

**Description**

The error is issued when no legal mask can be assigned for given PG via cut.

**What Next**

Please check if the spacing between via cut is correct.

---

## PGR-086

(error) Can not find valid site row for power switch insertion.

**Description**

The error is issued when tool can not find valid site row for power switch insertion.

**What Next**

Please check if site row is created correctly.

---

## PGR-087

(error) Your specified pitch %s on layer %s in pattern %s is too small to accommodate all straps.

Feedback

**Description**

The tool issues this error when the value specified in pitch in a pattern is too small to fit all straps. The minimum pitch is based on the widths specified in the pattern and the required spacing between wires.

**What Next**

Increase the value of pitch or decrease the value of widths specified in the pattern.

---

## PGR-088

(error) plan.pgroute.support_polygon_wires only support adjacent layers creation

**Description**

The error is issued when the app_option is set to true and user hasn't specified adjacent layers in -from_layers and -to_layers in create_pg_vias. Non-adjacent layers is not supported. The application option is specialized for complex intersection handling.

**What Next**

Please check if the setting is intended.

---

## PGR-089

(info) Option "%s" is not set, automatically load it %s for backside ring creation.

**Description**

When set_pg_strategy -backside, and some of the options are not set, then the missing values are automatically set.

Including:

Set command create_pg_ring_pattern option "-horizontal_layer" and "-vertical_layer" as the value of application option "plan.backside.ring_layer".

Set command create_pg_ring_pattern option "-horizontal_width" and "-vertical_width" as the value of application option "plan.backside.ring_width".

Set command set_pg_strategy option "offset" as minus half the value of application option "plan.backside.ring_width".

Set command set_pg_strategy option "side_offset: {side }" as "T B".

Set command set_pg_strategy option "side_offset: {offset }" as the value of application option "plan.backside.alignmnet".

Feedback

### What Next

Check if the automatically set value meet the requirement. If not, input the value from the related commands.

---

## PGR-090

(warn) In region %s, failed to smoothen the merged boundary of macros and blockages for ring creation. Use the unsmooth boundary to create ring.

### Description

For ring pattern set with {merge: placement_blockage}, the macros and placement blockages are merged to form a region to create ring. Small slivers and holes in the merged boundary caused by unaligned placement blockage is smoothen before ring creation. The smoothen process might failed when the unaligned condition is serious. Then the ring is created on the unsmooth boundary.

### What Next

Aligned the placement blockage to the macros manually using the GUI tools and create the PG ring again.

---

## PGR-091

(warn) %s

### Description

This message reports a failed attempt to create wire or via using the compile_pg command. The reason for failure can be either wrong parameters in the compile_pg command or DRC violations. Perform the following steps to ascertain the actual cause of failure. 1) Check for invalid parameter in the compile_pg command using <-ignore_drc> option. If the compile_pg command fails to create wires and/or vias with the <-ignore_drc> option, it means that some invalid parameter has been provided to the compile_pg command. Use the details provided in the compile_pg command page to know more about valid parameters that you can use with this command. Try running the command again with correct parameters. If the command succeeds in creating wires and vias, proceed to the next step. 2) Run the compile_pg command without the <-ignore_drc> option but add the <-show_phantom> option. If the command fails to create some wires and vias then some DRC violations have occurred. To view the details of the DRC violations, use View->Error Browser in the tool GUI.

### What Next

On finding any DRC rule violation you can look at the relevant DRC manuals to rectify any related issues in the design. The DRC manuals can be found in Solvnetplus.

Feedback

## PGR-501

(warning) Some defined variables in -parameters option are not used by other options.

**Description**

Some defined variables are not used.

**What Next**

Remove the unused variables from -parameters option.

## PGR-502

(warning) Option %s is incompatible with other option %s. The first option is therefore ignored.

**Description**

Ignore some incompatible option.

**What Next**

Remove the incompatible option when specifying the command.

## PGR-503

(warning) For option %s, the specified value %s is invalid and ignored.

**Description**

This option value is invalid.

**What Next**

Check the command man page and specify the correct value.

## PGR-504

(warning) Via master rule %s has been removed and will be ignored.

**Description**

This via master rule is removed and will be ignored in the corresponding strategy via rules or patterns.

**What Next**

Redefine the removed via master rule using set_pg_via_master_rule command.

Feedback

## PGR-505

(warning) Strategy %s in strategy via rule is undefined and the rule will be ignored.

**Description**

PG route adopts a methodology called lazy evaluation, which allow users to specify constraints like set_pg_strategy even though certain contents (like strategy) does not exist. The corresponding strategy via rule will be ignored by compile_pg if the missing strategy is not specified.

**What Next**

Define the corresponding PG strategy before invoking compile_pg.

## PGR-506

(warning) %s is undefined.

**Description**

The keyword is not defined in the design.

**What Next**

Please define the required info.

## PGR-507

(warning) The specified net %s is not P/G net. Create_pg_vias may not generate vias successfully.

**Description**

App_option plan.pgroute.honor_signal_route_drc default vaule is false. Create_pg_vias will not check signal route drc when the app option is off.

**What Next**

Set the app option plan.pgroute.honor_signal_route_drc true or check if the net name is correct.

## PGR-508

(warning) Metal or via layer is missing in tech file.

Feedback

**Description**

Metal or via layer is missing, PG creation command will error out.

**What Next**

Check if there is any metal or via layer is missing in tech file.

---

## PGR-509

(warning) Cannot find default via between layer %s and layer %s. %s

**Description**

Default via def cannot be found in the tech file.

**What Next**

Check if the current tech file is correct for via creation. It may need to be replaced.

---

## PGR-510

(warning) The %s is deprecated. It will be retired on %s release.

**Description**

The feature is going to be retired soon.

**What Next**

Check if the feature is used intended.

---

## PGR-599

(warning) %s

**Description**

General warning message.

**What Next**

Follow the warning message instruction.

---

## PGR-600

(error) %s

Feedback

**Description**

Error in command line options for *check_pg_drc*.

**What Next**

Correct the command line options, please consult the manpage of check_pg_drc.

---

## PGR-601

(warning) %s

**Description**

Warning in command line options for *check_pg_drc*.

**What Next**

Consult the manpage of check_pg_drc for correcting the warning issues.

---

## PGR-610

(error) Wrong Contact Code Violation for rule %s in the design. Required Contact code %d, and actual is %d. So we are dropping these via. Change Via Def Name %s and add correct via defination.

**Description**

The error is issued when pg router cannot find the specified contact code in the tech file or the pg via rule defined for the current block.

**What Next**

Please specify correct contact code or via rule.

---

## PGR-999

(error) %s

**Description**

General error.

**What Next**

Follow the error message instruction.

Feedback

# PI

## PI-001

(error) An error prevented PI optimization. %s

**Description**

Something in the design or the configuration prevented the successful run of a Power Integrity optimization.

**What Next**

It may be necessary to alter the design, configuration or application options to complete the information required for the PI optimization.

# PLACE

## PLACE-001

(warning) Infeasible tiling in MVDD placer.

**Description**

Infeasible tiling in MVDD placer. Please check your bound creation.

## PLACE-002

(warning) Infeasible tiling in MVDD placer: %s

**Description**

Infeasible tiling in MVDD placer. Please check your bound creation.

## PLACE-003

(error) Error in placement tiling. Not enough room available for the following cells: %s

**Description**

Infeasible tiling in placer.

**What Next**

Fix the amount of space available for these cells and run placement again.

Feedback

## PLACE-004

(error) Fail in placement: %s

**Description**

Placement failure

**What Next**

Fix the error and run placement again.

## PLACE-005

(warning) Fail in placement: %s

**Description**

Fixed area greater or equal than chip area. Total moveable area is zero.

**What Next**

Fix the error and run placement again.

## PLACE-006

%s

**Description**

Placement message

**What Next**

Informational message - may require analysis to see if placement needs to be run again.

## PLACE-007

(Error) Library cell %s/%s has Vth implant on layer %d which does not correspond to any Vth implant layer defined in the technology file. Advanced rule checking will not be performed for this library cell.

**Description**

This error message indicates an inconsistency between reference library technology file and design library technology file. This error will likely result in incorrect placement legalization and legality checking results.

Feedback

**What Next**

Revisit the design preparation process.

---

## PLACE-008

(Error) Library cell %s/%s has TrimPoly implant on layer %d which does not correspond to any TrimPoly implant layer defined in the technology file. Advanced rule checking will not be performed for this library cell.

**Description**

This error message indicates an inconsistency between reference library technology file and design library technology file. This error will likely result in incorrect placement legalization and legality checking results.

**What Next**

Revisit the design preparation process.

---

## PLACE-009

(Warning) User set forbidden pair "%d - %d" is not legal. It will be ignored.

**Description**

This error message indicates that illegal values for "forbidden pair" have been set by the user with the app_option "place.legalize.vertical_abutment_forbidden_pairs". Values of forbidden indexes must be greater than 0. As a result, the given pair will be skipped. This user error may result in incorrect placement legalization and legality checking results.

**What Next**

Revisit the design preparation process.

---

## PLACE-010

(Warning) %d cells are not placed.

**Description**

This error message indicates that legalization engine found some unplaced cells in the design. It is expected that user run coarse placement prior to legalization. A design may contain a small number of unplaced cells, but a large number usually indicates a flow/script problem.

Feedback

**What Next**

Revisit the flow script.

---

## PLACE-011

(Warning) Overlapping site rows found in block %s.

**Description**

This warning message indicates that legalization engine found overlapping site rows of different siteDefs in the placement block. This design style is not completely supported. This error may result in failure of legalization and/or legality checking.

**What Next**

Revisit the design floorplan.

---

## PLACE-012

(Warning) Reference cell %s has site dimensions (%d, %d) that do not equal top block site dimensions (%d, %d).

**Description**

This error message indicates that legalization engine found the given reference cell is associated with site def dimensions that are different then those used by the top design. This usually indicates a library data preparation problem. The reference library was likely created with a different version of the technology file than the top design.

**What Next**

Revisit the design and refererence library preparation procedures.

---

## PLACE-013

(Warning) Invalid capacitance value detected. It will be ignored.

**Description**

This error message indicates that an invalid capacitance value was encountered. The value will be changed to zero.

**What Next**

This is an internal error. Please report to Synopsys.

Feedback

## PLACE-014

(Warning) Reference cell %s has width %d that is not multiple of its site def %d.

**Description**

This error message indicates that legalization engine found the given reference cell is associated with site def with dimensions that are not compatible with its size. This usually indicates a library data preparation problem. The reference library was likely created with a different version of the technology file than the top design.

**What Next**

Revisit the design and refererence library preparation procedures.

## PLACE-015

(Warning) Circuit has no valid timing endpoints

**Description**

This error message indicates that the circuit has no valid timing endpoints. Placement will continue.

**What Next**

Revisit the timing information

## PLACE-016

(Error) Placer has detected a timing graph with too many logic levels. This may indicate a loop in the timing graph.

**Description**

This error message indicates that the timnig graph either has too many logic levels or has a loop. Placement cannot continue.

**What Next**

Revisit the timing information

## PLACE-017

(error) Error in placement constraints.

Feedback

**Description**

Placement bound constraints are infeasible.

**What Next**

Fix the placement bound constraints and run placement again. To check the constraints before running placement, use check_placement_constraints.

---

## PLACE-018

(error) No valid core area defined.

**Description**

Coarse placement cannot be run without a valid core area..

**What Next**

Use *initialize_floorplan* to define your core area.

---

## PLACE-019

(error) The region defined by the constraints %s has zero area and %ld cells.

**Description**

Infeasible constraints in coarse placement.

**What Next**

Fix the constraints and run the placement again.

---

## PLACE-020

(error) The region defined by the constraints %s is not feasible.

**Description**

Infeasible constraints in coarse placement.

**What Next**

Fix the constraints and run the placement again.

---

## PLACE-021

(Error) Library cell %s/%s has TrimPoly implant width which is wider than cell width. Advanced rule checking will not be performed for this library cell.

Feedback

**Description**

This error message indicates an error in library preparation for this cell. This error will likely result in incorrect placement legalization and legality checking results if this cell is instantiated.

**What Next**

Revisit the library/design preparation process.

---

## PLACE-022

(Info) %d placement spacing labels and %d placement spacing rules are stored in design NDM.

**Description**

This message notifies user that user placement spacing rules and labels are stored in the design NDM and will be loaded the next time the design is opened.

---

## PLACE-023

(Error) Layer %s has non-positive RC values.

**Description**

This warning message indicates that the RC values coming from extraction are either negative, zero, or infinity for the given layer. RC values could be zero for superconducting layers. If certain options, such as buffer aware placement are enabled, this will cause the placer to exit.

**What Next**

Verify that the RC values in the TLUplus for the given layer are correct. Check if this layer should be specified as an ignored layer.

---

## PLACE-024

(Error) Placement of Power/Ground rails conflicts with NDM row definition.

**Description**

This error message indicates that placement of Power/Ground rails is such that no legal placement exists for any cell. Legalization is aborted. This error indicates a problem with the floorplan, either in the PG grid generation, or in the site row definition.

Feedback

### What Next

Please review your floorplanning steps. The check that produces this error may be switched off with application option "place.legalize.enable_pg_rail_sanity_check" set to false. Be aware that doing so, will result in a placement that cannot be legally taped out.

---

## PLACE-025

(Info) Instance %s dimensions are not a multiple of unit site def.

### Description

This message indicates given standard cell instance dimensions are not a multiple of the unit site def. This notice may be safely ignored if the cell's intended row is not a unit site row.

### What Next

Please review your floorplanning and library prep steps, if necessary.

---

## PLACE-026

(error) There are unfixed macros in design. Use create_placement -floorplan to place macros or fix all macros with the app option place.coarse.fix_hard_macros.

### Description

You are getting this message because the current design has unfixed macros. If you want to place these macros then you need to use the command create_placement -floorplan which will invoke the macro placement engine. If you already have a macro placement and want to fix all the macros then you can set the app option place.coarse.fix_hard_macros to true.

### What Next

Based on what you want to do action is described above.

---

## PLACE-027

(info) Automatic density control has selected the following settings: max_density %.2f, congestion_driven_max_util %.2f.

### Description

This message indicates that automatic density control is enabled for coarse placement, and reports the selected settings.

Feedback

## PLACE-028

(Warning) Characterization of reference cell %s VT ignored.

### Description

This message indicates that issues were encountered in characterization of the given reference cell's VT parameters. This may lead to incorrect placement of instances of the given reference cell.

### What Next

Please review your library prep steps, if necessary.

## PLACE-029

(Warning) There is insufficient area available to achieve the target routing density of %s %s. Using %s of %s instead.

### Description

This message indicates that the congestion reduction step of coarse placement cannot reduce the cell density enough in congested areas to achieve the target routing density, because there is not enough area available for that. This can happen because there is too much area that is congested, or because the cell density in uncongested areas cannot be increased further. The message also indicates which routing density value is used by the congestion reduction step instead.

### What Next

Check the value of application option "place.coarse.congestion_driven_max_util" to make sure that it is not set too low (in particular a value below 0.8). Review the global route congestion map and the cell density map, to determine whether the main issue is the amount of congestion or the cell density in the uncongested areas. In the latter case, check whether the cell area is reduced by the final_opto step of place_opt. If that is the case, running "place_opt -from final_place" or "refine_opt" after "place_opt" may help with reducing congestion further.

## PLACE-030

(info) Reducing cell density for %s%% of the movable cells to alleviate congestion. This changes the average cell density in non-congested areas from %s to %s.

### Description

This message reports several statistics for the congestion reduction step of coarse placement: It reports the percentage of movable cells that are in areas where congestion

Feedback

removal is reducing the cell density. It also reports how that increases cell density for cells in non-congested areas.

## PLACE-032

(Error) Unequal vertical abutment pattern sizes found for top (=%d bits) and bottom (=%ld bits) of reference %s. Check database consistency.

**Description**

This message notifies user that the vertical abutment pattern on the for top and bottom edges are of unequal length.

## PLACE-033

(Error) Reference width (=%u bits) is inconsistent with vertical abutment pattern size (=%u bits) for reference %s. Check database inconsistency.

**Description**

This message notifies user that the length of vertical abutment pattern set on a reference is not equal to the width of that reference.

## PLACE-034

(Error) PNET_AWARE: Unable to find core site. The app_options

**Description**

The pnet aware functionality will be disabled if there are no core sites.

**What Next**

Make sure the design has core sites.

## PLACE-035

(Info) PNET_AWARE: %d power stripes treated as placement blockages.

**Description**

Report how many power stripes are treated as placement blockages.

**What Next**

Please review the number of power stripes treated as placement blockage is reasonable.

Feedback

## PLACE-036

(Warning) The user setting for the target routing density of %.2f is outside the range from 0.8 to 1.0. Using a value of %.2f instead.

**Description**

To avoid excessive or insufficient congestion reduction, the coarse placer only supports target routing density values in the range from 0.8 to 1.0. If the user setting is outside the range, the nearest value within the range is used instead.

**What Next**

Update the value of application option "place.coarse.target_routing_density" or restore the default value.

## PLACE-037

(Info) PNET_AWARE: The app_option

**Description**

Use setting of the minimal width.

**What Next**

Please review the setting is intended or not.

## PLACE-038

(Info) PNET_AWARE: The app_option

**Description**

Print out the internally computed the default minimal width.

**What Next**

Please review the setting is intended or not.

## PLACE-039

(Info) PNET_AWARE: The minimal height for horizontal power stripes to be treated as a placement blockage is set to %lg microns (half of row-height). (This does not affect vertical power stripes).

Feedback

**Description**

Print out the internally decided the minimal height for horizonal power stripes.

**What Next**

Please review the setting is intended or not.

---

## PLACE-040

(Error) PNET_AWARE: Unable to find layer

**Description**

The layer name specified in app_option

**What Next**

Please check the layer name.

---

## PLACE-041

(Error) The option %s is obsolete. See the man page for %s for migration assistance.

**Description**

This message notifies that the option %s to the command %s is obsolete.

---

## PLACE-042

(error) No valid scan def found.

**Description**

This error message indicates that scan def has not been loaded for this design.

**What Next**

To run placement without scan def please use: set_app_options -name place.coarse.continue_on_missing_scandef -value true

---

## PLACE-043

(Warning) Fixed cell %s (%s) has illegal site_name

Feedback

**Description**

This warning message indicates that a fixed cell is associated with an invalid site def. It will be trated as a blockage. This may result in placement violations if there are any placement rules associated with the cell. This message is often expected behavior for certain flows.

**What Next**

Verify that this is expected behavior.

---

## PLACE-046

(warning) Soft move bound %s is present inside exclusive move bound %s.

**Description**

The reported soft move bound does not make sense because it is covered by an exclusive move bound. Please check your bound creation.

---

## PLACE-047

(warning) Overlap between move bounds %s and %s.

**Description**

The reported overlapping move bounds may fail the create_placement because one or both of them are exclusive. Please check your bound creation.

---

## PLACE-048

(warning) Parent move bound %s is not covering child move bound %s.

**Description**

The reported parent move bound is expected to cover the child move bound because they are hierarchially related(ancestor-descendant relationship). Please check bound creation.

---

## PLACE-049

(error) Exclusive move bound %s covers hard/exclusive move bound %s.

**Description**

The reported hard or exclusive move bound must not be covered by the exclusive move bound because during placement it will have zero area for cells present inside it. Infeasible move bounds definitions.

Feedback

**What Next**

Fix the constraints and check placement again.

---

## PLACE-050

(error) Hierarchically related disjoint Hard/Exclusive move bounds %s and %s.

**Description**

The ancestor move bound should cover the descendant move bound because they are both of type hard or exclusive.

**What Next**

Fix the constraints and check placement again.

---

## PLACE-051

(warning) Unplaced cell %s is not placed %s

**Description**

Coarse placement will not place the cell which has CTS size_only flag or is the isolation cell. If such a cell is unplaced, it will keep the unplaced physical status after placement, causing ZRT-064 error in router.

**What Next**

Review each unplaced cell and mark it as placed (or fixed if the cell is not allowed to be moved in the following optimization steps) if the cell location is still valid. Otherwise go back to steps in which such a cell is placed.

---

## PLACE-052

(error) The app options %s %s are not compatible.

**Description**

The two given app options are incompatible and cannot be used together.

**What Next**

Decide which of the 2 app options you want to use and use only that one.

Feedback

## PLACE-053

(error) IR drop aware placement disabled. Unable to find a scenario with power analysis enabled.

### Description

To run IR drop aware placement there needs to be at least 1 scenario with power analysis enabled. This is needed to compute the power usage of each cell.

### What Next

Check your scenarios using report_scenarios and turn on leakage power and/or dynamic power analysis using set_scenario_status.

## PLACE-054

(error) Power density aware placement disabled. Unable to determine a maximum power density target.

### Description

To run power density aware placement there needs to be a maximum power density target. By default the tool will attempt to calculate a maximum power density target which is 1.4 times the average power density. However, this message indicates that the calculation has failed some some reason.

### What Next

Set a maximum power density manually by using the app option place.coarse.max_power_per_area. One way to get a reasonable value is to look at the power density map of the placed design in the GUI. Set a value somewhat less than the maximum power density value shown.

## PLACE-055

### NAM5

*PLACE-055* (info) %s aware placement disabled. Reason: Unable to load %s data.

### Description

To run %s aware placement the %s data must be loaded into the design before placement is run.

### What Next

Load the data.

Feedback

## PLACE-056

(info) Because automatic density control is enabled, congestion analysis effort high is used and the value of application option place.coarse.congestion_analysis_effort is ignored.

### Description

This message indicates that effort high is used for congestion analysis, instead of the effort level selected by application option place.coarse.congestion_analysis_effort. The reason for using effort high is that automatic density control is enabled, which requires high effort congestion analysis.

## PLACE-057

(error) Cannot run timing driven placement, because zero interconnect delay is used in timing analysis.

### Description

Timing analysis uses zero interconnect delay for the current design, which is not supported by timing driven placement.

### What Next

Change the design setup such that the interconnect delays are not zero, or run coarse placement with timing driven placement disabled.

## PLACE-058

### NAM5

*PLACE-058* (error) Effective resistance placement disabled. Unable to load effective resistance data.

### Description

To run effective resistance placement the effective resistance data must be loaded into the design before placement is run.

### What Next

Load the effective resistance data.

## PLACE-060

(warning) MVDD placer. Tile %s, does not have enough area.

Feedback

**Description**

The Voltage Area doesn't have enough area to accommodate all the cells.

---

## PLACE-061

(warning) Ignoring %s bound on cell %s due to placement obstructions.

**Description**

The movebound on the reported cell is completely blocked by placement obstructions. The bound will be ignored.

**What Next**

Check the placement obstructions and bounds and modify the placement constraints to resolve the conflict.

---

## PLACE-062

(warning) Cell %s cannot satisfy placement constraints.

**Description**

This error message occurs when a cell cannot be legally placed anywhere in the design. Commonly, this is caused by conflicting hard move bounds and blockages.

**What Next**

Analyze the placement constraints of the indicated cell to identify sets of conflicting constraints such as hard move bounds and placement blockages. Experiment with deleting and adding subsets of these bounds and blockages to find a set that does not overconstrain the cell.

---

## PLACE-063

(warning) Placement timed out on user-defined macros.

**Description**

The number of macros increases in each pass, increasing the runtime for overlap removal for a plane and hence placement.

**What Next**

Reduce the number of macros and run again.

Feedback

## PLACE-064

(warning) %s cells have hard move bounds.

**Description**

Specified cells are forced to be places inside the hard MBs. With increase in number of hars mbs, optimization of the circuit degrades due to increase in congestion and poor quality of placement.

**What Next**

Reduce the number of move bounds and run placement again.

## PLACE-065

(warning) Infeasibity during density aware blockage shoving due to movebounds.

**Description**

Presence of hard/exclusive MBs on blockages would force the cells inside them to be placed over blockages. Shoving won't be possible for such cells.

**What Next**

Re-check the movebounds definitions and run placement again.

## PLACE-066

(warning) Constraints for macro cells present on logic %s are unsatisfied.

**Description**

Overlap removal is given up on logic containing macro cells having auto keepouts around them.

**What Next**

Check placement constraints

## PLACE-067

(error) Placer detected conflicting constraints on the following cells: %s.

**Description**

Cells violating macro constraints are present in the logic. Placement/Parameter Calculation will be aborted.

Feedback

**What Next**

Recheck placement constraints and run again.

---

## PLACE-068

(warning) Placer detected conflicting constraints on the following bounds : %s.

**Description**

Bounds conflicting placement constraints found. Differernt bounds might be containing same cells, or they might be overlapping. Either such groupbounds are removed and conflicting quadratic groupbounds may be converted to linear bounds, or placement will be aborted.

**What Next**

Recheck placement constraints and run again.

---

## PLACE-069

(warning) Conflicting constraints detected on bounds. Too many quadratic groupbounds present.

**Description**

Conflicting bounds found. All groupbounds with more than two cells are converted to linear.

**What Next**

Recheck constraints and run placement again.

---

## PLACE-070

(warning) Floating point stack is corrupt.

**Description**

Errors have occurred in floating point stack calculation.

**What Next**

Clean up the stack and continue.

Feedback

## PLACE-071

(info) The cpu mem report : %s CPU: %s s (%s hr) ELAPSE: %6s s (%s hr) MEM-PEAK: %s Mb.

**Description**

Runtime and memory information.

## PLACE-072

(info) The final rpsa process memory report : %s CPU: %s s (%s hr) ELAPSE: %6s s (%s hr) MEM-PEAK: %s Mb.

**Description**

The final runtime and memory information.

## PLACE-073

(warning) Highest utilization value of a plane for the circuit is %s.

**Description**

Plane/s in the circuit is/are over-utilized, resulting in increase in congestion and insufficient placement area.

**What Next**

Check design constraints and run placement again.

## PLACE-074

(warning) Utilization of %s is %s.

**Description**

Plane/chip over-utilized. Insufficient available area for movable cells. Load file

**What Next**

Recheck

## PLACE-075

(warning) The circuit has a large number of planes present.

Feedback

**Description**

Circuit has a total of %s exclusive bounds, plan groups, voltage areas, and/or category blockages. Large coarse placement runtime / memory usage expected.

**What Next**

Reduce the number of planes and run again.

---

## PLACE-076

(error) Placer has detected a timing graph in excess of %s logic levels in depth. Aborting.

**Description**

Excess graph depth while seting up the graph after the nodes etc have been added.

---

## PLACE-077

(warning) Cache circuit count is inconsistent.

**Description**

Overlap area cache memory has been modified, but the memory still contains the old data.

**What Next**

Clean up the memory and run placement again.

---

## PLACE-078

(info) Constraint %s has utilization %s. Adjusting max density from %s to %s for this area since soft_max_density is enabled.

**Description**

This message reports the change in max density when the soft_max_density app option is enabled.

---

## PLACE-079

(info) Placer used soft congestion map.

**Description**

This message indicates that the placer is driven by ZGR's soft congestion map.

Feedback

## PLACE-080

(warning) Disabling clock gate latency aware placement because trial clock tree construction was enabled.

### Description

Latency estimation during coarse placement only works for non-propagated clocks. This is incompatible with trial tree construction and therefor clock gate latency aware placement was disabled.

Clock gate latency aware placement is enabled by setting place.coarse.clock_gate_latency_aware to "true", or by setting place.coarse.clock_gate_latency_aware to "auto" and enabling clock gate latency estimation at the flow level by seting one of app option place_opt|refine_opt|compile.flow.estimate_clock_gate_latency to "true".

### What Next

Decide whether you want trial clock tree construction OR clock gate latency aware placement for latency estimation. If the latter, switch off trial_clock_tree and/or optimize_icgs. Note that optimize_icgs implicitly enables trial clock tree construction.

### See Also

- place.coarse.clock_gate_latency_aware
- place_opt.flow.trial_clock_tree
- place_opt.flow.optimize_icgs
- place_opt.flow.estimate_clock_gate_latency

## PLACE-081

(info) Removed %d clock network latencies at clock gate inputs in scenario '%s'. New clock gate input latencies will be estimated.

### Description

This message indicates that user- or tool-specified latencies at clock gate inputs will be ignored (removed) and that new latencies will be applied based on internal clock tree latency estimation. This will happen if app option 'place.coarse.clock_gate_latency_aware' is set to 'true'. The message indicates how many latency settings are removed/ignored. Removing latencies at clock gate inputs may imply that latency settings have to be moved (copied) to the clock gate output to preserve the ideal latency in the fanout of the clock gate. If this is required, the tool will automatically take care of that.

Feedback

Note that a clock gate in this context not only refers to integrated clock gates (ICGs) but also to discrete clock gates and clock dividers. Basically it refers to all clock cell that have a timing-checked data input.

**See Also**

- place.coarse.clock_gate_latency_aware

---

## PLACE-082

(info) Created %d clock network latencies at the output of clock gates in scenario '%s'.

**Description**

This message indicates that the tool created SDC set_clock_latency at the output of clock gates. This is to prepare for latency estimation at the input of the clock gates as imposed by app option 'place.coarse.clock_gate_latency_aware'. In order to avoid that estimated latencies at the input of a clock gate impact the ideal clock network latency in the fanout of the clock gate, the ideal clock network latency at the input is set to the output of the clock gate. This will only happen if the output of the clock gate does not have an existing SDC clock network latency specified.

Note that a clock gate in this context not only refers to integrated clock gates (ICGs) but also to discrete clock gates and clock dividers. Basically it refers to all clock cell that have a timing-checked data input.

**See Also**

- place.coarse.clock_gate_latency_aware

---

## PLACE-083

(warning) Placement continues with over utilized regions in the design.

**Description**

Placement is forced to continue eventhough there are overutilized exclusive movebounds or voltage areas present in design or whole design is overutilized.

**What Next**

Please check the PLACE-074 warnings printed before this warning. Increase the available region or modify blockages to remove the PLACE-074 warnings. These warnings need to be resolve before running normal place_opt and clock_opt flows. Please be aware that this is likely to cause high density areas.

Feedback

## PLACE-084

(warning) Overutilized regions for %s are modified by %s.

### Description

Insufficient available area for movable cells. Early data flow modifies blockages and fix cells to decrease utilization.

### What Next

Increase the available region or modify blockages to remove the warning. These warnings need to be resolve before running normal place_opt and clock_opt flows.

## PLACE-085

(info) Clock gate latency aware placement is enabled.

### Description

Informs that timing-driven placement will be performed with consideration of (estimated) clock network timing. This will have an impact on the timing budget of clock gate enable paths. At the end of placement, the estimated clock network timing will be annotated as set_clock_latency on the clock gates.

### See Also

- place.coarse.clock_gate_latency_aware
- place_opt.flow.estimate_clock_gate_latency

## PLACE-086

(info) Auto congestion effort reduced congestion effort from high to medium.

### Description

Informs that enable_auto_congestion_effort reduced congestion effort to medium because congestion is low.

### See Also

- place_opt.place.congestion_effort

## PLACE-087

(warning) %s Exiting wide-cell placement mode.

Feedback

**Description**

This message indicates that the placement model is unable to return information about the PG pitch and width, which is used by the wide-cell plane to determine how to handle the densities of wide-cells.

**What Next**

Check if the PG structure is set up correctly. The feature place.coarse.wide_cell_use_model should be used on N7 designs with narrow M1 PG straps.

---

## PLACE-088

(warning) A manual setting has been set when a value could be auto-derived from the app_option '%s'.

**Description**

This message indicates that user has set a value which could have been auto-derived.

**What Next**

The user may want to use the auto-derived value by using the app_option mentioned in the warning message.

---

## PLACE-089

(warning) Utilization of %s is %s.

**Description**

Reports Movebound/Voltage region having utilization more than a threshold. The threshold is controlled by app option place.coarse.utilization_warning_threshold. Default is 90%. In case a movebound is intersecting with one or more exclusive movebound or voltage areas, then utilization of each overlapping region of the movebound is calculated and worst region is reported if it is more than the threshold. High utilization could cause longer runtime.

**What Next**

Resize the Movebounds or Voltage areas to decrease utilization.

---

## PLACE-090

(info) Found %d sequential and %d combinational multibit cells in the design.

Feedback

### Description

There are sequential/combinational multibit cells that could impact the quality of placement results.

### What Next

Debank multibit cells with the *split_multibit* command, and call banking after initial_opto.

---

## PLACE-091

(warning) Value 'true' for app option place.coarse.clock_gate_latency_aware is obsolete and will be interpreted as 'auto'.

### Description

The value 'true' for app option place.coarse.clock_gate_latency_aware is obsolete. The tool will interpret the value of 'true' as 'auto'.

### What Next

Modify your scripts to set the value to 'auto'. See the manpage of place.coarse.clock_gate_latency_aware for more information on app option values.

### See Also

- place.coarse.clock_gate_latency_aware

---

## PLACE-092

(warning) Skipping %s command as global_route_opt has been run.

### Description

Message indicates that the tool detected a situation where global_route_opt has already been run. Therefore, this command will be skipped. Application option place.coarse.force_rerun_after_global_route_opt can be used to override this behavior.

### What Next

No action necessary.

---

## PLACE-093

(info) Forcing rerun of %s command after global_route_opt due to application option place.coarse.force_rerun_after_global_route_opt being set.

### Description

Message indicates that the tool detected place.coarse.force_rerun_after_global_route_opt as set. In this case, placer will be forced to rerun after global_route_opt.

### What Next

No action necessary.

---

## PLACE-094

(error) Early data check failures detected. Placement failed.

### Description

During the coarse of placement, one or more early data checks failed. At least one of those failing checks was configured to be an error.

### What Next

Use 'report_early_data_checks' to inspect the failling check(s) after placement. For more detail, search in the log file for EDC-001 early data check messages. Fix the issue(s) or use 'set_early_data_check_policy' to relax the failing check(s).

---

## PLACE-095

(error) Value '%s' is not valid. Specify one of 'false' or 'auto'.

### Description

This app option only supports values 'false' and 'auto'.

### What Next

Specify one of the supported values. See manpage of place.coarse.clock_gate_latency_aware for details.

### See Also

- place.coarse.clock_gate_latency_aware

---

## PLACE-096

(Info) Technology node %s has been set by set_technology command. Technology-specific rules may not be fully supported by export_advanced_technology_rules command. Please consider using PrimeECO flow instead.

Feedback

**Description**

Message indicates that the tool detected the technology node set by user. Some advanced technology node rules are not supported. Please use PrimeECO flow instead.

**What Next**

Use PrimeECO flow.

---

## PLACE-097

(Warning) Enhanced Legalization Driven Placement technology is skipped for a hybrid row design.

**Description**

This warning message indicates that eLDP (place.legalize.enable_advanced_legalizer) is kipped for a hybrid-row design. Placement will continue.

**What Next**

Disable eLDP in the hybrid-row design flow.

---

## PLACE-098

(info) %sAuto Density Control is %s.

**Description**

This message indicates the status of automatic density control for the coarse placer.

**See Also**

- place.coarse.auto_density_control

---

## PLACE-099

(info) Scan connections are present in the design. More than %d%% of sequential cells are stitched. Valid scan def is required.

**Description**

This message indicates that scan def is required for this design as design is stitched.

**What Next**

Provide a valid scan def to run placement.

Feedback

## PLACE-100

(warning) Running placement without scan def on stitched design can result in suboptimal placement.

**Description**

This message indicates that scan def has not been loaded for this design. Placement result may be suboptimal.

**What Next**

Provide a valid scan def to avoid possible suboptimal placement.

## PLACE-101

(Warning) %s attribute not created.

**Description**

This message notifies user that the specified attribute is failed to be created in ndm and feature will be no-op.

## PLACE-102

(warning) Placer may continue without valid scan def.

**Description**

This warning message indicates that scan def has not been loaded for this design and the placer will continue.

**What Next**

A valid scan def is needed.

## PLACE-103

(error) Invalid power setup detected.

**Description**

This error message indicates that the power setup is invalid.

**What Next**

To check the UPF file and make sure it is complete.

Feedback

## PLACE-104

(warning) Placer may continue with invalid power setup.

**Description**

This waring message indicates that the placer will run with invalid power setup.

**What Next**

To check the UPF file.

## PLACE-105

(error) Invalid IR drop setup detected%s.

**Description**

This error message indicates that the IR drop setup is invalid.

**What Next**

To check the IR drop setup for print out message.

## PLACE-106

(warning) Skipping IR drop aware placement because setup is invalid%s.

**Description**

This waring message indicates that the placer will run with skipping IR drop aware placement.

**What Next**

To check the IR drop with print out message.

## PLACE-107

(warning) Placer may continue with infeasible constraints %s.

**Description**

This warning message indicates that the placer may continue with infeasible constraints.

**What Next**

To check the multi-voltage data and its placement constraints.

Feedback

## PLACE-108

(error) Placer will abort due to invalid region(s).

**Description**

This error message indicates that the physical region infered from voltage_areas and/or placement bounds have issues.

**What Next**

To check the voltage areas or bounds have invalid region.

## PLACE-109

(warning) Placer may continue with invalid region(s). Ignoring movebounds and voltage areas.

**Description**

This waring message indicates that the placer will run with ignoring movebounds and voltage areas.

**What Next**

To check the movebounds or voltage areas have valid region or not.

## PLACE-110

(error) Issues during timing analysis detected%s.

**Description**

This error message indicates that the timing analysis for timing-driven placement has issues.

**What Next**

To check the timing analysis for print out message.

## PLACE-111

(warning) Issues during timing analysis detected%s.

**Description**

This warning message indicates that the timing analysis for timing-driven placement has issues.

Feedback

**What Next**

To check the timing analysis for print out message.

---

## PLACE-112

(error) Data for timing-driven placement is missing.

**Description**

This error message indicates that the required data for timing-driven placement is not complete or not correct.

**What Next**

To check the timing data for timing-driven placement.

---

## PLACE-113

(warning) Data for timing-driven placement is missing.

**Description**

This warning message indicates that the data for the required data for timing-driven placement is complete and correct.

**What Next**

To check the required data for timing-driven placement.

---

## PLACE-114

(error) Macro %s should have physical_status fixed.

**Description**

This error message indicates that the macro is not fixed during placement.

**What Next**

To fix the macro or run with command create_placement -floorplan

---

## PLACE-115

(warning) Macro %s should have physical_status fixed.

Feedback

**Description**

This warning message indicates that the macro is not fixed during placement and it will be mark as fixed.

---

## PLACE-116

(error) Spare cell placement will abort due to infeasible spare cell constraint(s).

**Description**

This error message indicates that the spare cells constraint is infeasible.

**What Next**

To check with the constraint of the spare cells, like voltage area or valid region.

---

## PLACE-117

(warning) Spare cell placement may continue with infeasible spare cell constraint(s).

**Description**

This warning message indicates that the spare cells constraint is infeasible.

**What Next**

To r-name place.coarse.continue_on_missing_scandef -value true To check with the constraint of the spare cells, like voltage area or valid region.

---

## PLACE-118

(error) There are unfixed physical only cells in the design. Change the early data check policy unfixed_physical_cells to tolerate or fix the unfixed physical only cell.

**Description**

This error message indicates that there are unfixed physical only cells and may lead to bad runtime for placer.

**What Next**

To fix the unfixed physical only cell or change the policy to tolerate.

---

## PLACE-119

(warning) Unfixed physical cells are fixed.

Feedback

**Description**

This warning message indicates that there are unfixed physical only cells and the placer has marked it as fixed for itself.

---

## PLACE-120

(Info) %s

**Description**

This message is a generic informational message for coarse placer.

---

## PLACE-121

(Info) Adjusting congestion_driven_max_util to %s. This reserve area (%s) for %d cells.

**Description**

This message indicates that congestion_driven_max_util was adjusted to handle resereved area for certain cells. (legalization and/or timing)

---

# PNA

---

## PNA-001

(error) No power or ground net is specified

**Description**

User should specify one or multiple power or ground nets for analysis

**What Next**

Please specify one or a list of power and/or ground nets.

---

## PNA-002

(error) PNA is running out of memory.

**Description**

There is no enough memory for PNA to solve matrix during IR drop simulation.

Feedback

### What Next

Please use app_option plan.pna.ignore_objects_below_layer to ignore lower layer objects. It can help reducing memory usage but degrading accuracy of IR drop.

### See Also

- plan.pna.ignore_objects_below_layer

---

## PNA-003

(error) Net %s is not a power or ground net.

### Description

The net type of the specified net is neither Power nor Ground. PNA can only be performed on Power or Ground nets.

### What Next

Please update the net type or specify correct P/G nets.

---

## PNA-004

(error) No power pad can be found for net %s in the design.

### Description

PNA requires at least one power pad to be specified for the P/G net to be analyzed.

### What Next

Please specify power pad using *set_virtual_pad* command.

### See Also

- set_virtual_pad

---

## PNA-005

(error) Power pads are not connected to net %s.

### Description

PNA cannot identify any power pads or virtual pads that is physically connected to the %s P/G network; nor can PNA create virtual connections to the pads possibly due to route blockage.

Feedback

### What Next

Please change the location of P/G pads or virtual pads, or disable the blockage for virtual connection to pads.

---

## PNA-006

(error) No cell instance is connected to the %s power network or all the cell instances cannot reach the power pads.

### Description

PNA cannot find any cell instance that is connected to the power pads through the %s P/G network. It could be that none of the cells is logically connected to net %s; or they are floating.

### What Next

Please check the logic connection of cells in the design or check floating cells.

---

## PNA-007

(error) Power tap type is not defined.

### Description

User must specify one of the options '-virtual', '-pad_lib_cells' and '-pad_cells' to define power taps.

### What Next

Please specify the correct option.

