(error) Only one port is allowed for the '%s' boundary scan signal type.

**Description**

This error message occurs when multiple ports for a BSD signal type are specified with the *-port* option of the *set_dft_signal* command. Only one port should be used as a boundary scan TAP port.

Feedback

### What Next

Use only one port with the *-port* option of the *set_dft_signal* command for boundary scan TAP ports.

---

## UIT-917

(warning) BSD Test Data Register hookup pins are going to be obsoleted in existing_dft view for synthesis, specify them in spec view.

### Description

Considering that BSD Test Data Registers can be useful only at spec view, it is decided to remove the -existing_dft option of *set_scan_path* and *set_dft_signal* commands for BSD Test Data Registers.

### What Next

Use -hookup_pins option with option -view spec for Test Data Registers in BSD, while using *set_dft_signal* or *set_scan_path* commands.

---

## UIT-918

(warning) BSD Test Data Register hookup pin of type reset is obsoleted, specify the pin type as bsd_reset, changing the pin type to bsd_reset.

### Description

The hookup pin type *reset* is obsoleted in BSDC, instead it is suggested to use the new option *bsd_reset* for the same functionality. You get this message if -type reset is used while specifying hookup pin for Test Data Register using *set_dft_signal* command.

### What Next

You can ignore this warning as hookup pin type *reset* is read as *bsd_reset* by BSDC. Instead hookup pin type *bsd_reset* can be used to not get this warning.

---

## UIT-919

(warning) Incorrect active state '%d' specified for TRST port, resetting the active state of the port to 0.

### Description

This warning message occurs when the *set_dft_signal -active_state* option is not set to 0 (zero) for the TRST port type. If the TRST port *-active_state* is not set to 0, BSDC forces the active state to 0.

Feedback

**What Next**

This is only a warning message. No action is required.

You can ignore this warning as BSDC sets the active state to 0 internally. To avoid this message, use 0 with the *-active_state* option for a TRST port while using *set_dft_signal* command.

---

## UIT-920

(error) The option -include_elements of set_scan_path command does not accept a collection as an input.

**Description**

You have specified a collection as an input parameter for the -include_elements option of the set_scan_path command. This option accepts only a list of elements.

**What Next**

Use a list of elements as an input parameter

---

## UIT-921

(warning) Incorrect active state '%d' specified for TAP port, resetting the active state of the port to 1.

**Description**

This warning message occurs when the *set_dft_signal -active_state* option is not set to 1 (one) for the TAP port type (TCK/ TMS/ TDI / TDO). If the TAP port *-active_state* is not set to 1, BSDC forces the active state to 1.

**What Next**

This is only a warning message. No action is required.

You can ignore this warning as BSDC sets the active state to 1 internally. To avoid this message, use 1 with the *-active_state* option for a TAP port while using *set_dft_signal* command.

---

## UIT-923

(error) Pipeline Scan Data is not enabled.

Feedback

**Description**

Pipeline scan data configuration specification is discarded because pipeline scan data is not enabled. You should enable the pipeline scan data flow using the set_dft_configuration -pipeline_scan_data enable command before specifying pipeline scan data configuration specifications.

**What Next**

Please enable pipeline scan data flow using *set_dft_configuration* command.

---

## UIT-924

(warning) Cannot find cell %s in design %s.

**Description**

You receive this message because you have specified a cell using the *-include_elements* option that cannot be found in the current design.

**What Next**

Use the *get_cells* command to verify the presence of the cell you want to specify.

You can ignore this message if it was issued for a CTL-modeled black-box cell.

---

## UIT-925

(warning) -test_mode option not specified; specification applies only to the indicated test mode.

**Description**

You receive this message because you have issued a DFT configuration command command without the *-test_mode* option after user-defined test modes have been defined. In this case, the specification is applied only to the current test mode, which is indicated by the subsequent specification acceptance message.