### See Also

- analyze_power_plan

---

## PNA-008

(error) Cannot specify the option '-layer'.

### Description

The '-layer' option is valid only when virtual power taps are specified.

### What Next

Please specify '-layer' option together with '-virtual'.

Feedback

**See Also**

- analyze_power_plan

---

## PNA-009

(error) Power network analysis failed because no instance is connected to net %s.

**Description**

At least one cell in the design need to be logically connected to the P/G net being analyzed before power network analysis is performed.

**What Next**

Please check if cells' ports are connected to net %s. If not, please use *connect_pg_net* command to connect them.

**See Also**

- connect_pg_net

---

## PNA-010

(error) Cannot open file %s for read.

**Description**

Power network analysis may need the information from file %s.

**What Next**

Please check the access to file %s.

---

## PNA-011

(error) Cannot open file %s for write.

**Description**

Power network analysis may need write out information to file %s. It could be due to not sufficient disk space or the file name is incorrect.

**What Next**

Please check the access to file %s.

Feedback

## PNA-012

(error) Cannot specify the option '-coordinate'.

**Description**

The '-coordinate' option is valid only when virtual power taps are specified.

**What Next**

Please specify '-coordinate' option together with '-virtual'.

**See Also**

- analyze_power_plan

## PNA-013

(error) No horizontal or vertical straps.

**Description**

Both horizonatl and vertical straps need to exist before invoking analyze_rail.

**What Next**

Please create both horizonatl and vertical straps.

**See Also**

- analyze_power_plan

## PNA-014

(error) Fail to get parasitic model and corner to perform resistance extraction of P/G wires.

**Description**

The extraction engine of power network analysis uses parasitic model and corner to extract resistance of P/G wires and build network for IR drop analysis. The extractor failed to get defined parasitic model, and/or corner with associated parasitic model.

**What Next**

Please define parasitic model using "read_parasitic_tech", create a corner using "create_corner", and set corner & parasitic model association using "set_parasitic_parameters".

Feedback

**See Also**

- read_parasitic_tech
- create_corner
- set_parasitic_parameters

---

## PNA-015

(error) The required option -net is missing.

**Description**

For the command remove_virtual_pads, user can either use -all option to remove all existing virtual pads, or use -net and -coordinate to remove a specific virtual pad.

**What Next**

Please specify both -net and -coordinate options.

**See Also**

- remove_virtual_pads

---

## PNA-016

(error) The required option -coordinate is missing.

**Description**

For the command remove_virtual_pads, user can either use -all option to remove all existing virtual pads, or use -net and -coordinate to remove a specific virtual pad.

**What Next**

Please specify both -net and -coordinate options.

**See Also**

- remove_virtual_pads

---

## PNA-017

(error) Neither power budget nor power file is specified.

Feedback

**Description**

To perform power estimation for IR drop analysis, either -power_budget or -read_power_file needs to be specified.

**What Next**

Please specify -power_budget or -read_power_file option.

**See Also**

- analyze_power_plan

---

## PNA-018

(error) Syntax error in via rule file %s on line %d: %s.

**Description**

This message occurs when the specified via rule file has syntax errors.

**What Next**

Please refer to man page and correct the syntax errors.

**See Also**

- check_pg_missing_vias

---

## PNA-019

(error) Unrecognized power file format.

**Description**

This message occurs if the format of the specified power file is not default, or PT-PX.

**What Next**

Please apply default power file or PT-PX power report file.

---

## PNA-020

(error) Unable to find %s wire for virtual pad connection at %s on layer %s.

**Description**

This message occurs when there is no wire to be connected for the specified virtual pad.

Feedback

**What Next**

Please apply correct virtual pad.

---

## PNA-021

(error) Power analysis failed for net %s.

**Description**

This message occurs when calculating cell instance power fails.

**What Next**

Please check if power budget is set or power file exists.

---

## PNA-022

(error) fail to extract resistance for wire segment (%.3f %.3f %.3f %.3f) on layer %d .

**Description**

This message occurs when extracting resistance fails. The reason could be lack of RC information in this layer

**What Next**

Please check if tech file and corner are porperly set.

---

## PNA-023

(error) fail to extract resistance for via at (%.3f %.3f).

**Description**

This message occurs when extracting resistance fails. The reason could be lack of RC information in this layer

**What Next**

Please check if tech file and corner is porperly set.

---

## PNA-024

(error) Cannot get technology data for NDM.

**Description**

Power network analysis needs technology file information.

Feedback

**What Next**

Please check the access to technology file is correct.

---

## PNA-025

(error) Cannot find net %s in the design. Virtual pads cannot be created.

**Description**

Virtual pad can be created only if the desired net exists.

**What Next**

Please generate desired power nets and then use this command.

**See Also**

- read_virtual_pad_file

---

## PNA-026

(error) It is an unbound design.

**Description**

Power network analysis needs via definition in the design.

**What Next**

Please check if any required information is removed.

---

## PNA-027

(error) Cannot find the cut layer name in group_stapling_vias: %s

**Description**

User has to specify one correct cut layer name in group_stapling_vias.

**What Next**

Please specify one cut layer name in group_stapling_vias option. i.e. -group_stapling_vias VIA1

---

## PNA-028

(error) Neither power net nor report_track_utilization is specified.

Feedback

### Description

To perform power estimation for IR drop analysis or track utilization, either -nets or -report_track_utilization needs to be specified.

### What Next

Please specify -nets or -report_track_utilization option.

### See Also

- analyze_power_plan

---

## PNA-029

(error) The input network is too large to solve. Please use the app option: plan.pna.pna_auto_simplify_network -value true.

### Description

The input network is too large to solve. The size is over the capacity of matrix solver.

### What Next

Please try the app option plan.pna.pna_auto_simplify_network -value true.

### See Also

- analyze_power_plan

---

## PNA-030

(error) Current scenario doesn't exist. Please create a scenario.

### Description

Analyze_power_plan needs current scenario when using -analyze_power option.

### What Next

Please create a scenario.

### See Also

- analyze_power_plan
- create_scenario

Feedback

## PNA-501

(warning) unable to remove the specified virutal pad.

**Description**

The specified virutal pad to be removed does not exist.

**What Next**

Please specify correct net, coordinate, layer for the virtual pad to be removed.

## PNA-502

(warning) unable to create the specified virutal pad.

**Description**

The specified virutal pad exists in the design.

**What Next**

Please specify correct net, coordinate, layer for the virtual pad to be created.

## PNA-503

(warning) cannot find instance %s in the design.

**Description**

The instance defined in power file does not exist in the design.

**What Next**

Please specify correct instance in the power file.

## PNA-504

(warning) Specified power net %s is removed from net vector.

**Description**

The specified power net is secondary net, and will not be analyzed.

**What Next**

Please specify primary net, or ignore this warning.

Feedback

## PNA-505

(warning) Macro %s has no PG port.

**Description**

The macro has no PG port.

**What Next**

Create PG port for the macro, or ignore this warning.

## PNA-506

(warning) Power switch cell %s resistance is not valid, and is ignored.

**Description**

PNA expects a positive resistance value for a power switch cell.

**What Next**

Please specify a valid power switch cell resistance by set_app_options/set_attr command, or ignore this warning.

## PNA-507

(warning) The power_switch_resistance attribute of %s (%f) is not valid, and will be ignored.

**Description**

The specified power switch cell resistance by set_attr/set_attribute command is equal to or smaller than zero. PNA expects a positive resistance value for a power switch cell.

**What Next**

Please specify a valid power switch cell resistance by set_app_options/set_attr command, or ignore this warning.

## PNA-508

(warning) This virtual pad is outside of block boundary. Coordinate of the virtual pad :(%.3f, %.3f).

Feedback

**Description**

The virtual pad is out of current design boundary, but it will still be created and analyzed in PNA.

**What Next**

Please make sure the virtual power pad is in desired location, or ignore this warning.

---

## PNA-509

(warning) This virtual pad cannot connect to any PG wire. Coordinate of the virtual pad : (%.3f, %.3f).

**Description**

The virtual pad cannot create a virtual straight wire that connect to any PG wire. PNA will ignore the virtual pad.

**What Next**

Please change coordinates of the virtual power pad, or ignore this warning.

---

## PNA-510

(warning) There are standard cells/macros unplaced. PNA will distributed the power uniformly to the design.

**Description**

The power of unplaced standard cells/macros will be distributed uniformly to the design. The result will be different after placement/legalization.

**What Next**

Please place standard cells/macros and running analyze_power_plan again to achieve better result.

---

## PNA-511

(warning) For option %s, the specified value %s is invalid and ignored.

**Description**

This option value is invalid.

**What Next**

Check the command man page and specify the correct value.

Feedback

### PNA-512

(warning) User specified %s in %s is duplicated. It will ignore duplicated input.

**Description**

There are duplicated inputs in option. The command will only ignore duplicated input.

**What Next**

Please check if the input is intended.

### PNA-513

(warning) The value specified in %s is ignored. %s will take the value from %s only.

**Description**

There are exclusive control. Tool will only accept one of the setting

**What Next**

Please check if the input is intended.

## POW

### POW-001

(information) Propagated activity information for %s has been invalidated.

**Description**

There was propagated activity information available for certain modes or scenarios, but due to a design change it has been invalidated. It will be re-computed automatically next time power analysis is run.

**What Next**

No action required.

### POW-002

(warning) Design context is not valid.

**Description**

This message occurs when wrong design context is specified.

Feedback

### What Next

Specify correct design context.

### See Also

- report_power

---

## POW-003

(warning) Constraint design is not valid.

### Description

This message occurs when wrong constraint design is specified.

### What Next

Specify correct constraint design.

### See Also

- report_power

---

## POW-004

(warning) Design is not valid.

### Description

This message occurs when wrong design is specified.

### What Next

Specify correct design.

### See Also

- report_power

---

## POW-005

(information) Activity for scenario %s was cached, no propagation required.

### Description

Switching activity for a scenario was already calculated earlier. Therefore switching activity information will not be re-calculated.

Feedback

### What Next

No action is required.

---

## POW-006

(information) Propagated activity on scenario %s identical to that on %s

### Description

During activity propagation, a scenario with propagated data was detected that already contains the propagated activities. This data is being reused.

### What Next

No action required.

---

## POW-007

(warning) Pin %s is not a power pg pin.

### Description

This message occurs when specified pin is not a power pg pin.

### What Next

Specify a power pg pin.

---

## POW-008

(warning) No valid %sscenarios found in the user specified mode/corner/scenario list in design '%s'%s.

### Description

This message occurs when no valid scenarios are found in the mode/corner/scenario list specified by the user.

### What Next

Specify a valid scenario in the mode/corner/scenario list.

### See Also

- report_power
- report_switching_activity

Feedback

- set_switching_activity
- get_switching_activity
- reset_switching_activity
- propagate_switching_activity
- read_saif

## POW-009

(warning) Power analysis is disabled %s as leakage/swcap/internal mode power app options can be off and/or leakage_power/dynamic_power scenario flags are set to false.

**Description**

This message occurs when the scenario power flags are false and/or leakage/swcap/internal app options are 'off'.

**What Next**

Set the required power analysis app option to 'on' and enable the scenario power flags.

**See Also**

- report_power
- report_scenarios
- power.leakage_mode
- power.swcap_mode
- power.internal_mode

## POW-010

(warning) Ignoring invalid %s '%s' for %s-dependent %s specifications for the %s '%s'.

**Description**

state-condition or path-source specified for annotating sdpd data is not valid.

**What Next**

Specify a valid state-condition and/or path-source.

Feedback

## POW-011

(warning) Object for '%s' not found.

### Description

This message occurs when the object (instance, net, port, iopath or leakage) specified in the SAIF file is not found in the design.

### What Next

Check the name and pathname of the object and specify the correct object name which is present in the design.

### See Also

- read_saif

## POW-012

(error) Wrong format in line no %d of SAIF file.

### Description

This message occurs when the SAIF file contains a line which has incorrect format.

### What Next

Check the incorrect line number and re-write it according to the SAIF format.

### See Also

- read_saif

## POW-013

(warning) Unable to find pin '%s' specified as path source for the state condition '%s'.

### Description

This message occurs when an improper state dependent path dependent directive is specified in the SAIF file.

### What Next

Ensure that the pins specified in the state condition and the path source for the concerned object in the SAIF file actually exist in the design.

Feedback

### See Also

- read_saif

---

## POW-014

(warning) A value of '0.0' has been specified in the '-period' option. The tool will set it to the default value of '1.0' for activity computation.

### Description

This message occurs when a value of '0.0' is specified for the '-period' option.

### What Next

Check the value specified in the '-period' option to confirm if it should indeed be '0.0'.

### See Also

- get_switching_activity
- reset_switching_activity
- report_switching_activity

---

## POW-015

(warning) Cell '%s' is hierarchical, specify a non-hierarchical cell.

### Description

Command needs a non-hierarchical cell.

### What Next

Specify a non-hierarchical cell.

---

## POW-016

(info) No activity data found %s for %s '%s' scenario '%s'.

### Description

The message occurs when no activity data is found for specified state-condition and/or path-source.

### What Next

No action required.

Feedback

## POW-017

(warning) Clock '%s' specified as base clock is not a valid clock. It will be ignored for setting activities.

### Description

This message occurs when an invalid base clock is specified in the 'set_switching_activity' command.

### What Next

Check the base clock name specified in the 'set_switching_activity' command.

### See Also

- get_switching_activity
- reset_switching_activity
- report_switching_activity

## POW-018

(error) 'object_list' must contain valid objects.

### Description

This message occurs when object_list contains invalid elements or is empty.

### What Next

Specify at least one element, and make sure that all objects are of the valid type(s).

### See Also

- report_power
- set_switching_activity
- reset_switching_activity
- report_threshold_voltage_groups

## POW-019

(error) No valid %s specified.

Feedback

### Description

This message occurs when -cell_power and/or -net_power is specified without specifying a valid cell and/or net.

### What Next

Specify atleast one valid cell and/or net.

### See Also

- report_power

---

## POW-020

(error) The %s option cannot be used without -net_power or -cell_power.

### Description

This message occurs when 'objects' or '-leaf' option is specified without specifying -net_power or -cell_power.

### What Next

Specify -net_power and/or -cell_power.

### See Also

- report_power

---

## POW-021

(error) The -leaf option cannot be used when specifying objects.

### Description

This message occurs when objects are specified with -leaf option.

### What Next

Specify -leaf without specifying objects.

### See Also

- report_power

Feedback

## POW-022

(warning) Power group '%s' does not exist.

**Description**

This message occurs when invalid power group is specified.

**What Next**

Specify a valid power group.

## POW-023

(warning) Cannot determine rise/fall transition for unconnected pin '%s' for scenario '%s'.

**Description**

The transition on this pin cannot be determined as pin is unconnected. update_timing could not set transition for this pin.

**What Next**

connect the unconnected pin or set the transition attribute on the unconnected pin.

## POW-024

(information) Doing activity propagation for mode '%s' and corner '%s' with effort level '%s'.

**Description**

Specifies that activity propagation is being done for a given mode and corner.

**What Next**

Activity propagation should proceed for a valid combination of mode and corner.

## POW-025

(warning) Invalid switching activity annotation on constant object '%s' is being ignored.

**Description**

This message occurs when activity is being annotated on either a power or a ground object or a logic constant in the design. If you are annotating a power or logic1 object, the probability can only be specified as 1.0. If you are annotating a ground or logic0 object, the probability can only be specified as 0.0. The toggle rates in such cases can only be specified as 0.0.

Feedback

**What Next**

Check whether you really intended to apply those activities on constant objects.

**See Also**

- get_switching_activity

---

## POW-026

(information) Activity is being annotated on an unconnected net '%s'.

**Description**

This message occurs when activity is being annotated on an unconnected net.

**What Next**

Check if activity annotated on this unconnected net is useful.

**See Also**

- get_switching_activity

---

## POW-027

(warning) Invalid switching activity type '%s' is being %s

**Description**

This message occurs when wrong activity type is specified.

**What Next**

Specify a valid activity type and re-run the command.

**See Also**

- report_switching_activity

---

## POW-028

(error) File is not a backward annotated SAIF file.

**Description**

This message occurs when the string in the DIRECTION construct of the file is not backward.

Feedback

**What Next**

Specify the DIRECTION string as backward and re-run the command.

**See Also**

- read_saif

---

## POW-029

(error) Wrong scaling factor in line number %s.

**Description**

This message occurs when the scaling factor in TIMESCALE construct is neither 1, 10 or 100.

**What Next**

Specify the scaling factor as either 1, 10 or 100 and re-run the command.

**See Also**

- read_saif

---

## POW-030

(warning) %s

**Description**

The command action returned the specified information message.

**What Next**

n/a.

---

## POW-031

(error) Wrong time unit in line number %s.

**Description**

This message occurs when the time unit in the TIMESCALE construct is neither of s, ms, us, ns, ps or fs.

**What Next**

Specify the time unit as one of allowed types and re-run the command.

Feedback

**See Also**

- read_saif

---

## POW-032

(info) Setting toggle rate to 0.0 since probability has been specified as '%f'.

**Description**

The toggle rate can only be 0.0 if probability has been set to either 1.0 or 0.0. The tool will automatically reset the user specified toggle rate to 0.0 if anything other than 0.0 is provided.

**What Next**

Check whether you really intended to specify this activity for the object under consideration.

**See Also**

- get_switching_activity

---

## POW-033

(warning) Object '%s' does not have switching activity specified %s %s %s %s.

**Description**

The specified path_source/state_condition is not valid or switching activity has not been set for this path_source/state_condition.

**What Next**

Check whether specified path_source/state_condition is correct and switching activity has been set for this path_source/state_condition.

**See Also**

- set_switching_activity

---

## POW-034

(warning) No valid clocks available in mode '%s'. Setting clock frequency to %s GHz.

Feedback

### Description

Specified mode does not have any valid clocks. The simulation resolution needed to determine random vector generation during switching activity propagation is based on the fastest clock.

### What Next

Ensure there are valid clocks defined for the mode.

### See Also

- set_switching_activity
- get_switching_activity

---

## POW-035

(info) Setting the total toggle rate for net '%s' to 0.0 since probability has been set as '%f'.

### Description

The total toggle rate can only be 0.0 if probability has been set to either 1.0 or 0.0 during switching activity propagation.

### What Next

N/A.

### See Also

- set_switching_activity
- get_switching_activity

---

## POW-036

(warning) The toggle rate value of '%0.7f' for object '%s' exceeds the maximum toggle rate value of '%0.7f' of the fastest clock in the design.

### Description

The toggle rate of the object under consideration exceeds the maximum toggle rate possible during switching activity propagation. No data signal in the design should exceed the toggle rate of the fastest clock.

Feedback

### What Next

Ensure that any user activity annotations done through the 'set_switching_activity' command or activities enforced through reading SAIF files are valid.

### See Also

- set_switching_activity
- get_switching_activity

---

## POW-037

(warning) Cannot determine rise/fall transition for pin '%s' for scenario '%s'.

### Description

The transition on this pin cannot be determined and needs to be used for power estimation. During power estimation the 0.0 is used for the transition. This might cause extrapolation of the power tables in the library.

### What Next

The reason could be that it is driven by a primary input and the transitions as not been set. Please specify the transition. Another reason could be that the pin is driven by a constant, but that the toggle rate is non-zero. Please remove the (annotated) activity on the pin.

---

## POW-039

(warning) While computing leakage for instance '%s', mismatches in operating condition settings have been found in the design.

### Description

The operating condition mismatches may be triggered due to voltage, temperature or process label mismatches.

### What Next

Check the specifications in 'set_process', 'set_process_label', 'set_voltage' and 'set_temperature' commands.

### See Also

- report_power

Feedback

## POW-040

(warning) There are more than one instances present in the design for the saif name %s. Only one instance will be considered for annotating the switching activity.

### Description

The command action returned the specified information message.

### What Next

n/a.

### See Also

- read_saif

## POW-041

(warning) report_power can not generate net report for option '-net' as either power.swcap_mode app option is 'off' or its scenario is off for dynamic power.

### Description

Option '-net' of report_power command requires both power.swcap_mode app option 'on' and its scenario turned on for dynamic power.

### What Next

Turn ON the power.swcap_mode app option and/or turn ON the dynamic power for the scenario.

### See Also

- report_power
- power.swcap_mode

## POW-042

(error) Multiple objects cannot be specified if '%s' option is used in the 'report_power_calculation' command.

### Description

For virtual internal power queries using any of the '-capacitance', '-toggle_rate', '-probability' or '-transition' options, only a single object can be specified. The {pin, value}

Feedback

pairs given in these options will apply to the pins or ports of the specified instance or the module.

**What Next**

Specify a single object for the query.

**See Also**

- report_power

---

## POW-043

(error) The object '%s' specified can only be either an instance or a module if '%s' option is used in the 'report_power_calculation' command.

**Description**

For virtual internal power queries using any of the '-capacitance', '-toggle_rate', '-probability' or '-transition' options, only a single object of type either instance or module can be specified. The {pin, value} pairs given in these options will apply to the pins or ports of the specified instance or the module.

**What Next**

Specify either a module or an instance object for the query.

**See Also**

- report_power

---

## POW-044

(error) The object '%s' specified in the '%s' option in the 'report_power_calculation' command is not a pin or port in the instance or module being queried.

**Description**

For virtual internal power queries using any of the '-capacitance', '-toggle_rate', '-probability' or '-transition' options, the ports or pins specified in those options should be part of the instance or module object being queried.

**What Next**

Specify pins or ports in the '-capacitance', '-toggle_rate', '-probability' or '-transition' options that correspond to the module or instance being queried.

Feedback

**See Also**

- report_power

---

## POW-045

(info) %s

**Description**

The command action returned the specified information message.

**What Next**

n/a.

---

## POW-046

(warning) Power table extrapolation (%s mode) for port %s on %s for parameter %s. Lowest table value = %f, highest table value = %f, value = %f

**Description**

This message is given when a parameter during power table access is outside of the table range. Based on the mode, it will be extrapolated or clipped to the range.

**What Next**

The extrapolation mode can be set by app option power.table_extrapolation

**See Also**

- report_power

---

## POW-047

(warning) Power table estimation for parameter %s reduced to %f. Resulting power number will be multiplied with factor %f.

**Description**

This message is given when a parameter during power table access is outside of the table range and extrapolation mode is estimation. This will only be done for capacitive load parameters exceeding the highest power table index. In that case the power will be computed as if the load was driven by factor parallel drivers. So the load is reduced by 1/factor, the power number will be multiplied with factor for the given reduced load.

Feedback

### What Next

The extrapolation mode can be set by app option power.table_extrapolation.

### See Also

- report_power

---

## POW-048

(error) Timing model information not found for libcell '%s'.

### Description

This message occurs when timing model information for a libcell is not found.

### What Next

Check why timing model information is not found.

---

## POW-049

(warning) Option -tables not supported for libcell %s

### Description

The detailed library format is not available because the .lib data has been marked as confidential.

### What Next

Issuing report_power_library with out -tables will show a summary of what ta is available, but not the precise numerical values. The latter cannot be obtained from this library.

---

## POW-050

(error) '%s' is not a floating point number.

### Description

This message occurs when command expects a floating point number but user has not specified a valid floating point number.

### What Next

Specify valid floating point number.

Feedback

## POW-051

(information) Timer-derived activity data cached on scenario %s is invalidated.

**Description**

There was timer-derived activity information available for certain modes or scenarios, but due to a design change it has been invalidated. It will be re-computed automatically on demand.

**What Next**

No action required.

## POW-052

(information) Timer-derived activity data is cached on scenario %s

**Description**

Timer-derived activity informations been calculated and cached for the given scenario. It will be invalidated and re-calculated automatically on demand.

**What Next**

No action required.

## POW-053

(error) '%s' is not a '{pin_name value}' pair.

**Description**

This message occurs when command expects a pair but user has not specified a valid pair.

**What Next**

Specify valid pair.

## POW-054

(information) Activity cache is invalidated for scenario '%s'. Do activity propagation for this scenario to get updated activity.

Feedback

**Description**

There was cached activity information available for the scenario but it has been invalidated.

**What Next**

Re-run activity propagation for the scenario.

---

## POW-055

(error) Only leaf cells, black box cells and physical blocks can be annotated for power. Cell '%s' is neither.

**Description**

The set_annotated_power command only accepts leaf cells, black box cells or physical blocks for annotation.

**What Next**

Inspect the passed cell list for hierarchical cells that are not physical blocks or black box cells.

---

## POW-056

(warning) %s '%s' present in activity side file %s is not present in %s '%s', ignoring this object data.

**Description**

This happens when specified object in activity side file in not present in that hierarchy in the design.

**What Next**

Check if netlist has changed after writing the activity side file, write the activity side file again.

---

## POW-057

(error) value '%f' for option '%s' is invalid: must be > 0.

**Description**

This message occurs when the command option value specified is less than or equal to zero.

Feedback

**What Next**

Specify a non-zero non-negative number for this command option and re-run the command.

---

## POW-058

(error) %s

**Description**

The command action returned the specified error message.

---

## POW-059

(warning) Static probability of %d objects has been truncated to '1', to avoid this set option normalize to true.

**Description**

The message appears when option normalize is set to false and total weight applied is greater than 1 which resulted merged probablity of an object to be greater than 1.

**What Next**

Set option normalize to true.

---

## POW-060

(error) The activity group '%s' does not exist.

**Description**

The message appears when an activity group is specified that does not exist.

**What Next**

Specify an activity group that does exists. The 'report_switching_activity -essential' will give a report with all essential groups listed.

---

## POW-061

(error) Cannot assign to a non-user defined essential activity group.

**Description**

The message appears when the user wants to mark an activity point as a non-user defined essential activity point. Non-user essential activity point are automatically

Feedback

extracted by the tool and cannot be assigned by the user. The user is allowed to mark user-defined essential activity points.

**What Next**

Specify an user-defined activity group.

---

## POW-062

(error) Cannot set essential group on hierarchical port or pin named '%s'.

**Description**

The message appears when the user wants to set an essential group on a hierarchical port or pin.

**What Next**

Specify a leaf cell pin or port.

---

## POW-063

(error) Object must be pin or port.

**Description**

The message appears when the user specifies an object that is not a port nor pin.

**What Next**

Specify a leaf cell pin or port.

---

## POW-064

(error) Object must be pin, port or net.

**Description**

The message appears when the user specifies an object that is not a port nor pin nor net.

**What Next**

Specify a leaf cell pin, port or net.

---

## POW-065

(information) Essential activity is out-of-date. Do 'report_switching_activity -essential' to update essential activity points.

Feedback

### Description

Essential activity points have been queried, but the essential activity points are not up-to-date.

### What Next

Do 'report_switching_activity -essential' to update essential activity points.

---

## POW-066

(warning) Clock '%s' for mode '%s' has period 0.0 and will be ignored during power analysis.

### Description

This message occurs when a clock with period 0.0 has been defined.

### What Next

Check the clock definition with report_clock.

### See Also

- report_clock

---

## POW-067

(error) Invalid hierarchy selection '%s' specified.

### Description

The hierarchy option defines the scope for finding nets. Valid values are current, physical or all. In current hierarchy, net selection will take place within the logical hierarchy of the objects in the object list, or in the top module when no objects were defined. It means that no objects are reported that are not in the logical hierarchy of the objects (or top module). In physical hierarchy, nets are selected in the block scope (physical scope) of the objects. When the hierarchy is set to all, then all nets in the full hierarchy may be selected.

---

## POW-068

(warning) Cell(s) "%s" are non-hierarchical, hence ignoring them.

### Description

Command needs only hierarchical cells.

Feedback

**What Next**

Specify hierarchical cells.

---

## POW-069

(warning) %s toggles on pin %s are impossible given input states; converted to %s toggles.

**Description**

Power calculation deteected a situation where there are toggles of a certain polarity (rise/fall) on a pin whereas from the input states it would appear such toggles are impossible. In this case, the toggles are interpreted as the opposite type (i.e. rise toggles as fall toggles, and vice versa).

This situation can occur when inconsistent activities have been annotated on a cell.

**What Next**

You may want to review the activities annotated on this cell.

---

## POW-070

(information) Multi driven net '%s' is %s driven.

**Description**

This message occurs when a net is multi-driven by same type of drivers.

**What Next**

No action required.

---

## POW-071

(information) Multi driven net '%s' drivers %s and %s have different %s.

**Description**

This message occurs when a net is multi-driven by same type of drivers..

**What Next**

No action required.

Feedback

## POW-072

(warning) Multiple user power groups '%s' present for object '%s' and 'power.report_user_power_groups' is set as 'exclusive'. Considering group '%s' for this object.

**Description**

This message occurs when mulitple user power groups are found for an object and 'power.report_user_power_groups' is set as 'exclusive'.

**What Next**

'power.report_user_power_groups' can be set as 'inclusive'.

## POW-073

(information) Reading file '%s'.

**Description**

This message occurs when a saif file is read.

**What Next**

No action required.

## POW-074

(information) Power analysis being done for the %sactive scenario '%s'%s

**Description**

This message occurs when -force option is specified with report_power command to generate the power report for an inactive scenario or to override the leakage_power/ dynamic_power flags of a scenario.

**What Next**

No action required.

## POW-075

(warning) '%s' present in saif_map is not found in the current design.

Feedback

### Description

This warning message will be given when an object is not found in the design when reading a saif_map. After giving this warning, the parsing of saif_map will continue to give exhaustive list of objects not found.

### Examples

If an instance is not found in the design, then following error is reported - INSTANCE (full_cell_name) present in saif_map is not found in the current design.

If a net is not found in the design, then following error is reported - NET (full_net_name) present in saif_map is not found in the current design.

If a port is not found in the design, then following error is reported - PORT (full_port_name) present in saif_map is not found in the current design.

If a pin is not found in the design, then following error is reported - PIN (full_pin_name) present in saif_map is not found in the current design.

---

## POW-076

(warning) Simulated activity at netlist object '%s' was inconsistently redefined %d times. Last inconsistent SAIF definitions are on object %s and object %s.

### Description

This warning message indicates that inconsistent activities are present in the SAIF activity file. Activities are called inconsistent if the resulting probability and/or toggle rate are different. If two inconsistent SAIF activities refer to the same netlist object, this warning will be issued. This will for example happen when two pins that are connected to the same net have different activities in the SAIF file.

### What Next

Check the SAIF file or the tool that generated the SAIF file for issues.

---

## POW-077

(warning) No netlist object found to annotate simulated activity of SAIF object %s.

### Description

This warning message indicates that a specified activity in the SAIF activity file cannot be annotated in the netlist. This can happen when the original object that existed at SAIF generation time was deleted or completely remapped.

Feedback

**What Next**

If the SAIF file belongs to the current status of the netlist, this warning is not expected and should be investigated. Possibly the top level instance in the SAIF file does not correspond to the design. However, when the netlist has undergone optimizations, objects may have been deleted or remapped and this message can typically be ignored.

---

## POW-078

(warning) SDPD leakage data in the activity side file is incorrect. Skipping the SDPD leakage data of the design.

**Description**

This happens when the activity side file has improper SDPD leakage data.

**What Next**

Generate the activity side file again.

---

## POW-079

(error) Design '%s' present in saif_map is not same as the current top module '%s'.

**Description**

This error message will be shown when the current top module is not same as the design in the saif_map.

---

## POW-080

(warning) No default %s defined in the design, taking it as zero for power calculations.

**Description**

This message occurs when default voltage/temperature is not defined in the design.

**What Next**

Specify voltage/temperature using 'set_voltage/set_temperature'.

---

## POW-081

(information) Switching and internal power cannot be computed for the module '%s' because it does not have any ports.%s

Feedback

### Description

If the specified module does not have any ports, only leakage power can be calculated for it.

### What Next

Specify a module having ports for the query.

### See Also

- report_power

---

## POW-082

(warning) Simulated activity on object %s is changed by object %s at line:%d

### Description

This message occurs when we overwrite the activity on an object that has already been annotated in the same SAIF file.

### What Next

'power.only_use_unconditional_saif_information_for_nets' can be set to false.

---

## POW-083

(warning) The setting of ratio to 1 for the generated clock '%s' may not be equivalent to reset. Usage of reset_power_clock_scaling is recommended.

### Description

This message occurs when we set the scaling ratio for a generated clock to 1.

### What Next

Use reset_power_clock_scaling.

---

## POW-084

(warning) 'HighVT_select_fail_ratio' is not specified in file '%s'. Default value 1.0 will be applied for estimate context leakage calculation.

### Description

Leakage file must have HighVT_select_fail_ratio. It is used for estimating context leakage calculation.

Feedback

**What Next**

Provide HighVT_select_fail_ratio in leakage file.

---

## POW-085

(warning) Cell '%s' is a gtech cell which will limit activity propagation and power analysis results.

**Description**

Activity propagation and power analysis results for designs containing gtech cells can be limited.

**What Next**

Please compile to std cells to remove limitations.

---

## POW-086

(warning) Generic tech cell '%s' is too complex and will be modeled as a black box cell.

**Description**

Generic tech cell is too complex for activity propagation and power analysis. It will be modeled as a black box cell. Activity propagation and power analysis for this cell will be limited.

**What Next**

Compile the design to std cells.

---

## POW-087

(info) The activity type of object '%s' is '%s' so it is associated with either a supply or a constant. The activity of these kind of objects cannot be changed.

**Description**

The object is associated with a supply (power or ground) or a logic constant. The activity of these kind of objects are given and cannot be changed or set. If you have the intent to change the probability that a block/net is switched on for power scaling of switched blocks, then you should use the command *set_supply_net_probability*.

**What Next**

Dont annotate activity on supplies or constants.

Feedback

## POW-088

(information) Activity annotation on %s %s is %s to %s %s.

**Description**

Activity annotation is moved/copied from inside the repeater tree to root of the repeater tree if power.annotate_repeater_tree is enabled.

## POW-089

(error) Invalid state_condition '%s' specified in command %s_switching_activity.

**Description**

state-condition for sdpd data is not valid.

**What Next**

Specify a valid state-condition.

## POW-090

(warning) Command 'report_switching_activity' is deprecated, please use 'report_activity' instead.

**Description**

Command 'report_switching_activity' is deprecated.

**What Next**

Please use 'report_activity' instead.

## POW-091

(warning) %s

**Description**

The command action returned the specified warning message.

## POW-092

(warning) %s

Feedback

**Description**

The command action returned the specified warning message.

---

## POW-093

(error) %s

**Description**

The command action returned the specified error message.

---

## POW-094

(warning) report_power_calculation not enabled in the library '%s'.

**Description**

'report_power_calculation' library_feature is not enabled in this library, hence users do not have access to the power table values used for power calculation.

---

## POW-095

(warning) '%s' is not a valid vtGroup.

**Description**

This message occurs when the specified vtGroup name is not a valid vtGroup.

**What Next**

Specify a valid vtGroup name for this command option and re-run the command.

---

## POW-096

(error) value '%d' for option '%s' is invalid: must be > 0.

**Description**

This message occurs when the command option value specified is less than or equal to zero.

**What Next**

Specify a non-zero non-negative number for this command option and re-run the command.

Feedback

## POW-097

(error) Calculated '%s' power value is NaN for '%s'. Please check its input data, such as slew, load, and activity.

**Description**

This message occurs when calculated power value is NaN. It could be due to invalid slew value, load value, or activity toggle rate and static probability value.

**What Next**

Check slew, load, and activity values on this pin.

## POW-098

(warning) '%s' is a leaf cell, hence ignoring it in -hierarchy report.

**Description**

This message occurs when the specified cell is a leaf cell.

**What Next**

Specify a hierarchical cell and re-run the command.

## POW-099

(information) Net '%s' is being mapped to '%s' driven by pin '%s'.

**Description**

This message occurs when combinational logic driven by sequential cell is modified outside Fusion compiler. Hence we need to map old logic to modified logic and update saif_map database.

## POW-100

(warning) Value of '%s' for object '%s' should be non-negative, ignoring it.

**Description**

This message occurs when specified value is negative.

**What Next**

Specify a non-negative value for annotation.

Feedback

## POW-101

(error) Saif file should have DURATION specified and it should be greater than 0.

**Description**

This message occurs when duration is unspecified or less than or equal to 0.

**What Next**

Specify positive duration value.

## POW-102

(warning) Ignoring activity propagation as none of the flags(power or em) are set for scenario '%s'.

**Description**

Activity propagation is not done for the scenario if none of the flags(power or em) are set.

**What Next**

Enable the power/em flags for the scenario to propagate activity.

## POW-103

(warning) Ignoring boundary leakage for cell '%s' as it has not been legalized.

**Description**

Boundary leakage is not computed for cells that have not been legalized.

**What Next**

Please run create_placement and legalize_placement.

## POW-104

(error) Indesign PrimePower flow is unable to generate gate level saif.

**Description**

This could be due to issues reading the fsdb file in PrimePower.

**What Next**

Please check the input options '-strip_path', '-path', '-time', '-format' set in set_indesign_primepower_options command. Also ensure that the input fsdb file is correct.

Feedback

**See Also**

- set_indesign_primepower_options

---

## POW-105

(error) The SAIF map database for the '%s' block is corrupt.

**Description**

The SAIF map database could not be read successfully as it is corrupt.

**What Next**

Contact Synopsys Support and provide a test case with the implementation step used to create the specified block.

---

## POW-106

(information) C1Cn pin cap is not available for lib cell pin '%s', fall back.

**Description**

This message occurs when app option use_c1cn_pin_capacitance is enabled while the c1cn library data is not available for the cell pin.

---

## POW-107

(warning) Flat net for Net '%s' is not valid, cannot perform power analysis for design '%s'.

**Description**

This message occurs when any flat net for a design is not valid, and hence power analysis will not be performed for design.

---

## POW-108

(warning) Option '-write_fsdb' is not compatible with PrimePower C-CAPP time-based analysis.

**Description**

Option '-write_fsdb' is not compatible with PrimePower C-CAPP time-based analysis. It can only work with CAPP mode.

Feedback

**What Next**

Set power.indesign_use_capp to true to switch to CAPP mode, if gate level fsdb needs to be written.

---

## POW-109

(warning) The estimated activity has calculated toggle rate being inf or nan or negative number. Tool will use default probability and toggle rate as estimated activity value.

**Description**

The calculated toggle rate during activity estimation is found to be negative value or not a valid number. Tool will use default propability and toggle rate as estimated activity value. Please check if design fastest clock frequency is too low comparing to annotated toggle rate. Usually it happens when user speicified or SAIF specified activities have much higher frequency than design's SDC clock.

**What Next**

Please check clock frequency in SAIF, and sdc clock setup in the design. If inconsisitent, please use set_power_clock_scaling to make them consistent.

---

## POW-110

(error) Cannot create saif map temp file.

**Description**

This message occurs when shell.common.tmp_dir_path points to an invalid directory or the directory has incorrect read/write permissions.

**What Next**

Check shell.common.tmp_dir_path points to a valid directory with proper read/write permissions.

---

## POW-111

(warning) Command is ignored as saif map is not started.

**Description**

This message occurs during saif_map -write_map when saif_map is not started.

**What Next**

You needs to call saif_map -start before executing saif map command.

Feedback

# PPD

## PPD-001

(error) %s

**Description**

Persistent path data internal error.

**What Next**

Please send the log to Synopsys.

## PPD-002

(error) File format not supported.

**Description**

The format of the persistent path data file is not supported.

**What Next**

Please use gui_write_timing_paths command to generate valid timing path files.

**See Also**

- gui_write_timing_paths
- gui_read_timing_paths

## PPD-003

(error) File version %s not supported.

**Description**

The version of the persistent path data file is not supported.

**What Next**

Please use the correct version of the tool to generate timing path data.

Feedback

**See Also**

- gui_write_timing_paths
- gui_read_timing_paths

## PPD-004

(warning) Some timing paths will be skipped during reading. %s

**Description**

Some timing paths in the persistent path data file could not be properly read back in. This may be due to the fact that the associated design, scenario, mode, corner, pathgroup, clocks, and/or ports/pins etc... are not defined.

**What Next**

Please use the correct version of the design before reading timing path data.

**See Also**

- gui_write_timing_paths
- gui_read_timing_paths

# PRG

## PRG-002

(Information) %s

**Description**

The is an informational progress message. Messages of this type have a medium verbosity level.

**What Next**

No action is needed.

Feedback

# PT

## PT-001

(fatal) %s is not enabled.

**Description**

The application tried to reserve the specified license, but it was not available.

**What Next**

Verify that the key file is up to date and that sufficient licenses are available.

## PT-002

(error) Unrecognized feature name '%s'.

**Description**

You tried to get or remove a license that does not exist in the key file.

**What Next**

Verify that the key file is up to date and that the feature name is spelled correctly.

## PT-003

(Information) There are already %d licenses checked out for feature %s.

**Description**

This error occurred because you specified the *-quantity* option with the *get_license command* command and the specified quantity is smaller than the number of licenses that are already checked out for the specified feature.

The value specified for *-quantity* is the total number of licenses that should be checked out after the command has completed, which might not be the same as the incremental number of licenses checked out by the command.

**What Next**

Verify that the feature name is spelled correctly in case it was a different feature that you wanted to get. Specify a quantity that is equal to or greater than the number of licenses that have already been obtained.

Feedback

**See Also**

- get_license
- list_licenses

---

## PT-004

(error) You don't have a '%s' license to remove.

**Description**

You tried to remove a license that is not checked out.

**What Next**

Verify that the feature name is spelled correctly in case it was a different feature that you wanted to remove.

---

## PT-005

(error) Can't remove your '%s' license: %s.

**Description**

You tried to remove a license that is locked by the application. For example, this might be the license that is required to launch the application, or the license might be required by a design that is in memory. The message will indicate the condition that triggered it.

**What Next**

Action based on the message text.

---

## PT-006

(error) %s is not supported on '%s' platform.

**Description**

This is an error message indicating the command or option is not supported on the specified platform.

**What Next**

Please check the command manpage or product manuals for supported platforms. Make sure you run this command on the platforms that are supported.

Feedback

## PT-007

(warning) %s is deprecated; it will be obsoleted and removed starting with the %s release of PrimeTime.

**Description**

This is a warning message indicating the specified command, option, or variable is currently deprecated, and it will become obsoleted and removed in a future release of PrimeTime.

A "deprecated" feature is a feature that has not yet been removed but is planned to be removed in a future release. Thus, its use should be discontinued or transitioned to another feature.

An "obsoleted" feature is a feature that has been removed from the tool.

**What Next**

Please check the command/variable manpages, product manuals, or release notes for more details about the deprecation, and whether there are alternative approaches or replacements for this deprecated feature.

## PT-008

(error) %s was obsoleted starting with the %s release of PrimeTime; it is no longer supported.

**Description**

This is an error message indicating that the specified command, option, or variable has been obsoleted and is no longer supported.

**What Next**

Please check the command/variable manpages, product manuals, or release notes for more details about the obsolescence, and whether there are alternative approaches or replacements for this obsoleted feature.

## PT-009

(warning) The BC_WC analysis mode will be phased out in future releases.

**Description**

The analysis mode you are setting, best case - worst case, is potentially inaccurate and should be avoided for sign-off. It will be obsoleted in a future release of PrimeTime.

Feedback

For a thorough analysis, both setup and hold times should be checked at each corner of interest using the on_chip_variation analysis mode. In the BC_WC analysis mode, two corners are analyzed simultaneously. Hold times are checked at the fast (min) corner, and setup times are checked at the slow (max) corner. In the fast corner, fast slews are propagated along both the launch and capture sides of hold timing paths. As a result, worst-case slow timing cannot be guaranteed on the hold capture paths. In the slow corner, slow slews are propagated along both the launch and capture sides of setup timing paths. Again, worst-case fast timing cannot be guaranteed on the setup capture paths. In addition, the BC_WC analysis is incomplete because setup times are not cross-checked in the fast corner, and hold times are not cross-checked in the slow corner.

**What Next**

Migrate flows and scripts to avoid setting BC_WC analysis mode.

---

## PT-010

(error) %s is not enabled.

**Description**

The application tried to reserve the specified license, but it was not available.

**What Next**

Verify that the key file is up to date and that sufficient licenses are available.

---

## PT-011

(Warning) Obtained %d of requested %d licenses for feature %s.

**Description**

This warning is printed out because you specified the *-quantity* option with the *get_license command* and the number of licenses that was obtained is less than the requested quantity of licenses the specified feature.

At least one license of the specified feature was obtained.

**What Next**

No action is necessary if it is acceptable to run the tool with less than requested number of licenses (this may have tool performance implications). Otherwise, check the number of licenses of the specified feature and their usage by other processes and re-run the command when there are enough licenses available.

Feedback

### Description

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE in pt_shell.

### What Next

This is an informational message only. No action is required on your part.

### See Also

- PT-018

Feedback

## PT-018

(Information) License queuing is enabled.

**Description**

You receive this message because you have enabled license queuing.

The license queuing is enabled by setenv SNPSLMD_QUEUE TRUE

When enabled the following timeouts can be adjusted:

Timeout for the initial license: setenv SNPS_MAX_WAITTIME <number of seconds>

Timeout for all subsequent licenses: setenv SNPS_MAX_QUEUETIME <number of seconds>

Defaults are equivalent to setenv SNPS_MAX_WAITTIME 259200 setenv SNPS_MAX_QUEUETIME 28800

**What Next**

This is an informational message only. No action is required on your part.

## PT-019

(Information) Checked out license '%s'

**Description**

The application checked out 1 license of the feature specified.

## PT-020

(Information) Checked in license '%s'

**Description**

The application checked in 1 license of the feature specified.

## PT-021

(information) Setting license limit for feature '%s' to %d.

**Description**

The limit on number of licenses for the specified feature has been set.

Feedback

### What Next

This is an informational message only. No action is required on your part.

### See Also

- get_license
- remove_license

---

## PT-022

(warning) Failed to set license limit for feature '%s': existing license count is higher than limit (%d > %d).

### Description

Failed to set the limit on number of licenses for the specified feature because the number of currently used licenses for the feature is higher than the specified limit.

### What Next

Reduce the license count for the specified feature to a number lower or equal of the given limit.

---

## PT-023

(Warning) Requested '%d' licenses for feature '%s', '%d' checked out.

### Description

Failed to checkout the requested number of licenses for the specified feature but did manage to check out some.

If the number of licenses requested is higher than the number already checked out, this occurs when the license server cannot fulfil the requests for the number of licenses due to a lack of licenses or because some of its licenses are already in use. The number of license indicated as checked out are all the license that can be acquired at this time.

If the number of licenses requested is lower than the number already checked out, this occurs because incremental licensing is not enabled.

PrimeTime can only check out licenses for a single feature from a single license server at a time. If the licenses for a feature are split across multiple license servers, the maximum number of licenses of that feature that PrimeTime can check out is determined by the license server with the largest number of licenses. PrimeTime cannot span its license check outs for a single feature across multiple license servers at this time. However, it can check out licenses for different features from different license servers.

Feedback

**What Next**

If the warning is due to a failure to increase the number of licenses then increase the number of licenses available on the license server so that subsequent attempts to checkout licenses succeed.

---

## PT-024

(information) Removing license limit for feature %s.

**Description**

The limit on number of licenses for the specified feature has been removed.

**What Next**

This is an informational message only. No action is required on your part.

---

## PT-025

(error) Cannot modify this variable after the first timing update.

**Description**

This variable can only be set prior to the initial timing update of the current design.

**What Next**

Please reconsider when to set this variable in your script or interactive run.

---

## PT-026

(warning) %s has been made obsolete since the %s release of PrimeTime and is no longer supported.

**Description**

This is an error message indicating that the specified command, option or variable has been obsoleted and is no longer supported.

**What Next**

Please check the command/variable manpages, product manuals or release notes for more details about the obsolescence, and whether there are alternative approaches or replacements for this feature being obsleted.

Feedback

## PT-027

(error) Cannot set the license limit for the crucial feature '%s' to '%d'

### Description

The limit on the number of licenses of the specified crucial feature cannot be set to the level specified. Typically this occurs when setting the limit to '0' which is not allowed as at least 1 license key of a crucial feature must remained checked out at all times during a session.

### What Next

Specify a higher limit on the number of licenses.

## PT-029

(information) Failed to checkout '%s' license ... exiting!

### Description

PrimeTime exited after failing to checkout a license for a feature required by commands in the users script. Typically this occurs when all the license keys for the required feature are in use.

Exiting under these conditions is a user selected behaviour, by default PrimeTime does not exit when a feature license is not available it continues execution without the commands/ capabilities enabled.

### What Next

In order to prevent PrimeTime from exiting immediately when the feature license cannot be checked out, turn on license queuing to have the tool wait for a period of time for a license to become available. License queuing can be turned on by applying the following in the UNIX shell prior to launching PrimeTime.

setenv SNPSLMD_QUEUE TRUE

By default, the queuing timeout is 28800 seconds.

If license queuing is already enabled then the queuing time may be too short and can be set by applying the following in the UNIX shell prior to launching PrimeTime along with enabling license queuing.

setenv SNPS_MAX_QUEUETIME <number of seconds>

Feedback

## PT-030

(error) The '%s' license cannot be removed, it is a pre-requisite of the '%s' license.

**Description**

The license cannot be removed as it is a pre-requisite of another license which is currently checked out.

**What Next**

Remove the license that depends on this license before removing this license.

## PT-031

(error) the '%s' license cannot be removed, it is required by the '%s' variable setting.

**Description**

The license cannot be removed as it is required by the analysis type enabled by the specified variable.

**What Next**

Disable the analysis type specified by the variable and then remove the license.

## PT-032

(error) The '%s' license limit cannot be set to '%d' '%s' is a prerequisite of the '%s' feature which already has '%d' licenses checked out.

**Description**

Where a feature is a prerequisite of another feature, the limit on the prerequiste feature cannot be less than the number of licenses already checked out for the feature with the license dependency.

**What Next**

Reduce the number of licenes checked out for the feature with the prerequisite dependency before reducing the limit on the prerequisite feature.

## PT-033

(error) The '%s' license limit cannot be set to '%d' '%s' is a prerequisite of the '%s' feature whose limit is already set to '%d'

Feedback

### Description

Where a feature is a prerequisite of another feature, its limit cannot be set less than the limit set for the feature with the prerequisite dependency.

### What Next

Reduce the limit on the feature with the prerequisite dependency before reducing the limit for the prerequisite feature.

---

## PT-034

(Information) License filtering is enabled.

### Description

You receive this message because you have enabled licensing filtering.

The license filtering is enabled by setting the following UNIX environmental variable before starting PrimeTime.

setenv SNPSLMD_DISABLE_NTA_LICENSE_CHECKS 1

When enabled, this indicates to PrimeTime that the user is not interested in any capabilities associated with the PrimeTime New Technology feature licenses. As a result PrimeTime will not even query the license server for the existence of these licenses, it will be as if the feature keys are not present in the license server and any associated capabiliteis will remain disabled.

### What Next

This is an informational message only. No action is required on your part.

---

## PT-035

(error) Cannot reduce %s license count to %d because %d licenses of this feature are required for feature %s.

### Description

This error occurred because you specified the *-keep* option with the *remove_license command, but the number of licenses for the specifed feature cannot be reduced because it is a pre-requisite of another feature.*

Where a feature is a prerequisite of another feature, its license count cannot be set to a lower number than the license count of the feature with the prerequisite dependency.

Feedback

### What Next

Reduce the license count on the feature with the prerequisite dependency before reducing the license count for the prerequisite feature.

### See Also

- remove_license
- get_license
- list_licenses

---

## PT-036

(error) Feature %s is limited to %d licenses.

### Description

This error occurred because you specified the *-quantity* option with the *get_license command, but the number of licenses for the specifed feature is limited to a lower number than the requested number of licenses.*

The get_license *command will attempt to obtain licenses up to the limit.*

### What Next

Set higher limit or remove the limit for the specified feature using the set_license_limit *command.*

### See Also

- get_license
- list_licenses

---

## PT-037

(error) Cannot get more than %d licenses for feature %s due to pre-requisite limits.

### Description

This error occurred because you specified the *-quantity* option with the *get_license command, but the number of licenses for the specifed feature cannot be set to a higher number than the license limit set on a feature the specified feature depends on.*

The get_license *command will attempt to obtain licenses up to the maximum allowable number.*

Feedback

### What Next

Set higher limit or remove the limit for the feature the specified feature depends on using the set_license_limit *command.*

### See Also

- get_license
- list_licenses

---

## PT-040

(information) Advanced waveform propagation is enabled.

### Description

You receive this message because you have enabled the advanced waveform propagation mode.

### What Next

This is an informational message only. No action is required on your part.

---

## PT-041

(information) Message '%s' %s limit (%d) exceeded. Remainder will be suppressed.

### Description

You receive this message if the total number of warning messages of a particular message id exceeds a default (or user set) limit.

### What Next

This is an informational message only. To avoid receiving this message, you can increase the default limit using the variable *sh_message_limit* or the command *set_message_info*.

### See Also

- PT-041

---

## PT-042

(information) No license limit set for feature %s.

Feedback

**Description**

You are trying to remove the limit on the number of licenses set for a feature shown in the informational message, but the limit cannot be removed because it was not previously set.

**What Next**

This is an informational message only. No action is required on your part.

---

## PT-043

(information) No limits are set on feature licenses.

**Description**

There are no limits on the number of licenses set for any feature.

**What Next**

This is an informational message only. No action is required on your part.

---

## PT-044

(Warning) Only one %s license can be checked out at a worker process.

**Description**

You have issued the *get_license* command with the *-quantity* option, requesting check out of more than one license for the given feature at a worker process. There is no need for worker processes to use more than one license of a feature, so *get_license* will attempt to check out only one of the requested feature licenses.

**What Next**

Check out the required number of licenses at the manager process instead of checking out licenses at worker processes. Alternatively, modify your scripts to check out no more than one license of the feature by a worker process.

---

## PT-045

(Error) PrimeTime New Technology license %s cannot be checked out.

**Description**

You have issued the *get_license* command requesting check out of a PrimeTime New Technology license. PrimeTime does not require check out of New Technology feature licenses.

Feedback

**What Next**

Remove the request to check out a PrimeTime New Technology license from your script.

---

## PT-046

(Error) the '%s' feature license cannot be checked out.

**Description**

You have issued the *get_license* command requesting check out of the debug feature indicated, however the UNIX environmental variable *SNPSLMD_DISABLE_DEBUG_LICENSE_CHECKS* is set to 1 indicating that all debug licenses should be skipped for access.

**What Next**

Remove the request to check out the indicated feature from your script or unset the *SNPSLMD_DISABLE_DEBUG_LICENSE_CHECKS* UNIX environmental variable.

---

## PT-047

(error) Cannot set limit for dependent feature %s to %d which is higher than the limit %d set on a pre-requisite feature.

**Description**

This error occurred because you specified the *-quantity* option with the *set_license_limit command, but the limit of licenses for the specifed feature cannot be set to a higher number than the license limit set on a feature the specified feature depends on.*

**What Next**

Set higher limit or remove the limit for the feature the specified feature depends on using the set_license_limit *command.*

---

## PT-048

(error) Checkout of these licensed features has failed: %s.

**Description**

The application tried to reserve the specified list of licensed features, but one or more of them was not available.

**What Next**

Verify that the key file is up to date and that sufficient licenses are available.

Feedback

## PT-049

(error) Cannot reduce the %s license count from %d to %d, %d licenses are in use for %s.

### Description

This error occurred because you tried to reduce the number of licenses checked out, for the specified feature, to below the number of licenses currently in use for the analysis indicated.

### See Also

- remove_license
- get_license
- list_licenses

## PT-050

(error) cannot checkout '%s' because it is suppressed.

### Description

The feature license cannot be checked out because it has been suppressed for checkout by the user.

### What Next

If the feature license is required, do not suppress it. Remove whatever suppression method has been applied.

## PT-051

(error) cannot checkout '%s' because its prerequisite '%s' is suppressed.

### Description

The feature license cannot be checked out because it one or more of its prerequisite features has been suppressed.

### What Next

If the feature license is required, do not suppress any of its prerequisites. Remove whatever suppression method has been applied.

Feedback

## PT-052

(Information) License queuing is disabled.

**Description**

You receive this message because you have explicity disabled license queuing.

The license queuing is disabled by setenv SNPSLMD_QUEUE FALSE

**What Next**

This is an informational message only. No action is required on your part.

## PT-054

(Information) Changing the license checkout maximum wait time from '%d' seconds to '%d' seconds.

**Description**

You receive this message because you requested the maximum wait time for the initial license checkout to be changed to the specifed value.

**What Next**

This is an informational message only. No action is required on your part.

## PT-055

(Information) Changing the license checkout maximum queue time from '%d' seconds to '%d' seconds.

**Description**

You receive this message because you requested the maximum queue time for license checkouts to be changed to the specifed value.

Where the process is a PrimeTime DMSA manager, it is recommended to set this value to a reaonably small value (< 300s) because where there are insufficient licenses available, each distributed command executed at the manager will incur queuing for licenses. The queuing will occur for every command until all the required licenes have been acquired impacting performance.

**What Next**

This is an informational message only. No action is required on your part.

Feedback

## PT-056

(Error) Failed to enable incremental licensing.

**Description**

You receive this message because the tool tried to enable incremental licensing internally and failed.

**What Next**

Contact the tool support team.

## PT-058

(Error) Failed to initialize critical licensing component.

**Description**

You receive this message because a critical licensing component failed to initialise and the tool cannot start up.

**What Next**

Please open a star with Synopsys specifying this error message.

## PT-059

(Warning) could not load Itcl package.

**Description**

You receive this message because the Incremental Tcl (Itcl) package supplied as part of the PrimeTime installation cannot be loaded.

**What Next**

Please check your Primetime installation directories include the itcl package library.

## PT-060

(Warning) Background process invalidates the -baseline_delta option of mem command

**Description**

The -set_baseline option of the mem command sets a baseline of the current memory used by PrimeTime. Subsequently, mem -baseline_delta returns the peak memory since the last baseline. If a background process is launched by the tool (e.g. by parallel_execute

Feedback

or redirect -background) after a baseline has been set, the memory used by the background proces will not be accounted in the result of mem -baseline_delta.

**See Also**

- mem

---

## PT-061

(Error) Failed to initialize the licensing call-home functionality.

**Description**

You receive this message because the licensing infrastructure failed to initialize a critical component necessary for checking out licenses.

**What Next**

Please file a STAR reporting the circumstances under which this occurred.

---

## PT-063

(Error) Library Compiler executable path is not set.

**Description**

When you install the PrimeTime tool, you need to specify the path to the Library Compiler executable, which PrimeTime tool uses for reading Liberty (.lib) files. The Library Compiler executable cannot be found because no path was specified.

**What Next**

Do one or both of the following:

- Add the Library Compiler executable path to the existing PrimeTime installation by running the following script:

  ```
  $synopsys/admin/install/syn/bin/install_pt
  ```

  The script prompts you for the location of the Library Compiler root directory:

  ```
  Synopsys Library Compiler root directory:
  ```

  At the prompt, enter the root installation directory of the Library Compiler tool.

- Set the SYNOPSYS_LC_ROOT environment variable to the path to the Library Compiler executable before you invoke the PrimeTime shell.

Feedback

## PT-064

(Error) Incorrect argument %s passed to load : %s.

**Description**

You receive this message because an option passed to the *load* command is incorrect.

**What Next**

The the arguments passed to the *load* command.

## PT-065

(Error) Loading command %s failed limitations checking: %s.

**Description**

You receive this message because the *load* tried to define commands which do not conform to PrimeTime's requirements.

**What Next**

Modify the source code of the loaded shared library to make it compatible with Primetime's requirements.

## PT-066

(fatal) Existing command %s was overwritten by load.

**Description**

You receive this message because the *load* command tried to overwrite one the existing PrimeTime commands.

**What Next**

Modify the source code of the loaded shared library to use command names different to the names of existing PrimeTime commands.

## PT-067

(fatal) Failure to open file due to system error "%s".

**Description**

A file could not be opened because of operating system error.

Feedback

### What Next

Depending on the system error, take the appropriate action on your OS or in your scripts. For example, an error of "Too many open files" may indicate that file handles are being leaked (opened but not closed) in a tcl script. See the linux man page for 'errno' for more information.

---

## PT-068

(warning) The dynamically loaded library was not linked against the collections library.

### Description

The dynamically linked library was not linked against the Synopsys supplied Collections API library. The load may still proceed, but this native Collections API functionality will be unavailable.

### What Next

If you wish to access the Collections API functionality, please ensure you are following Synopsys supplied instructions for this, or contact Synopsys.

---

## PT-072

(error) License checkout is not allowed in subprocesses.

### Description

Cross command parallel execution directives *redirect -bg* and *parallel_execute* launch subprocesses to perform the commands in parallel. It is required that these subprocesses do not try to checkout additional license while performing their work. Therefore, commands and variables which implicitly try to checkout licenses are not executed and error is issued.

### What Next

Remove the license checkout command from subprocesses running in parallel, and move them to the main parent process so they are executed in serial mode. The license checked-out by the parent process will be avilable for use to all the subprocesses.

---

## PT-073

(error) Cannot request %d keys of %s in the In-Design Mode.

Feedback

**Description**

In the In-Design mode an external application instructs the tool such as PrimeTime to manage licenses in the pre-programmed way. This error occurs if the number of license keys requested by the tool is larger than 1.

**What Next**

Remove the license checkout command from the script passed to the tool (e.g. PrimeTime) which requests multiple license keys. Alternatively, multiple keys may be requested internally by the tool due to enabling of some capability, in that case rewrite the script to request only a single key of the license.

---

## PT-074

(error) The license %s is not available in the In-Design Mode.

**Description**

In the In-Design mode an external application instructs the tool such as PrimeTime to manage licenses in the pre-programmed way. This error occurs if the reported license is not allowed to be checked out by the tool.

**What Next**

Remove the license checkout command from the script passed to the tool (e.g. PrimeTime) which requests the license.

---

## PT-075

(error) %s or %s is not enabled.

**Description**

The application tried to reserve the specified license, but either one or both of them were not available.

**What Next**

Verify that the key file is up to date and that sufficient licenses are available.

---

# PTLIB

---

## PTLIB-001

(error) The input of option -index_1 is invalid.

Feedback

### Description

The command *set_lib_max_cap_table* issues this error message when option -index_1 is specified with a invalid list of values.

### What Next

Make sure the values in the list are monotonically increasing.

---

## PTLIB-002

(error) The length of the input option -index_1 and -value should be the same.

### Description

The command *set_lib_max_cap_table* issue this message when the input frequency indices and capacitance values are of two different length input lists.

### What Next

Make sure the the input list of options -index_1 and -value have same length.

---

## PTLIB-003

(error) No max cap table on the specified library pin '%s', failed to set max cap table.

### Description

The *set_lib_max_cap_table* command issues this message when there is no max cap table on the specified library pin.

### What Next

Make sure the specified library pin contains max cap table or use -force option.

---

## PTLIB-004

(error) The desired table on the specified library pin '%s' is not a 1-d frequency based max_cap table, failed to set max cap table.

### Description

The *set_lib_max_cap_table* command issue this message when the desired table on the specified library pin is not a 1-d frequency based max_cap table. The *set_lib_max_cap_tablecommand supports only to override the 1-d frequency based max_cap table.*

Feedback

**What Next**

Make sure the desired table on the specified library pin is a 1-d frequency based max_cap table.

---

## PTLIB-005

(error) The input list of options -index or -value are empty.

**Description**

The command *set_lib_max_cap_table* issues this error message when the input list of options -index or -value are empty.

**What Next**

Make sure to provide values.

---

## PTLIB-006

(error) Invalid frequency index value '%f', failed to override frequency index on the library pin '%s'.

**Description**

The *set_lib_max_cap_table* command issues this message when the specified -index_1 option is not in the table. Allowed only to override the existing table index

**What Next**

Please provide the existing max cap table frequency index.

---

## PTLIB-007

(error) Trying to set max cap table on library pin '%s' of directon '%s', failed to set max cap table.

**Description**

The *set_lib_max_cap_table* command issues this message when try to set max cap table on library pin which is not of direction Output or Inout.

**What Next**

Please provide a library pin of direction Output or Inout.

Feedback

## PTLIB-008

(error) Slew derate inconsistency found in library %s for %s.

### Description

This message is issued when slew derate inconsistency is found for the specified library. The inconsistency happens when slew derate times the difference between upper and lower thresholds for pct rice/fall is greater than 1.

### What Next

Please verify the values for slew_lower[upper]_threshold_pct_rise[fall] attributes in the library.

## PTLIB-009

(Error) %s CCS noise model is invalidated because: %s

### Description

This error message indicates that an issue was found with an arc or pin CCS noise model during library read. As a result, the model is invalidated and not used in delay calculation.

These checks are always performed, but they are reported only when the *rc_ccsn_enable_library_error_reporting* variable is set to *true*.

If library scaling groups are being used, invalidated CCS noise models can cause scaling group inconsistencies, resulting in SLG-403 errors.

The limit value for the maximum current check can be set with the following variable:

```
pt_shell> set_app_var rc_ccsn_dc_current_limit_in_ma ...
```

### What Next

Investigate and fix the CCS noise model issue in the library.

### See Also

- SLG-403

## PTLIB-010

(Warning) CCS receiver model of %s : %s

Feedback

**Description**

You receive this warning because PrimeTime find a library CCS receiver model issue that may affect delay calculation accuracy. The message shows only when rc_receiver_enable_library_error_reporting is set to TRUE.

Types of warning

Negative capacitance value detected: PrimeTime does not support negative capacitance value in delay calculation.

Capacitance glitch detected: large fluctuation in C1Cn cap value may cause delay calculation inaccuracy.

The following example shows when negative value is detected:

Warning: CCS receiver model INV_4X: arc I->ZN : negative capacitance value detected. (PTLIB-010)

**What Next**

This is an informational message and no action required.

---

## PTLIB-011

(Warning) Extrapolation is applied bounding to 10% of the limit.

**Description**

Extrapolation is applied to estimate the value of the capacitance for the respective frequency value and is bounded to 10% of the limit,if the freq lies in a range outside of the given data set.

This warning message will be thrown when user has overriden the freq-cap data from library i.e. when *set_lib_max_cap_table* is used to override the freq-cap data for the lpin.

**What Next**

This is an informational message and no action required.

---

# PVT

---

## PVT-010

(warning) Multiply-defined voltage for rail %u from supplyNet %s connected to pin %s: %g vs %g in corner %s.

Feedback

### Description

This message is issued when there are conflicting voltage settings for a power rail of some cell. This could happen if the rail has multiple power pins with different supply net connections, or if two supply nets have different voltages (from set_voltage), and are both connected to the rail.

### What Next

Review the UPF data for an incorrect supply net configuration. Review the constraints for duplicate or incorrect set_voltage commands.

---

## PVT-011

(warning) No voltage defined for supplyNet %s of pin %s, rail %u in corner %s.

### Description

This message is issued when the voltage value of a supply net connected a cell's power pin is not known. This could happen if no set_voltage command has been given to set the voltage on a supply network, or if a different supply net has the correct voltage, but there is no connection (via supply_ports) between the powered supply net and the one actually connected to the cell.

### What Next

Review the UPF data for an incorrect or incomplete supply net configuration. Review the constraints for missing set_voltage commands.

---

## PVT-012

(warning) Using default primary voltage %g.

### Description

This message is issued (usually after a PVT-011 or PVT-013 message) when the voltage value of a cell's power pin is not known, and the corner's default primary supply voltage is used instead.

### What Next

Review the UPF data for an incorrect or incomplete supply net configuration. Review the constraints for missing set_voltage commands.

Feedback

## PVT-013

(warning) No supply net for power pin %s with power function %s and pg type %s in corner %s.

### Description

This message is issued when there is no supply net connected a cell's power pin, and thus the pin's supply voltage is not known. This could happen if there is no primary supply set or no connect_supply_net command to implicitly or explicitly connect a UPF supply net to the cell's power pin. If no UPF commands have been given, the tool will automatically create default primary supply nets to implicitly connect all cells' primary power pins. In this case, this message would be seen only for non-primary power pins.

### What Next

Review the UPF data for an incorrect or incomplete supply net configuration.

## PVT-014

(warning) Network of supply net %s has no %s voltage defined in corner %s.

### Description

This message is issued when the early or late voltage value of a supply net cannot be determined for some corner. This could happen if no set_voltage command has been given to set the voltage on the supply net's network, or if the supply net has not been properly connected to the rest of its network.

### What Next

Review the constraints for missing set_voltage commands. Review the UPF data for an incorrect or incomplete supply net configuration.

## PVT-020

(warning) Mismatched voltage in corner %s.

### Description

This message is issued when a specified voltage value for some cells in a particular corner does not match any of the voltages supported by the cells' library. Additional information will be printed identifying the relevant cell library, the number of affected cells, and the voltage that will actually be used for timing analysis.

Feedback

### What Next

Review the P/V/T operating conditions supported by the relevant cell library. Review the constraints for missing or incorrect set_voltage commands. Review the UPF data for an incorrect or incomplete supply net configuration.

---

## PVT-021

(warning) Mismatched temperature in corner %s.

### Description

This message is issued when the specified temperature value for some cells in a particular corner does not match any of the temperatures supported by the cells' library. Additional information will be printed identifying the relevant cell library, the number of affected cells, and the temperature that will actually be used for timing analysis.

### What Next

Review the P/V/T operating conditions supported by the relevant cell library. Review the constraints for missing or incorrect set_temperature commands. Review the constraints for missing or incorrect set_operating_conditions commands.

---

## PVT-022

(warning) Mismatched process number in corner %s.

### Description

This message is issued when the specified process number for some cells in a particular corner does not match any of the process numbers supported by the cells' library. Additional information will be printed identifying the relevant cell library, the number of affected cells, and the process number that will actually be used for timing analysis.

### What Next

Review the P/V/T operating conditions supported by the relevant cell library. Review the constraints for missing or incorrect set_process_number commands. Review the constraints for missing or incorrect set_operating_conditions commands.

---

## PVT-023

(warning) Mismatched process label in corner %s.

Feedback

### Description

This message is issued when the specified process label for some cells in a particular corner does not match any of the process labels supported by the cells' library.

Additional information is printed identifying the relevant cell library, the number of affected cells, and the process label that is actually used for timing analysis.

Remember that process labels are optional, and are needed only to distinguish between operating conditions that have identical voltages, temperatures, and process numbers.

### What Next

Review the PVT operating conditions supported by the relevant cell library. Review the constraints for missing or incorrect *set_process_label* commands.

---

## PVT-030

(warning) Corner %s: %d process number, %d process label, %d voltage, and %d temperature mismatches.

### Description

This message is issued when there are mismatches between the specified and effective values of the process number, process label, voltage, or temperature operating conditions of a particular corner. The *report_pvt* command will print information and warnings identifying the mismatched values, the relevant cell libraries, the number of affected cells, and the operating conditions that will actually be used for timing analysis.

### What Next

Review the P/V/T operating conditions supported by the relevant cell libraries. Review whether specified P/V/T is missing some library cells. Review the constraints for missing or incorrect set_voltage, set_temperature, set_process_number, set_process_label, or set_operating_conditions commands. Review the UPF data for an incorrect or incomplete supply net configuration. The *report_pvt* command will give more information about this situation.

---

## PVT-031

(warning) %d cells affected for early, %d for late.

### Description

This message is issued when there are mismatches between the specified and effective values of the process number, process label, voltage, or temperature operating conditions of a particular corner. It describes the number of cells affected by the mismatched PVT values. It will be preceded by a PVT-030 warning, which lists the number of mismatches.

Feedback

**What Next**

Review the P/V/T operating conditions supported by the relevant cell libraries. Review the constraints for missing or incorrect set_voltage, set_temperature, set_process_number, set_process_label, or set_operating_conditions commands. Review the UPF data for an incorrect or incomplete supply net configuration. The *report_pvt* command will give more information about this situation.

---

## PVT-032

(info) Corner %s: no PVT mismatches.

**Description**

This message is issued when there are no mismatches between the specified and effective values of the process number, process label, voltage, or temperature operating conditions of a particular corner.

**What Next**

No action is required. This is the desired situation.

---

## PVT-033

(warning) %d voltage and %d temperature extrapolations.

**Description**

This message is issued when voltage or temperature scaling is happening, and the specified voltage or temperature values for some part of the design are outside the ranges supported by a cell library. This situation can degrate the accuracy of the timer's delay and slew calculations.

**What Next**

Review the V/T operating conditions supported by the relevant cell libraries.
Review the constraints for missing or incorrect set_voltage, set_temperature, or set_operating_conditions commands. Review the UPF data for an incorrect or incomplete supply net configuration. The *report_pvt* command will give more information about this situation.

---

## PVT-034

(warning) %d port driving_cells affected for early, %d for late.

Feedback

### Description

This message is issued when there are mismatches between the specified and effective values of the process number, process label, voltage, or temperature operating conditions of a particular corner. It describes the number of port driving_cells affected by the mismatched PVT values. It will be preceded by a PVT-030 warning, which lists the number of mismatches.

### What Next

Review the P/V/T operating conditions supported by the relevant cell libraries. Review the constraints for missing or incorrect set_voltage, set_temperature, set_process_number, set_process_label, or set_operating_conditions commands applied to the port or the top level of the design. The *report_pvt* command will give more information about this situation for a particular port.

---

## PVT-073

(warning) %s have the same PVT: %s.

### Description

The *report_lib* command found a reference library with multiple panes that use the same PVT values. These panes are indistinguishable, so one of them will never be used. This problem originates in the library preparation process. For every PVT-073 warning, there would have been a LM-073 warning when the library was built.

### What Next

This is just a warning to alert you to the situation. You should be able to make adjustments to your library preparation script and rebuild the library to remove the duplicates.

### See Also

- LM-073

---

## PVT-080

(warning) Incorrect PVT value(s) specified for %s, %s. Pane:%d Voltage:%f Temperature: %f

### Description

This message is generated when invalid PVT value is encountered for a lib_cell or lib_pin. The PVT value used may be user specified or tool generated.

A library with multiple panes can trigger this warning for an out of range pane value or invalid voltage or temperature values. Please use report_lib command to check the details.

Feedback

### What Next

Please check for valid pane, voltage and temperature values for the library. If the PVT values are user specified then fix the script(s) to specify the correct PVT value(s).

If the message is generated by optimization command then the PVT value(s) may be tool generated. Please check all the instances of the lib_cell for correct PVT value(s) using if the reported values are correct. As an added measure, please file a star for the command.

---

## PVT-081

(warning) Incorrect PVT value(s) passed for %s %s; LibCell (lib:%s, pane:%d) but PVT data is (lib:%s pane:%d)

### Description

This message is generated when invalid PVT value is encountered for a lib_cell or lib_pin. The PVT value used may be user specified or tool generated.

A library with multiple panes can trigger this warning for an out of range pane value or invalid voltage or temperature values. Please use report_lib command to check the details.

### What Next

Please check for valid pane, voltage and temperature values for the library. If the PVT values are user specified then fix the script(s) to specify the correct PVT value(s).

If the message is generated by optimization command then the PVT value(s) may be tool generated. Please check all the instances of the lib_cell for correct PVT value(s) using if the reported values are correct. As an added measure, please file a star for the command.

---

## PVT-085

(Warning) Rails (count=%d) in PVT value (LibId: %d Pane: %d) mismatches with specified timing library %s (count=%d)

### Description

This message is generated when the rail count ( number of effective voltages ) is less than those found in the timing library for the cell. Tool will use the larger rail count always to determine the effective voltages.

### What Next

Please check that NDM does not have any unresolved cells after linking. Please check if there exists any hierachical insts with a specified library.

Feedback

If the message is generated by optimization command then the PVT value(s) may be tool generated. Please check all the instances of the lib_cell for correct PVT value(s) using if the reported values are correct. As an added measure, please file a star for the command.

---

## PVT-1201

(warning) %s.

### Description

*PVT-1201* is a generic warning message which gives the reason why a specific library cell cannot be used.

The following messages complain that a library cell does not match PVT requirement of a corner. Please use *report_mv_lib_cell* to display PVT settings of the library cell and *report_pvt* to display PVT requirements of the corner.

- Can't use LIB_1/CELL_1 because it doesn't match PVT setting in corner 'default'. (PVT-1201)
- Can't use LIB_1/CELL_1 because it doesn't match process label/number (L1/1.000) in corner 'max'. (PVT-1201)
- Can't use LIB_1/CELL_1 because it doesn't match power supply net voltage (VDD = 0.72V) in corner 'max'. (PVT-1201)
- Can't use LIB_1/CELL_1 because it match temperature (-40C) in corner 'fast'. (PVT-1201)

The following message complains that a library cell does not have the correct lib cell purpose required by tool. Please use *set_lib_cell_purpose* to update lib cell purpose of the library cell.

- Can't use LIB_1/CELL_1 because it has a lib cell purpose of 'none' but 'opto' is required. (PVT-1201)

The following message complains that a library cell is not in the correct threshold voltage group as required by tool. Please use *report_threshold_voltage_groups* to display threshold voltage group specified in the design.

- Can't use LIB_1/CELL_1 because it is in hvt threshold voltage group but lvt group is needed. (PVT-1201) "

The following message complains that a library cell has a site def id which is different than the one specified for the design.

- Can't use LIB_1/CELL_1 because it has a site def id which is incompatible with current top module. (PVT-1201)

Feedback

The following message complains that a library cell is in a different library cell subset from that required by an instance. Please use *report_libcell_subset* to display library subsets specified to the instance.

- Can't use LIB_1/CELL_1 because it has a lib cell subset LIB_SET_A but LIB_SET_B is needed. (PVT-1201)

The following messages complain that a library cell has a conflict with the target library subset specified in a hierarchy. Please use *report_target_library_subset* to display target library subsets specified in the hierarchy.

- Can't use LIB_1/CELL_1 in %s because it is not in hierarchy's set_target_library_subset. (PVT-1201)
- Can't use LIB_1/CELL_1 in MID1 because it is in another hierarchy's set_target_library_subset -only_here list. (PVT-1201)
- Can't use LIB_1/CELL_1 in MID/BOT because it is in hierarchy's set_target_library_subset -dont_use list. (PVT-1201)

The following message complains that an isolation library cell has an isolation clamp value which is different from that specified in *set_isolation*. Please use *report_mv_lib_cells -isolation -verbose* to display isolation cell properties of the library cell.

- Can't use LIB_1/CELL_1 because of isolation clamp value mismatch. (PVT-1201)

The following message complains that a retention library cell is not a zero-pin retention library cell but one is needed. Please use *report_mv_lib_cells -retention -verbose* to display retention cell properties of the library cell.

- Can't use LIB_1/CELL_1 because it is not a zero-pin retention lib cell. (PVT-1201)

The following message complains that a library cell does not have bias PG pins but the design requires to use one with bias PG pins. Please use *report_mv_lib_cells -verbose* to display bias PG pin information of the library cell.

- Can't use LIB_1/CELL_1 because it does not have bias PG pins". (PVT-1201)

**What Next**

Please correct settings on the specified library cell to address issues described in the message.

---

## PVT-1202

(warning) %u out of %u %s%slibrary cell%s %s%s.

Feedback

### Description

*PVT-1202* is issued when tool cannot find a legal library cell of a specified type to be used from user libraries. This usually happens during library analysis phrase when tools try to confirm that certain type of library cells with correct properties exist in user libraries.

The following messages complain that no buffers or inverters cannot be used because all of them have site def id's which are different from that specified for the design. Please use *report_site_defs* to display site def id's specified in the design. Please use *get_attribute -name site_def <lib_cell_name>* to display site def id specified to a library cell. Please use *get_lib_cells -filter site_name==<site_def_name>* to collect library cells with a specified site def name.

- Warning: 957 out of 957 buffer library cells have incompatible site def id (PVT-1202)
- Warning: 869 out of 869 inverter library cells have incompatible site def id (PVT-1202)
- Error: Library analysis failure - cannot find buffers and inverters (OPT-1006)

The following messages complain that no buffer or inverter library cells can be used in the top hierarchy because all of them do not have the required bias properties specified in the design. Please use *report_mv_lib_cells -standard -verbose* to display bias PG pin information and nwell/pwell voltages specified by the library cells. Please check that their nwell and pwell voltages match that specified in nwell and pwell supply functions of top power domain's primary supply set.

- Warning: 47 out of 47 buffer library cells have bias property mismatch in top hierarchy (PVT-1202)
- Warning: 55 out of 55 inverter library cells have bias property mismatch in top hierarchy (PVT-1202)

The following messages complain that no two-input NAND library cells can be used in hierarchy MID/BOT because all of them have voltage mismatch with that of the power domain primary supply net. Please use *report_mv_lib_cell -standard* to display PVT settings of the library cells and *report_supply_nets* to display operating voltages specified on supply nets.

- Warning: 45 out of 45 two-input NAND library cells have supply net voltage mismatch in MID/BOT (PVT-1202)
- Error: Insufficient library cells to generate synthetic parts. Need either one of nand2/ nor2 or an inverter and one of and/or. (DWS-0103)

The following messages are issued from *create_mv_cells -verbose* and complain that no buffer or inverter library cells can be used to implement a repeater specified in *set_repeater* or *set_port_attributes -repeater_supply*. Some have voltage mismatch with that specified in the top power domain's primary supply net. Some have conflicts with

Feedback

target library subset specified in the top hierarchy. Please use *report_target_library_subset* to display target library subsets specified in the top hierarchy.

- Warning: 50 out of 143 buffer library cells have supply net voltage mismatch in top hierarchy (PVT-1202)
- Warning: 93 out of 143 buffer library cells have incompatible target library subset (PVT-1202)
- Warning: 40 out of 118 inverter library cells have supply net voltage mismatch in top hierarchy (PVT-1202)
- Warning: 78 out of 118 inverter library cells have incompatible target library subset (PVT-1202)
- Warning: Repeater at port MID/Y with repeater supply (VDD, VSS) is not inserted due to non-availability of matching buffers and inverters in the libraries. (MV-201)

**What Next**

Please correct settings on the specified type of library cells to address issues described in the message.

# QTCL

## QTCL-001

(error) Cannot find widget '%s'.

**Description**

The widget with the specified hierarchical name cannot bre found. The listed command options are exclusive. Only one of them can be specified.

**What Next**

Check whether the hierarchical path of the widget name is correct or whether the widget is already created.

## QTCL-002

(error) At least one of the following options need to be specified: '%s'.

**Description**

Not all required arguments are specified.

Feedback

**What Next**

Check the correct syntax of the command and add all required arguments.

---

## QTCL-003

(error) No widget name specified (option: %s).

**Description**

The new name of the widget is not specified.

**What Next**

Add the widget name with the described option.

---

## QTCL-004

(error) Sender widget '%s' not found.

**Description**

The sender widget is not found with the specified hierarchical name.

**What Next**

Check whether the hierarchical path of the widget name is correct or whether the widget is already created.

---

## QTCL-005

(error) Receiver widget '%s' not found.

**Description**

The receiver widget is not found with the specified hierarchical name.

**What Next**

Check whether the hierarchical path of the widget name is correct or whether the widget is already created.