If the expectation is for the specification to be global because the *-test_mode* option was omitted, then the specification must be corrected.

**What Next**

If the specification should be global, add the *-test_mode all_dft* option to the command.

If the specification is intended for the indicated test mode, you can eliminate the warning by explicitly specifying the test mode with the *-test_mode* command.

Feedback

If you have many such occurrences of this warning and want to suppress them all, use the *suppress_message* command.

---

## UIT-930

(error) Signal of data type '%s' is not valid for -connect_to option.

**Description**

The indicated signal type is not supported for the *-connect_to* or *-associated_clock* option.

For the *-connect_to* option, the supported signal types are:

- *MasterClock*
- *ScanMasterClock*
- *ScanClock*
- *Oscillator*
- *ScanDataIn*
- *ScanDataOut*
- *ScanEnable* (with *-usage scan* or *-usage clock_gating*)
- *wrp_shift*
- *TestMode* (with *-usage clock_gating*)

In addition, each signal type supports only a particular set of connection object types.

For *-associated_clock*, the supported signal type is *ScanEnable*, and the domain-based scan-enable feature must also be enabled with the following command:

```
prompt> set_scan_configuration -domain_based_scan_enable true
```

**What Next**

See the *set_dft_signal* man page for a complete description of what signal type and object type combinations are supported by the *-connect_to* or *-associated_clock* option.

---

## UIT-931

(error) Pin '%s' direction is not valid for -connect_to option.

**Description**

You receive this message because you specified a wrong pin direction for *-connect_to* option. In this case, the pin should be of direction In.

Feedback

**What Next**

Please specify a pin with a valid direction using the *set_dft_signal* command.

---

## UIT-932

(Warning) In FIDO dft architecture the -outputs specification will be ignored. The tool will build the output configuration as needed.

**Description**

The -outputs specification of FIDO dft architecture is ignored

---

## UIT-935

(error) Invalid clock controller specification due to inconsistent pll clock sources.

**Description**

This error message occurs when a single clock controller is specififed for pllclocks sources that come from different hierarchical blocks.

**What Next**

Specify a clock controller for each group of pllclocks that belong to the same hierarchy using the *set_dft_clock_controller* command.

---

## UIT-936

(error) Retiming Flop Specification is incorrect.

**Description**

You must specify '/begin_only', '/end_only', '/none' or '/begin_and_end'.

---

## UIT-999

(Error) The scan state is invalid for running this command. The scan state should be scan existing.

**Description**

You receive this error message because the scan state should be either *scan_existing* (scan routed) for the *disconnect_scan_chains* command to run. If the current state of the design is not scan existing, this error message prevents disconnect_scan_chains command from proceeding.

Feedback

**What Next**

Set the scan state using the *set_scan_state* command before using the *disconnect_scan_chains* command.

---

## UIT-1000

(error) Invalid argument for -use_register_io: '%s'. Argument must be either true or false.

**Description**

You receive this message if you execute either *set_core_wrapper_configuration* or *set_core_wrapper_cell* command and use an invalid argument for the *-use_register_io* option. Valid arguments are true or false.

**What Next**

Reexecute the command and use a valid argument for the *-use_register_io* option.

---

## UIT-1002

(error) Can not insert '%s' scan chains.

**Description**

The set_core_wrapper_configuration command accepts a chain_count option. This tells DFT Compiler the number of scan chains to implement in the testable design. Option arguments must be positive integers or "default" strings.

**What Next**

Repeat the set_core_wrapper_configuration command using a positive integer or the string "default".

---

## UIT-1003

(error) Cannot find the specified port '%s' in the current design.

**Description**

You receive this message if you execute the *set_core_wrapper_path* command and a port you specify cannot be found in the current design. This could be caused by a typo or spelling error or an invalid name being used as a port name.

**What Next**

Verify the name of the port. Then reissue the command *set_core_wrapper_path* using the correct port name of the current design.