---

## QTCL-006

(error) Parent Widget '%s' not of class type %s.

**Description**

The parent of the new widget is not of the required class type.

Feedback

**What Next**

Check which parent class types are allowed for the new widget and correct the appropriate option.

---

## QTCL-007

(error) Widget with name '%s' already exists.

**Description**

A widget with the specified hierarchical name already exists. You cannot create widgets with identical hirarchical names.

**What Next**

Choose a unique hirarchical name for the new widget.

---

## QTCL-008

(error) Property '%s' of widget '%s' is not valid or not readable.

**Description**

A widget property with the specified name does not exist or is not readable.

**What Next**

Check the existence or readability of the property or correct the name.

---

## QTCL-009

(error) Property '%s' of widget '%s' not found.

**Description**

The specified widget property does not exist.

**What Next**

Check whether the specified widget property exists or correct the property name.

---

## QTCL-010

(error) Widget '%s' of class type '%s' does not support list of items.

Feedback

**Description**

The class type of the specified widget does not support list of items. The current tcl function cannot be apllied on this widget.

**What Next**

Correct the class type or widget name.

---

## QTCL-011

(error) Setting value '%s' for property '%s' of widget '%s' failed.

**Description**

Cannot set the property value of specified name.

**What Next**

Check in the widget documentation whether the property is not writable. Check the correctness of the hierarchical widget name and property name.

---

## QTCL-012

(error) Cast of value '%s' for property '%s' of widget '%s' to type '%s' failed.

**Description**

Cannot convert the value of the specified widget value to the data type of the property.

**What Next**

Check whether this data type is supported. Check the correctness of the hierarchical widget name and the property name.

---

## QTCL-013

(error) Cannot cast value '%s' for property '%s' of widget '%s' to type '%s'.

**Description**

Cannot convert the value of the specified widget value to the data type of the property.

**What Next**

Check whether this data type is supported. Check the correctness of the hierarchical widget name and the property name.

Feedback

## QTCL-014

(error) Widget of class '%s' not supported.

**Description**

The specified class type is not yet supported.

**What Next**

Choose one of the supported widget class types.

## QTCL-015

(error) Value '%d' of option '%s' is out of range ( %d <= index <= %d ).

**Description**

The specified option value is out of the allowed range.

**What Next**

Correct the value according to the described option value range.

## QTCL-016

(error) Indices list '%s' is not correct. Syntax: {i1 i2 ... in}.

**Description**

The syntax of the index list is not correct.

**What Next**

Correct the syntax according to the described syntax.

## QTCL-017

(error) Specified ui file '%s' does not exist.

**Description**

The specified ui file does not exist.

**What Next**

Correct the path name and filename and check the existence of the file.

Feedback

## QTCL-018

(error) Value '%d' of option '%s' is out of range (must be %s).

**Description**

The option value os out the the allowed described range.

**What Next**

Correct the option value according to the described range rules.

## QTCL-019

(error) Cannot connect signal '%s' of sender '%s'\nto slot '%s' of receiver '%s'.

**Description**

Cannot setup a connection between sender and reciever widget.

**What Next**

CHeck for the correct hierarchical names of the sender and receiver widgets. Check the correct names and arguments for signal and slot functions.

## QTCL-020

(error) Cannot connect signal '%s' of sender '%s'\nto tcl command '%s'.

**Description**

Cannot setup a connection between sender widget and a tcl clallback function.

**What Next**

CHeck for the correct hierarchical name of the sender widget. Check the correct name and arguments for signal and tcl function.

## QTCL-021

(error) The star '*' is not allowed as last name in hierarchical widget name %s'.

**Description**

The charecter '*' cannot be used as the last name in the specifier of a hierarchical widget name.

Feedback

**What Next**

Use this character only for levels in between.

---

## QTCL-022

(error) Widget '%s' has already specified %sproperty '%s'.

**Description**

The widget has already a property or extra property of the specified name.

**What Next**

Check for the correct hierarchical name of the sender widget. Check the correct name of the extra widget property and make sure that no other extra property is already attached to the widget.

---

## QTCL-023

(error) Incorrect value '%s' for enum property '%s' of widget '%s'.

**Description**

The property with a enum datatype cannot be initialized with the specified value.

**What Next**

Make sure that you only use supported values for the enum datatype.

---

## QTCL-024

(error) Object '%s' is not of type 'widget'.

**Description**

The specified object is not derived from QWidget. In order to work properly is needs to be derived from QWidget or from a class derived frm QWidget.

**What Next**

Derive the object from QWidget or from a class derived from QWidget.

---

## QTCL-025

(error) Parent object '%s' is not derived from QWidget

Feedback

**Description**

The specified parent object is not derived from QWidget.

**What Next**

Derive the parent object from QWidget or from a class derived from QWidget.

---

## QTCL-026

(error) The specified file '%' does not exist or is not readable

**Description**

The specified file does not exist or is not readable.

**What Next**

Check the existence and the read permissions of the specified file.

---

## QTCL-027

(error) Cannot find parent '%s'.

**Description**

The object with the specified hierarchical name specified as parent cannot be found.

**What Next**

Check whether the hierarchical path of the widget name is correct.

---

## QTCL-028

(error) Widget '%s' is not inherited from QDialog.

**Description**

The specified widget needs to be inherited from QDialog in order to provide the correct functionality.

**What Next**

Derive specified widget from QDialog or widget derived from QDialog.

---

## QTCL-029

(error) Cannot find extension widget '%s'.

Feedback

**Description**

The specified dialog extension widget does not exist.

**What Next**

Check correct name and creation of dialog extension widget.

---

## QTCL-030

(error) Dialog extension object '%s'is not a widget.

**Description**

The specified dialog extension widget is not a widget.

**What Next**

Derive the dialog extension object from QWidget or an object derived from QWidget.

---

## QTCL-031

(error) Syntax of string list argument value '%s' incorrect.

**Description**

The syntax of the value of a string list argument is incorrect.

**What Next**

Correct the value of the string list argument.

---

## QTCL-032

(error) Cannot find menu item '%s'.

**Description**

The specified menu item does not esist.

**What Next**

Check the existence and specification of the menu item.

---

## QTCL-033

(error) Object alias '%s' already in use.

Feedback

**Description**

The object specified object alais is already in use by another object.

**What Next**

Choose another object alias name.

---

## QTCL-034

(error) Cannot disconnect signal '%s' of sender '%s'\nto slot '%s' of receiver '%s'.

**Description**

Cannot disconnect the specified signal from specified sender to receiver.

**What Next**

Check correct names of signal, sender, receiver and slot.

---

## QTCL-035

(error) Cannot disconnect signal '%s' of sender '%s'\nto tcl command '%s'.

**Description**

Cannot disconnect the specified signal from specified sender to tcl command.

**What Next**

Check correct names of signal, sender and tcl command name.

---

## QTCL-036

(error) Property '%s' of object '%s' is ReadOnly

**Description**

Cannot set the value of specified property since it is a 'ReadOnly' property.

---

## QTCL-037

(error) Value list has more items than signal or slot argument definition

**Description**

The number of values passed to a signal or slot function does not match the number of arguments of the signal or slot function.

Feedback

**What Next**

Check the number of arguments of signal or slot function and the number of values.

---

## QTCL-038

(error) Cannot activate slot '%s' of receiver object '%s'

**Description**

Cannot find the name of the slot function for the specified receiver object

**What Next**

Check correct names of the slot function and the receiver object.

---

## QTCL-099

(error) '%s'

**Description**

Generic error

**What Next**

Fix issue or request specific error

---

# RAIL

---

## RAIL-200

(error) Cannot find layer of layer number %d.

**Description**

The layer of specified layer number cannot be found. One possible cause is that the technology for creating the rail result files is different with current technology.

**What Next**

Fix the incorrect data and try again.

---

## RAIL-300

(error) Must specify option '%s' first. Use comamnd '%s' to set the relevant option.

Feedback

**Description**

The invoked command requires some option to be set before running the command.

**What Next**

Use recommended command to set the relevant option then invoke the command again.

---

## RAIL-301

(error) Option %s is not supported for %s. Specify %s for the option instead.

**Description**

The specified option is not supported for the flow.

**What Next**

Specify the option according to the message.

---

## RAIL-302

(warning) No previous ICC2 generated %s to reuse!

**Description**

Reuse not possible on first run.

**What Next**

Run analyze_rail and try again.

---

## RAIL-303

(info) Writing %s..

**Description**

A resource file is being written.

**What Next**

n/a

---

## RAIL-304

(info) Generated %s: %s

Feedback

**Description**

A resource file has been generated at a location.

**What Next**

n/a

---

## RAIL-305

(info) Skip write %s..

**Description**

The write step for a resource file is being skipped.

**What Next**

n/a

---

## RAIL-306

(info) Using user-specified %s for %s: %s

**Description**

Using a user-specified resource file for a purpose.

**What Next**

n/a

---

## RAIL-307

(info) Captured %s log.\n\tSee "%s" for details

**Description**

The output of a process has been captured.

**What Next**

n/a

---

## RAIL-308

(info) To specify %s, use: set_app_options -name %s -value %s

Feedback

**Description**

Suggesting the use of an application option to override the write step for a resource file.

**What Next**

n/a

---

## RAIL-309

(info) Script file for %s: %s

**Description**

Indicating the location of a script file for a purpose.

**What Next**

n/a

---

## RAIL-310

(info) Reusing previous ICC2 generated %s for %s.

**Description**

Indicating reuse of a previous ICC2 generated resource.

**What Next**

n/a

---

## RAIL-400

(error) Rail result with name '%s' may be modified and thus cannot be opened.

**Description**

The rail result generated from previous analyze_rail command may have been modified. Common mistakes are: result directory name is modified; or some files under the result directory have been removed or renamed.

**What Next**

Rail result directory once created cannot be renamed. Result files underneath cannot be modifiedi or deleted. Run analyze_rail command again to re-generate the result.

Feedback

## RAIL-401

(warning) Rail result is opened. It will be closed before a new rail result is generated.

**Description**

There is one rail result opened from previous analyze_rail or open_rail_result command. This result will be closed first, so a new rail result can be generated.

**What Next**

None.

## RAIL-402

(error) Rail result with name '%s' is already opened.

**Description**

This occurs when user wants to open a rail result which is already opened through previous open_rail_result command or analyze_rail command.

**What Next**

Close the rail result using close_rail_result command and then open a rail result.

## RAIL-403

(error) Rail result with name '%s' is not generated from Redhawk Analysis Fusion flow.

**Description**

This occurs when Redhawk fails to generate the result files back to ICC2 to read.

**What Next**

Check Redhawk log file to see if fusion flow is successful or not.

## RAIL-404

(error) Rail database path cannot be changed while current rail result is opened.

**Description**

This occurs when set_app_options -name rail.database is used to change rail database path while a current rail result is still opened.

Feedback

**What Next**

Close currently opened rail result, then change the rail database path.

---

## RAIL-405

(error) Rail result cannot be opened before open_block.

**Description**

This occurs when open_rail_result is invoked before open_block.

**What Next**

Invoke open_lib/open_block command first, then run open_rail_result.

---

## RAIL-406

(error) Rail result file is generated from a Redhawk version which is not compatible with the current product version. %s.

**Description**

This occurs when an incompatible Redhawk binary is used to generate the rail result files for the Fusion Analysis flow. Those files cannot be read back into the current product.

**What Next**

Use a compatible Redhawk version to rerun the flow.

---

## RAIL-407

(error) Rail result file is out of date.

**Description**

This occurs when an old rail result which is saved by an old ICC2 version is opened in a newer ICC2 version. Between those two versions of ICC2, rail result file format is changed. As a result, those rail result files cannot be opened in the new version of ICC2.

**What Next**

Use an older ICC2 version to open the rail result, or re-run the analysis flow to re-generate result files.

---

## RAIL-408

(warning) No rail result can be closed since there is no rail result currently opened.

Feedback

**Description**

This occurs when close_rail_result is invoked on a design which has no rail result currently opened. For example, once analyze_rail finishes, if close_rail_result is invoked twice consecutively, the second close_rail_result will trigger this warning message.

**What Next**

None.

---

## RAIL-409

(error) No rail result is currently opened for %s

**Description**

This occurs when there is no rail result opened in the current session; or the currently opened rail result does not contain the net specified.

**What Next**

Invoke analyze_rail to generate a rail result or use open_rail_result to open a rail result generated from previous sessions.

---

## RAIL-410

(warning) Rail result is not consistent with current design. Possible reason: %s.

**Description**

This occurs when design is changed after rail analysis is run. Design change may include design name change, or netlist change, and thus caused inconsistency between current design and saved rail result.

**What Next**

Recommend to invoke analyze_rail again to generate a new rail result for current design. If user really wants to reuse previous rail result, use *open_rail_result -back_annotate*.

---

## RAIL-411

(error) Rail result is not consistent with current design. Possible reason: %s.

**Description**

This occurs when design is changed after rail analysis is run. Design change may include design name change, or netlist change, and thus caused inconsistency between current design and saved rail result.

Feedback

### What Next

Recommend to invoke analyze_rail again to generate a new rail result for current design. If user really wants to reuse previous rail result, use *open_rail_result -back_annotate*.

---

## RAIL-412

(error) Fail to annotate rail result on %s %s. This may be due to design is changed and thus not consistent with currently opened rail result.

### Description

This occurs when design is changed after rail analysis is run. Design change may include netlist change, for example, cells or PG pins are added or removed. This will introduce inconsistency between current design and current rail result.

### What Next

Recommend to invoke analyze_rail again to generate a new rail result for current design. Use *open_rail_result -back_annotate* may not solve the problem. For newly added cells or PG pins, there will be no rail result to be annotated, and thus the same error may occur.

---

## RAIL-500

(error) In voltage drop hot spot area (grid index %d), current is dominated by one instance %s (%s). Cell movement technique may not be effective.

### Description

In voltage drop hot spot area or grid which is indexed by an id, its current is dominated by one instance. Therefore cell movement technique is not effective in this area, because otherwise the voltage drop hot spot could just be moved from one area to another different area.

### What Next

Use report_hot_spots -index id to get more detail on how current is distributed cross different cells. To reduce voltage drop in this hot spot area, techniques other than cell movement may be applied.

---

## RAIL-600

(error) %s is not a supply net.

Feedback

**Description**

The specified net name is not a supply net in the design. Rail analysis requires net names specified to be supply nets.

**What Next**

Use command create_supply_net to create relevant supply nets.

---

## RAIL-601

(warning) Supply voltage is not defined for supply net %s.

**Description**

There is no supply voltage defined for the specified supply net. Default 1.0 will be used for power nets, and 0.0 for ground nets.

**What Next**

Use command set_voltage to define supply voltage.

---

## RAIL-900

(error) %s

**Description**

Basic input error checking.

**What Next**

Please re-check the command inputs and use '-help' option to verify if the input is correct.

---

## RAIL-903

(error) Required argument for names of the power or ground nets is not found.

**Description**

There is a user settings problem or preconditions for an operation are not met.

**What Next**

Correct the user settings problem or satisfy the preconditions for the operation and try again.

Feedback

**See Also**

- analyze_rail

---

## RAIL-904

(error) -primerail_script_file and -script_only options can't enable simultaneously.

**Description**

There is a user settings problem or preconditions for an operation are not met.

**What Next**

Correct the user settings problem or satisfy the preconditions for the operation and try again.

**See Also**

- analyze_rail

---

## RAIL-905

Following operations aren't allowed when background job is running: 1. analyze_rail 2. change rail database 3. open_rail_result

Feedback

**See Also**

- analyze_rail
- open_rail_result

---

## RAIL-1108

(warning) Warning: Check missing via rule with valid threshold dropped because voltage drop analysis not performed!

**Description**

*set_missing_via_check_options* settings with unspecified or positive threshold require voltage drop analysis.

*set_missing_via_check_options* settings with negative threshold do not require voltage drop analysis.

You are seeing this warning because there are *set_missing_via_check_options* settings with unspecified or positive threshold, but voltage drop analysis is not being performed.

**NEXT STEPS**

1. Re-issue *set_missing_via_check_options* with negative threshold. This will return all missing via errors without the voltage drop analysis dependency.
2. Re-issue *analyze_rail* with *-voltage_drop*. This will take into account the voltage drop analysis result but will take more time to generate. Also, this may result in fewer missing via errors due to filtering.

The default threshold 1mV is used if *set_missing_via_check_options* is called without specifying *-threshold*.

The default threshold is positive, hence, will require voltage drop analysis.

If *analyze_rail* is invoked with *-check_missing_via*, but without *set_missing_via_check_options*, a minimal *mesh vias -report_missing* will still be generated in the run script.

**See Also**

- analyze_rail
- set_missing_via_check_options
- report_missing_via_check_options

Feedback

## RAIL-1109

(error) %s is not a valid net for app-option %s.

**Description**

The net specified for the aforementioned app-option does not exist in the database.

**What Next**

Please check the net name and it's validity in the database.

## RAIL-1110

(error) %s is not a valid die name for app-option %s.

**Description**

The die name specified for the aforementioned app-option does not exist in the database.

**What Next**

Please check the die name and it's validity in the database.

## RAIL-1111

(error) %s is not a valid voltage value for app-option %s.

**Description**

The voltage value specified for the aforementioned app-option is not valid.

**What Next**

Please check the voltage value.

## RAIL-1112

(error) %s is not a valid die.

**Description**

The die specified does not exist in the database.

**What Next**

Please check the die name.

Feedback

## RAIL-1113

(error) %s.

**Description**

Errors are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

## RAIL-1114

(error) failed to parse %s.

**Description**

The specified PRE_ANA_SUPPLY_LOG file either doesn't exist or is of an incorrect format.

Expected format: <DIE_INSTANCE> <DIE_MASTER> <RAIL_DATABASE> <RAIL_RESULT>

**What Next**

Point app-option rail.database toward RAIL_DATABASE with PRE_ANA_SUPPLY_LOG file with the expected format.

## RAIL-1115

(warning) %s(%s) cannot find voltage waveform.

**Description**

Cannot find voltage waveform for reported pin in boundary_condition file.

**What Next**

Check if RAIL_DATABASE contains file matching pattern *boundary_condition* and it contains voltage waveform for reported pin.

## RAIL-1116

(error) Found %d tokens, but expect %d tokens in %s.

Feedback

**Description**

Self-heat result file has an incorrect number of tokens.

**What Next**

Set app-option rail.technology to the correct technology node.

**What Next**

User needs to double check set_resynthesize_netlist_option

Feedback

## RESYN-003

(Error) The specified shell %s is not recognizable.

**Description**

This message indicates that the shell is not valid synopsys tool. User needs to provide valid ICC/ICC2/DC/ICC2_LM shell.

**What Next**

User needs to double check set_resynthesize_netlist_option

## RESYN-004

(Error) Directory %s already exists. Please remove the directory and rerun.

**Description**

This message indicates that the working directory already exists. User needs to remove directory firstly.

**What Next**

User needs to remove resynthesize working directory

## RESYN-005

(Error) Design with physical hierarchy is not supported for resynthesize flow.

**Description**

Tool found design has physical hierarchy, which is not supported in resynthesize flow.

**What Next**

User needs to double check the design setting

## RESYN-006

(Error) Design with dummy power domain is not supported for resynthesize flow.

**Description**

Tool found design has dummy power domain, which is not supported in resynthesize flow.

**What Next**

User needs to double check the design setting

Feedback

## RESYN-007

(Error) Design has MV violations, abort resynthesize flow.

**Description**

Tool found design has MV violation.

**What Next**

User needs to clean up MV violation before resynthesize flow.

## RESYN-008

(Error) Could not find TLU+ %s, Consider adding -search_path switch

**Description**

Tool could not find valid TLU+ file in search path.

**What Next**

User needs to provide valid TLU+ file in search path.

## RESYN-009

(Error) Could not find TLU+ mapping file %s, Consider adding -search_path switch

**Description**

Tool could not find valid TLU+ mapping file in search path.

**What Next**

User needs to provide valid TLU+ mapping file in search path.

## RESYN-010

(Error) Could not find db file %s, Consider adding -search_path switch

**Description**

Tool could not find valid db file in search path.

**What Next**

User needs to provide valid db file in search path.

Feedback

## RESYN-011

(Error) Working directory %s does not exist.

**Description**

Tool could not find valid working directory.

**What Next**

User needs to provide valid working directory.

## RESYN-012

(Error) Script %s does not exist.

**Description**

Tool could not find valid resynthesize script.

**What Next**

User needs to provide valid resynthesize script.

## RESYN-013

(Error) Input file not found.

**Description**

Tool could not find valid input file.

**What Next**

User needs to provide valid input file.

## RESYN-014

(Error) Please create output directory first.

**Description**

Tool could not find valid output directory.

**What Next**

User needs to provide valid output directory.

Feedback

### RESYN-015

(Error) This .tbc can not be used outside DC or ICCII

**Description**

This .tbc can not be used outside DC or ICCII.

**What Next**

User needs to provide valid running shell.

### RESYN-016

(Error) Resynthesize flow failed at %s stage.

**Description**

This message indicates that the resynthesize flow failed at specific stage. User needs to double check setting and re-run this stage.

**What Next**

User needs to double check design setting and re-run the stage.

## ROPT

### ROPT-001

(error) Block %s has no physical data. route_opt will exit now!\n

**Description**

There are physical hierarchical blocks which have no physical data defined route_opt cannot run on such designs

**What Next**

Ensure that all blocks have physical data before running route_opt

### ROPT-002

(warning) SI analysis is not enabled for post-route optimization.

Feedback

### Description

SI analysis is usually enabled for post-route optimization for best correlation with signoff timing analysis. Please consider enabling it.

### What Next

Consider enabling SI before route_opt by doing "set_app_options -name time.si_enable_analysis -value true"

### See Also

- route_opt

---

## ROPT-003

(warning) repair shorts over macro is enabled after initial routing.

### Description

This is not recommended in route_opt because it may lead to increased runtime and significant detours on critical nets. Please consider disabling it.

### What Next

Consider disabling app option before route_opt by doing "set_app_options -name route.detail.repair_shorts_over_macros_effort_level -value off"

### See Also

- route_opt

---

## ROPT-004

(warning) Total %zu nets have their routing open (data: %zu nets, clock: %zu nets). This will cause problems for extraction, timing and post-route optimization. Some examples of open nets are listed below.\n

### Description

Open nets will not provide precise routing information to route_opt. If there are too many opened nets, the optimization may fail or give incorrect result.

### What Next

Review the design and use "route_eco" to reroute the opennets.

Feedback

**See Also**

- route_opt
- route_eco

---

## ROPT-005

(warning) No parasitic data is present for any scenarios.

**Description**

Parasitic data is required for post-route optimization. route_opt cannot be proceed without parasitics.

**What Next**

Configure the design correctly.

**See Also**

- route_opt

---

## ROPT-006

(warning) Many nets are not fully detailed routed. Some examples are listed below.

**Description**

route_opt expects a fully detail routed design. More than 15% of nets are not fully routed.

**What Next**

Please make the design fully detailed routed using command such as route_auto.

**See Also**

- route_opt
- route_auto

---

## ROPT-007

(error) Design has unresolved cell references..

Feedback

### Description

Post-route optimization can not take designs with unresolved cell references. Please check link_block message LNK-081 to understand problem and solve it before run route_opt.

### What Next

Configure the design correctly.

### See Also

- route_opt

---

## ROPT-008

(error) Design has unbound sites or vias.

### Description

Postroute optimization can not take designs with unbound sites or vias. Please check previous design logs, especially loading/linking message, to understand problem and solve it before run route_opt.

### What Next

Use the *report_unbound* command to identify the unbound sites and vias. To resolve the issue, either delete the unbound objects or bind the objects by replacing the technology file or using the *create_site_def* or *create_via_def* commands.

### See Also

- create_via_def
- create_site_def
- route_opt

---

## ROPT-009

(error) Design has no active scenarios.

### Description

Post-route optimization cannot use designs without any active scenario. Please use report_scenarios to check that at least one scenario is active, and at least one active scenario has either setup or hold analysis enabled.

Feedback

### What Next

User can solve the error by making one or more scenarios active using set_scenario_status {<scenario list>} -active true.

### See Also

- report_scenarios
- set_scenario_status
- route_opt

---

## ROPT-010

(error) Design has no active scenarios with setup or hold analysis enabled.

### Description

Post-route optimization cannot use designs without any setup or hold analyses enabled. Please use report_scenarios to check that at least one active scenario has either setup or hold analysis enabled.

### What Next

User can solve the error by setting setup and/or hold analyses to true in one or more active scenarios using set_scenario_status {<scenario list>} -setup true, and/or set_scenario_status {<scenario list>} -hold true.

### See Also

- report_scenarios
- set_scenario_status
- route_opt

---

## ROPT-011

(error) Power flow is enabled but no leakage power analysis is enabled.

### Description

Post-route optimization cannot use designs without leakage analysis enabled when power flow is enabled. Please use report_scenarios to check that at least one active scenario has leakage analysis enabled when using power flow.

Feedback

### What Next

User can solve the error by setting leakage analysis to true in one or more active scenarios using set_scenario_status {<scenario list>} -leakage true.

### See Also

- report_scenarios
- set_scenario_status
- route_opt

---

## ROPT-012

(error) Terminate the command since previous command has failed.

### Description

The command status is tracked during running some mega commands. There are failed commands before you see the message. It is unnecessary to continue.

### What Next

User can find messages telling which command failed like "XXX-opt command failed". User need to fix the failure and then continue.

### See Also

- route_opt
- clock_opt
- place_opt

---

## ROPT-013

(error) Design has no routing layer.

### Description

Post-route optimization cannot continue without routing layer info.

### What Next

User can solve the error by ensuring routing layer existence in the design.

Feedback

### See Also

- route_opt

---

## ROPT-014

(error) Metal fill is enabled within route_opt, but ICV executable path is not set properly.

### Description

When ropt.enable_metal_fill_within_ropt is on, metal fill will be enabled within route_opt, so ICV executable path must be set properly before route_opt command.

### What Next

User can solve the error by adding the ICV executable in the PATH.

### See Also

- signoff_create_metal_fill
- route_opt

---

## ROPT-015

(warning) The LVT percentage of the incoming netlist (%f%%) is already higher than the constraint value (%f%%). The LVT percentage in optimized netlist may not meet the constraint.

### Description

The LVT percentage of the incoming netlist is already higher than the LVT percentage constraint value. This command reduces LVT percentage without seriously degrading other QoR metrics. Therefore, result LVT percentage may still be higher than the constraint.

### What Next

Adjust LVT percentage constraint before running this command based on result LVT percentage, timing and power if needed. Or reduce the LVT percentage of the incoming netlist by tightening LVT percentage constraint for previous optimization commands.

### See Also

- set_multi_vth_constraint
- reset_multi_vth_constraint
- report_multi_vth_constraint

Feedback

## ROPT-016

(warning) Sanity check found an endpoint in hold violations with large clock skew.

### Description

Sanity check found an endpoint in hold violations with large clock skew. This check collects the worst path in each endpoint and checks if the ratio of clock skew to clock period exceeds the threshold. This ratio is used to determine whether there are potential problems with the current endpoint. If there are too many such endpoints, it will lead to excessive runtime or the hold not fixing.

### What Next

This warning message does not suppress the subsequent flow. If you suspect a problem with the hold timing clock skew related, we recommend that you combine the later provided details table, using *analyze_design_violations -type hold* and *report_timing -to -scenario* for further information. If proven to be caused by a clock skew issue, it is suggested checking the *synthesize_clock_trees* or *clock_opt* stage.

### See Also

- synthesize_clock_trees
- clock_opt
- report_timing

# RPGP

## RPGP-001

(warning) The hierarchical relative placement group '%s' will not be processed.

### Description

The command processes top level relative placement groups only so hierarchical relative placement groups given in input will not be processed.

### What Next

Please provide top level relative placement group of given group.

Feedback

### See Also

- create_rp_group
- add_to_rp_group
- report_rp_groups
- legalize_rp_groups

---

## RPGP-002

(error) Possible placement failure of relative placement group.

### Description

No enough area for the entire relative placement group to be placed together because of overlapping with fixed cells or placement obstruction. Note that the search region for the relative placement group in the core area is based on the value that you specify to the -move_effort option. The relative placement cells will be placed around blockages if possible. The relative placement group constraints might not be respected. Also, if an existing group is modified by adding or deleting objects, this message will be issued and a placement command or legalization command needs to be run.

### What Next

Bring up the GUI and check the placement results. Use the command *report_rp_groups* for finding any relative placement constraint violations.Re run any placement command to re place modified groups. If the failure is due to modification then either legalize_rp_groups or legalize_placement or any placement command needs to be run to replace the modified RP groups.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-003

(warning) The relative placement group has not been placed yet.

### Description

Placement of relative placement group has not been done yet.

Feedback

### What Next

The relative placement group is either newly created or was ignored during placement. Please look at log for any ignore messages.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-004

(warning) The '%s' alignment has not been respected for relative placement group.

### Description

The warning indicates failure of column alignment or row alignment of RP groups. This warning occurs when alignment specified for an RP group or any of its hierarchical RP groups has not been met. Pleas use -verbose option of *report_rp_groups* command for details of the alignment failure.

### What Next

You may open up the GUI and check the alignment of the RP groups. The specified alignment may not be met after placement because of overlap with fixed placement objects.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-005

(error) The bbox set on relative placement group %s does not match with calculated bbox.

### Description

This error occurs when bbox calculated by *report_rp_groups* command does not match with bbox set on relative placement group.

Feedback

### What Next

This can happen when there is some BUG in tiling code. It can also happen where RP cells are getting optimized, but RP tiling is not being done. Please analyze and fix the issue.

### See Also

- legalize_rp_groups

---

## RPGP-006

(warning) The x_offset specified for the RP group %s has not been satisfied. The movement from the specified location is '%s'.

### Description

This warning message occurs because while processing a Relative Placement (RP) group, an *x_offset* was present, and the RP group could not be placed at the requested location.

### What Next

This is only a warning message. The movement may not be significant. If it is significant then it may be caused by obstructions/blockages around that area. In such a case please specify appropriate x_offset.

### See Also

- set_rp_group_options
- remove_rp_group_options

---

## RPGP-007

(warning) The y_offset specified for the RP group %s has not been satisfied. The movement from the specified location is '%s'.

### Description

This warning message occurs because while processing a Relative Placement (RP) group, an *y_offset* was present, and the RP group could not be placed at the requested location.

Feedback

### What Next

This is only a warning message. The movement may not be significant. If it is significant then it may be caused by obstructions/blockages around that area. In such a case please specify appropriate y_offset.

### See Also

- set_rp_group_options
- remove_rp_group_options

---

## RPGP-008

(error) Relative placement group '%s' is ignored during placement.

### Description

You receive this message because the relative placement group's estimated height or width (or both) is greater than that of core area or you anchored the group such that it cannot be placed inside the core area.

### What Next

Redo the floorplan to increase the core area or shrink the RP group.

### See Also

- remove_from_rp_group
- remove_rp_groups
- report_rp_groups
- create_rp_group

---

## RPGP-009

(warning) The option '%s' can not be set on hierarchical relative placement group '%s'.

### Description

The given option can be set on only top level relative placement group.

### What Next

Please provide top level relative placement group of given group.

Feedback

**See Also**

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

---

## RPGP-010

(warning) The keepout margin of relative placement group '%s' is overlapped with other relative placement group(s).

**Description**

This warning occurs when rp only keepout margin specified for an relative placement group has been overlapped with other relative placement group(s). The overlap of keepout margins is also considered a failure. Please use -verbose option of *report_rp_groups* command for details of the keepout margin failure for report on overlapped relative placement group(s).

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-011

(info) The option '%s' will be ignored for hierarchical relative placement group '%s'.

**Description**

The given option is applicable for top level relative placement group only, so will be ignored for the hierarchical relative placement group being added.

**See Also**

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

Feedback

## RPGP-013

(warning) %s cells of the relative placement group %s are fixed.

### Description

This warning occurs because the physical status of some or all cells of the specified relative placement group is fixed. The partially fixed relative placement group will be ignored during placement/legalization and fully fixed relative placement group will not be touched during placement/legalization. Please use -verbose option of *check_rp_constraints* command to get the list of fixed cells.

### What Next

Please remove the fixed cells from relative placement group or remove the fixed physical status from the cells and rerun the command.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

## RPGP-014

(warning) The even height cell of relative placement group '%s' is getting placed after multi column cell '%s' of next row.

### Description

This warning occurs because the even height cell of current row is getting placed after multi column cell of next row. The multi column cell is added in one of the previous columns and is part of current column too. The even height cell is illegal at original location so has to be moved up, but it overlaps with multi column cell at that location. To avoid this possible overlap, the even height cell moves after the multi column cell to get placed legally. There may be several reasons for even height cell ending up at illegal site row and one of them is conflicting location relative to some other even height cell of relative placement group. Please check man page for RPGP-022 for more details about conflicting location.

Feedback

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-015

(warning) The anchored relative placement group '%s' overlaps with fixed object(s).

**Description**

This warning occurs because the specified anchored relative placement group may overlap with macro(s) or placement blockage(s) or other anchored relative placement group(s). This may lead to critical or non-critical failure of relative placement group. Please change the anchor location of the specified relative placement group. Please use -verbose option of *check_rp_constraints* command to get the list of overlapped figures.

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-016

(warning) The relative placement group '%s' has only physical only cells.

**Description**

This warning occurs because the specified relative placement group has only physical only cells in it. This may lead to failure of relative placement group after placement.

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-017

(warning) Relative placement group '%s' contains no cell.

Feedback

### Description

This warning occurs because the specified relative placement group has no cells in it and it will not be placed even if blockages are there in it.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-018

(warning) The height of relative placement group '%s' is more than the height of voltage area or exclusive move bound.

### Description

This warning occurs because the height of specified relative placement group is greater than the height of the voltage area or exclusive move bound. Please use -verbose option of *check_rp_constraints* command to get the voltage area or exclusive move bound.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-019

(warning) The width of relative placement group '%s' is more than the width of voltage area or exclusive move bound.

### Description

This warning occurs because the width of specified relative placement group is greater than the width of the voltage area or exclusive move bound. Please use -verbose option of *check_rp_constraints* command to get the voltage area or exclusive move bound.

Feedback

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-020

(warning) The bounding box of the anchored relative placement group '%s' is going outside the voltage area or exclusive move bound.

**Description**

This warning occurs because the specified anchored relative placement group's bounding box is going outside the voltage area or exclusive Move Bound. This may lead to critical failure of RP group after placement. Please use -verbose option of *check_rp_constraints* command to get the voltage area or exclusive move bound.

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-022

(warning) The even height cell '%s' in specified relative placement group '%s' has conflicting location.

**Description**

This warning occurs because the specified relative placement group contains double height (or even height) cell(s) in conflicting location(s). One of these even height cells in conflicting location may move up leading to row alignment failure.

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

Feedback

## RPGP-023

(warning) The utilization of specified relative placement group '%s' is not honored.

### Description

This warning occurs because the utilization constraint of specified relative placement group is not honored after the placement. This can occur if there is any fixed cell inside the relative placement group area forcing the relative placement objects in a column to move to avoid overlap.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

## RPGP-024

(warning) The specified option '%s' of relative placement group '%s' is not set.

### Description

This warning occurs because user is attempting to remove a constraint which is not set on the specified relative placement group.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

## RPGP-025

(info) The estimated height is '%s' and estimated width is '%s' for relative placement group '%s".

### Description

This message prints the estimated height and width of the relative placement group during coarse placement.

Feedback

**See Also**

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

---

## RPGP-026

(warning) The cell of relative placement group '%s' is getting placed after multi row cell '%s' during horizontal compression.

**Description**

This warning occurs because the cell of relative placement group is getting placed after multi row cell of subsequent column. The multi row cell is added in one of the previous rows and is part of current row too. This happens when width of relative placement objects before multi row cell in current row is more compared to placed row of multi row cell.

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-027

(warning) The '%s' is not supported with horizontal compression for the specified relative placement group '%s'.

**Description**

This message specifies that the utilization or alignment type are not supported with horizontal compression. They are supported only with bit slice tiling type.

**See Also**

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

Feedback

## RPGP-028

(error) The relative placement object(s) of the specified relative placement group are not placed in its expected location.

### Description

This message specifies that the relative placement object(s) in specified relative placement group are not placed in expected location after tiling. This error occurs if the specified relative placement object(s) is moved before/below the previous relative placement object(s) in its row/column. This error will be issued if the previous relative placement object(s) in the row/column is moved next/above the specified relative placement object(s). This error will also be reported if two or more relative placement object(s) overlap with each other. Please use -verbose option of report_rp_groups command for details of the location movement failure.

### See Also

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

## RPGP-029

(warning) The specified %s '%s's block '%s' and the relative placement group '%s's block '%s' are not same.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to add an object, whose block is not same as the relative placement group's block. An object can be added to the relative placement group only if its block and relative placement group's block are same.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

Feedback

## RPGP-030

(error) The right override alignment of relative placement object is not supported since its relative placement group '%s''s alignment type is pin.

### Description

This error message occurs when the *add_to_rp_group* command detects that you tried to set right override alignment for the relative placement object when the alignment type of relative placement group is pin.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## RPGP-031

(Warning) The cell '%s' is not placed.

### Description

This error message occurs when the *create_clock_rp_groups* command detects that the sequential cell is not placed. The command will not be able to create relative placement groups for clock tree sinks if all sequential cells are not placed.

### See Also

- create_rp_group
- create_placement

## RPGP-032

(info) The %s '%s' will be renamed to '%s' because of the naming conflict.

### Description

This information message specifies that there is a relative placement group/blockage name conflict during uncommitting of block. The relative placement group/blockage name will be prefixed with the uncommitted block's name.

Feedback

### See Also

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

---

## RPGP-033

(warning) The relative placement group '%s' in the block '%s' will not be committed because it has partial cells from hierarchical instance '%s'.

### Description

The message specifies that the relative placement group will not be copied to the committed block because it has only partial cells belonging to the committed block's hierarchical instance. The relative placement group will stay in its current block excluding the relative placement cells committed to the physical hierarchy. For a relative placement group to get fully committed to committed block, all the cells of this relative placement group should belong to the committed physical block.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-034

(warning) The relative placement group %s is not completely inside of hierBoundary for module instance %s, but it has members that belong to that module instance.

### Description

During the command commit_blocks, a relative placement group was encountered which did not lie completely inside a hierBoundary or partition, but had cell members that belonged to that module instance. Please note that the placement information of this relative placement group is removed in the committed block.

Feedback

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-035

(warning) The '%s' of anchored relative placement group %s is completely outside the hierBoundary for module instance %s, but it has members that belong to that module instance.

### Description

During the command commit_block, the anchored relative placement group was encountered which has x_offset/y_offset that does not lie inside the hierBoundary or partition, but had cell members that belonged to that module instance. Please note that the placement information of this anchored relative placement group is removed in the committed block.

### What Next

Please set the anchor point of relative placement group inside hierBoundary/partition.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-036

(warning) The right override alignment cannot be set on multi column relative placement cell '%s'.

### Description

This error message occurs when the *add_to_rp_group* or *set_attribute* command detects that you tried to set right override alignment on the multi column relative placement cell. The right alignment is not supported for multi column relative placement cell.

Feedback

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-037

(warning) The Relative Placement group '%s' is already placed.

**Description**

This error message occurs when the *recover_rp_placement* command detects that you tried to recover the placement information of the Relative Placement group which is already placed. We can recover the placement information of the Relative placement group only when it is not placed and relatively placed.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-038

(Warning) The retrieved placement information for relative placement group '%s' may be diferent from original placement.

**Description**

This information message occurs when the *recover_rp_placement* command detects that you tried to recover the placement information of the relative placement group whose relative placement objects are not relatively placed. Hence the retrieved placement information may not be exactly same as it was in *Design Compiler* or *IC Compiler*.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

Feedback

## RPGP-039

(warning) The relative placement group '%s' is not being legalized because it does not belong to the current block.

### Description

This error message occurs when the *legalize_rp_groups* command detects that the relative placement group being legalized is present in a different block. The relative placement group(s) can be legalized only from their block.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## RPGP-040

(warning) The duplicate entry of %s '%s' is not being processed.

### Description

This error message occurs when the command detects that the duplicate entry of relative placement group or relative placement object is provided in the input. The relative placement groups from multiply instantiated blocks are also not allowed.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## RPGP-041

(warning) The anchor_corner set on the relative placement group '%s' may lie outside the core area when it's defined.

### Description

This warning message occurs when the *set_rp_group_options* command detects that the user tried to set the anchor_corner on the relative placement group, whose core area has not been defined yet.

Feedback

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-042

(error) The values of both anchor_row and anchor_column of the relative placement group should not be zero.

**Description**

This error message occurs when the *set_rp_group_options* command detects that the values provided for both *anchor_row* and *anchor_column* are zero for *-anchor_corner* rp_location.

**What Next**

Please change the *anchor_corner* to bottom_left or change the value of either *anchor_row* or *anchor_column*.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-043

(error) The anchor_corner rp_location specified for the relative placement group should be provided with both anchor_row and anchor_column options.

**Description**

This error message occurs when the *set_rp_group_options* command detects that both *anchor_row* and *anchor_column* options are not provided for the relative placement group with *anchor_corner* rp_location.

Feedback

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-044

(error) The anchor_row or anchor_column option(s) are not allowed for non rp_location anchor_corner of the relative placement group.

**Description**

This error message occurs when the *set_rp_group_options* command detects that the user has specified the *anchor_row* or *anchor_column* option(s) for the non rp_location *anchor_corner* of the relative placement group.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-045

(error) The anchored relative placement location for rp_location anchor_corner specified using anchor_row and anchor_column is empty for relative placement group '%s'.

**Description**

This error message occurs when the *set_rp_group_options* command detects that the anchored relative placement location is empty for rp_location *anchor_corner*. The relative placement location specified using *anchor_row* and *anchor_column* cannot be empty for anchoring the relative placement group.

**See Also**

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

Feedback

## RPGP-046

(info) The anchor_corner for relative placement group '%s' is removed because the anchored relative placement location for rp_location anchor_corner is empty.

### Description

This error message occurs when the *modify_rp_groups* command detects that after modification of relative placement group structure, the anchored relative placement location is empty for rp_location *anchor_corner*. The *anchor_corner* of the relative placement group is removed because the relative placement location specified in command *set_rp_group_options* using *anchor_row* and *anchor_column* options cannot be empty for anchoring the relative placement group.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

## RPGP-047

(Error) The relative placement group '%s' cannot be created because given design is read only.

### Description

This error message occurs when the command *create_rp_group* detects that given design through option *-design* is read only and relative placement group can not be created.

### See Also

- create_rp_group
- add_to_rp_group

## RPGP-048

(Error) The relative placement group '%s' cannot be created because design view is not loaded.

Feedback

### Description

This error message occurs when the command *create_rp_group* detects that given design through option *-design* is not loaded as design view, so relative placement group can not be created. The other view types are abstract view, frame view etc.

### See Also

- create_rp_group
- add_to_rp_group

---

## RPGP-049

(Warning) The relative placement group '%s' is not placed.

### Description

This error message occurs when unplaced relative placement group is detected during congestion aware coarse placement. The congestion aware coarse placement is done by *refine_placement* command or by *create_placement -congestion*. Please note that cells of such relative placement groups may move large distance.

### What Next

Please check why relative placement group was unplaced and getting rid of reason may make the group placed. If unplaced realative placement group is getting placed during congestion aware placement then please make sure desired placement is being achieved.

### See Also

- create_rp_group
- create_placement
- refine_placement

---

## RPGP-050

(Error) The number of given min_sinks is more than number of given max_sinks.

### Description

This error message occurs when the *create_clock_rp_groups* command detects that the number of minimum sinks given using option *-min_sinks* is more than max sinks given using *-max_sinks*.

Feedback

**See Also**

- create_rp_group
- create_placement

---

## RPGP-051

(Warning) The cell '%s' is being ignored because it is '%s'.

**Description**

This error message occurs when the *create_clock_rp_groups* command ignores some cell and does not consider it for clustering (i.e. fixed cell). If the cell is a driver then all its sinks are also not clustered.

**See Also**

- create_rp_group
- create_placement

---

## RPGP-052

(info) The attribute '%s' is not applicable for top level relative placement group '%s'.

**Description**

The given attribute is applicable for hierarhical relative placement group only, so will not be processed for top level relative placement group.

**See Also**

- create_rp_group
- set_rp_group_options
- report_rp_groups
- legalize_rp_groups

---

## RPGP-053

(Warning) The relative placement group '%s' is not being processed because it is unplaced and has hard macros.

Feedback

### Description

This warning message occurs when relative placement group is found to be unplaced during coarse placement or legalization and it has added hard macro cells.

### What Next

The relative placement group should be placed during floorplanning using *create_placement -floorplan* command.

### See Also

- create_rp_group
- create_placement
- legalize_placement
- legalize_rp_groups

---

## RPGP-054

(Warning) The hard macro cell '%s' is not fixed.

### Description

This warning message occurs when hard macro cell is detected as unfixed during coarse placement or legalization. This warning is given for hard macro cells which are part of relative placement group.

### What Next

The hard macros which are part of relative placement group are expected to be fixed after design planning. Please mark all relative placement hard macros fixed at start of placement and routing flow.

### See Also

- create_rp_group
- create_placement
- legalize_placement
- legalize_rp_groups

---

## RPGP-055

(error) The site def information for '%s' '%s' is missing.

Feedback

### Description

This error message indicates that the site def information is not available for the reported cell reference or site row. This error message can occur either during placement, legalization or design planning.

### What Next

You can check the site def information using either of the commands *get_site_defs* or *report_site_defs*. If no site def is present, you can add site def information and rerun the command.

### See Also

- get_site_defs
- report_site_defs

---

## RPGP-056

(error) The '%s' attribute cannot be modified for the relative placement free placement cell '%s'.

### Description

This error occurs when you try to modify either the *rp_override_alignment* or *rp_pin_name* attribute on a relative placement free placement cell. These attributes cannot be set or removed from a relative placement free placement cell.

### See Also

- add_to_rp_group
- remove_from_rp_group

---

## RPGP-057

(error) The '%s' option can be used only with '-free_placement' or '-blockage' option.

### Description

This error message occurs when the *add_to_rp_group* command detects that you used the *-height* or *-width* option without either '-free_placement' or '-blockage'. The *-height* and *-width* options are not valid with *-rp_group* option. They are also not valid with *-cells* if '-free_placement' option is not provided.

Feedback

### What Next

Please see the man page of *add_to_rp_group* command for the correct combination of options.

### See Also

- add_to_rp_group
- remove_from_rp_group

---

## RPGP-058

(error) The area provided for the relative placement free placement cells is not sufficient to place all the specified Cells.

### Description

This error message occurs when the *add_to_rp_group* command detects that the area provided by you for the relative placement free placement cells not sufficient to place the specified relative placement free placement cells.

### What Next

Please increase the height or width of the free placement region provided for the relative placement free placement cells or remove some of the cells from the list and rerun the command.

### See Also

- add_to_rp_group
- remove_from_rp_group

---

## RPGP-059

(warning) The '%s' '%s' cell cannot be added as a relative placement free placement cell.

### Description

This error message occurs when the *add_to_rp_group* command detects that you are adding a hard macro or a physical only cell to relative placement free placement region.

### What Next

Please remove any hard macro or physical only cells from the list of specified free placement cells.

Feedback

### See Also

- add_to_rp_group
- remove_from_rp_group

---

## RPGP-060

(warning) Some of the relative placement free placement cells in the relative placement group are not placed in the free placement region.

### Description

This message occurs when the *report_rp_groups* command detects that relative placement free placement cells of the either the top or hierarchical relative placement group have been placed outside the free placement region defined for them. Pleas use -verbose option of *report_rp_groups* command for details of this failure. This failure may happen because of overlap with fixed placement objects.

### What Next

Please increase the height or width of the free placement region provided for the relative placement free placement cells and rerun the create_placement command.

### See Also

- add_to_rp_group
- report_rp_groups
- remove_from_rp_group

---

## RPGP-061

(error) The anchored relative placement location for rp_location anchor_corner specified using anchor_row and anchor_column contains relative placement free placement cells.

### Description

This error message occurs when the *set_rp_group_options* command detects that the anchored relative placement location for rp_location *anchor_corner* contains relative placement free placement cells. The relative placement location specified using *anchor_row* and *anchor_column* cannot have relative placement free placement cells.

### What Next

Pleae remove the anchor_corner from the relative placement locations containing relative placement free placement cells and rerun the command.

Feedback

### See Also

- set_rp_group_options
- add_to_rp_group
- remove_from_rp_group

---

## RPGP-062

(warning) The '%s' provided for the relative placement free placement cells is less than the maximum '%s' of relative placement free placement cells.

### Description

This warning message occurs when the *add_to_rp_group* command detects that the height or width provided by you for the relative placement free placement cells is less than the maximum height or width of the specified free placement cells.

### What Next

Please increase the height or width of the free placement region provided for the relative placement free placement cells.

### See Also

- add_to_rp_group
- remove_from_rp_group

---

## RPGP-063

(error) The '-pin_name', '-override_alignment' and '-orientations' options cannot be used with '-free_placement' option.

### Description

This error message occurs when the *add_to_rp_group* command detects that you used the one of *-pin_name* or *-override_alignment* or *-orientations* options with '-free_placement'. These options cannot be used while adding relative placement free placement cells. not provided.

### What Next

Please see the man page of *add_to_rp_group* command for the correct combination of options.

Feedback

### See Also

- add_to_rp_group
- remove_from_rp_group

---

## RPGP-064

(warning) The cell of relative placement group '%s' is getting placed after multi row free placement cells during horizontal compression.

### Description

This warning occurs because the cell of relative placement group is getting placed after multi row free placement cells of subsequent column. The multi row free placement cells are added in one of the previous rows and is part of current row too. This happens when width of relative placement objects before multi row free placement cells in current row is more compared to placed row of multi row free placement cells.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-065

(warning) The cell '%s' will not be legalized because all the cells of the relative placement group are not provided.

### Description

This warning message indicates that a cell was not legalized because it is relative placement cell and all the cells of the relative placement group are not provided to be legalized. The relative placement group moves as a whole unit and individual cells should not be legalized.

### What Next

Please provide all cells of the relative placement group. If you want to legalize individual cells only then please remove the relative placement group.

Feedback

### See Also

- create_placement
- legalize_rp_groups
- legalize_placement

---

## RPGP-066

(warning) The cell of relative placement group '%s' is getting placed after multi row free placement cells at row '%s' column '%s' during horizontal compression.

### Description

This warning occurs because the cell of relative placement group is getting placed after multi row free placement cells of subsequent column. The multi row free placement cells were added in one of the previous rows and are part of current row too. This happens when width of relative placement objects before multi row free placement cells in current row is more compared to placed row of multi row free placement cells.

### See Also

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-067

(warning) The cell of relative placement group '%s' is getting placed after multi column cell '%s' during vertical compression.

### Description

This warning occurs because the cell of relative placement group is getting placed after multi column cell of subsequent row. The multi column cell is added in one of the previous columns and is part of current column too. This happens when height of relative placement objects before the multi column cell in current column is more compared to placed column of multi column cell.

Feedback

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

---

## RPGP-068

(warning) The vertical compression tiling has not been respected for relative placement group '%s'.

**Description**

This warning occurs when vertical compression tiling has not been respected for the relative placement group. The gap between two objects in consecutive rows of a relative placement groups is considered as vertical compression failure.

**See Also**

- check_rp_constraints
- report_rp_groups
- set_rp_group_options

---

## RPGP-069

(warning) The cell of relative placement group '%s' is getting placed after multi column free placement cells at row '%s' column '%s' during vertical compression.

**Description**

This warning occurs when the cell of relative placement group is getting placed after multi column free placement cells of subsequent row. The multi column free placement cells were added in one of the previous columns and are part of current column too. This happens when height of relative placement object is higher than the object in same row of previous column.

**See Also**

- report_rp_groups
- create_rp_group
- set_rp_group_options

Feedback

## RPGP-070

(error) The region provided is not sufficient to perform the placement analysis for relative placement group '%s'.

### Description

This error message occurs during check_rp_constraints command when the size of the region provided by user is not large enough to perform placement analysis. The size of the region must be at least greater than the size of relative placement group.

### What Next

Please increase the size of the region provided.

### See Also

- check_rp_constraints
- report_rp_groups

## RPGP-071

(warning) The cell '%s' is illegal everywhere. The relative placement group '%s' may not be placed.

### Description

This warning message indicates that a cell is not legal on any site. The placement of parent relative placement group of this cell may fail.

### What Next

Please modify the library cell of the problematic cell to make it legal.

### See Also

- create_placement
- legalize_rp_groups
- legalize_placement

## RPGP-072

(error) The anchor_corner specified for the relative placement group '%s' is outside it's physical block '%s'.

Feedback

### Description

This error message occurs when the *set_rp_group_options* command detects that the user tried to set the anchor_corner on the relative placement group present in a physical block, outside of the defined core_area of the block.

### See Also

- add_to_rp_group
- create_rp_group
- remove_from_rp_group

---

## RPGP-073

(warning) The specified cell '%s' could not be added to the relative placement group '%s' because its reference library cell is missing.

### Description

This warning message occurs when the *add_to_rp_group* command detects that you tried to add a cell whose reference cell is not present in the library. A cell with missing reference library cell is not allowed to be added to a relative placement group. Please check the library for the missing reference library cell ('LNK-005' messages during library linking).

### See Also

- create_rp_group
- remove_from_rp_group

---

## RPGP-074

(Information) Checking the legality of '%s' relative placement cells which have been swapped during relative placmeent variant-aware legalization.

### Description

This information message occurs during relative placement variant-aware legalization when we check the legality of relative placement cells which have been swapped.

### See Also

- legalize_placement
- legalize_rp_groups

Feedback

## RPGP-075

(Information) Starting normal relative placement legalization to fix violations after variant-aware legalization.

### Description

This information message occurs when all the cells are not legal after relative placement variant-aware legalization and normal relative placement legalization is being run to fix them.

### See Also

- legalize_placement
- legalize_rp_groups

## RPGP-076

(Information) Relative Placement legalization is not supported for advanced legalization flow.

### Description

This information message occurs when legalize_rp_groups command is run with advanced legalization flow enabled. Relative Placement groups are not supported in advanced legalization flow.

### See Also

- legalize_placement

## RPGP-077

(Warning) RP cell %s have either top, bottom or both the keepouts which are not supported.

### Description

This warning message occurs when relative placement cell have either top, bottom or both the keepout as RP technology does not support these keepouts on RP cell.

## RPGP-078

(warning) Both anchor corner and site row values cannot be set on relative placement group %s.

Feedback

### Description

This warning message occurs when the *set_rp_group_options* command tries to set *-anchor_corner* and *-site_row* value on relative placement group.

### What Next

Please set both anchor corner and offset values for the relative placement group.

### See Also

- set_rp_group_options
- add_to_rp_group

# RPT

## RPT-001

(Warning) No paths found. Design has unmapped elements. This command works on mapped netlists only.

### Description

This message occurs while running the report_logic_levels command, when there are no paths found for analysis and the design has some unmapped elements. The command works only on mapped netlist.

### What Next

Please run compile command to map all the elements. If the command is already run, then try passing differnt arguments to the reporting command so that paths are found for analysis.

## RPT-002

(Warning) No paths found. Please supply slack options to include positive slack paths, if desired.

### Description

This message occurs while running the report_logic_levels command, when there are no paths found for analysis. By default, this command analyses only the -ve slack path paths.

Feedback

**What Next**

Invoke the reporting command with -slack_lesser_than & -slack_greater_than options to include +ve slack paths as well for analysis.

---

## RPT-003

(Warning) No paths matched analysis criterion. Please specify different set of options.

**Description**

This message occurs while running the report_logic_levels command, when there are no paths found for analysis.

**What Next**

Invoke the command with different set of options.

---

## RPT-004

(error) One of threshold value or reset flag must be specified.

**Description**

This message occurs while running the set_analyze_rtl_logic_level_threshold command without any of the required options.

**What Next**

Either specify the threshold value or the -reset option.

---

## RPT-005

(error) Both threshold value and reset flag cannot be specified.

**Description**

This message occurs while running the set_analyze_rtl_logic_level_threshold command, both threshold value and -reset flag is specified.

**What Next**

Specify only one of the the threshold value or the -reset option.

---

## RPT-006

(error) Invalid path group name %s supplied with -group option.

Feedback

### Description

This error message occurs if you specify a non-existent path group name when using the *-group* option with the *report_logic_levels* command.

### What Next

Specify a valid (existing) path group name when using the *-group* option and then run the *report_logic_levels* command again.

Path groups are created implicitly according to the clock of the destination register of a path. You can also define a path group with via the *group_path* command. To see a list of all valid path groups, issue the *report_path_group* command. Any of the path group names listed can be supplied with the *-group* option in the *report_logic_levels* command.

### See Also

- report_path_group

---

## RPT-007

(warning) value '%s' for app option '%s' is not valid. \n Valid values are '%s' . \n Setting value to '%s' :

### Description

The value given for the listed argument is not one of the limited allowable strings. Only valid strings are set for this app option. This messages lists all of the appropriate values.

### What Next

Supply a compatible value for the argument.

---

## RPT-008

(warning) Option

### Description

The option is in conflict with another one and therefore is ignored.

---

## RPT-181

(error) Errors occurred during write_qor_data while running the %s report.

Feedback

**Description**

*write_qor_data* captures data from tool reports (or other sources) into a structured table format. *compare_qor_data* later uses this table data to create the QORsum report. This error occurs when an unexpected problem occurs while *write_qor_data* was running or extracting data from the report named in the error message. In some cases, you may find clues to what went wrong by looking at the report file created in the *write_qor_data -output* dir: <output>/<label>/reports/<report_name>.rpt.

**What Next**

Report this problem to your Synopsys support team.

# RT

## RT-022

(error) %s has not been specified.

**Description**

The command failed since you did not specify necessary inputs. You may specify the inputs by the options of this command, or via another command prior to executing this command.

**What Next**

Specify necessary inputs and then execute this command again. Please refer to the man page of the command for more information.

## RT-036

(error) Layer '%s' does not exist in design.

**Description**

You receive this message because you used a layer that does not exist in design.

**What Next**

Check the layers from the design and use the right routing layer name.

## RT-048

(info) No DRC error is reported!

Feedback

**Description**

This information message notifies you that there is no DRC violation after running this command.

**What Next**

This is an informational message only. No action is required on your part.

---

## RT-050

(error) Failed in executing %s.

**Description**

Command has failed.

**What Next**

Please check the log file and correct any errors reported.

---

## RT-066

(warning) The '%s' via enclosure width is less than NDR width constraint of '%s' layer.

**Description**

You receive this message because the via enclosure width is less than NDR width constraint of the layer. Zroute may report "Less than NDR width" violation for these via enclosure.

**What Next**

Please increase NDR via enclosure to meet metal layer NDR width.

---

## RT-080

(info) %s

**Description**

As described in the message.

**What Next**

This is for your information.

Feedback

## RT-113

(warn) Net pattern did not match any nets.

**Description**

The net pattern specified did not match with any nets.

**What Next**

Verify that the net pattern specified is correct.

## RT-115

(warn) %s

**Description**

Basic input error checking.

**What Next**

Please recheck the command inputs and use the -help option to verify the input is correct.

## RT-116

(warn) Please set flip_chip.route.design_style to %s style. %s is auto-selected for the current command.

**Description**

flip_chip.route.design_style value does not match the actual design style. Please set the correct value so that the following push_rdl_routes, optimize_rdl_routes or route_3d_rdl command works properly.

**What Next**

For route_rdl_flip_chip, please set flip_chip.route.design_style to flip_chip_peripheral_io. For route_3d_rdl, please set flip_chip.route.design_style to 3dic_single_die.

## RT-119

(error) %s

**Description**

An unexpected error has occured.

Feedback

**What Next**

Please check the log file and correct any errors reported.

---

## RT-120

(error) %s

**Description**

Basic input error checking.

**What Next**

Please recheck the command inputs and correct any errors reported in the log file.

---

## RT-201

(error) Cells are not placed.

**Description**

This error message indicates that check_lvs stops checking because many cells are not been legally placed.

**What Next**

Please make sure all the cells are placed before running check_lvs.

---

## RT-202

(warn) Pin shape %s is skipped by check_lvs because its area is 0. Skip this pin.

**Description**

This warning message indicates that pin shape is skipped by check_lvs because its area is 0.

**What Next**

Please check your design.

---

## RT-203

(warn) Port %s have no valid pin shapes. Skip this port.

**Description**

This warning message indicates that port has no valid pin shapes. Skip this port.

Feedback

**What Next**

Please check your design.

---

## RT-204

(warn) Net %s has less than 2 valid port. Skip open checking for this net.

---

## RT-205

(warn) Via %s has no via_def. Skip this via.

**Description**

This warning message indicates that via has no via_def. Skip this via.

**What Next**

Please delete the problematic via or provide a replacement tech file. Please refer to create_via_def.

---

## RT-301

(error) The input spacing "%.3f" of layer "%s" is smaller than the minimum spacing "%.3f" defined in techfile.

**Description**

The input spacing value cannot violate the minimum spacing rule defined in techfile.

**What Next**

Please correct your input.

---

## RT-302

(error) This command only support design with rectangular boundary.

**Description**

Rectlinear or polygon design boundary is not supported in this command.

**What Next**

Please use create_routing_guide -rdl_routing to create the route guides

Feedback

## RT-303

(error) "nonDefaultRDLRegionMinSpacing" value is not defined for layer "%s" in the techfile. Please provide the value by "-spacing" option or define it in the techfile.

**Description**

For RDL routing guides, the spacing value comes either from the "nonDefaultRDLRegionMinSpacing" defined in the layer section of the techfile, or input by the "-spacing" options. Please use either way to specify the spacing value of the routing guides.

**What Next**

Please specify the spacing vaule.

## RT-304

(error) Input %s vaule %.3f is larger than half of the block width or half of the block height. Unable to create rdl routing guides using this value.

**Description**

For RDL routing guides, the -boundary_distance and -corner_distance are measured from for side of the block boundary. So the vaules need to be smaller than half of the block width and half ot the block height to create vaild rdl routing guide.

**What Next**

Please check your input and modify it.

## RT-305

(info) Remove existing RDL routing guide before creating new one.

**Description**

Remove existing RDL routing guides before creating new one to avoid ambiguty to the RDL router.

## RT-306

(warning) RDL routing guide "%s" has non-Manhattan and non-45-degree edge, which is not supported by RDL router. Ignore this routing guide.

Feedback

**Description**

RDL router only support routing guides with manhanttan or 45-degree edges. Routing guides with any angle edges are ignored during routing.

**What Next**

Please modify the routing guide.

---

## RT-307

(warning) RDL routing guide "%s" overlaps with RDL routing guide "%s" on layer "%s" with different associated spacing values. Ignore this routing guide to avoid confusion during routing.

**Description**

RDL routing guides with different associated spacing values should not overlap with each others. Such overllaped routing guides are ignored to avoid confusion during routing.

**What Next**

Please modify the region of the routing guides to avoid overlap issue.

---

## RT-308

(error) The input spacing "%.3f" of layer "%s" is smaller than the nonDefaultRDLRegionMinSpacing spacing "%.3f" defined in techfile.

**Description**

The input spacing value cannot violate the nonDefaultRDLRegionMinSpacing spacing rule defined in techfile.

**What Next**

Please correct your input.

---

## RT-309

(error) The input -boundary_distance vaule "%.3f" is larger than the -corner_distance vaule "%.3f", which is an invalid input.

**Description**

To form a vaild rdl routing guide, the -boundary_distance vaule has to be smaller or equal to -corner_distance value.

Feedback

**What Next**

Please correct your input.

---

## RT-310

(warning) The input "%s" vaule is not the multiple of minimum grid. It is snap up to the nearest on grid value.

**Description**

The side length of the routing guides needs to be the multiple of minimum grid. Otherwise, the off-grid value might cause issue during routing. Tools automatically snap up off-gird value to the nearest on-grid number.

**What Next**

Please check your input.

---

## RT-311

(Warning) Pin %s can not be found, skipping it.

**Description**

Please check if pin setting correctly.

---

## RT-502

(warn) %s

**What Next**

Please recheck the command inputs and make sure the design is verified.

---

## RT-505

(error) Cannot find contact information for the %d layer.

**Description**

An error related to contact information occurred in the design.

**What Next**

Check the via layer or contact code section in the technology file to make sure that the vias and contact codes are correctly defined.

Feedback

## RT-511

(warn) Net %s is not a valid net for this router. Skip this net.

**Description**

This net is not identified as an RDL net.

**What Next**

Please check if the flip-chip IO pad cell design type is set as 'pad' or 'flip_chip_driver' Please check if the bump cell design type is set as 'flip_chip_pad' If the net is a multiple IO pad pins to multiple bumps net, user needs to run place_io first to determine the IO pad pin to bump connections If one IO pad pin is connected to more than 4 bumps, user needs to set app option flip_chip.route.routing_style to spanning_tree style to route this IO pad pin

## RT-513

(warning) Net %s {(%.3f %.3f), (%.3f %.3f)}, corresponding cells {%s}, would have potential cross with %d nets, {%s}.

**Description**

The net would have potential cross with current net assignment.

**What Next**

Please fix the problem by swap cell before routing.

## RT-516

(warn) No routable RDL nets found.

**Description**

Tool cannot find routable RDL nets in the design.

**What Next**

Please check the following things: 1. Please check if the given net names are correct. 2. Please check if the flip-chip IO pad cell design type is set as 'pad' or 'flip_chip_driver' 3. Please check if the bump cell design type is set as 'flip_chip_pad' 4. If the net is a multiple IO pad pins to multiple bumps net, user needs to run place_io first to determine the IO pad pin to bump connections 5. If one IO pad pin is connected to more than 4 bumps, user needs to set app option flip_chip.route.routing_style to spanning_tree style to route this IO pad pin

Feedback

## RT-518

(warn) %s on net '%s' is blocked at (%.3f %.3f), (%.3f %.3f). Net cannot be routed.

**Description**

Routing point of the net is blocked at the given location. Router cannot route the net.

**What Next**

Please check the blocked net at given location.

## RT-519

(warn) Multi-pin net

**Description**

Multi-pin nets will not be routed with this command.

**What Next**

Multi-pin nets will not be routed with this command. Please disconnect unnecessary ports or use route_tsv_nets to route back-side bump-to-TSV power/ground nets, and Template-based PNS to create power/ground mesh for each power domain.

## RT-520

(warn) Net %s contains more than one bump cell set as connect-only. Router skips the net.

**Description**

There are more than one bump cell set as connect-only in the net. Router will skip routing for this net.

**What Next**

Please use report_flip_chip_bump_attributes to see the settings on the bump cells. Then modify your design by set_flip_chip_bump_attributes -connect_only (true|false) to set only one bump cell as connect-only in one net.

## RT-521

(error) Too many routing layers.

Feedback

**Description**

With -auto_via true, there should be no more than 2 routing layers.

**What Next**

Please specify only 1 or 2 routing layers or set -auto_via false.

---

## RT-522

(error) Routing layers are not adjacent.

**Description**

With -auto_via true, the routing layers should be adjacent.

**What Next**

Please specify adjacent routing layers or set -auto_via false.

---

## RT-523

(warn) No existing global routes on the design.

**What Next**

Please run global routing first.

---

## RT-524

(error) Failed to open child cell %s.%s.

**Description**

This warning message indicates that the router was not able to open the child cell for read. This could be because the reference library where the child cell resides does not have read permission or is missing.

**What Next**

Please make sure the reference library is linked and readable to the current design.

---

## RT-525

(warn) Cannot push, optimize or split an open net %s.

**Description**

The net to push, optimize or split is not detail routed.

Feedback

## RT-526

(error) Cannot push EEQ or multi-terminal nets with -mode neighbor without specifying -terminal_names.

**Description**

The net to be pushed or optimized is an EEQ or multi-terminal net. Please specify -terminal_names to selectively push the routes connected to the specified driver pins or EEQ pins.

## RT-527

(error) Cannot push more than one net with -mode neighbor.

## RT-528

(warn) Delete global routes in the design.

**Description**

All global routes in the design are deleted after command optimize_rdl_route, push_rdl_route and split_rdl_route.

## RT-529

(error) Route shape of net %s could not be split. Net width is %.3f, but it is requested to split into %d nets with width of %.3f and spacing %s in between.

**Description**

Fail to spilt route shape since the width is not wide enough.

**What Next**

Please check your width and spacing settings, and modify it by set_route_flip_chip_options. Please make sure that (width before spilt) >= 2*(width after split) + (spacing).

## RT-532

(warning) Net %s contains off-grid segments.

**Description**

Please check the segments of this net.

Feedback

**What Next**

Please fix all off-grid segments.

---

## RT-533

(warn) NDR via %d setting is useless and will be ignored.

**Description**

NDR via setting is useless and will be ignored for the follwing reason 1. This via can not be found in technology file. 2. This via array size is incorrect.

**What Next**

Please check your setting if it is correct.

---

## RT-535

(warn) The via of net %s has a spacing violation with a blockage.

**Description**

The via has a spacing violation with a metal/cut blockage or route guide.

**What Next**

Check the design and follow these instructions to correct any errors:

1. Check the net spacing setting in the technology file.
2. Check the net spacing rule in the nondefault routing rule.
3. Set the view level to 1 and turn on the visibility of route guides and system blockages. Make sure that nothing blocks the resource.

---

## RT-536

(warn) not able to create stack via for net %s

**Description**

There is no routing resource to create stack via for the target net.

Feedback

**What Next**

Check the design and follow these instructions to correct any errors:

1. Check the net spacing setting in the technology file.
2. Check the net spacing rule in the nondefault routing rule.
3. Set the view level to 1 and turn on the visibility of metal, pin, route guides and system blockages. Make sure that nothing blocks the resource.

---

## RT-537

(error) No shielding net is found.

**Description**

There is no shielding net in design.

**What Next**

Use set_route_rdl_options -shielding_net to specify shielding net.

---

## RT-538

(warn) Routes of net %s contain shapes of different width. Skip the route for splitting.

**Description**

Routes that contain shapes of different width cannot be split in order to prevent open nets. These routes are skip by the splitting command.

**What Next**

Please check if the net has tapering setting that makes the shapes vary in width.

---

## RT-539

(error) Please specify no more than %d nets.

**Description**

Too many nets are specified.

**What Next**

Please specify less nets.

Feedback

## RT-540

(warning) Net %s is previously shielded on layer %s. Skip creating shields on this net.

## RT-541

(warning) Net %s has no shielding rules defined or its shielding width defined on layer %s is 0. Skip this net.

## RT-542

(warning) Net %s has 45 degree routed shapes, which cannot be pushed, optimized or split in 90_degree mode. %s

## RT-545

(warning) Differential group parallel mode routing failed due to insufficient routing space or bad net assignment.

**Description**

Tool requires sufficient routing space and good net assignment to perform differential group parallel mode routing.

Please check that there is sufficient routing space, especially between bump pin and bump pin. For net assignment, please check that there is no flyline crossing before routing and the pins are not far away from each others.

**What Next**

Please make sure that there is sufficient routing space or re-assign the nets.

## RT-546

(error) Layer %s: The orginal width of net %s is %.3f. The route cannot be split into routes of required width and spacing.

**Description**

When -widths and -spacings options are both given, the summation of widths and spacings should equal to the oringal route width.

**What Next**

Please adjust the value of -widths and -spacings options.

Feedback

## RT-547

(warn) Cannot split net %s, since it is already split by another mode.

**Description**

A net which is already split by same_layer mode cannot be split by adjacent_layer mode, and vice versa.

## RT-548

(warn) For net %s, the width of split wire on layer %s is smaller than the rule width on layer %s.

## RT-549

(warn) Cannot split via for net %s.

**Description**

Cannot split via due to failing to find suitable small via/via array to drop on the split route.

**What Next**

Please check the split route setting and the via sizes aviable.

## RT-550

(warn) Net %s contains split vias which are marked as User Enter type, which might cause incorrect result.

**Description**

Net %s contains vias which are split by split_rdl_route -split_via command before. But now these vias are marked as UserEnter type, which might cause incorrect result.

**What Next**

If the result is incorrect, undo the command if possible and mark the vias as Signal Route. Otherwise, mark the vias as Signal Route, rip-up reroute the net and redo the split command. Then redo your command.

## RT-551

(warn) place_io guidance for net %s does not exist.

Feedback

**Description**

The tool cannot honor place_io guidance because it does not exist.

**What Next**

Make sure place_io is applied before routing, or

apply the routing command without "-honor_place_io_guidance".

---

## RT-553

(warning) No shielding rules are set to RDL nets.

---

## RT-558

(warn) Remove extension shapes with violations in the area{{%.3f %.3f} {%.3f %.3f}}.

**Description**

Remove extension shapes.

**What Next**

Please check the log file and correct any errors reported.

---

## RT-562

(warn) Tapering setting does not work for net %s on layer %s.

**Description**

Taper distance must be larger than half of NDR width of Net.

**What Next**

Please check if the net has correct tapering setting.

---

## RT-563

(warn) extend_vias_on_pin setting does not work for tappering net %s.

**Description**

extend_vias_on_pin setting does not work for tappering net.

**What Next**

Please check if the net has tapering setting.

Feedback

## RT-564

(warn) extend_vias_on_pin setting does not work for connect_pad_without_endcap net %s.

**Description**

extend_vias_on_pin setting does not work for connect_pad_without_endcap option.

**What Next**

Please check the option connect_pad_without_endcap setting.

## RT-567

(warn) NDR via {%s %dx%d %s} does not satisfy fat metal contact rule.

**Description**

You receive the message because the NDR via does not satisfy fat metal contact rule. Zroute may have unsolvable DRCs while using the NDR via.

**What Next**

Check fat metal contact rule and remove the NDR via from -via_cuts or -cuts option in non-default routing rule setting.

## RT-568

(warn) Frame or design view for block {%s} not found.

**Description**

You receive the message because the frame or design view for the child block can not be found. The router will skip this child block.

**What Next**

Make sure $search_path includes the directory of the reference library. Make sure the frame or design view is in the reference library. If not, regenerate the reference library.

## RT-569

(warn) Gui is not running. Option -display does not work.

**Description**

The option -display will sjohow flyline on GUI. The application GUI must start.

Feedback

**What Next**

Please start the application GUI.

---

## RT-570

(error) Net %s not found.

**Description**

Failed to find the net in the current design.

**What Next**

Check the spelling of the net name. Make sure net of that name exists.

---

## RT-571

(warning) Multi-bump connection on net %s is not supported for length matching routing.

**Description**

Multi-bump connection is not supported for length matching routing. Normal routing will be performed on the connection.

**What Next**

Modify the net assignment so that every connection contains only one bump.

---

## RT-572

(warning) Unable to honor connect_edge_center on bump %s.

---

## RT-584

(warning) %s.frame does not exist.

**Description**

This message indicates that check_lvs cannot find frame cell for a design in physical library.

**What Next**

If not having frame view for this design is intended, ignore this warning. If frame view is expected for this design, please check the designs in the library and man page of LNK-055 for more details.

Feedback

## RT-585

(info) Detected open violation for Net %s. %s

**Description**

As described in the message.

**What Next**

This is for your information.

## RT-586

(info) Detected short violation. %s. %s. %s

**Description**

As described in the message.

**What Next**

This is for your information.

## RT-587

(info) Detected floating route violation for Net %s. %s

**Description**

As described in the message.

**What Next**

This is for your information.

## RT-588

(info) Detected floating pin violation for Net %s. %s

**Description**

As described in the message.

**What Next**

This is for your information.

Feedback

## RT-589

(Warn) Does not meet the value of flip_chip.route.number_of_ring_connections due to space limitation. (Bump %s)

**Description**

As described in the message.

**What Next**

This is for your information.

## RT-590

(Info) Auto computed river route bounding box {%.3f %.3f} {%.3f %.3f}.

**Description**

If the river routing coordinates are not given from input, tool automatically computes the routing bounding box by all the pins/vias of the target nets on the routing layer. Note that for river routing, all pins/vias need to fall on one of the routing bounding box edge. If any pin/via lie inside the routing bounding box, then it becomes floating and cannot be routed using the river routing methodology.

**What Next**

This is for your information.

## RT-591

(error) The input coordinates form disjoint regions which are not suitable for river routing. Please correct your input.

**Description**

River routing need to be perform in a single routing region with all pins/vias lying on the region boundaries. If the the input regions are disjoint, river routing cannot be performed.

**What Next**

Please correct your input.

## RT-592

(warn) Net '%s' has pin/via at (%.3f, %.3f) which is not lying on the routing boundary. This pin/via cannot be routed using river route.

Feedback

**Description**

River routing needs to be perform in a single routing region with all target pins/vias lying on the region boundaries. Please either adjust the vias position to make them lie on the boundary, or provide a routing boundary which touches all the target pins/vias by the option -coordinates.

**What Next**

Please correct your input.

---

## RT-593

(warn) There are %d stripe shape parts of net %s in the bbox (%.3f %.3f) (%.3f %.3f). Stripe to stripe routing is skipped for the bbox.

**Description**

The tool finds the intersection parts of the stripe shapes and the bbox as routing targets. And stripe-to-stripe routing can only connect two stripe shape parts. If there are more than two intersection parts, then RDL router will skip routing in this bbox.

**What Next**

Please correct your input bbox to overlap with only two stripe shapes.

---

## RT-594

(error) There are invalid input nets for this router. Stop command under -strict mode.

**Description**

Under -strict mode, the router will not route if any invalid input nets exist.

**What Next**

Please see RT-511 for valid RDL net definition. If you want to skip the invalid nets and route the valid nets, please set option '-strict' as 'false'.

---

## RT-595

(warning) flip_chip.route.bump_via_landing_mode is ignored in non-3DIC style routing.

**Description**

flip_chip.route.bump_via_landing_mode is designed only for 3DIC flow.

Feedback

**What Next**

Please set flip_chip.route.design_style to 3DIC-related value (3dic_single_die or 3dic_interposer).

---

## RT-596

(warning) Net '%s' is not found in P2P file '%s'. Skipped.

**Description**

The P2P file should contain at least one entry for each target net, or the net is skipped.

**What Next**

Please check the P2P file and ensure there is at least one entry for the target net.

---

## RT-597

(warning) Net %s is previously shielded on layer %s within the region specified in -coordinates or -create_shield_coordinates. Skip creating shields on this net.

---

## RT-598

(warning) Ignore option -offset in side-wall shield mode.

---

## RT-599

(warning) keep_existing_route option only works with bump_via_landing_mode. Ignore the setting.

**Description**

The "keep_existing_route" option only works when "bump_via_landing_mode" option is also set as true. Otherwise, the "keep_existing_route" setting will be ignored and use the default value.

**What Next**

Please check "report_app_option flip_chip.route.bump_via_landing_mode".

---

## RT-600

(warning) Ignore RDL routing guides in this command.

Feedback

**Description**

RDL routing guide is not supported in this comamnd. It is only supported in route_rdl_flip_chip, push_rdl_routes, optimize_rdl_routes.

---

## RT-601

(warning) Point (%s, %s) is not on grid. Skip routing point pair (%s, %s) - (%s, %s) for net %s on layer %s.

**Description**

For point-to-point routing, all the specified points in the input files need to be on grid. Router can only route to on-grid points. All the off-grid points will be skiped in point-to-point routing.

**What Next**

Please correct your input.

---

## RT-602

(warning) Point (%.3f, %.3f) is neither a wire end point nor falls inside a pin/via shape of the same net. Skip routing point pair (%.3f, %.3f) - (%.3f, %.3f) for net %s on layer %s.

**Description**

For point-to-point routing, all the specified points are either wire end points or fall inside pin/via shapes of the same net. All the points not following the rule above will be skiped in point-to-point routing. Please note that the "shape_use" of the pre-placed wires need to be set as "user_route" before calling the router. Otherwise, they will be removed.

**What Next**

Please correct your input.

---

## RT-603

(warning) Cannot find same net via of bump pin '%s'. No routing for this bump.

**Description**

For bump_via_landing_mode routing, a pre-placed same net via is required. Please set "shape_use" as "user_route". Otherwise, router will treat it as dangling shape and remove it before routing.

Feedback

**What Next**

Please pre-place landing via for this bump pin.

---

## RT-604

(warning) Point (%.3f, %.3f) is too close too another same net shape. Skip routing point pair (%.3f, %.3f) - (%.3f, %.3f) for net %s on layer %s.

**Description**

For point-to-point routing, if the point is a wire end-point and very close to another same net shape so that putting a unit wire on this point will directly touch that shape, then the routing to this point is disabled.

**What Next**

Please extend the length of this wire shape to make the routing point away from the other shapes.

---

## RT-605

(warning) Ignore option -apply_new_sequence when point_to_point_connection_file_name is not specified"

**Description**

Option -apply_new_sequence only works for point-to-point routing, Ignore this optoin when it is not point to point routing.

---

## RT-606

(warning) Ignore option -half_shield for coaxial shield mode"

**Description**

Option -half_shield is not supported in coaxial shield mode.

---

## RT-607

(warning) Ignore app option flip_chip.route.route_to_user_route_shapes when flip_chip.route.point_to_point_connection_file_name is set.

Feedback

## RT-608

(Info) Skip creating shields for net %s since the net direction does not match -half_shield direction.

## RT-609

(warning) Ignore app option "flip_chip.route.auto_coordinate_for_bump_via_landing_mode" when command option "-coordinates" is set.

**Description**

Command option -coordinates has higher priority than app option "flip_chip.route.auto_coordinate_for_bump_via_landing_mode".

## RT-610

(warning) App option "flip_chip.route.auto_coordinate_for_bump_via_landing_mode" only goes with app option "flip_chip.route.bump_via_landing_mode".

**Description**

The auto coordinate calculation only works on bump-via landing mode.

**What Next**

Please set app option "flip_chip.route.bump_via_landing_mode" as true first.

## RT-611

(warning) App option "flip_chip.route.auto_coordinate_for_bump_via_landing_mode" is not applicable for this command.

**Description**

The auto coordinate calculation is only works on route_rdl_flip_chip, route_3d_rdl, optimize_rdl_routes commands.

## RT-612

(info) App option "flip_chip.route.design_style" is automatically set to "%s" to match the RDL routing command %s.

Feedback

**Description**

flip_chip.route.design_style is automatically set to match the RDL routing command. The correct value need to be set so that the following push_rdl_routes, optimize_rdl_routes command works properly.

**What Next**

If the automatically set design style does not match current design, please set the app option "flip_chip.route.design_style" correctly before calling RDL routing command.

---

## RT-613

(warn) Routing pair (%.3f %.3f) (%.3f %.3f) of net '%s' on layer '%s' is not inside routing region specified by -coordinates option. Skip this pair.

**Description**

With -coordinates option specified, routing is only allowed in the specified region. Thus, any points in the point-to-point routing file that are not inside the specified routing region are not reachable for the router. These point pairs are skipped.