Feedback

## UIT-1004

(error) Wrapper Cell type must be either "in" , "out" or "en".

### Description

You receive this message if you execute *set_core_wrapper_path* and specify an invalid wrapper cell type. Valid cell types are "in", "out" or "en". For *set_core_wrapper_path*, you can specify the type of a wrapper cell by attaching /in , /out or /en to the port name in the *identifier_list*. The cell types /in, /out, /en can be used to identify wrapper cells attached to a bidirectional port. The cell types /out, /en can be used to identify wrapper cells attached to a tr-state port. No cell type can be used to identify wrapper cells attached to input ports.

### What Next

Choose a valid cell type for the Wrapper cell, and reissue the command *set_core_wrapper_path* using the valid wrapper cell type.

## UIT-1005

(warning) Ignoring the -complete true option because wrapper chain '%s' is empty.

### Description

The *set_core_wrapper_path* command accepts a list of ports and *-complete* option. This tells DFT Compiler the order of wrapper cells in a wrapper chain to implement in the testable design. This error occurred as user didn't specify any valid ports and *-complete* option is set to TRUE for the command.

### What Next

Repeat the *set_core_wrapper_path* command using either a set of valid ports or setting the *-complete* option to false.

## UIT-1006

(information) You have invoked remove_core_wrapper_specification with no options. The command is ignored.

### Description

The *remove_core_wrapper_specification* command does nothing when it is invoked without options.

This, in itself, is not a problem. No core wrapper specifications are removed. You might, however, have meant to use the "-all" option or one of the other more limited options.

Feedback

**What Next**

To get rid of the information message, invoke *remove_core_wrapper_specification* with options.

---

## UIT-1007

(error) Pipelining is only supported with the "no_mix" scan clock domain constraints.

**Description**

You get this message when you have selected something else than *no_mix* after the option *-clock_mixing* and you have enabled scan enable pipelining. Pipelining scan enable supports only the no_mix scan clock domain constraints.

**What Next**

Modify the scan clock domain constraint to *no_mix*, using the set_scan_configuration command

---

## UIT-1008

(error) Invalid argument for -register_io_implementation: '%s'. Argument must be either swap or in_place.

**Description**

You receive this message if you execute either *set_core_wrapper_configuration* or *set_core_wrapper_cell* command and use an invalid argument for the *-register_io_implementation* option. Valid arguments are swap or in_place.

**What Next**

Reexecute the command and use a valid argument for the *-register_io_implementation* option.

---

## UIT-1009

(error) Invalid argument for -one_wrapper_clock: '%s'. Argument must be either true or false.

**Description**

You receive this message if you execute either *set_core_wrapper_configuration* or *set_core_wrapper_cell* command and use an invalid argument for the *-one_wrapper_clock* option. Valid arguments are swap or in_place.

Feedback

### What Next

Reexecute the command and use a valid argument for the *-one_wrapper_clock* option.

---

## UIT-1010

(error) Scan %s '%s' element '%s' has internal and wrapper segments.

### Description

This error message is generated when you try to include a core cell into a scan path or scan segment. A core cell is a cell with a test model and has both internal scan and wrapper segments. As internal scan segments and wrapper segments can't be mixed during core integration, you can't include such a cell with other elements of a scan path or a scan segment.

### What Next

Check if you have specified core_integration flag of dft configuration. If you are not integrating cores, remove such a specification and reinvoke the current command.

---

## UIT-1011

(error) Scan Chain '%s' has %s segments.

### Description

This error message is generated when you try to include a wrapper or an internal scan segment with other segments in a scan path during core integration. Wrapper or internal scan segments can not be mixed with other segments during core integration.

### What Next

Check if you have specified core_integration flag of dft configuration. If you are not integrating cores, remove such a specification and reinvoke the current command.

---

## UIT-1012

(Error) Incorrect lockup element type specified.