**What Next**

Resolve the conflict between -coordinates option and the content of point-to-point routing file from the app option "flip_chip.route.point_to_point_connection_file_name".

---

## RT-614

(warning) flip_chip.route.extend_spanning_tree_style_routing option only works with flip_chip.route.routing_style as "spanning_tree". Ignore the setting.

**Description**

The "extend_spanning_tree_style_routing" option only works when "routing_style" option is set as "spanning_tree". Otherwise, the "extend_spanning_tree_style_routing" setting will be ignored.

**What Next**

Please check "report_app_option flip_chip.route.routing_style".

---

## RT-615

(warning) The origin (%.4f %.4f) of cell %s is not on minimum grid.

Feedback

**Description**

Off minimum grid shapes cause unexpected issue in RDL routing, thus RDL router snaps the off-gird shapes to gird to avoid issues. The snap on min-grid process is to expand the oringinal shape to fit to the minimum grid. The expanded shapes occupy more routing resource, thus the routing might fail in region where the routing resources are tight.

**What Next**

Please fix the off-grid issue manually to avoid routing issues.

---

## RT-616

(warning) Library cell %s has geometry on layer %s which is not on minGrid..

**Description**

Off minimum grid shapes cause unexpected issue in RDL routing, thus RDL router snaps the off-gird shapes to gird to avoid issues. The snap on min-grid process is to expand the oringinal shape to fit to the minimum grid. The expanded shapes occupy more routing resource, thus the routing might fail in region where the routing resources are tight.

**What Next**

Please fix the off-grid issue manually to avoid routing issues.

---

## RT-617

(warning) Option -post_shield_fill_empty_space and -extend_to_pg_structure are ignored in non-3DIC style routing.

**Description**

Option -post_shield_fill_empty_space and -extend_to_pg_structure are designed only for 3DIC flow.

---

## RT-618

(warning) Option flip_chip.route.secondary_shielding_net is ignored in non-3DIC style routing.

**Description**

Option flip_chip.route.secondary_shielding_net is designed only for 3DIC flow.

Feedback

## RT-619

(error) The routing region (from -coordinates option) is not allowed to be smaller than the desgin data read-in region (from application option flip_chip.route.data_in_coordinates). Please correct your input.

**Description**

The routing region, input from -coordinates options, needs to be smaller than the desgin data read-in region, input from application option flip_chip.route.data_in_coordinates. Otherwise, design rule violations cannot be detected correctly.

**What Next**

Please correct either the -coordinates option value or the application option flip_chip.route.data_in_coordinates value.

## RT-620

(warning) Ignore user-defined group setting on port %s since must_join_group is also set.

## RT-621

(warning) Terminal %s is not assigned to one and only one user-defined group. check_lvs will ignore user-defined group setting for port %s.

## RT-622

(Error) No valid pins to be routed.

**Description**

Among all the input pins, there is no any valid PG pins that can be routed.

**What Next**

Check the pin list to ensure there is at least one PG pin.

## RT-623

(Error) stripe layers are not specified or valid.

**Description**

The stripe layer is either not specified or not routable.

Feedback

**What Next**

Check the stripe layer setting.

---

## RT-624

(Error) No valid routing layer combinations.

**Description**

The routing layer combination is not routable given the stripe layer.

**What Next**

Check the routing layer setting, and make sure that the routing direction of stripe layer, main-trunk layer, sub-trunk layer is either horizontal, vertical, horizontal or vertical, horizontal, vertical.

---

## RT-625

(Warning) App option %s is disabled in RDL router.

**Description**

App option is disabled in RDL router when one of minWidthForConcaveCorner, concaveConvexMinEdgeLength, convexConvexMinEdgeLength, and maxLength is set in tech file for the routing layer.

---

## RT-626

(Warning) Ignore minWidthForConcaveCorner, concaveConvexMinEdgeLength, convexConvexMinEdgeLength, and maxLength rules in this command.

---

## RT-627

(Warning) Detected bad input pattern for optimize_rdl_routes in net %s. The result might be not correct after optimization.

---

## RT-628

(Warning) Ignore app option flip_chip.route.bumps_to_honor_bump_spacing_only on layer %s, since app option flip_chip.route.layer_bump_spacings is not specified.

Feedback

**Description**

Please specify flip_chip.route.layer_bump_spacings if you would like to honor bump spacing.

---

## RT-629

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer %s since one of them is not specified.

**Description**

Please review your tech file settings.

---

## RT-630

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer %s since routing angle is 90-degree.

**Description**

Please review the routing angle settings.

---

## RT-631

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer %s due to invalid bump region settings.

**Description**

The invalid bump region might be caused by smaller bumpRegionRDLDistance or disjoint bump regions. Please review your tech file settings or design.

---

## RT-632

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer %s because there are some shapes inside bump region.

**Description**

Please clean up the bump region before routing.

Feedback

## RT-633

(Warning) Skip contact %s for incorrect lower_layer_name and upper_layer_name.

**Description**

Please check your tech file.

## RT-634

(Error) Skip this command since bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules are set.

**Description**

Please check if the tech file is correct set.

## RT-635

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer %s because rectilinear bumps are detected.

**Description**

Only round / octaongal bump are supported to bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules.

## RT-636

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer %s because the channel width between bump to bump is too large.

**Description**

The channel width between bump to bump should be only allowed bumpRegionRDLMaxAdjRouteCount routes to pass.

## RT-637

(Warning) Ignore bumpRegionRDLDistance, bumpRegionRDLAllowedSpacing, bumpRegionRDLAllowedWidth, and bumpRegionRDLMaxAdjRouteCount rules on layer

Feedback

%s because bumpRegionRDLAllowedSpacing/bumpRegionRDLAllowedWidth is larger than minSpacing/minWidth.

**Description**

bumpRegionRDLAllowedSpacing/bumpRegionRDLAllowedWidth should be less than minSpacing/minWidth. Please review your tech file.

---

## RT-638

(Warning) Routing width of net %s on layer %s does not meet maxWidth/minWidth constraints.

**Description**

Please check if the tech file is correct set.

---

## RT-639

(Warning) Invalid pin %s(%s) for routing layer %s.

**Description**

Please check if routing layers are set correctly or the pin is a valid routing pin.

---

## RT-640

(Warning) Pin %s does not belong to a PG Net, skipping it.

**Description**

Please check if pin setting correctly.

---

## RT-641

(warn) Net '%s' specified in option '%s' is not found and is ignored.

**Description**

Failed to find the net in the current design.

**What Next**

Check the spelling of the net name. Make sure net of that name exists.

Feedback

## RT-642

(info) There is only one group for route_rdl_differential pattern match mode. Use normal routing flow in which the tool only routes one group, but more than two nets can be in the group..

**Description**

For single differential group, route_rdl_differential pattern match mode uses the normal routing flow. The normal routing flow tries more solution, and the routing pattern might differ from the pattern using group routing flow.

**What Next**

Check the routing result.

## RT-643

(info) There are %d groups for route_rdl_differential pattern match mode. Use group routing flow in which the tool uses the group routing flow to route the nets.

**Description**

For multiple differential group, route_rdl_differential pattern match mode uses the group routing flow. This flow routes all groups together, and the routing pattern might differ from the pattern using normal routing flow.

**What Next**

Check the routing result

## RT-644

(warning) More than %d nets are specified in group '%s'. This group is skipped in routing.

**Description**

Too many nets are specified in the group.

**What Next**

Specify less nets in a group.

## RT-645

(warning) Only %d nets are specified in group '%s'. This group is skipped in routing.

Feedback

**Description**

Too less valid nets are specified. The minimum is two nets.

**What Next**

Specify more nets in a group.

---

## RT-646

(warning) Fail to create parallel points for %s.

**Description**

The parallel points are created at the middle point of the pins of the net group. If there is no sufficient space at the middle point, for example, creating the parallel point causes DRC violation, or there is no feasible solution that can be found. In such cases, the parallel points cannot be created.

**What Next**

Check the routing resource at the middle point of the pins of the net group. You can do this by turning on the GUI and measure the distance between bumps/pins/blockages/existing routes, and check the width/spacing setting, to understand that the routing resource is not enough at the middle point to create parallel points.

---

## RT-647

(warning) %s: fail to route from parallel start to endpoints.

**Description**

Fail to route the parallel part for the group. Each parallel group nets have a parallel startpoint and a parallel endpoint. The routing goes in parallel from the parallel startpoint to the parallel endpoint.

**What Next**

Check the routing resource and net assignment.

---

## RT-648

(warning) Group %d: net %s fail to route from parallel point to pin.

**Description**

Fail to route from parallel point to pin.

Feedback

**What Next**

Check the routing resource and net assignment. You can do this by turning on the GUI and measure the distance between bumps/pins/blockages/existing routes, and check the width/spacing setting, to understand that the routing resource is not enough at the middle point to create parallel points.

---

## RT-650

(warning) Tried to create parallel start/end point at (%.4f %.4f) but failed due to DRC violation.

**Description**

Creation of parallel start/end points failed due to DRC violation. Please check if there are any other shapes (including shapes in frame view), blockages at or too close to the creation location. Only limited locations are tried when creating the parallel start/end points.

---

## RT-651

(warning) There is only %d valid net in group '%s'. This group is skipped in routing.

**Description**

Please check if the other input nets in this group are valid nets or duplicate in other groups.

**What Next**

Correct the group input.

---

## RT-652

(warn) No routable differential RDL nets found.

**Description**

Tool cannot find routable differential RDL nets.

**What Next**

Set the routing nets by: 1. Specified by command option -nets or -nets_in_file 2. Specified by app option flip_chip.route.differential_groups

If nets are specified by above method, check if the input net is valid by 1. Check if the given net names are correct. 2. Check if the flip-chip IO pad cell design type is set as 'pad' or 'flip_chip_driver' 3. Check if the bump cell design type is set as 'flip_chip_pad' 4. If

Feedback

the net is a multiple IO pad pins to multiple bumps net, user needs to run place_io first to determine the IO pad pin to bump connections

---

## RT-653

(Warning) Number of %s density violations exceeds 10000 limitation.

**Description**

This message indicates that number of min/max density violations exceeds 10000 limitation.

**What Next**

Use check_rdl_route -check_window_density_mode (all|max|min|none) command to skip density violations checking.

---

## RT-654

(Warning) Option flip_chip.route.bump_via_landing_mode true is incompatible with -stripe_to_stripe_bboxs. Turn off this option for the current command.

---

## RT-655

(Warning) Discard a min cut rule in tech file for not supporting area and extension contact request.

---

## RT-656

(Warning) add_large_vias_from_techfile command does not support such library.

**Description**

This message indicates the tech library cannot be modified by the command.

---

## RT-657

(Warning) Skipping add_large_vias_from_techfile. The value of app option route.common.auto_dfm_redundant_via_tech_params is empty.

**Description**

This message indicates the app option route.common.auto_dfm_redundant_via_tech_params is empty.

Feedback

**What Next**

Use set_technology to setup app option value.

---

## RT-658

(Warning) Number of user_route shapes exceeds 1000000 limitation.

**Description**

This message indicates that number of user_route shapes exceeds 1000000 limitation.

**What Next**

Turn off check_from_user_shapes for check_rdl_routes.

---

# RTLA

---

## RTLA-001

(error) User script file %s does not exist.

**Description**

User script file specified by set_explore_design_options does not exist.

**What Next**

1. Create the script file, or 2. Use set_explore_design_options to reset script file.

---

## RTLA-002

(warning) %s file %s does not exist, set it as empty.

**Description**

The script file specified by set_explore_design_options does not exist, set it as empty so the flow can continue.

**What Next**

Create the script file reset script file using set_explore_design_options command.

---

## RTLA-003

(error) Power script %s does not exist.

Feedback

**Description**

Power shell set by command set_rtl_power_analysis_options does not exist.

**What Next**

Use command set_rtl_power_analysis_options to set correct power shell.

---

## RTLA-004

(warning) Power script %s does not exist,replaced by %s.

**Description**

Power shell set by command set_rtl_power_analysis_options does not exist, replaced it by pt_shell in Synopsys installation directory so the flow can continue.

**What Next**

Use command set_rtl_power_analysis_options to set correct power shell.

---

## RTLA-005

(error) Parameter -rtl_line has syntax error.

**Description**

The correct syntax for -rtl_line is {fileName lineNumber}, for example, get_metrics -rtl_line {/foo/cpu.v 121} -metric metrics_cong_number_cells Note, line number must be positive.

**What Next**

Correct the -rtl_line parameter.

---

## RTLA-006

(error) Cannot find RTL source file %s, line %d for %s metrics.

**Description**

Cannot find the source file with line number. There are two possible reasons: 1. The file and line number does not exist, or 2. The file and line number exists, but there is no timing or congestion metrics data for that line.

---

## RTLA-007

(error) Metric %s is not found, check if it is a supported metric.

Feedback

**Description**

The tool cannot find the specified metric as being a supported metric for the command.

**What Next**

Check if spelling of metric exactly matches the metric name. To see a list of metrics look at man page for *get_metrics*.

One special situation is that certain metrics do not have support for option *-local*. For congestion, the following metrics do not support option *-local*: metrics_cong_utilization, metrics_cong_shape_distortion, and metrics_cong_shape_dispersion.

For power metrics only the following power metrics are supported with *-local*: total_power, internal_power, switching_power, leakage_power, and glitch_power.

---

## RTLA-008

(error) Block %s has no boundary.

**Description**

This combination of command and options requires that the block have a boundary.

**What Next**

Use command initialize_floorplan to create a boundary.

---

## RTLA-009

(error) Memory configue file %s does not exist.

**Description**

Memory configure file specified by set_explore_design_options does not exist.

**What Next**

Use command set_explore_design_options to set correct memory configure file.

---

## RTLA-010

(error) Cannot write script %s because missing data in section: %s sub-section: %s key: %s.

**Description**

The memory configuration data is missing information needed to proceed. The key which is missing data is reported.

Feedback

### What Next

Use the command set_memory_configuration to add the needed information. Usually there are 2 ways to add the information. Either add the information directly into the key as specified in message, or set a default value. To set a default value, put the key/data into the section: memory_compiler_section.

---

## RTLA-011

(error) Failed to find required files from gui.verdi_indesign.verdi_home app option

### Description

To application failed to find the required files in the Verdi installation home directory.

The home directory should be specified in the gui.verdi_indesign.verdi_home app option or the VERDI_HOME environment variable.

### What Next

Check the value of the gui.verdi_indesign.verdi_home app option, or VERDI_HOME environment variable, points to a valid Verdi installation home directory.

### See Also

- gui.verdi_indesign.verdi_home

---

## RTLA-012

(error) Failed to find required files from gui.verdi_indesign.vcs_home app option

### Description

To application failed to find the required files in the VCS installation home directory.

The home directory should be specified in the gui.verdi_indesign.vcs_home app option or the VCS_HOME environment variable.

### What Next

Check the value of the gui.verdi_indesign.vcs_home app option, or VCS_HOME environment variable, points to a valid VCS installation home directory.

### See Also

- gui.verdi_indesign.vcs_home

Feedback

## RTLA-013

(error) Metric %s is not supported by RTL%s.

**Description**

The tool does not support usage of the metric passed for RTL (RTL cells, RTL modules and RTL constructs).

**What Next**

The following metrics are supported in this mode: %s

## RTLA-020

(Information) Register '%s' is a potential constant '%s' register.

**Description**

The mentioned register is detected to be a potential constant register.

**What Next**

Check the logic cone of the register.

## RTLA-021

(Information) Cell '%s' is unmapped because of reason code(s): '%s'.

**Description**

The mentioned cell is unmapped because of the given reason codes.

**What Next**

Check for the description of the reason codes in the man page of the command *report_rtl_unmapped_cells*.

## RTLA-300

(error) Option -inst_name is not valid in RTLA.

**Description**

Option -inst_name is not valid in RTLA.

**What Next**

Don't use this option.

Feedback

## RTLA-301

(error) Cannot find the result '%s' in the thermal database.

**Description**

The specified result name cannot be found in the current thermal database.

**What Next**

Specify the correct result name in the thermal database.

## RTLA-302

(Warning) There is no Power Profile to be removed.

**Description**

There is no Power Profile to be removed.

**What Next**

Check the Power Profile exists or not.

## RTLA-303

(Warning) There is no Thermal Profile to be removed.

**Description**

There is no Thermal Profile to be removed.

**What Next**

Check the Thermal Profile exists or not.

## RTLA-600

(warning) Could not determine a boundary for hierarchy %s.

**Description**

To compute certain metrics, it is necessary to have a boundary for a hierarchy. This boundary will encompass the cells in the hierarchy. For the given hierarchy, a boundary could not be determined. The most likely reason for this is that the hierarchy has no cells in it.

Feedback

### What Next

If having no cells is expected, then there is nothing to do. If it is expected that this hierarchy should have cells, then check to see why this hierarchy has no cells by looking at the verilog for this hierarchy.

---

## RTLA-601

(warning) Not able to get dispersion attribute on %s.

### Description

The computation to compute the dispersion metric on given hierarchy has failed and thus there is no dispersion attribute. The most likely cause of this is that the hierarchy has no cells in it.

### What Next

If having no cells is expected, then there is nothing to do. If it is expected that this hierarchy should have cells, then check to see why this hierarchy has no cells by looking at the verilog for this hierarchy.

If this hierarchy has cells, then look at log file to see if there are other messages with information on the failure.

---

## RTLA-602

(warning) Not able to get utilization attribute on %s.

### Description

The computation to compute the utilization metric on given hierarchy has failed and thus there is no utilization attribute. The most likely cause of this is that the hierarchy has no cells in it.

### What Next

If having no cells is expected, then there is nothing to do. If it is expected that this hierarchy should have cells, then check to see why this hierarchy has no cells by looking at the verilog for this hierarchy.

If this hierarchy has cells, then look at log file to see if there are other messages with information on the failure.

Feedback

## RTLA-603

(warning) Loading old DB version %d.%d. Tool version is %d.%d. Possible inconsistent data.

### Description

Metrics data is saved to the disk so that it can be quickly loaded back. However if the metrics data database (DB) is an older version than the tool version, this can lead to data inconsistency problems. Ideally the tool version and the metrics DB version should be identical.

For example in version 6.3 of metrics DB, support for hierarchical constructs was added. Previous versions (< 6.3) do not have this data. So if the tool supports version 6.3 or later, it will load earlier metrics DB but will not have correct hierarchical construct data.

A further problem is if this inconsistent data is then saved, the inconsistent data would then be saved with a new version number, which would then hide the issue and lead to hard to discover issues in the future.

### What Next

It is best practice to rerun the design from scratch to ensure that the metrics DB and the tool are in sync. In particular, the version 6.3 has a large change to the metrics DB so any previous version than 6.3 should be rerun from scratch.

## RTLA-604

(warning) Using an old DB version %d.%d. Tool version is %d.%d. Possible need to rerun from scratch.

### Description

It is detected that an old DB version is loaded into a newer tool version. It may be the case that running compute_metrics will clean up this issue, but not in all cases. Here are some situations where compute_metrics will not clear up the problem.

In version 6.3 of metrics DB, support for hierarchical constructs was added. Previous versions (< 6.3) do not have this data. For this particular enhancement, the flow needs to be run from scratch. This is because the hierarchical construct tree originates from the RTL and needs to be created at the begining of flow and carried forward.

A further warning is if this old database is saved, the inconsistent data would then be saved with a new version number, which would then hide the issue and may lead to hard to discover issues in the future.

Feedback

**What Next**

It is best practice to rerun the design from scratch to ensure that the metrics DB version and the tool version are in sync.

---

## RTLA-700

(error) Cannot open file '%s' for write. Paths cannot be saved.

**Description**

Tool was unable to access neither the current working directory nor the temporary directory specified through app option 'shell.common.tmp_dir_path' for writing the internal temporary files which are needed to save the timing path information.

**What Next**

Check the write permission of the current working directory, or the directory specified by app option 'shell.common.tmp_dir_path'.

---

## RTLA-701

(error) Metrics data not found. Compute metrics with the current release.

**Description**

Tool was unable to access the metrics data. Re-compute the metrics data with the current release.

**What Next**

Re-compute the metrics data with the current release.

---

## RTLA-705

(error) RTLA non-physical flow is disabled for hierarchical designs.

**Description**

Command rtl_opt currently does not support non-physical flow for hierarchical designs.

---

## RTLA-706

(error) Congestion metrics computation is disabled on non-physical designs. Non-physical designs found: '%s'

Feedback

**Description**

This combination of command and options requires the blocks to have physical data. Computation of congestion metrics is disabled on non-physical blocks.

**What Next**

Rerun with designs that include physical data.

---

## RTLA-800

(warning) app_option %s will be set as %s during the rtl_opt.

**Description**

The app option %s is being set to the value %s during rtl_opt.

**What Next**

Please check for usage of the specified app option.

---

# RTLRS

---

## RTLRS-001

(warning) Please ensure that this app-option is set before RTL is analyzed/elaborated and top-level module is linked.

**Description**

The recommended flow to perform RTL restructuring is as follows:

Step-1: Enable RTL Restructuring capabilities of Fusion Compiler

set_app_options -list {rtl_restructuring.enable_restructured_rtl_generation true}
set_app_options -list {rtl_restructuring.enable_formality_script_generation true}

Step-2: Read and Elaborate RTL

analyze -format verilog {*.v} elaborate top

Step-3: Link Design and initialize RTL restructuring engine

set_top_module top

Note: set_top_module will initialize RTL restructuring engine under the hood if the app-option "rtl_restructuring.enable_restructured_rtl_generation" is set to true before analyze and elaborate.

Feedback

Step-4: Load UPF and Timing Constraints

Step-5: Run RTL Restructuring functions like group and ungroup.

Step-6: Generate modified UPF and Constraints

Step-7: Generate modified RTL and formality mapping file

write_restructured_rtl

**What Next**

Update your scripts to set the RTL restructuring mode app-option to true prior to RTL analyze step.

---

## RTLRS-002

(error) Failed to initialize RTL restructuring engine. Please set the app-option which enables RTL restructuring mode before RTL analyze step.

**Description**

The recommended flow to initialize RTL restructuring engine and perform RTL exploration is as follows:

Step-1: Enable RTL Restructuring capabilities of Fusion Compiler

set_app_options -list {rtl_restructuring.enable_restructured_rtl_generation true}
set_app_options -list {rtl_restructuring.enable_formality_script_generation true}

Step-2: Read and Elaborate RTL

analyze -format verilog {*.v} elaborate top

Step-3: Link Design and initialize RTL restructuring engine

set_top_module top

Note: set_top_module will initialize RTL restructuring engine under the hood if the app-option "rtl_restructuring.enable_restructured_rtl_generation" is set to true before analyze and elaborate.

Step-4: Load UPF and Timing Constraints

Step-5: Run RTL Restructuring functions like group and ungroup.

Step-6: Generate modified UPF and Constraints

Step-7: Generate modified RTL and formality mapping file

write_restructured_rtl

Feedback

**What Next**

Update your scripts to set the RTL restructuring mode app-option to true prior to RTL analyze step.

---

## RTLRS-003

(error) Failed to generate restructured RTL since the RTL restructuring engine has not been activated.

**Description**

The recommended flow to initialize RTL restructuring engine and perform RTL exploration is as follows:

Step-1: Enable RTL Restructuring capabilities of Fusion Compiler

set_app_options -list {rtl_restructuring.enable_restructured_rtl_generation true}
set_app_options -list {rtl_restructuring.enable_formality_script_generation true}

Step-2: Read and Elaborate RTL

analyze -format verilog {*.v} elaborate top

Step-3: Link Design and initialize RTL restructuring engine

set_top_module top

Note: set_top_module will initialize RTL restructuring engine under the hood if the app-option "rtl_restructuring.enable_restructured_rtl_generation" is set to true before analyze and elaborate.

Step-4: Load UPF and Timing Constraints

Step-5: Run RTL Restructuring functions like group and ungroup.

Step-6: Generate modified UPF and Constraints

Step-7: Generate modified RTL and formality mapping file

write_restructured_rtl

**What Next**

Update your scripts to set the RTL restructuring mode app-option to true prior to RTL analyze step.

Feedback

## RTLRS-004

(warning) RTL restructuring mode can't be disabled at this stage of the flow. Please refer to the recommended flow described in the man page.

### Description

Due to current tool limitations, once the RTL restructuring engine has been initialized, it can't be disabled in the same session to continue with the synthesis flow. The recommended flow when performing RTL restructuring is as follows:

Step-1: Initialize RTL restructuring engine (as described in the man page of the app-option rtl_restructuring.enable_restructured_rtl_generation).

Step-2: Run RTL Restructuring functions like group and ungroup.

Step-3: Generate modified UPF and Constraints.

Step-4: Generate modified RTL using write_restructured_rtl.

Step-5: Exit the shell.

Step-6: Read and Elaborate restructured RTL.

Step-7: Load modified UPF and Timing Constraints.

Step-8: Continue with synthesis flow.

Even if none of the RTL restructuring functions were performed, the RTL restructuring mode can't be disabled and user would have to exit the shell and re-elaborate the original RTL.

### What Next

Please use the recommended flow until the limitations are addressed.

## RTLRS-005

(error) Failed to generate modified RTL since the restructuring engine has not been initialized.

### Description

In order to perform RTL restructuring functions and generate modified RTL, the restructuring engine must be initialized during top-level module link by enabling the app-option "rtl_restructuring.enable_restructured_rtl_generation" before reading and elaborating RTL as described in the man page of the app-option.

Feedback

**What Next**

Please follow the recommended flow highlighted in the man page of the app-option 'rtl_restructuring.enable_restructured_rtl_generation'.

---

## RTLRS-007

(information) Generating restructured RTL. The modified RTL files and file-list info will be written to directory named %s

**Description**

The command will selectively generate RTL for modified modules only and write the updated modules in the specified format or by maintaining the source format and also preserving the original RTL source file names in the specified directory. If the output directory name isn't specified, the command will by default write the restructured RTL files to a directory named 'output'.

The command will also print a file-list that contains information about both the modified RTL files generated as well as the unchanged modules that were imported.

---

## RTLRS-008

(information) Generating formality mapping file for design %s.

**Description**

The command will generate a supplementary formality mapping file in the current working directory which is required to perform formal verification to verify the correctness of the new generated RTL which contains modified hierarchies after the design was restructured.

The generated formality mapping file must be passed along with original and new RTL files for verification with Formality.

---

## RTLRS-009

(warning) Failed to create '%s' output directory. RTL will be written in default directory output/Verilog.

**Description**

The command will generate RTL which contains modified hierarchies after the design was restructured.

If the output directory name isn't specified, the command will by default write the generated RTL files to a directory named 'output/Verilog'.

Feedback

## RTLRS-010

(error) Currently supported formats are verilog and systemverilog.

**Description**

The command will selectively generate RTL for modified modules only and write the updated modules in the specified format or by maintaining the source format and also preserving the original RTL source file names in the specified directory. If the output directory name isn't specified, the command will by default write the restructured RTL files to a directory named 'output'.

The command will also print a file-list that contains information about both the modified RTL files generated as well as the unchanged modules that were imported.

## RTLRS-011

(error) Failed to initialize rtl restructuring engine as top design '%s' has been auto black-boxed.

**Description**

If the top design is black-boxed for some reasons( e.g. due to the presence of glue-block in it), rtl restructuring engine initialization fails.

## RTLRS-012

(warning) Design '%s' is auto black-boxed as %s

**Description**

The design will be automatically black-boxed if it has always block/glue block/generate statement/multiple view present in it.

## RTLRS-013

(warning) Editing connection of instance '%s' is not allowed in rtl restructuring flow as it is a glue logic cell. This change may not reflect in Output RTLs.

**Description**

If rtl_restructuring.enable_restructured_rtl_generation is set to true, editing connection of a glue logic cell is not allowed. This changes may not reflect in Output RTLs.

Feedback

## RTLRS-014

(warning) Ungrouping the Glue logic is not permitted in rtl restructuring mode.

**Description**

If rtl_restructuring.enable_restructured_rtl_generation is set to true, Ungrouping of a glue logic is not permitted.

## RTLRS-015

(error) Command remove_port %s: Partial port removal from a bus is not supported in restructuring mode. Specify all scalar ports of a bus or bus name for successful bus port removal.

**Description**

Removal of partial bits from a bussed port is not supported. Specify all scalar ports of bus or bus name for successful bus port removal.

## RTLRS-016

(error) Command remove_pin %s: Partial pin removal from a bus is not supported in restructuring mode. Specify all scalar pins of a bus or bus name for successful bus pin removal.

**Description**

Removal of partial pin bits from a bussed pin is not supported. Specify all scalar pins present on bus or bus name for successful bus pin removal.

## RTLRS-017

(warning) Failed to create '%s' directory. RTL restructuring related collaterals will be written in cwd.

**Description**

The command will generate rtl_restructuring_commands.tcl, rtl_restructuring_sources.f files which contains modified hierarchies after restructring.

If the output_dir app option isn't specified, the command will by default write the generated rtl_restructuring_commands.tcl, rtl_restructuring_sources.f, report directory and rtl_restructuring_log directory in cwd.

Feedback

# RTM

## RTM-1000

(info) Retiming results for instance '%s' (module '%s'): Clock period (Period - Uncertainty): %f, Typical Clock2q = %f, Typical Setup = %f, Netlist modified: %s, Period before: %f, Period after: %f, Registers before: %d, Registers after: %d

### Description

This message shows the result of retiming. It shows the clock period, typical register clock2q and setup considered during retiming. 'Netlist modified' is a boolean showing whether any retiming happened or not. It also shows the achieved clock period and registers before and after retiming.

### What Next

If results are not as expected, then enable other RTM messages to debug further

## RTM-1001

(warning) No retimable registers found for instance '%s' (module '%s'). If this module contains registers, re-run by enabling RTM-1004, RTM-1005 and RTM-1013 messages to know the reason

### Description

This warning shows up if a hierarchical instance with set_optimize_registers specification does not have any retimable registers.

If this module contains registers that were not identified as retimeable then re-run with enabling verbose retiming messages to see more details on the reason. Use following commands to enable these messages:

set_msg -level info RTM-1004

set_msg -level info RTM-1005

set_msg -level info RTM-1013

### What Next

Check the output of the verbose retiming messages and confirm or modify the design setup accordingly for the detailed reasons.

Feedback

## RTM-1002

(info) %s

**Description**

This message print the 'critical loop' for retiming. For the critical loop, it shows the placement of registers before and after retiming. This is typically used for debugging the quality of results during retiming.

**What Next**

Analyze if the retiming is reasonable

## RTM-1004

(info) %s is not retimed because : %s

**Description**

Retiming does not retime a register in certain situations. This message prints the reason for no retiming.

**What Next**

Follow the instructions in the message

## RTM-1005

(info) %s : %s

**Description**

Most commonly, this message prints the registers which has an 'invalid' clock. This usually happens when the clock constraint is not correct. In rare situations, it prints a message for empty module.

**What Next**

Follow the instructions in the message

## RTM-1013

(info) %s is not retimed due to one of these size_only reasons : %s

Feedback

### Description

Retiming tolerates a few types of size_only restrictions on registers, retimes them and propagates the restrictions to the new registers. When intolerable size_only restriction is encountered on a register, this message prints the intolerable size_only reasons.

### What Next

Check the constraints that caused this intolerable size_only

---

## RTM-1016

(info) Instance '%s' (module '%s') is retimed in place of user specified retimed instances %s because of chaining

### Description

Two retiming instances (modules) are considered to be chained if there exist combinational paths without registers between them. In this case, retiming them together is beneficial for timing QoR between these instances. Hence the least common parent hierarchy of the chained instances is retimed. Any other non-retime hierarchies or registers inside the parent hierarchy are prevented from getting retimed.

### What Next

Retiming the parent hierarchy usually helps QoR. Otherwise, this can be disabled by setting the app option compile.retiming.group_chained_retiming_modules to false.

---

# RULE

---

## RULE-001

(error) Value for message list must have %d elements.

### Description

The number of elements in the rule message list cannot be changed. The new message list must have the same number of elements as the previous message list value.

### What Next

Specify the correct number of elements for the message list.

---

## RULE-002

(error) Rule '%s' is already defined.

Feedback

**Description**

The rule name is in use by an existing rule.

**What Next**

Specify a valid rule name that is not already in use.

---

## RULE-004

(error) Rule '%s' is not defined.

**Description**

The specified rule cannot be found.

**What Next**

Specify a valid rule name.

---

## RULE-005

(error) Rule '%s' is permanent.

**Description**

This command works only on user-defined rules.

**What Next**

Specify a valid list of rules.

---

## RULE-006

(error) User-defined rule name '%s' does not begin with 'UDEF'.

**Description**

User-defined rules must have names beginning with 'UDEF'. For example, 'UDEF-0345'.

**What Next**

Specify a valid name for the user-defined rule.

---

## RULE-009

(error) Property '%s' does not exist on built-in rule '%s'.

Feedback

**Description**

Each built-in rule supports zero or more property names. Only valid property names can be set on built-in rules.

**What Next**

Specify a valid property name for the rule.

---

## RULE-010

(error) Property '%s' does not exist on rule '%s'.

**Description**

The rule does not have a property of this name.

**What Next**

Specify a valid property name for the rule.

---

## RULE-012

(error) Checker procedure '%s' does not exist.

**Description**

The checker procedure associated with a user-defined rule must be a valid Tcl procedure.

**What Next**

Specify the correct checker procedure.

---

# SCP

---

## SCP-001

(error) Unable to add library %s in session checkpoint

**Description**

Unable to add a library in session checkpoint

**What Next**

Please check for the write permission in the session checkpoint directory.

Feedback

## SCP-002

(error) Unable to load library %s

**Description**

Unable to load a library

**What Next**

Please check if the library exists

## SCP-003

(error) Unable to find current library

**Description**

There is no current library set.

**What Next**

Please set the current library in the session.

## SCP-004

(error) Unable to link design %s

**Description**

Unable to link the design.

## SCP-005

(error) Unable to find design %s

**Description**

Unable to find the design.

## SCP-006

(error) Unable to open design %s

**Description**

Unable to open the design

Feedback

## SCP-007

(error) Unable to set App option {%s %s}

**Description**

Unable to set App option

## SCP-008

(error) Unable to set %d App options

**Description**

Provides number of app options that were not set.

## SCP-009

(error) Session name not given

**Description**

The name of the session checkpoint is not given

**What Next**

Please provide the name of the session checkpoint.

## SCP-010

(error) Top module not found

**Description**

Unable to find the top module

## SCP-011

(error) Unable to open session checkpoint %s for write

**Description**

The session checkpoint directory cannot be opened for write.

**What Next**

Please check for the write permission in the destination directory.

Feedback

## SCP-012

(error) Incorrect session checkpoint structure

**Description**

This message indicates that the session checkpoint is corrupt.

**What Next**

Please regenerate the session checkpoint

## SCP-013

(error) Opening session was not entirely successful

**Description**

There were errors while opening session checkpoint

**What Next**

Please review earlier error messages

## SCP-014

(error) Unable to make directory %s

**Description**

Unable to make directory

**What Next**

Please check for the write permission in the destination directory.

## SCP-015

(error) Unable to open session checkpoint %s for read

**Description**

Unable to open session checkpoint for read

**What Next**

Please check if the given session checkpoint is a valid session checkpoint

Feedback

## SCP-016

(error) Unable to open session catalog file %s with error : %s

**Description**

Unable to open session catalog file

## SCP-017

(error) Inconsistency in session catalog

**Description**

Inconsistency in session catalog

**What Next**

Session checkpoint may be corrupt, please regenerate the session checkpoint

## SCP-018

(error) Unable to create session checkpoint catalog successfully

**Description**

Unable to create session checkpoint catalog successfully

## SCP-019

(error) Unable to read session checkpoint

**Description**

Unable to read session checkpoint

## SCP-020

(warning) The library name %s is not unique

**Description**

The library name is not unique

## SCP-021

(warning) Unable to on demand load library %s

Feedback

**Description**

Unable to on demand load library

---

## SCP-022

(warning) Overwriting existing session checkpoint %s

**Description**

Overwriting existing session checkpoint

---

## SCP-023

(warning) Unable to remove old session checkpoint %s, renaming it into %s

**Description**

When unable to remove old session checkpoint, it is renamed

---

## SCP-024

# SDC

## SDC-1

(information) Setting sdc_version outside of an SDC file has no effect

**Description**

You set the *sdc_version* variable outside of the context of an SDC file. In that context, changing the variable has no effect.

**What Next**

No action necessary.

## SDC-2

(warning) SDC version in file (%s) does not match the version you requested\n \tfrom read_sdc (%s). Some constraints and options may not function.

**Description**

The version indicated by the setting of the *sdc_version* variable in your SDC file does not match the version requested by the *read_sdc* command.

**What Next**

Ensure that you select the correct version when issuing the *read_sdc* command.

## SDC-3

(warning) Constraint '%s' is not supported by %s.

**Description**

Not all Synopsys Design Constraints are supported by all applications. The specified constraint is not supported by the current application, and it is ignored. For example, test constraints are not recognized by PrimeTime. One SDC-3 message is issued per instance of the constraint which is ignored. Then, after *read_sdc* completes, an SDC-4 summary message will tell you how many of each constraint was ignored.

## SDC-4

(information) Ignored %d unsupported '%s' constraint%s.

Feedback

**Description**

This is a summary message indicating how many instances of a particular constraint were ignored by *read_sdc* because the constraint is unsupported.

---

## SDC-5

(error) Errors reading SDC file:\n \t%s.\n \tUse error_info for more info.

**Description**

This message is generated by *read_sdc* when an syntax error occurs during the read. The specific error is shown in the text of the message.

**What Next**

You can use *error_info* to help trace the cause of the error. For example, it might show the file and line number of the syntax error.

---

# SDXF

---

## SDXF-001

(error) Rule '%s' has wrong %s '%s'

**Description**

The value(s) provided to given rule name is wrong.

**What Next**

Please refer to the SDXF Reference Manual and provide correct value given rule name.

---

## SDXF-002

(error) Multiple '%s' provided

**Description**

Multiple section(s)/attribute(s) provided whose occurrence number one or at most one.

**What Next**

Please refer to the SDXF Reference Manual and remove repetitive occurrences.

Feedback

## SDXF-003

(error) Wrong %s provided

**Description**

If file version is mentioned in the error, the given SDXF file version number is greater than reader's version number or non-numeric characters have been mentioned.

If the unit is mentioned in the error, not supported distance unit has been provided.

**What Next**

Please refer to the SDXF Reference Manual and provide correct distance unit or file version.

## SDXF-004

(error) Encountered while converting the data to %s

**Description**

This message indicates an internal data model error.

**What Next**

Send the log to Synopsys.

## SDXF-005

(error) Required %s not provided

**Description**

If file version is mentioned in the error, the required sdxf file version number is not provided in the sdxf file.

If the unit is mentioned in the error, the required attribute distance unit is not provided in the sdxf file.

**What Next**

Please refer to the SDXF Reference Manual and provide attribute distance unit or file version.

## SDXF-006

(error) Syntax error in the file : '%s'

Feedback

**Description**

Syntax error related to XML formatting was found in the specified SDXF file in the error message.

The line number of the syntax error and additional details will also be printed in case of missing operands like quote("), equal sign(=) and end tag(>).

In some other cases of a missing slash tag (/) or start tag(<) etc., the line number corresponding to end of file will be printed, along with error details like 'unexpected end of data' or 'expected element name'

**What Next**

Please fix the syntax error(s) and rerun the command.

---

## SDXF-007

(error) Could not parse sdxf file '%s'.

**Description**

There was a major syntax error in the specified sdxf file. It should be a single text file containing 3DIC information. Please refer to messages printed before this message.

**What Next**

Please correct the input sdxf file and rerun the command

---

## SDXF-008

(error) Unsupported %s file '%s' format '%s'.

**Description**

The input/include file format specified is not supported. Hence the command cannot parse the text file.

**What Next**

Provide a valid format, e.g. "sdxf".

---

## SDXF-009

(warning) Skipping rule '%s' because of wrong rule name

**Description**

This message indicates the given rule name is syntactically wrong.

Feedback

**What Next**

Please refer to the SDXF Reference Manual and provide correct rule name.

---

## SDXF-010

(warning) Skipping rule '%s' because %s

**Description**

This message indicates the given rule name is already exist or multiple rules with the same rule name has been provided in a constraint section.

**What Next**

Please check if the multiple rules are provided with the same name, if yes remove the repetitive rule or check if the rule already exists, if yes then give different rule name or remove the existing rule first.

---

## SDXF-011

(warning) Ignoring unknown %s : '%s'

**Description**

This message indicates the given section/attribute name is syntactically wrong.

**What Next**

Please refer to the SDXF Reference Manual and provide correct name.

---

## SDXF-012

(warning) There is no SDXF data in current lib.

**Description**

This message indicates that there is no SDXF data in current lib. So write_sdxf will do nothing but quit.

**What Next**

Please import SDXF data by "read_sdxf" or open a lib which contains SDXF data.

---

## SDXF-013

(error) File '%s' included multiple times.

Feedback

**Description**

The file specified is either included multiple times or having a cyclic dependency.

**What Next**

Please include the file only once. If file is included only once then check and remove the cyclic dependency.

---

## SDXF-014

(error) Rule '%s' of rule type '%s' is not supported in '%s_CONSTRAINT' section.

**Description**

This rule will not be considered in the mentioned constraints section.

**What Next**

Please refer to the SDXF Reference Manual and provide only supported rule types in the corresponding constraints section.

---

## SDXF-015

(error) Value '%s' is too large.

**Description**

The length value specified in the rule is too large to be supported by the tool.

The name of the rule for which this value error occurred is printed in the subsequent message.

**What Next**

Please check the value and provide the appropriate value.

---

# SEC

---

## SEC-0

(error) Software is not licensed for this machine.

**Description**

Could not find a valid matching key in the key file for this feature

Feedback

**What Next**

Check to see that the machine hostid, using the machine_id utility provided by Synopsys, matches the hostid in the key file for the feature.

---

## SEC-1

(error) %s

**Description**

The key file with all of the license information cannot be opened.

**What Next**

Check directory and file read permissions.

---

## SEC-21

(error) Failed to checkout license for feature(s): %s

**Description**

The application failed to check out the licenses required to enable this product. It may be that all the licenses are in use or the site is not licensed to use this product.

**What Next**

Make sure that the required features are in the key file.

Use lmstat to make sure that the server has enabled the required features and to find the current users of the features.

---

## SEC-23

(information) Waiting for required feature(s). (%s)

**Description**

This is an informational message that is displayed periodically when the process is queued for required set of features. You can find out the current users of all the required features by using the lmstat -A command.

**What Next**

Request the current users to release the licenses, if possible.

Let the process wait in queue for indicated period of time to acquire the license.

Feedback

## SEC-51

(error) This site is not licensed for '%s'.

**Description**

A possible cause is that no such feature exists. The feature could not be found in the license file.

A possible problem is that the version is not supported at the server end. The version specified in the checkout request is greater than the highest version number the daemon supports.

A possible problem is that the server does not support this feature or the feature has expired or has not yet started (on the server node).

**What Next**

Check to make sure that the license file supports this version.

## SEC-55

(error) Can't remove your '%s' license. You must always have one or more of the following license(s): %s.

**Description**

A request was received to remove a license that is necessary for the application to be run. At least one of these licenses is required for the application to be running.

**What Next**

Make sure that you are removing the right license.

## SEC-57

(error) License daemon version is older than application's FLEXlm version.

**Description**

This is an error message that is displayed if the FLEXlm version of the application is higher than than the license daemon version.

**What Next**

Please upgrade the license server to latest version.

Feedback

## SEC-71

(error) License checkout unsuccessful. Command '%s' cannot run.

**Description**

The command that you are trying to run needs some license(s) to run successfully. The required set of licenses is not available and hence the command cannot run.

**What Next**

Please ensure that you have all the required license keys on your license server. Check for any other messages preceding this message for more details.

## SEC-72

(error) Following set of licenses does not exist on server : %s. Combination of %s keys must exist.

**Description**

The tool is checking for the existence of a particular set of license keys on the license server. The required combination of licenses is mentioned in the message. If you are seeing this error, it means that the license requirement is not met.

**What Next**

Please ensure that you have all the required license keys on your license server.

## SEC-73

(information) Waiting for license key(s) was successful.

**Description**

The tool was waiting in queue for checking out a particular set of license keys. The waiting is over since all the required keys were successfully checked out.

**What Next**

The tool will proceed with the run.

## SEC-74

(information) Waiting in queue for the following license keys : %s

Feedback

### Description

The command that you are trying to run needs to check-out a set of license keys in order to run successfully. Some of these keys (mentioned in the message) are not available right now, and hence the tool is waiting in queue on the license server in order to obtain these keys. Until then, the tool cannot proceed with the run.

If the license keys are unavailable even after a particular timeout period, the tool will stop waiting and exit the queue. You can control this timeout period by setting the environment variable SNPS_MAX_QUEUETIME with the desired value (in seconds). If this variable is not set, the default timeout period will be 8 hours.

### What Next

Wait for the license keys to be available.

---

## SEC-75

(error) Timeout while waiting for license keys.

### Description

The tool was waiting in queue for checking out a particular set of license keys. The timeout period got over and still the license keys were not available. Hence the tool cannot run the command successfully.

You can control the timeout period by setting the environment variable SNPS_MAX_QUEUETIME with the desired value (in seconds). If this variable is not set, the default timeout period will be 8 hours.

### What Next

Please ensure that you have all the required license keys on your license server.
If you want to wait for a longer period of time, set the environment variable SNPS_MAX_QUEUETIME appropriately before the next run.

---

## SEC-76

(warning) Availability of the command '%s' is deprecated in this shell and it will be disallowed from 2020.09. Please use single-shell instead.

### Description

The command will not be available in this shell in future releases. However it is available in the single-shell. If you need to use it in your flow, you should switch to the single-shell where this command is available along with the current shell's other capabilities.

Feedback

**What Next**

Please use single-shell if you need to use this command.

---

## SEC-78

(error) This command '%s' is not allowed to run in a child process.

**Description**

This message occurs in a child process which gets launched by a command which uses distributed processing. It indicates that the run script which was automatically generated by the master to be run on this child process has been modified and the tool does not allow these modifications to be run on the child process.

**What Next**

Start a new run and do not modify the run script of the child process.

---

## SEC-81

(error) Unrecognized feature name '%s'

**Description**

The specified name is not a valid license feature for this product.

**What Next**

Check the feature name and rerun the command with a valid feature name.

---

## SEC-82

(information) Feature '%s' is not checked out.

**Description**

You are trying to check in a license feature which has not been checked out right now. Hence the *remove_license* command will not do anything.

**What Next**

Check the feature name and rerun the command with a valid feature that has been checked out.

---

## SEC-83

(error) Only %d keys of '%s' are checked out.

Feedback

### Description

The number of keys of the given feauture that you are trying to check-in is more number than the number of keys that have been checked out. Hence the *remove_license* command will not do anything.

### What Next

Ensure that you check-in the same or lesser number of keys than are currently checked out.

---

## SEC-84

(error) Cannot check out '%s' as another key of a different core-type is currently checked out.

### Description

The tool supports different kinds of license packages, with each package typically enabling a different multi-core capability. However, it does not support the simultaneous check out of keys from different packages. For example, if any 8-core key has been already checked out, the tool will not allow any 16-core key to be checked out.

If you are seeing this message, it means that at least one key of a different core-type has already been checked out in this session and hence the current key cannot be checked out. This can be verified by running the *list_licenses* command. Note that any key which is common between packages does not fall under a specific core-type and hence this rule does not apply to such keys.

### What Next

First check in all keys of all other core-types and then try to check out the current one.

---

## SEC-90

(error) Cannot check in '%s' as design '%s' is open and needs this license.

### Description

If you are seeing this message, it means that there is at least one open design which needs this key.

### What Next

If you want to remove this license, please close the design and then try to check-in.

Feedback

## SEC-91

(error) Cannot remove license when background jobs using redirect -bg are running.

**Description**

It is not allowed to remove license when background jobs using redirect -bg are running.

**What Next**

Wait for the redirect -bg jobs to complete and then issue the remove_license command

**See Also**

- report_background_jobs

## SEC-92

(error) Command %s cannot run as this functionality is disabled in %s when invoked with %s.

**Description**

The command is checking for particular license keys which are not allowed to run in the invoked shell and its mode.

**What Next**

Please ensure to invoke correct shell and mode to run this functionality.

# SEL

## SEL-001

(error) No such collection '%s'

**Description**

The collection which you specified does not exist.

**What Next**

Verify that the collection is the one you want. It is possible that it existed, but was transient. Transient collections are automatically garbage-collected and cannot be relied upon

Feedback

across command boundaries. In order to make a collection persistent, set it to a variable, and then use it. For example:

```
set uPorts [get_ports U*]
    command_for_ports $uPorts
```

## SEL-002

(warning) Collection '%s' has inappropriate type (%s).

**Description**

The collection which you specified contains objects which are not acceptable for this command. Either the data type of the objects is incorrect, or the objects are out of context (for example, they are not in the current design).

**What Next**

Check the command to determine the allowable object types for it, or specify objects that are in the correct context.

## SEL-003

(warning) Nothing implicitly matched '%s'

**Description**

The pattern which you specified did not match any objects of the classes acceptable for this command.

**What Next**

Check the pattern to see if it is what you expected.

## SEL-004

(warning) No %s objects matched '%s'

**Description**

The pattern which you specified did not match any objects of the class acceptable for this command.

**What Next**

Check the pattern to see if it is what you expected.

Feedback

## SEL-005

(error) Nothing matched for %s

**Description**

The pattern(s) which you specified did not match any objects.

**What Next**

Check the values which you entered.

## SEL-006

(error) More than one object matched for '%s'.

**Description**

The pattern(s) which you specified matched more than one object. This command option accepts only a single object.

**What Next**

Check the values which you entered.

## SEL-007

(error) Invalid index %d for collection %s

**Description**

During an iteration over a collection (with foreach_in_collection), an invalid index was generated.

**What Next**

Contact your application consultant.

## SEL-008

(warning) Collection/attribute class '%s' has not been defined

**Description**

The collection class which you specified does not exist. Classes of objects include designs, cells, etc.

Feedback

**What Next**

Verify that the class name is spelled correctly, or that the class of objects is applicable for this product.

---

## SEL-009

(warning) Collection class '%s' cannot be %s

**Description**

The collection class which you specified cannot be used for the operation you attempted. Some collection classes cannot be queried, indexed, or copied, so they cannnot be used as an argument to query_objects, index_collection, or copy_collection.

**What Next**

Only use collections of this class as arguments to appropriate commands.

---

## SEL-010

(warning) %s objects from '%s' were of the %scorrect class.

**Description**

A heterogeneous collection was passed to another command. This collection contained some objects that were of a class which is not accepted by the command. The message will indicate whether some objects or no objects were accepted by the command.

**What Next**

Some commands continue to operate when only a subset of the patterns match. Other commands only perform their action when all patterns match something. So, verify that the command was applied to the objects which were expected.

---

## SEL-011

(warning) Some objects (%s) could not be queried.

**Description**

A heterogeneous collection was passed into query_objects. This collection contained some objects that were of a class which cannot be the target of a query.

**What Next**

There is no adverse affect of this situation.

Feedback

## SEL-012

(information) Iteration for collection %s was terminated\n \tbecause the collection was modified or deleted.

**Description**

Commands in the body of a *foreach_in_collection* can affect the collection which is currently in iteration. Some commands can cause objects to be removed from the collection, and others can cause the collection to be deleted. When such events occur, the iterator is modified and in some cases will terminate. This message advises you of that event.

For example:

foreach_in_collection itr [get_cells *] { remove_design [current_design] }

would cause the collection of cells to be deleted, and the iteration would be terminated.

**What Next**

No action is required.

## SEL-013

(error) Regular expression error: %s.

**Description**

While using a regular expression with a collection command, you entered an invalid regular expression. For example, use of the * (zero or more) or + (one or more) operators alone always yields the empty set; therefore, ".*" or ".+" would be appropriate. Other errors such as unmatched parens or invalid characters within square braces will also cause this error.

**What Next**

Take action based on the error that occurred.

## SEL-014

(error) At least one %scollection required for argument '%s'%s

**Description**

Some commands do not allow heterogeneous collections as arguments, whereas others allow them only in some contexts. Other commands require at least one collection as an

Feedback

argument. You entered a variation of a command which requires at least one collection (either homogeneous, or of either type) for the named argument.

**What Next**

Consult the man page from the command which failed for further information.

---

## SEL-015

(warning) Ignored all implicit elements in argument '%s'%s

**Description**

Many commands allow implicit searches for objects - an argument can be a list of collections or patterns which are searched for in a documented set of object classes. However, in some cases, it is not possible to determine any object classes in which to search for an implicit pattern. For example, attempting to add an implicit pattern to a heterogeneous collection with *add_to_collection* would cause this warning.

**What Next**

Consult the man page from the command which failed for further information.

---

## SEL-016

(error) Name patterns are not allowed in this argument context - the pattern %s will be skipped/ignored; use only collections in this argument context.

**Description**

Many commands allow implicit searches for objects - an argument can be a list of collections or name patterns which are searched for in a documented set of object classes. However, in some cases, when there is more than one object class to be searched, it is not allowed to include name patterns, and only collections should be included in such an argument.

**What Next**

In the argument context in which this error happened, remove all name patterns from the offending argument, and make sure that only collections are included in the argument. You can typically use a "get" command to convert a name pattern to a collection.

---

## SEL-017

(error) %s index %s for collection %s

Feedback

**Description**

An invalid or out of range index was supplied to a command.

**What Next**

Contact your application consultant.

# SFT

## SFT-1000

(info) Register %s is restricted. The restriction is ignored while doing automatic safety register implementation.

**Description**

This message shows that there is some restriction on the register which is ignored for automatic safety register implementation.

## SFT-1001

(error) Ignoring set_safety_register_rule (and hence automatic replication) on register %s as %s.

**Description**

This message shows why a register marked as safety can not be implemented using any safety mechanism.

## SFT-1004

(warning) Register %s can not be mapped to a scan flop due to user constraint. So mapping to non-scan flop.

**Description**

This message says that due to some user constraints mapping to scan flop is not possible, so mapping it to non-scan flop. This message comes when some register is part of shift register chain and is considered for safety register inference, and during breaking of shift-register, this register should be mapped to scan flops but it cannot be mapped to scan flop.

## SFT-1005

(error) Could not map some instances during fault-tolerant library cell inference.

Feedback

**Description**

This message says that during inference of fault-tolerant library cell, some of the pulled-out logic could not be mapped.

---

## SFT-1006

(error) Ignoring error port connection/error detection as error signal %s provided with '-error_signal' option of 'set_safety_register_rule' is invalid. So valid error signal would be of type input pin, output pin, output port.

**Description**

This message says why an error hookup point for DMR/TMR is invalid.

---

## SFT-1007

(info) Removing empty safety group %s as its registers or register-pins are gobbled.

**Description**

This message comes when removing an empty safety group because its registers or register-pins are gobbled.

---

## SFT-1009

(error) Ignoring library cell %s provided with '-logic_mapping' option of 'create_safety_register_rule' as it %s.

**Description**

This error message comes when option '-logic_mapping' of 'create_safety_register_rule' is ignored due to some reason (for example, if there is no error port mapping provided).

---

## SFT-1010

(warning) 'set_safety_register_rule -target ...' exists, but set_spfm_target does not. Safety register inference is skipped.

**Description**

This warning message comes when safety inference is skipped as 'set_spfm_target' is not provided.

Feedback

## SFT-1011

(warning) Some registers (Eg., %s) selected for safety do not have a target rule. You can use 'set_safety_register_rule -target ...' to specify a common rule for all the registers.

**Description**

This warning message comes when some registers selected for safety inference based on spfm_loss doesn't have a target rule, so they are ignored for safey inference. So not to ignore such registers, user can provide common rule for all the registers using command 'set_safety_register_rule -target ...'.

## SFT-1013

(info) Current design SPFM '%f' is more than the target design SPFM '%f' set by command 'set_spfm_target', so safety register inference is skipped.

**Description**

This information message comes to let user know that safety register inferece is going to be skipped as current design SPFM is already more than the target design SPFM specified by command 'set_spfm_target'.

## SFT-1025

(error) Deleting safety register group %s as %s.

**Description**

This message says why safety register group is getting deleted.

# SG

## SG-001

(Error) Could not find '%s' contributing to any given reference library

**Description**

You passed a contributing library file name to the *define_scaling_lib_group* command, and this library file name could not be found in any reference library. By default, all reference libraries are searched. A specific set of reference libraries to be searched using the *-reflib* option.

Feedback

### What Next

Make sure the specification of library file names to define_scaling_lib_group is correct. You can use report_lib to look at the contributing files to any open reference library.

---

## SG-002

(Error) All panes must come from the same reference library

### Description

Your arguments to the *define_scaling_lib_group* command yielded panes from multiple reference libraries. A scaling group cannot span more than one reference library. It's possible that a DB was "split" so that some of its cells are in one reference library and others are in another.

### What Next

Make sure the specification of library file names to *define_scaling_lib_group* is correct. You can use *report_lib* to look at the contributing files to any open reference library. By default, all reference libraries are searched. A specific set of reference libraries to be searched using the *-reflib* option. In the case of a "split" DB, you will need to use *-reflib* to be specific.

---

## SG-003

(Warning) Invalid library '%s' ignored: %s

### Description

A library that was explicitly passed to the *define_scaling_lib_group* command using the *-reflib* option is not valid. Either it's a reference library with no timing content, or it's a design library. It was ignored. By default, all reference libraries are searched. A specific set of libraries to be searched using the *-reflib* option.

### What Next

This is just a warning. You should not be passing physical-only reference libraries or design libraries to this command with the *-reflib* option. That option is designed to steer a scaling group into a single reference library that has timing content.

---

## SG-004

(Error) No reference libraries to search

Feedback

### Description

Your arguments to the *define_scaling_lib_group* command yielded no matching reference libraries. Either no reference libraries are loaded, or all reference libraries passed to the command contain only physical information, or an empty library was found, or you tried to use a design library. In the latter cases, you should have seen some SG-003 warnings.

### What Next

Make sure the specification of library file names to *define_scaling_lib_group* is correct. You can use *report_lib* to look at the contributing files to any open reference library. By default, all reference libraries are searched. A specific set of reference libraries to be searched using the *-reflib* option.

---

## SG-005

(Error) Must have at least two panes for a scaling group

### Description

Your arguments to the command *define_scaling_lib_group* could not form a scaling group. Either only one pane matching was found for the file names contributing to the reference libraries searched, or more than one was found, but all of the panes have the same PVT. A scaling group requires at least two panes with different PVTs.

### What Next

Make sure the specification of library file names to *define_scaling_lib_group* is correct. You can force a specific set of reference libraries to be searched using the *-reflib* option. Without this option, all reference libraries in memory are searched. All panes must come from the same reference library. You can use *report_lib* to look at the contributing files to any open reference library.

---

## SG-006

(Error) %s thresholds do not match

### Description

When creating a scaling group with the *define_scaling_lib_group* command, some thresholds did not match. Each pane in the group must have the same thresholds. As well, for each library cell, each pin must have the same thresholds in each pane. The threshold values are input_threshold_pct_fall, input_threshold_pct_rise, output_threshold_pct_fall, output_threshold_pct_rise, slew_lower_threshold_pct_fall, slew_lower_threshold_pct_rise, slew_upper_threshold_pct_fall, slew_upper_threshold_pct_rise, and slew_derate_from_library, as defined in Liberty. Thresholds can be viewed using *report_lib*

Feedback

### What Next

You can go back to the Library Manager and adjust the thresholds there. Or, pick a different set of contributing libraries to form a different group.

---

## SG-007

(Error) All panes in a scaling group must have the same process information

### Description

While creating a scaling group with the *define_scaling_lib_group* command, the command found more than one process label or number between the panes. All panes must share the same process label and process number. Process information can be found using *report_lib*.

### What Next

You can go back to the Library Manager and adjust the process information there. Or, pick a different set of contributing libraries to form a different group.

---

## SG-008

(Error) Cannot use pre-scaled panes from '%s' in a scaling group

### Description

Your arguments to the *define_scaling_lib_group* command matched a pane from a reference library which was created by an older version of the Library Manager. This pane is the result of a Library Manager generated scaling group and cannot be used in this context.

### What Next

The application can still perform scaling using the reference library, but it cannot be combined into a new scaling group.

---

## SG-009

(Warning) Scaling group already exists %s

### Description

You tried to create a scaling group but have already done so with the same name, or same set of panes, and so on. The message will give you the specific reason.

Feedback

**What Next**

Check for a typo in your command.

---

## SG-010

(information) Removed scaling library group '%s' in reference lib '%s'

**Description**

The scaling library group was removed by the *remove_scaling_lib_group* command.

**What Next**

No action required.

---

## SG-019

(Error) No scaling library group named '%s'.

**Description**

The scaling library group specified has not been defined by the *define_scaling_lib_group* command.

**What Next**

Define the scaling library group with the *define_scaling_lib_group* command.

---

## SG-023

(Error) %s characterization point:%s

**Description**

While creating a scaling group, one of two things is wrong. In one case, there is a missing characterization point. If the panes you selected share two temperatures and three voltages for a single rail, you would need six panes to cover those points.

In the other case, more than one pane has the same characterization point. Each point can occur only once.

**What Next**

Try using a different set of panes for your scaling group.

Feedback

### SG-024

(Information) For %s, found values:%s

**Description**

While creating a scaling group, the application found missing or duplicate characterization points (PVTs). This message tells you which temperatures and rail voltages were found. To get complete coverage, each combination of these values needs to match one pane to allow a valid scaling group.

This informational message is paired with other messages, which will indicate if this is allowed or if it is an error which will prevent creation of the scaling group.

## SIG

### SIG-6006

(Information) Unable to load design attachment. Inconsistency in congestion estimation database.

**Description**

This message informs that reading the congestion estimation database from NDM attachment has failed. The database is used to estimate the metrices related to congestion.

### SIG-6086

(Information) Parsing error for string '%s', could not convert into a number.

**Description**

This message informs that parsed string could not be converted to a number while deserializing the signature DB attachment.

## SIGEM

### SIGEM-001

(error) unsupported syntax '%s', line %d.

Feedback

**Description**

A unsupported syntax is found in the EM seciton While reading TLU plus file.

**What Next**

Check the TLU plus file and reload it.

---

## SIGEM-002

(error) syntax error in line %d.

**Description**

A syntax error is found in the EM seciton while reading TLU plus file.

**What Next**

Check the TLU plus file and reload it.

---

## SIGEM-003

(error) line should be start with token '#', line %d .

**Description**

The EM syntax should be started with token '#'.

**What Next**

Check the TLU plus file and reload it.

---

## SIGEM-004

(error) '%s' has no corresponding token '%s' line %d.

**Description**

This message will be reported when a corresponding token is missing in the EM file. For example, token '{' must have a corresponding '}'.

**What Next**

Check the TLU plus file and reload it.

---

## SIGEM-005

(error) The current library has no technology information.

Feedback

**Description**

The current library must have technology information to correctly read the EM file.

**What Next**

Load the technology file to current library, then reload the EM file.

---

## SIGEM-006

(warning) Layer %s is not defined in technology file, the constraints in the layer ignored.

**Description**

The Layer is not defined in technology file, correcsponding EM data will be ignored.

**What Next**

Check the layer definitation in technology file, then reload the technology file and EM file.

---

## SIGEM-008

(error) unsupported syntax in line %d: %s

**Description**

An unsupported syntax is found While reading ALF file for signal EM.

**What Next**

Check the file syntax and reload it.

---

## SIGEM-021

(warning) The net '%s' is ignored in signal EM analysis because its toggle rate is zero.

**Description**

If the toggle rate of the net is zero, it is ignored in signal EM analysis.

**What Next**

Check the toggle rate setting.

---

## SIGEM-022

(warning) The net '%s' is ignored in signal EM analysis because it is constant net or case analysis is set.

Feedback

**Description**

If the net is constant (logic 0 or logic 1) or case analysis is set, there is no AC signal propagating through the net. It is ignored in signal EM analysis.

**What Next**

Check the net setting.

---

## SIGEM-023

(warning) Net '%s' has unfixable signal EM violation because the violation is inside block.

**Description**

Signal EM analysis is performed on the nets in top level and also on the nets in the block abstract. However, the violation inside the block cannot be fixed at the top level.

**What Next**

Analyze and fix the signal EM violations inside block at the block level.

---

## SIGEM-024

(warning) Net '%s' has unfixable signal EM violation because the shape with violation is locked.

**Description**

The net with EM violation or the shape with EM violation is locked, so the violation cannot be fixed.

**What Next**

To fix signal EM violation, please update the status on the net/shape.

---

## SIGEM-025

(error) Cannot analyze signal EM for scenario '%s' because '%s'.

**Description**

The signal EM analysis use both early and late data to compute the worst situation. For setup only scenario, please use option -max to perform signal EM analysis with only late data. For hold only scenario, please use option -min to perform signal EM analysis with only early data.

Feedback

**What Next**

To perform signal EM analysis correctly, please set the scenario status accordingly.

---

## SIGEM-026

(warning) '%s' is ignored in signal EM analysis, line %d.

**Description**

This syntax is only supported in Prime Rail for power EM analysis. It is ignored in signal EM analysis.

**What Next**

Check the Signal EM ITF file.

---

## SIGEM-027

(error) Cannot analyze signal EM for scenario '%s' because parasitic data is not available.

**Description**

The signal EM analysis is not performed when the parasitic data is not available because the parasitic data are used for computing current.

**What Next**

Please check the parasitic tech setup for the constraint corner of current scenario.

---

## SIGEM-028

(warning) The net '%s' is ignored in signal EM analysis because some parasitic data don't have layer information.

**Description**

Signal EM analysis use parasitics, timing and routing data to compute current and check violations. Layer information is needed to identify the shape based violation.

**What Next**

Please check routing and parasitics. Please recreate abstract if the net is located inside block.

---

## SIGEM-029

(warning) There are no signal electormigration rules defined.

Feedback

### Description

If there are no signal electromigration rules defined, signal electromigration analysis calculates the current, but does not check for violations.

### What Next

Use the *read_signal_em_constraints* command to load the signal electromigration rules.

### See Also

- fix_signal_em
- read_signal_em_constraints
- report_signal_em
- set_scenario_status

---

## SIGEM-030

(warning) The net '%s' is ignored in signal EM analysis because parasitic data is not available.

### Description

Signal EM analysis calculates current using parasitc data.

### What Next

Please check extraction and timing for the net.

---

## SIGEM-031

(warning) The net '%s' is ignored in signal EM analysis because it is not routed.

### Description

Signal EM analysis calculates current and limit for every routing shape. It is not performed if the net is unrouted.

### What Next

Please check routing for the net.

---

## SIGEM-032

(warning) The net '%s' is ignored in signal EM analysis because parasitic data don't have node locations.

Feedback

**Description**

Signal EM analysis use parasitics, timing and routing data to compute current and check violations. Parasitic node locations are needed for the shape based analysis.

**What Next**

Please check extraction data for the net.

---

## SIGEM-033

(warning) The net '%s' is ignored in signal EM analysis because it has no driver.

**Description**

Signal EM analysis uses timing data to compute current. The current cannot be calculated for nets without driver data.

**What Next**

Please check driver for the net.

---

## SIGEM-034

(warning) The net '%s' is ignored in signal EM analysis because the driver '%s' doesn't actually drive anything.

**Description**

Signal EM analysis uses timing data to compute current. The current cannot be calculated for nets without driver data.

**What Next**

Please check driver for the net.

---

## SIGEM-035

(warning) The net '%s' is ignored in signal EM analysis because it is unconnected.

**Description**

Signal EM analysis works on routed nets only.

**What Next**

Please check the connection for the net.

Feedback

## SIGEM-036

(error) syntax error in line %d. Invalid value for "EM_PEAK_EQUATION_SOURCE_TECHFILE".

**Description**

A syntax error is found while reading ITF file. The value of "EM_PEAK_EQUATION_SOURCE_TECHFILE" should be either 0 or 1.

**What Next**

Correct the value of "EM_PEAK_EQUATION_SOURCE_TECHFILE" and reload it.

## SIGEM-037

(warning) The net '%s' is ignored in signal EM analysis because it is inside block abstract and it is not fully retained.

**Description**

Signal EM analysis use parasitics, timing and routing data to compute current and check violations. This net is not fully retained in abstract.

**What Next**

Please check the net in block level.

## SIGEM-038

(error) syntax error in line %d. '%s' is incomplete.

**Description**

A syntax error is found while reading ITF or ALF file. Either the index table or the value table is missing.

**What Next**

Check input file and complete the table.

## SIGEM-039

(error) syntax error in line %d. Data count in '%s' is inconsistent (index %d vs. value %d).

Feedback

**Description**

A syntax error is found while reading ITF or ALF file. The total number in index table is inconsistent with the number in value table.

For factor value table, the number should be same as the number of index table.

For current value table, the number should be multiplication of the numbers of all index tables. For example, if it has two indexes, one with 2 values and the other one with 4 values, we are expecting there are 2*4=8 values in the current value table.

**What Next**

Check input file and correct the table.

---

## SIGEM-040

(warning) The %s transition time for net '%s' is missing and '%f' ns from setting is used.

**Description**

Signal EM analysis uses transition time from timer to compute current. When it is not available, the transition set by app option sigem.min_trans is used. The default value 10ps is used if the app option is not set.

**What Next**

Please check transition time on the net.

---

## SIGEM-041

(warning) Layer %s is not defined in technology file, its FIT parameters are ignored.

**Description**

The Layer is not defined in technology file, correcsponding FIT parameters will be ignored.

**What Next**

Check the layer definitation in technology file and FIT parameters file.

---

## SIGEM-042

(warning) The pin %s is missing in timing graph.

**Description**

Signal EM analysis uses data from timer to compute current. This pin is dangling.

Feedback

**What Next**

Please check the connectivity of the pin.

---

## SIGEM-043

(warning) Net '%s' has unfixable signal EM violation because the violation is inside pin.

**Description**

Signal EM analysis is checking routing shapes inside pin. However, the violation inside the pin cannot be fixed.

**What Next**

Check the driver and loads, reduce the driver current to resolve the signal EM violation.

---

# SIT

---

## SIT-001

(error) No physical information present for %s%s.

**Description**

Physical/Block information is not present. Operations involving physical data can't be performed.

**What Next**

Include physical data into the current design.

---

## SIT-002

(error) %s%s%s.

**Description**

Associated data provided for site array creation is incorrect.

**What Next**

Rectify the input data as per details in error message.

---

## SIT-003

(Information) %s%s.

Feedback

**Description**

General information about site arrays, like default site array creation, etc.

# SKW

## SKW-001

(Warning) '%s' cell is not a macro. So it is ignored.

**Description**

The cell specified is not a macro, and hence ignored.

**What Next**

Correct the specification

## SKW-002

(Warning) Some previous set_skew_macros command specified '%s' macro in a different bank. Removing the macro from the previous bank and adding in the current one.

**Description**

The macro specified in command is already present in another bank. Remove the macro from the previous bank and add into the current bank.

**What Next**

Remove the macro from one of the banks.

## SKW-003

(Warning) Some previous set_skew_macros command had specified bank '%s'. Removing the previous specification and overriding with the current one.

**Description**

The data in the bank due to previous specification is overridden with current one.

**What Next**

Do the necessary correction

Feedback

## SKW-004

(Info) Skew macro specification for bank '%s' is removed.

**Description**

Removed set_skew_macros specification on the bank

**What Next**

Ensure that removal is intended

## SKW-005

(Warning) Bank '%s' is not found.

**Description**

The specified bank is not found in the database

**What Next**

Correct as necessary

## SKW-006

(Warning) Some previous set_skew_registers command had specified bank '%s'. Removing the previous specification and overriding with the current one.

**Description**

The data in the bank due to previous specification is overridden with current one.

**What Next**

Do the necessary correction

## SKW-007

(Warning) '%s' cell is a macro. So it is ignored.

**Description**

The cell specified is a macro, and hence ignored.

**What Next**

Correct the specification

Feedback

## SKW-008

(Warning) Some previous set_skew_registers command specified '%s' register in a different bank. Removing the register from the previous bank and adding in the current one.

**Description**

The register specified in command is already present in another bank. Remove the register from the previous bank and add into the current bank.

**What Next**

Remove the register from one of the banks.

## SKW-009

(Info) Skew register specification for bank '%s' is removed.

**Description**

Removed set_skew_registers specification on the bank

**What Next**

Ensure that removal is intended

## SKW-010

(Warning) Bank '%s' is not found.

**Description**

The specified bank is not found in the database

**What Next**

Correct as necessary

## SKW-101

(Info) BankName = %s, ImproveSide = %s, Critical = {%s}, BankInputSlack = %f, BankOutputSlack = %f, SkewVal = {%s}.

**Description**

Message gives information about skew macro results

Feedback

### SKW-102

(Info) BankName = %s, ImproveSide = %s, BankInputSlack = %f, BankOutputSlack = %f, SkewVal = %f.

**Description**

Message gives information about skew registers results

## SLG

### SLG-001

(fatal) This is NOT a code crash but an intentional bailout to get your attention. There are scaling-related setting errors or library data issues that are considered fatal to your analysis, and need to be resolved as soon as possible. See the SLG-001 man page.

**Description**

The *define_scaling_lib_group* command specifies a group of libraries for scaling and exact-match usages. These features have these major requirements:

- Library data consistency requirements.
- Scaling formation requirements which are needed by scaling only.
- Cell instance operating condition setting cannot go beyond the acceptable range defined by the scaling group.

If these requirements are not met, PrimeTime issues SLG and DEL errors and warnings. You got the SLG-001 message and bailout because the script has one or more of these major errors that seriously affect QoR or even cause calculation failure and fatal errors. PrimeTime stops before *update_timing* so you can get a list of related errors.

If you choose to accept the error and want timing analysis to continue, you can set the *timing_continue_on_scaling_error* variable to true to bypass SLG-001 errors. In that case, you will still see SLG-418 warnings with a list of offending error IDs. However, by bypassing SLG-001 errors, calculation failure or QoR effects can occur.

**What Next**

Use the *check_timing -include operating_conditions* command and fix the following check failures:

```
SLG-202(n)
SLG-209(n)
SLG-211(n)
SLG-217(n)
```

Feedback

```
SLG-303(n)
SLG-310(n)
SLG-311(n)
SLG-316(n)
SLG-317(n)
SLG-320(n)
SLG-321(n)
SLG-330(n)
```

### See Also

- define_scaling_lib_group

---

## SLG-201

(error) A library can be in only one scaling library group.

### Description

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the *link_design* commands occur (either explicitly or implicitly).

If you try to use a library in more than one group, the SLG-201 error message occurs.

After design linking occurs, the remaining libraries in scaling library groups will be loaded to "complete" the groups. During the completion step, data for the same arcs and pins across libraries are associated with each other; if this association fails, the scaling library groups cannot be completed, and the SLG-202 error message is issued.

### What Next

Ensure that the set of arcs and pins is identical across the members of the scaling library groups. The positions of the arcs and pins within the libraries must be the same as well.

### See Also

- define_scaling_lib_group
- SLG-201
- SLG-202
- SLG-203
- SLG-205

Feedback

## SLG-202

(error) Completion of scaling library groups failed %s.

### Description

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is read.

If you try to use a library in more than one group, the SLG-201 error message occurs.

After design linking occurs, the remaining libraries in scaling library groups will be loaded to "complete" the groups. During the completion step, data for the same arcs and pins across libraries are associated with each other; if this association fails, the scaling library groups cannot be completed and the SLG-202 error message is issued.

### What Next

Ensure that the set of arcs and pins is present across the members of the scaling library groups. This message is issued when some of the arcs or cells are missing across the members of the scaling library groups.

If you are using Base-curve Technology CCS Timing libraries, also verify if the base curve information in the libraries have been discretized and normalized in identical manner; that is, check if curve_x has identical values across the scaling libraries in a library group.

### See Also

- define_scaling_lib_group
- SLG-201
- SLG-202
- SLG-203

## SLG-203

(information) The members of a scaling library group have significantly different output-capacitance indexes; this can adversely affect scaling accuracy.

### Description

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the *read_db* and *link_design* commands occur (either explicitly or implicitly).

If you try to use a library in more than one group, the SLG-201 message occurs.

Feedback

After design linking occurs, the remaining libraries in scaling library groups are loaded to complete the groups. During the completion step, data for the same arcs and pins across libraries are associated with each other. If this association fails, the scaling library groups cannot be completed, and the SLG-202 error message is issued.

**What Next**

Ensure that the set of arcs and pins is identical across the members of the scaling library groups. The positions of the arcs and pins within the libraries must be the same as well.

The output-capacitance indexes used for Composite Current Source (CCS) driver data is better to have identical values across the libraries. If this is not satisfied, the SLG-203 message is issued.

**See Also**

- define_scaling_lib_group
- SLG-201
- SLG-202
- SLG-203

## SLG-204

(warning) The timing arcs %s cannot be uniquely determined across the scaling libraries, it is assumed that the timing arcs are defined in the same order across all the libraries.

**Description**

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is linked.

If you try to use a library in more than one group, the SLG-201 message occurs.

After design linking occurs, the remaining libraries in scaling library groups are loaded to complete the groups. During the completion step, data for the same arcs and pins across libraries are associated with each other. If the timing arcs cannot be associated across the scaling libraries because the timing arcs cannot be identified uniquely within a library, the SLG-204 warning message is issued. Since the timing arcs cannot be uniquely identified, the arcs are assumed to be in the same order across the libraries in a library group.

Note that this is only an informational warning; the scaling relationship for the scaling library group is still created.

Feedback

### What Next

Ensure that the set of arcs that cannot be uniquely identified are present in the same order across the members of the scaling library groups. Run LC scaling check to detect and correct all major violations.

## SLG-205

(warning) CCS Noise information is inconsistent for %s across the libraries in the scaling library group. Scaling for CCS noise will not be supported.

### Description

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is read.

If you try to use a library in more than one group, the SLG-201 message occurs.

After design linking, the remaining libraries in scaling library groups are loaded to complete the groups. During the completion step, data for the same arcs and pins across libraries are associated with each other. If this association fails, the scaling library groups cannot be completed, and SLG-202 error message is issued. If the association fails only due to missing or inconsistent CCS noise data, the SLG-205 warning message is issued and the inconsistent CCS noise data is not used in calculation.

### What Next

Ensure that the CCS noise data for the set of arcs and pins is present across the members of the scaling library groups. This message is issued when some of the arcs or pins have at least one of the following conditions:

- Missing CCS noise model information across the members of the scaling library groups
- CCS noise model information with the input voltage and output voltage indexes not in the same percent vdd in all libraries of a scaling group

Feedback

- Inconsistent or missing conditions for CCS noise models across the members of a scaling library group
- Inconsistent ordering of conditional CCS noise models across the members of a scaling library group

## SLG-206

(warning) Completion of scaling library group failed for power analysis: %s.

**Description**

This message is issued when some of the power arcs are missing across the members of the scaling library group.

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is read.

After design linking, the remaining libraries in scaling library group are loaded to complete the group. During the completion step, data for the same arcs and pins across libraries are associated with each other. If this association fails for associating power arcs across the libraries, the SLG-206 warning message is issued, and scaling is not enabled for power analysis.

Note that this warning is for power analysis, the scaling relationship for the scaling library group is still created. The scaling for timing analysis is not affected. The SLG-202 message is issued when some of the timing arcs or cells are missing across the members of the scaling library group.

**What Next**

Ensure that the set of power arcs is present across the members of the scaling library group.

Feedback

## SLG-207

(warning) Some of the power arcs cannot be uniquely determined across the scaling libraries, it is assumed that the power arcs are defined in the same order across all the libraries.

### Description

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is linked.

After design linking, the remaining libraries in scaling library group are loaded to complete the group. During the completion step, data for the same arcs and pins across libraries are associated with each other. If the power arcs cannot be associated across the scaling libraries because the power arcs cannot be identified uniquely within a library, the SLG-207 warning message is issued. Since the power arcs cannot be uniquely identified, the arcs are assumed to be in the same order across the libraries in a library group.

Note that this is only an informational warning, the scaling relationship for the scaling library group is still created.

### What Next

Ensure that the set of arcs that cannot be uniquely identified are present in the same order across the members of the scaling library group.

- SLG-203

---

## SLG-209

(error) Invalid set of libraries passed to define_scaling_lib_group.

### Description

A valid set of libraries should be passed to *define_scaling_lib_group*. Check the characterization operating conditions of the libraries in the group.

For example, if you want to use operating conditions between 0.8 and 0.9 V and temperatures between -40 and 125 degrees, libraries characterized at all four voltage and temperature combinations should be specified:

```
pt_shell> define_scaling_lib_group { \\
          lib_max_125_0.8V_cccs.db \\
          lib_max_125_0.9V_cccs.db \\
          lib_max_-40_0.8V_cccs_v2.db\\
          lib_max_-40_0.9V_cccs_v2.db }
```

If any of the four libraries are missing, the scaling library group is rejected. When specifying multiple temperatures or voltages, all libraries on the resulting voltage-temperature grid must be provided.

### What Next

Check the characterization operating conditions of the libraries provided to *define_scaling_lib_group*, and ensure that the grid is fully populated.

---

## SLG-210

(error) Zero or more than one scaling library is in the link_path or link_path_per_instance. Creation of scaling group failed.

**Description**

Only one library in each scaling library group should be in the link_path, or be the min library of a library in the linked path. If there is none or more than one scaling library in the link_path, the tool does not create this library group.

**What Next**

Fix the scaling library group, and rerun your script.

**See Also**

- define_scaling_lib_group

---

## SLG-211

(warning) Loading of CCS data for multi-rail scaling support has failed , the reason is: %s.

**Description**

The reasons that might cause the loading to fail include: if the libraries are non-PG-pin libraries; if the libraries do not have any CCS data; if more than one or none of the specified libraries is a link library or a min library of a link library, and finally a series of data inconsistencies such as if a specific arc has driver data but no receiver data.

When this warning is issued, multirail scaling is not possible for that scaling group, and the scaling calculations using the scaling library group revert to regular single-rail scaling.

**What Next**

Ensure that libraries specified are CCS PG-pin libraries, and exactly one of them is a link library or min library of a linked library. Also, ensure that corresponding receiver and driver data is available for every arc in each of the libraries.

**See Also**

- define_scaling_lib_group

Feedback

## SLG-212

(information) The variable %s cannot be turned on because %s.

### Description

If you set the *variation_enable_analysis* variable after you use the *define_scaling_lib_group* command, the variable setting change does not take effect.

### What Next

Set the *variation_enable_analysis* variable before using the *define_scaling_lib_group* command.

## SLG-213

(information) The number of dimensions in dimension_names and dimension_values list are not consistent.

### Description

The size of the list in *dimension_names* and *dimension_values* should match.

When this information is issued, the command does not take effect.