### Description

This is issued from the command *set_scan_configuration* or *set_scan_path*, when the user intends to specify the type of lockup element to be used (-lockup_type). Values for the lockup type are restricted to either "latch" or "flip_flop". By default, the lockup type is set to "latch"

Feedback

**What Next**

Check the value entered after the option -lockup_type.

---

## UIT-1013

(Error) The period %f must evenly divide the default period %f.

**Description**

This error occurs when you use the -mbist_clock argument and the specified period does not evenly divide the default period. This relation is required to create the MBIST protocols.

**What Next**

Specify a different clock period with the *create_test_clock* command, or change the default period with the *test_default_period* command.

---

## UIT-1014

(Error) The parameter for the -write_ip_rtl option has to be enable, generate_only or disable.

**Description**

This message indicates that a set_dft_insertionj_configuration command has been issued, but the parameter for the option is not a valid one. The valid parameters are enable, generate_only or disable.

**What Next**

Change the parameter for the option and re-issue the command.

---

## UIT-1015

(Error) The parameter for the -ip_rtl_format option has to be verilog or vhdl.

**Description**

This message indicates that a set_dft_insertionj_configuration command has been issued, but the parameter for the option is not a valid one. The valid parameters are verilog or vhdl.

**What Next**

Change the parameter for the option and re-issue the command.

Feedback

## UIT-1016

(error) %s.

### Description

This error is generated when the *-design* or *-memory_ref* arguments of the *create_mbist_standalone* command specify a wrong design name.

### What Next

Make sure that the *-design* or *-memory_ref* arguments specify a valid design name then retry the *create_mbist_standalone* command.

## UIT-1020

(error) : Component signal type '%s' is not specified in user design interface signals.

### Description

This error message is generated when you try to define a dft design with command define_dft_design. The error message is issued when a pin of the specified signal type is not included in the interface of the dft design.

### What Next

Reexecute the *define_dft_design* command and specify a dft design pin of the signal type with the *-interface* argument.

## UIT-1021

(error) Unknown signal type '%s' is specified in user design interface signals.

### Description

This error message occurs when attempting to define a DFT design with the *define_dft_design* command. The error message indicates that an unknown signal type is specified with the interface of the DFT design.

### What Next

If the port of the specified signal type is used in DFT insertion, add the correct signal type for the port and rerun the *define_dft_design* command.

## UIT-1022

(error) : Unable to find the specified design type '%s', make sure that proper dw libs are included in link_library.

Feedback

### Description

This error message is generated when you try to define a dft design with command define_dft_design. The error message is issued when the specified design type is not a known design type. This can happen if all dw libraries are not specified with the link_library variable.

### What Next

Specify all dw libraries with link_library variable and rerun the define_dft_design command.

---

## UIT-1023

(error) : One of the options '-design_name' or '-type' or '-all' is mandatory.

### Description

This error message is generated when you try to remove a dft design with command remove_dft_design. The error message is issued when the command is run with insufficient options.

### What Next

Specify one of the options '-design_name' or '-type' or -all' with the remove_dft_design command.

---

## UIT-1024

(error) : Options '-design_name', '-type', '-all' are mutually exclusive, specify only one of them.

### Description

This error message is generated when you try to remove/report a dft design with command remove_dft_design/report_dft_design. The error message is issued when the command is run with invalid combination of options. Please note that options '-design_name', '-type', '-all' of the command remove_dft_design/report_dft_design are mutually exclusive.

### What Next

Specify only one of the options '-design_name' or '-type' or -all' with the remove_dft_design/ report_dft_design commands.

Feedback

## UIT-1025

(error) : Design '%s' is not specified with define_dft_design command.

### Description

This error message is generated when you try to remove/report a dft design with command remove_dft_design/report_dft_design. The error message is issued when the command is run with the '-design_name' option and the specified design is not defined using define_dft_design command.

### What Next

Check if the specified design is defined using define_dft_design command. You can use report_dft_design command to see all the user dft designs.