### What Next

Reissue the command with correct set of *dimension_names* and *dimension_values*.

### See Also

- define_scaling_lib_group

## SLG-214

(warning) Scaling will not be done for cell %s, since it does not have consistent scaling information across the scaling libraries.

### Description

Scaling cannot be done for specific arcs or pins of the specified cell because of inconsistent or missing scaling data.

### What Next

Check the scaling libraries using the Library Compiler utility to correct the inconsistencies. This might be due to missing arc or pin data in one of the libraries. Reissue the command with a correct set of scaling libraries.

Feedback

**See Also**

- SLG-209

---

## SLG-215

(warning) Scaling creation for the %s has failed due to missing or mismatching data.

**Description**

If there is an arc or pin with missing or mismatching data, the scaling relation for that arc or pin is not created. The other arcs or pins in the scaling library group are not affected. The calculation of that arc or pin uses linked library data instead.

**See Also**

- define_scaling_lib_group
- SLG-202

---

## SLG-216

(error) An unexpected exact-match has been detected for the cell timing %s in %s calculation

**Description**

If you use the *define_scaling_lib_groups* command with the *-exact_match_only* option, only exact matches are considered acceptable. If the cell operating condition requires scaling, or none of the library operating condition matches the desired one, it is considered an exact-match failure, and this message is issued. Then the linked library is used.

**What Next**

In the case or *-exact_match_only*, change the operating condition of the cell instance, or add a library in the scaling group with the specified operating condition. Operating conidtions include voltage, rail voltage, temperature, and process. Alternatively, consider using scaling.

You can use "check_timing -override_default operating_conditions -verbose" to determine detail information about the PVT mismatch between design and library. And use "report_lib_group -scaling -show { process voltage temperature} " can determine each library PVT, "report_power_pin_info" can display the cell instance voltage setting. Compare both reports, you can see the PVT difference.

Please do not ignore this message. This error must be fixed or it will impact QoR.

## SLG-217

(warning) Scaling will not be done for cell %s, since the associated scaling library group does not meet the scaling formation requirement.

### Description

Scaling cannot be mathematically performed if the data is insufficient for performing scaling, such as trying to do two-dimensional scaling with only two libraries. Scaling formation is done by the points representing the operating conditions of the libraries in a multidimensional space.

PrimeTime supports on-the-grid, n+1, and 2n+1 scaling formations. This message is issued when the scaling operating condition formation of an arc or pin data of a cell does not meet any of the three formations.

### What Next

Check the operating conditions of the libraries, including voltage, rail voltages, temperature, and so on. Provide libraries that meet the scaling formation requirements, and reissue the command.

### See Also

- report_lib
- SLG-209

## SLG-218

(information) Find %s, check your scaling libraries.

### Description

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. This requires data consistency otherwise scaling might encounter issues. This message detects inconsistency issues, such as missing voltage_maps or mismatch voltage_map sequence across the scaling libs.

### What Next

This informational message indicates an issue that the tool attempts to fix internally. However, you should fix the library to avoid any potential issues and run the Library

Feedback

Compiler scaling check. All libraries used in scaling should pass the Library Compiler scaling check.

**See Also**

- define_scaling_lib_group

## SLG-220

(warning) Completion of scaling library group failed for rail analysis: %s.

**Description**

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is read.

After design linking, the remaining libraries in scaling library group are loaded to complete the group. During the completion step, data for the same arcs and pins across libraries are associated with each other. If this association fails for associating power arcs across the libraries, the SLG-220 warning message is issued, and scaling is not enabled for analysis.

**What Next**

Ensure that the set of power arcs is present across the members of the scaling library group. This message is issued when some of the power arcs are missing across the members of the scaling library group.

**See Also**

- define_scaling_lib_group

## SLG-221

(warning) Some of the power arcs cannot be uniquely determined across the scaling libraries for rail analysis, it is assumed that the power arcs are defined in the same order across all the libraries.

**Description**

The *define_scaling_lib_group* command specifies a group of libraries to interpolate between for voltage and temperature scaling. The command must be issued after the design is linked.

After design linking, the remaining libraries in scaling library group are loaded to complete the group. During the completion step, data for the same arcs and pins across libraries are associated with each other. If the power arcs cannot be associated across the

Feedback

scaling libraries because the power arcs cannot be identified uniquely within a library, the SLG-221 warning message is issued. Since the power arcs cannot be uniquely identified, the arcs are assumed to be in the same order across the libraries in a library group.

Note that this is only an informational warning; the scaling relationship for the scaling library group is still created.

**What Next**

Ensure that the set of arcs that cannot be uniquely identified are present in the same order across the members of the scaling library group.

**See Also**

## SLG-224

(warning) Replacing library for '%s' with '%s'

Feedback

### Description

This message warns you that you have the same cell instance listed multiple times in the setting for the *define_cell_alternative_lib_mapping* variable. In the following example, the *uls/utlb_ctl/U112* instance is listed twice.

```
define_cell_alternative_lib_mapping liberty_ss_0p600v_m25c_mis.db -cell
 "uls/utlb_ctl/U112 uls/utlb_ctl/U112"
```

### What Next

Examine the setting for the *define_cell_alternative_lib_mapping* variable, and ensure that only one valid library exists per cell-instance.

---

## SLG-225

(error) The *define_cell_alternative_lib_mapping* command failed due to missing library group information for library '%s'

### Description

You need to create a scaling group for the library used in the *define_cell_alternative_lib_mapping* command.

### What Next

Specify the library group using the *define_scaling_lib_group* command as shown in the following example.

```
set link_path "* my_linked_lib.db"
read_verilog my_design.v
link_design my_design
define_scaling_lib_group -exact_match_only {my_linked_lib.db
 my_alt_lib.db}
define_cell_alternative_lib_mapping my_alt_lib.db -cells {U1 U2}
update_timing
```

---

## SLG-226

(warning) Scaling creation for the %s has failed due to unsupported 3-D NLDM data.

Feedback

### Description

If there is an arc using 3-D NLDM data, the scaling relation for that arc will not be created. The other arcs or pins in the scaling library group are not affected. The calculation of that arc or pin uses linked library data instead.

### See Also

- define_scaling_lib_group
- SLG-202

---

## SLG-227

(error) An unexpected exact-match failure due to missing arc/pin has been detected for the cell timing %s in %s calculation

### Description

If you use the *define_scaling_lib_groups* command with the *-exact_match_only* option, only exact matches are considered acceptable. You get this message when the exact_match library does not have the matching arc/pin as the linked library.

### What Next

Please run Library Compiler scaling check to find the mismatching arc/pin and fix accordingly.

---

## SLG-228

(error) An unexpected scaling failure due to extrapolation has been detected for the cell timing %s in %s calculation

### Description

This is a special error on extrapolation. You receive this error because your operating conditon of the cell is too close to a missing scaling library cell or a missing scaling library. Therefore accuracy is impacted and it is considered extrapolation.

### What Next

Please change cell operating condition to stay away from the missing library or the missing library cell. Check report_power_pin_info/report_design and report_lib_group -scaling -show {process voltage temperature} to check why the cell PVT is not in the range of the scaling group. Also check whether there is any lib cell/pin/arc is missing message SLG-305, SLG-307 and SLG-308 in the previous define_scaling_lib_group processing log file.

Feedback

## SLG-229

(error) An unexpected scaling calculation failure has been detected for the cell timing %s in %s calculation

### Description

This is an error to let you know that CCS or NLDM data scaling has failed. This is a very rare failure, often due to bad library data causing scaling to go wrong, that triggers internal detection to issue this error.

### What Next

Please check for bad library data, in particular if any data that is way too large or too small than it should be. Also, whether multiple libraries with same operating conditons are used. This could happen when most of the rails of the libraries are excluded from scaling calculation, then scaling uses the left over rails to decide scaling connection. Scaling choose to use the first library among the libraries with same set of remaining rails. If the first library happends to have dramatically different data than other libraries used in scaling, you may get this error on bad data triggering scaling failure.

## SLG-231

(error) Detected a scaling failure because specified operating conditions is not on proper grid of the scaling group for the cell timing %s calculation.

### Description

You receive this error because your operating conditon of the cell is far to the desired range of the scaling library group. This error message is to attention customer that it may have bad scaling calculation results due to the inproper operating condition setting or scaling lib definition.

### What Next

Please change the cell operating condidtion or add more full grid library corner and make sure the specified cell operating condition is within desired scaling range.

If it is voltage-only scaling, use 'report_power_pin_info' to get the related cell voltage setting, and use 'report_lib_group -scaling -show {voltage}' to find out the scaling range of the group.

## SLG-300

(error) Scaling libraries cannot be defined after timing analysis.

Feedback

### Description

You tried to use the *define_scaling_lib_group* command after a timing update.

### What Next

Close the current block and reopen the block. Be sure to run the *define_scaling_lib_group* before the first timing update.

### See Also

- define_scaling_lib_group

---

## SLG-301

(warning) Scaling libraries are defined after timing analysis.

### Description

*define_scaling_lib_group* command is recommended to be used before any timing update.

### What Next

To modify your running script and make all *define_scaling_lib_group* commands are used before any timing update. If user doesn't change the script and wants to skip this warning message, user needs to run update_timing -full to honor the newly added scaling libraries.

### See Also

- define_scaling_lib_group

---

## SLG-302

(error) Scaling libraries can be defined only after the design is linked.

### Description

You tried to use the *define_scaling_lib_group* command before the *link_design* command.

### What Next

Read in and link the design with the *link_design* command. Then use the *define_scaling_lib_group* command. Do this before the first timing update.

### See Also

- define_scaling_lib_group

Feedback

## SLG-303

(error) Multiple scaling libraries '%s' are in the link path specfied by the link_path and link_path_per_instance variables. Creation of the scaling group failed.

### Description

The *define_scaling_lib_group* command requires exactly one library of a scaling library group to be in the link path specified by the *link_path* and *link_path_per_instance* variables. The remaining scaling libraries are automatically read in to create the group. This error message indicates that more than one scaling library was found in the link path.

### What Next

Change either the link path or the *define_scaling_lib_group* command so that exactly one library in the scaling library group exists in the link path.

### See Also

- define_scaling_lib_group

## SLG-305

(error) Cell '%s' is not present in scaling library '%s'. Scaling will not be performed for this cell.

### Description

The *define_scaling_lib_group* command requires every library cell in a link library to be also present in every scaling library. This error message reports a library cell in a link library that does not exist in a scaling library.

### What Next

Make sure that all the libraries listed in *define_scaling_lib_group* command contain all of the library cells in the linked libraries.

### See Also

- define_scaling_lib_group

## SLG-306

(error) define_scaling_lib_group '%s', cannot find scaling Library '%s', scaling will not be performed.

Feedback

### Description

*define_scaling_lib_groups* command requires all libraries in the scaling lib group are present. This message will be issued if there is one scaling library cannot be found.

### What Next

Correct the library in the define_scaling_lib_group and make sure all scaling libraries are present.

---

## SLG-307

(error) Pin '%s' of cell '%s' is present in link library '%s' but not in scaling library '%s'.

### Description

The *define_scaling_lib_group* command requires every pin of every library cell in a link library to be also present in every scaling library. This error message reports a pin of a library cell in a link library that does not exist in a scaling library. define_scaling_lib_group command will error out when detect this error.

### What Next

Make sure that all the libraries listed in *define_scaling_lib_group* command contain all of the library pins in the linked libraries. Please modify script remove or change the library that contain different pin.

### See Also

- define_scaling_lib_group

---

## SLG-308

(error) Arc '%s' of cell '%s' is present in link library '%s' but not in scaling library '%s'. Scaling might not be performed for this arc.

### Description

The *define_scaling_lib_group* command requires every timing arc of every library cell in a link library to be also present in every scaling library. This error message reports an arc of a library cell in a link library that does not exist in a scaling library. If the related scaling lib group is exact_match_only, calculation will fallback to link library arc lib data.

### What Next

Make sure that all the libraries listed in *define_scaling_lib_group* command contain all of the library arcs in the linked libraries.

Feedback

## SLG-309

(error) The voltage rail of scaling library '%s' does not match that of the link library '%s'. The scaling group cannot be formed.

### Description

*define_scaling_lib_groups* command requires each scaling library voltage rail is same with the link library among the library group. If any scaling library voltage rail is different with the link library, define_scaling_lib_group command will error out, and output this message.

### What Next

Replace the offending scaling library with library that has same library voltage rail as link library.

## SLG-310

(error) The pin thresholds of scaling library '%s' do not match those of the link library '%s'.

### Description

The *define_scaling_lib_group* command requires each scaling library threshold to be the same as that of the the link library in the library group. This message indicates that the *define_scaling_lib_group* command found a threshold difference.

### What Next

Replace the offending scaling library with a library that has the same library threshold definitions as the link library.

### See Also

- define_scaling_lib_group

## SLG-311

(error) The CCS driver data of scaling library '%s' does not match that of link library '%s'. The scaling group cannot be formed.

### Description

The *define_scaling_lib_group* command requires library CCS data to be consistent between each scaling library and the link library. This error message indicates that the command found inconsistent CCS library data.

Feedback

### What Next

Make sure that the *define_scaling_lib_group* command specifies a list of libraries with CCS driver data consistent with the link library.

### See Also

- define_scaling_lib_group

---

## SLG-312

(error) The user data of scaling library '%s' does not match that of the link library '%s'. The scaling group cannot be formed.

### Description

The *define_scaling_lib_group* command requires library user data to be consistent between each scaling library and the link library. This error message indicates that the command found inconsistent user data.

### What Next

Make sure that the *define_scaling_lib_group* command specifies a list of libraries with user data consistent with the link library.

### See Also

- define_scaling_lib_group

---

## SLG-313

(error) Arc %s in library %s arc group index is different from the index of the library group. The scaling group cannot be formed.

### Description

The *define_scaling_lib_group* command requires each library arc index in the arc group to match its library index in the library group. This error message indicates that the command found inconsistent arc group index data.

### What Next

Make sure that each library arc is present in all libraries in the scaling library group defined by the *define_scaling_lib_group* command.

### See Also

- define_scaling_lib_group

Feedback

## SLG-314

(error) Pin '%s' in library '%s' pin group index is different from the index of the library group. The scaling group cannot be formed.

### Description

The *define_scaling_lib_group* command requires each library pin index in the pin group to match its library index in the library group. This error message indicates that the command found inconsistent pin group index data.

### What Next

Make sure that each library pin is present in all libraries in the scaling library group defined by the *define_scaling_lib_group* command.

### See Also

- define_scaling_lib_group

## SLG-315

(error) Invalid set of libraries '%s' passed to define_scaling_lib_group. Multi-dimension scaling requires the number of libraries to be at least the number of dimensions plus one.

### Description

The *define_scaling_lib_group* command requires the number of libraries in a group to be at least the number of scaling dimensions plus one. This error message indicates that too few libraries were listed.

### What Next

Check numbers of process, temperature, and voltage rail values. Make sure that the number of scaling libraries is at least the number of scaling dimensions plus one.

### See Also

- define_scaling_lib_group

## SLG-316

(error) Library '%s' already belongs to a scaling library group.

### Description

A library listed in the *define_scaling_lib_group* command already belongs to a scaling library group. Each library can belong to no more than one scaling library group.

Feedback

### What Next

Report the existing library groups using the *report_lib_groups* command. You can create multiple scaling library groups to cover different parts of the design, but each library can belong to no more than one group.

## SLG-317

(error) No library in the scaling library group was found in the link path specified by the link_path and link_path_per_instance variables. Creation of the scaling group failed.

### Description

The *define_scaling_lib_group* command requires exactly one library of a scaling library group to be in the link path specified by the *link_path* and *link_path_per_instance* variables. The remaining scaling libraries are automatically read in to create the group. This error message indicates that no scaling library was found in the link path.

### What Next

Change either the link path or the *define_scaling_lib_group* command so that exactly one library in the scaling library group exists in the link path.

### See Also

- define_scaling_lib_group

## SLG-318

(error) Parallel lib arc '%s' of cell '%s' is present in link library '%s' but not in scaling library '%s'. Scaling might not be performed for this arc.

### Description

The *define_scaling_lib_group* command requires every timing arc of every library cell in a link library to be also present in every scaling library. This error message reports a parallel

Feedback

arc of a library cell in a link library that does not exist in a scaling library. If the related scaling lib group is exact_match_only, calculation will fallback to link library arc lib data.

**What Next**

Make sure that all the libraries listed in *define_scaling_lib_group* command contain all of the library arcs in the linked libraries. Please check whether the same from lib pin and to lib pin contain different number of parallel arcs between link library and scaling library.

---

## SLG-320

(error) Cell '%s' hits scaling extrapolation problem, '%s' value '%f' is less than scaling range low value '%f'. Scaling calculation cannot be performed on this cell.

**Description**

Scaling calculation can only be done if one cell pvt is within the range of the scaling lib group.

**What Next**

Check problem cell operating condition and voltage setting, correct the design setting problem.

**See Also**

- define_scaling_lib_group

---

## SLG-321

(error) Cell '%s' hits scaling extrapolation problem, '%s' value '%f' is larger than scaling range high value '%f'. Scaling calculation cannot be performed on this cell.

**Description**

Scaling calculation can only be done if one cell pvt is within the range of the scaling lib group.

**What Next**

Check problem cell operating condition and voltage setting, correct the design setting problem.

**See Also**

- define_scaling_lib_group

Feedback

## SLG-328

(warning) Arc '%s' of cell '%s' is tagged as invalid in scaling library '%s'. This may affect scaling of this arc.

### Description

The *define_scaling_lib_group* command expects that every timing arc of every library cell in a link library will also be present in every scaling library. This warning message reports an arc of a library cell in a scaling library that has been explicitly tagged as invalid. Scaling calculations will be done for the arc as if it did not exist in that scaling library. One-dimensional scaling may have degraded accuracy or may result in an exprapolation error and multi-dimensional scaling may fail completely, with calculation falling back to link library arc data. If the related scaling lib group is exact_match_only and the invalid arc is an exact match, calculation will fall back to link library arc lib data.

### What Next

Confirm that this is the expected behavior, and that the scaling group structure and design operating conditions are compatible with the presence of the invalid arc data.

## SLG-330

(error) in the define_scaling_lib_group command, there are at least two libraries share the same name '%s', and they have same process, temperature and voltage definition. Creation of scaling group failed.

### Description

The libraries in one define_scaling_lib_group command should not have exactly same process, temperature and voltage definition, when detect their names are also same, define_scaling_lib_group command disallows such duplicate library usage.

### What Next

Fix the scaling library group, and rerun your script.

### See Also

- define_scaling_lib_group

## SLG-331

(warning) In the define_scaling_lib_group command, library '%s' and '%s' have same process, temperature and voltage definition.

Feedback

**Description**

In order to do scaling calculation, any two libraries in one define_scaling_lib_group command should not have exactly same process, temperature and voltage.

**What Next**

User should check and correct the wrong library in the define_scaling_lib_group command.

**See Also**

- define_scaling_lib_group

---

## SLG-401

(error) Pin '%s' of cell '%s' library '%s' data is present in link library '%s', but it is not present in scaling library '%s'. This type library data scaling will not be performed for this pin.

**Description**

Scaling requires library data is consistent across all libraires in the group. If one pin lib data exists in link library but doesn't exist in scaling library, this message will be displayed.

**What Next**

Check and correct the missing library data in the scaling library.

**See Also**

- define_scaling_lib_group

---

## SLG-402

(error) Arc '%s' of cell '%s' library '%s' data is present in link library '%s', but it is not present in scaling library '%s'. This type library data scaling will not be performed for this arc.

**Description**

Scaling requires library data is consistent across all libraires in the group. If one arc lib data exists in link library but doesn't exist in scaling library, this message will be displayed.

**What Next**

Check and correct the missing library data in the scaling library.

Feedback

**See Also**

- define_scaling_lib_group

---

## SLG-403

(error) Pin '%s' of cell '%s' library '%s' data isn't consistent between link library '%s' and scaling library '%s', this type library data scaling will not be performed for this pin.

**Description**

Scaling requires library data is consistent across all libraires in the group. If one pin lib data are not consistent between link library and scaling library, this message will be displayed.

**What Next**

Check and correct the missing library data in the scaling library. If the error is related to CCS Noise model consistency but library group has corresponding CCSN models, please enable rc_ccsn_enable_library_error_reporting to check if any CCSN model is invalidated by CCS Noise model checking.

**See Also**

- define_scaling_lib_group

---

## SLG-404

(error) Arc '%s' of cell '%s' library '%s' data isn't consistent between link library '%s' and scaling library '%s', this type library data scaling will not be performed for this arc.

**Description**

Scaling requires library data is consistent across all libraires in the group. If one arc lib data are not consistent between link library and scaling library, this message will be displayed.

**What Next**

Check and correct the missing library data in the scaling library.

**See Also**

- define_scaling_lib_group

Feedback

## SLG-405

(warning) Pin '%s' of cell '%s' library '%s' data isn't consistent between link library '%s' and scaling library '%s', partial scaling will be performed on those consistent data.

### Description

Scaling requires library data is consistent across all libraries in the group. If there are some partial lib data are consistent across the lib group, scaling will only be performed on those consistent lib data and this message will be displayed.

### What Next

Check and correct the missing library data in the scaling library.

### See Also

- define_scaling_lib_group

## SLG-417

(information) The arc '%s' in lib cell '%s' in scaling library '%s' has significantly different output-capacitance indexes with link library '%s'; this can adversely affect scaling accuracy.

### Description

The *define_scaling_lib_group* requires ccs receiver cap indexes are closed between scaling library and link library, big difference could result in accuracy problem.

### What Next

Ensure that the set of arcs and pins is identical across the members of the scaling library groups. The positions of the arcs and pins within the libraries must be the same as well.

The output-capacitance indexes used for Composite Current Source (CCS) driver data is better to have identical values across the libraries. If this is not satisfied, the SLG-417 message is issued.

### See Also

- define_scaling_lib_group

## SLG-418

(warning) Timing analysis accuracy will be degraded because of problems with scaling group or library data.

Feedback

**Description**

The *define_scaling_lib_group* requires library data is consistent across all scaling libraries in the scaling group. If there is severe library data missing or inconsistency, it will bail out with SLG-001. If user enable variable timing_continue_on_slg001 to ignore the problem, this message will be displayed with a list of offending scaling check errors.

**What Next**

Correct all the library data issues for the offending check errors.

**See Also**

- define_scaling_lib_group

## SLG-419

(error) DCALM failed on cell %s as its libcell %s is not found in the specified dcalm library.

**Description**

The *define_cell_alternative_lib_mapping* command requires the libcell of the specified cell to exist in the dcalm library specified. If not dcalm will not be applied on the cell.

**What Next**

Please use the library which has the libcell for the cell used in the DCALM.

# SLM

## SLM-1005

(Error) "The parameter list is parsed as key-value pair of parameter name and parameter value, please provide even number of arguments in the parameter list."

**Description**

This error message is sent when during set_slm_element command odd number of arguments passed and it is expecting arguments as key-value pair. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The parameter list is parsed as key-value pair of parameter name and parameter value, please provide even number of arguments in the parameter list." (SLM-1005)

**What Next**

Please check for missing argument and values to pass in set_slm_element command.

Feedback

## SLM-1006

(Error) "The parameter name is invalid. Supported parameters are: %s"

**Description**

This error message is sent when during set_slm_element command wrong value for '-parameter' option is passed and it is not expected. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The parameter name is invalid. Supported parameters are: "PMM_NUM_PMU, PMM_PATH, PMM_DELAY, PMM_PIPE_PMC, PMM_PIPE_INTER,..."." (SLM-1006)

**What Next**

Please check for typos and suppported '-parameter' option and value to pass in set_slm_element command.

## SLM-1007

(Error) "The type

**Description**

This error message is sent when during set_slm_element command wrong value for '-type' option is passed and it is not expected. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The type "pimm_test" is invalid. Supported Values are "pmm_test | hsio_pcie | hsio_usb"." (SLM-1007)

**What Next**

Please check for typos and valid '-type' option and value to pass in set_slm_element command.

## SLM-1008

(Error) "The type

**Description**

This error message is sent when during set_slm_element command not supported for '-type' option and it is being used. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The type "pmm_field" is currently unsupported. Supported Values are "pmm_test | hsio_pcie | hsio_usb | pmu_field | pmc_field | cdm"." (SLM-1008)

Feedback

**What Next**

Please check for suppported '-type' option and correct value to pass in set_slm_element command.

---

## SLM-1009

(Error) "The provided parameter width

**Description**

This error message is sent when during set_slm_element command wrong or invalid width for any PMM parameters is used. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The provided parameter width "45" for "PMM_PATH" is invalid. Width for "PMM_PATH" can range from "2" to "32" and be incremented only in steps of 1." (SLM-1009)

**What Next**

Please check for typos and suppported width for '-parameter' options to pass in set_slm_element command.

---

## SLM-1010

(Error) "The interface list is parsed as key-value pair of interface name and interface value, please provide even number of arguments in the interface list."

**Description**

This error message is sent when during set_slm_element command odd number of arguments is passed for '-interface' option and it is expected as key-value pair. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The interface list is parsed as key-value pair of interface name and interface value, please provide even number of arguments in the interface list.." (SLM-1010)

**What Next**

Please check for the correct number of arguments to pass in '-interface' option during set_slm_element command.

---

## SLM-1011

(Error) "The parameter value is invalid. %s"

Feedback

**Description**

This error message is sent when during set_slm_element command wrong or invalid option value is used for '-paramter' option. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The parameter value is invalid. The PMM_DELAY values should be power of 2." (SLM-1011) Error: "The parameter value is invalid. The PMM_PATH values should be power of 2." (SLM-1011)

**What Next**

Please check for typos and suppported '-paramter' options/value to pass in set_slm_element command.

---

## SLM-1013

(Error) "The interface name %s is invalid."

**Description**

This error message is sent when during set_slm_element command interface keyword used is not correct or valid. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The interface name "PMM_PMMU_CLOCK" is invalid." (SLM-1013)

**What Next**

Please check for typos and valid '-interface' keyword options to pass in set_slm_element command.

---

## SLM-1014

(Error) "The port %s does not exist provided in interface %s ."

**Description**

This error message is sent when during set_slm_element command wrong or non existing port name used for any PMM interface. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "The port "my_pmu_clock0" does not exist provided in interface "PMM_PMU_CLOCK"." (SLM-1014)

**What Next**

Please check for typos and provide correct/existing port for PMM interface to pass in set_slm_element command.

Feedback

## SLM-1015

(Error) "PMU instance %s not found in any set_slm_element specification."

### Description

This error message is sent when during set_slm_element command wrong or non existing PMU instance name is used and it is not specified during set_slm_element command. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "PMU instance "PMU1_u1" not found in any set_slm_element specification." (SLM-1015)

### What Next

Please check for typos and existing or correct PMU instance name to pass in set_slm_loop command.

## SLM-1101

(Error) "The interface list is parsed as key-value pair of interface name and portname <interfaceName, portName>, please provide even number of arguments in the interface list. List of mandatory interface keywords %s"

### Description

This error message is sent when during set_slm_element command wrong/less argument of interface and port name pair passed, error is basically for invalid Interface List Count. In this case set_slm_element will not set any HSIO configuration and put this error. For example,

See - o_SCAN_CLK -interface [list sub_inst/i_SO1 sub_inst/i_SO2 i_SE sub_inst/o_SE i_SCAN_CLK sub_inst/o_SCAN_CLK o_SI sub_inst/i_SI i_SO sub_inst/o_SO o_SE sub_inst/i_SE o_SCAN_CLK] Error: "The interface list is parsed as key-value pair of interface name and portname, please provide even number of arguments in the interface list. List of mandatory interface keywords is "aclk, aresetn, awaddr, awvalid, awready, wid,...."." (SLM-1101)

### What Next

Please check number arguments passed in '-interface' options during set_slm_element command.

Feedback

## SLM-1102

(Error) "The %s list is parsed as key-value pair of %s, please provide correct number of arguments."

### Description

This error message is sent when during set_slm_element command wrong number of arguments for parameter or configuration option is passed. List should be even and expected as key-value pair. In this case set_slm_element will not set any configuration and put this error for invalid List Count. For example,

Error: "The configuration list is parsed as key-value pair of option name and value, please provide correct number of arguments." (SLM-1102) Error: "The parameter list is parsed as key-value pair of parameter name and width, please provide correct number of arguments." (SLM-1102)

### What Next

Please provide correct number of argument as key-value pair to set_slm_element comman.

## SLM-1103

(Error) "The provided interface type

### Description

This error message is sent when during set_slm_element command wrong value/spelling of interface keyword is used. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "The provided interface type "o_rvaalid" is incorrect. List of supported interface types: supported interface list"" (SLM-1103)

### What Next

Please remove invalid Interface Keyword Provided during set_slm_element and pass the correct one.

## SLM-1104

(Error) "The provided %s type

Feedback

**Description**

This error message is sent when during set_slm_element command wrong value of parameter and configuration option is used . In this case set_slm_element will not set any configuration and put this error. For example,

Error: "The provided configuartion type "jtagg" is incorrect. List of supported configuration types: "jtag, debug, security,..."." (SLM-1104)

**What Next**

Please check typos or supported option values to pass in set_slm_element command.

---

## SLM-1105

(Error) "The argument

**Description**

This error message is sent when during set_slm_element command wrong value option for any configuration is passed and it is not as expected. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "The argument "dissable" provided with configuration "debug" is incorrect. Supported values are enable|disable" (SLM-1105)

**What Next**

Please check for valid and supported option values for set_slm_element command.

---

## SLM-1106

(Error) "The provided port name

**Description**

This error message is sent when during set_slm_element command wrong value/name of interface port is used. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "The provided port name "sub_inst/i_rvalid" is incorrect. Please provide a valid port name." (SLM-1106)

**What Next**

Please check typos and correct values to pass as arguments during set_slm_element command.

Feedback

## SLM-1107

(Error) "The provided parameter width

**Description**

This error message is sent when during set_slm_element command wrong value of width used for any HSIO parameter. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "The provided parameter width "280" for "AXI_DATA_WIDTH" is invalid. Width for "AXI_DATA_WIDTH" can range from "32" to "256" and be incremented only in steps of 1." (SLM-1107)

**What Next**

Please provide correct and supported HSIO option name/value to set_slm_element command.

## SLM-1108

(Error) "Please use set_slm_configuration -hsio enable option."

**Description**

This error message is sent when command set_slm_element -type hsio_pcie/hsio_usb is being used without enabling hsio. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "Please use set_slm_configuration -hsio enable option." (SLM-1108)

**What Next**

Please check whether HSIO is enable using set_slm_configuration.

## SLM-1109

(Error) "The provided parameter list does not contain the mandatory parameters %s. List of mandatory parameters: %s"

**Description**

This error message is sent when during set_slm_element command mandatory parameter option keywords are not passed. In this case set_slm_element will not set any configuration and will ask to add those parameters by putting this error. For example,

Error: "The provided parameter list does not contain the mandatory parameters "[list AXI_ADDR_WIDTH 32 AXI_DATA_WIDTH 64 NUM_SCAN_DATA 64

Feedback

NUM_SCAN_CTRL_DYNAMIC_DATA 8 NUM_SCAN_CTRL_STATIC_DATA 8 NUM_SCAN_CLK 32 TAP_CTRL_WIDTH 1 AXI_WR_ID_WIDTH 4 AXI_RD_ID_WIDTH 4]". List of mandatory parameters:." (SLM-1109)

**What Next**

Please check missing Required Parameters to pass in set_slm_element command.

---

## SLM-1110

(Error) "The provided interface list does not contain the mandatory interfaces %s. List of mandatory interfaces: %s"

**Description**

This error message is sent when during set_slm_element command mandatory interface keywords are missing. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "The provided interface list does not contain the mandatory interfaces [list aresetn i_aresetn awid i_awid awaddr i_awaddr awlen i_awlen awsize i_awsize awburst i_awburst]. List of mandatory interfaces: "aclk, aresetn, awaddr, awvalid, awready, wid,...."." (SLM-1110)

**What Next**

Please check for missing Required Interfaces options to pass in set_slm_element command.

---

## SLM-1111

(Error) "%s

**Description**

This error message is sent when during set_slm_element command when existing port connection used again or duplicately for any another connection. In this case set_slm_element will not set second connection and put this error. For example,

-interfcae [list aresetn_invalid i_aresetn awid i_awid_invalid awlen i_awlen awlen i_awlen awsize i_awsize] Error: ""awlen" "i_awlen" driving same "awlen" ports." (SLM-1111)

**What Next**

Please remove duplicate and redundant enteries of arguments in set_slm_element command.

Feedback

## SLM-1112

(Error) "Module definition of instance

**Description**

This error message is sent when during set_slm_element command module instance not found for the pin specified. In this case set_slm_element will not set any HSIO configuration and put this error. For example,

Error: "Module definition of instance "sub_inst1" not found." (SLM-1112)

**What Next**

Please provide correct instance/sub_instanace name to set_slm_element command.

## SLM-1113

(Error) "Required argument '-interface' was not found."

**Description**

This error message is sent when during set_slm_element command '-interface' option is not being used. In this case set_slm_element will not set any HSIO configuration and put this error. For example,

set_slm_element -configuration [jtag enable] -parameters [list AXI_DATA_WIDTH 48]
Error: "Required argument '-interface' was not found." (SLM-1113)

**What Next**

Please provide 'interface' option to set_slm_element command.

## SLM-1114

(Error) "Wrong bus width specified for the following interfaces %s."

**Description**

This error message is sent when during set_slm_element command wrong value of width used for any HSIO interface port. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "Wrong bus width specified for the following interfaces "i_SO"." (SLM-1114)

**What Next**

Please provide correct and supported bus width for port/pin to set_slm_element command.

Feedback

## SLM-1115

(Error) "Expected width of

**Description**

This error message is sent when during set_slm_element command wrong value of width used for any HSIO parameter. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "Expected width of "sub_inst/o_SI" being connected to sub_inst/o_SO is [10:2], but found it [20:0] in design." (SLM-1115)

**What Next**

Please provide correct and supported bus width to set_slm_element command.

## SLM-1116

(Error) "Expected direction of

**Description**

This error message is sent when during set_slm_element command when port or pin with wrong direction is used as part of -interface option. In this case set_slm_element will not set any configuration and put this error. For example,

Error: "Expected direction of "sub_inst/o_TRSTN" being connected to "sub_inst/i_TRSTN" is "in", but found it "out" in design" (SLM-1116)

**What Next**

Please check and provide valid Port Direction to set_slm_element command.

## SLM-1117

(Error) "Please enable ebc_mode when ebc_sram is enabled."

**Description**

This error message is sent when in command set_slm_element we enable ebc_sram configuration without enabling ebc_mode Configuration. For example, set_slm_element \ -type hsio_usb \ -parameter [list FIFO_PTR_WIDTH 9 AXI_ADDR_WIDTH 32 AXI_DATA_WIDTH 64 NUM_SCAN_DATA 64 NUM_SCAN_CTRL_DYNAMIC_DATA 8 NUM_SCAN_CTR L_STATIC_DATA 8 NUM_SCAN_CLK 32 TAP_CTRL_WIDTH 1 AXI_WR_ID_WIDTH 4 AXI_RD_ID_WIDTH 4] \ -configuration [list ebc_mode disable ebc_sram enable]\

Feedback

Error: "Please enable ebc_mode when ebc_sram is enabled." (SLM-1117)

**What Next**

Please check configuration in set_slm_element command

---

## SLM-2000

(Error) "%s

**Description**

This error message is sent when during set_slm_element command duplicate or multiple input enteries found for some option or its value. In this case set_slm_element will not set any PMM configuration and put this error. For example,

-parameter {PMM_NUM_PMU 5 PMM_PATH 4 PMM_PATH 8 PMM_DELAY 4 PMM_PIPE_PMC 2 PMM_PIPE_INTER 1 PMM_PIPE_PMU 3} Error: ""PMM_PATH 4" already specified. Ignoring duplicate "PMM_PATH 8"." (SLM-2000)

**What Next**

Please check and remove redundant and duplicate inputs passed during set_slm_element command.

---

## SLM-2001

(Error) "Number of PMU clocks are not equal as number of PMUs"

**Description**

This error message is sent when there is mismatch between number PMU clocks and number of PMUs. In this case set_slm_element will not set any PMM configuration and put this error. For example,

Error: "Number of PMU clocks are not equal as number of PMUs" (SLM-2001)

**What Next**

Please check for total number of PMU clocks and PMU's set during set_slm_element command.

---

## SLM-2100

(Warning) "Expected width of "%s" being connected to "%s" is "[%d:%d]", but found it "[%d:%d]" in design. Considering width of "[%d:%d]"."

Feedback

**Description**

This warning message is sent when bus width is not as expected as specified in command set_slm_element . In this case set_slm_element will not set any configuration and put this warning. For example,

warning: "Expected width of sub_inst/o_SI being connected to sub_inst/o_SO is [10:2], but found it [20:0] in design. Considering width of [10:2]" (SLM-2100)

**What Next**

Either provied correct bus width during set_slm_element or continue with considered bus width.

---

## SLM-2101

(Warning) "No port connection specifed for %s interface "%s", tying to constant "%s""

**Description**

This warning message is sent when port connection is not as expected as specified in command set_slm_element . In this case set_slm_element will set specified port with constant and put this warning. For example,

warning: "No port connection specifed for "o_rvalid" interface "rvalid", tying to constant "sub_inst/i_rvalid"." (SLM-2101)

**What Next**

Either provied correct connection for interface during set_slm_element or continue with considered connection.

---

## SLM-2102

(Error) "Please enable jtag when scan_over_tap is enabled."

**Description**

This Error message is sent when scan_over_tap is enable with jtag disable using configuartion option in command set_slm_element.

Error: "Please enable jtag when scan_over_tap is enabled." (SLM-2102)

**What Next**

Please enable jtag during set_slm_element.

Feedback

## SLM-2103

(Warning) "%s"%s" driven by %s "%s" ports"

**Description**

This warning message is sent when ports are not driven correctly, as specified in command set_slm_element . For example,

warning: ""i_TAP_CTRL sub_inst/o_TAP_CTR" driven by "i_TAP_CTRL sub_inst_1/o_TAP_CTR" ports." (SLM-2103)

**What Next**

Either provied correct port connection or continue with considered connection.

## SLM-2104

(Warning) "%s "%s:%s" already specified. Ignoring duplicate "%s:%s""

**Description**

This warning message is sent when port Duplicate Inputs are given, using interface option in command set_slm_element. In this case set_slm_element will set the value which is provided in the beginning rest of them will be ignored and put this warning. For example,

warning: "sub_inst/o_SI[12:8] already specified. Ignoring duplicate sub_inst/o_SI[14:8]." (SLM-2104)

**What Next**

Remove redundant duplicate enteries in interface option during set_slm_element.

## SLM-2105

(Warning) "%s should be enabled when %s interface keyword is specified."

**Description**

This warning message is sent when some interface port is specified without enabling correct configuration option. In this case set_slm_element will put this warning to enable particular configuration. For example,

warning: ""debug" should be enabled when "debugCtrlEn" interface keyword is specified." (SLM-2105)

Feedback

**What Next**

Either provied correct confuguration for interface option during set_slm_element or continue with considered connection.

---

## SLM-2106

(Warning) "%s option is not available when "%s" -type is specified."

**Description**

This warning message is sent when some configuration option is used when it is not supported with specific hsio type. In this case set_slm_element will ignore the configuration and put this warning. For example,

warning: "'usb_ebc_mode' option is not available when "hsio_pcie" -type is specified." (SLM-2106)

**What Next**

Either set correct type or avoid usage of configuration option during set_slm_element.

---

## SLM-2107

(Error) "PDL file passed as the target doesn't exist."

**Description**

This error message is sent when during write_test_protocol command

For example,

Error: "PDL file passed as the target doesn't exist." (SLM-2107)

**What Next**

Please check for correct PDL file name to be passed with target under write_test_protocol command.

---

# SML

---

## SML-001

(Warning) %s: Low memory availability: system memory usage is %s for the last %s minutes.

Feedback

**Description**

Host machine is running low on available memory. System memory usage percentage mentioned in message is percentage of RAM, swap and cache memories put together.

**What Next**

Run on a host with sufficient RAM or on a host where it is not competing with other processes for RAM.

---

## SML-002

(Warning) %s: High CPU usage: current process(%s); other processes(%s) for the last %s minutes.

**Description**

The current process is using less percent of total cpu but the host is running with very high load (greater than 95%).

**What Next**

Run on a host with sufficient cores to satisfy the number of cores the tool is specified to use.

---

## SML-003

(Warning) %s: Poor network. Packet retransmission rate is high(%s) for the last %s minutes.

**Description**

The current process is running on a host where more than 5 percent of all packets are being retransmitted due to loss or damage. It indicates the network is heavily congested.

**What Next**

Contact your IT department to check and address the poor network connectivity problem.

---

## SML-004

(Warning) %s: Poor network. Packet loss is high(%s) for the last %s minutes.

**Description**

The current process is running on a host where more than 5 percent of all packets it is sending are not being received by the recipient. It indicates poor network connectivity.

Feedback

**What Next**

Contact your IT department to check and address the poor network connectivity problem.

---

## SML-005

(Warning) %s: High network latency to these hosts: %s.

**Description**

The current process is running on a host that has high network latency (>300ms) to the hosts specified in the message. These hosts may include disk filers.

**What Next**

Contact your IT department to check and address the high network latency to specified hosts and/or disk filers.

---

## SML-006

(Warning) Failed to initialize SML.

**Description**

SML was not initialized due to internal errors in SML library.

**What Next**

Contact your AC.