## UIT-1026

(information) Memory-driven specification mode is enabled. You can not specify any Tests with the set_mbist_controller command.

### Description

You just enabled the MBIST configuration, and memory-driven specification mode is enabled, because you set the test_mbc_memory_driven_spec environment variable to true.

### What Next

All memory models should contain complete Test specifications. You can not specify any Tests with the *set_mbist_controller* command. This means all Test parameters (ie Test0, Test1, ...) are invalid.

## UIT-1027

(warning) Memory-driven specification mode is enabled. The test you just defined will not be synthesized.

### Description

The memory-driven specification mode is enabled, because you set the test_mbc_memory_driven_spec environment variable to true. This means that all synthesized tests are specified in the memory models. Any tests you define with the *define_mbist_program* command can only be used at run-time by the *set_mbist_run* command.

Feedback

### What Next

Do not attempt to specify any Tests with the *set_mbist_controller* command. This means all Test parameters (ie Test0, Test1, ...) are invalid.

---

## UIT-1028

(warning) Invalid option(s) specified to the set_optimize_registers command.

### Description

You receive this message if you execute the *set_optimize_registers* command with options that are not supported in non-XG mode.

### What Next

Please see the man page of the *set_optimize_registers* command for a list of options that are supported in XG/non-XG modes.

---

## UIT-1030

(error) Option -time, -clock_cycles and -signature can not be specified for instruction '%s'.

### Description

You receive this error message when you execute the *set_bsd_instruction* command and specify time constant or signature for an invalid instruction. Time constants are supported only for the following instructions.

INTEST RUNBIST EXTEST_PULSE EXEST_TRAIN

Signature is supported only for RUNBIST instruction.

For EXTEST_PULSE instruction, options -time specifies minimum wait duration in real time and option -clock_cycles specifies minimum wait duration in TCK pulses. These two option are mutually exclusive for this instruction.

For EXTEST_TRAIN instruction minimum number of TCK pulses should be specified with -clock_cycles option in addition to maximum time with -time option.

### What Next

Reexecute the *set_bsd_instruction* command with out time constant and signature specifications.

Feedback

## UIT-1031

(error) Invalid IEEE1149 Std. version '%s', valid values are : ieee1149.1_2001 | ieee1149.1_1993, ieee1149.6_2003 .

### Description

You receive this error message when you execute the *set_bsd_configuration* command and specify an incorrect std. version. The following std. versions are leagl.

"ieee1149.1_1993" "ieee1149.1_2001" "ieee1149.1_2001 ieee1149.6_2003" "ieee1149.1_1993 ieee1149.6_2003" "ieee1149.6_2003"

Std. version "ieee1149.6_2003" is same as "ieee1149.1_2001 ieee1149.6_2003" .

The default valud for the Std. option is "ieee1149.1_2001" .

### What Next

Reexecute the *set_bsd_configuration* command with the correct std. version name(s).

## UIT-1032

(Warning) IEEE1149 Std. versions ieee1149.1_2001, ieee1149.1_1993 are mutually exclusive, ignoring std. version ieee1149.1_1993 .

### Description

You receive this error message when you execute the *set_bsd_configuration* command and specify an incorrect std. version. The following std. versions are leagl.

"ieee1149.1_1993" "ieee1149.1_2001" "ieee1149.1_2001 ieee1149.6_2003" "ieee1149.1_1993 ieee1149.6_2003" "ieee1149.6_2003"

Std. version "ieee1149.6_2003" is same as "ieee1149.1_2001 ieee1149.6_2003" .

The default valud for the Std. option is "ieee1149.1_2001" .

### What Next

Reexecute the *set_bsd_configuration* command with the correct std. version name(s).

## UIT-1033

(error) Incorrect port '%s' with direction '%s' specified, only ports with direction 'out' or 'inout' are allowed.

Feedback

**Description**

You receive this error message when you execute the *set_bsd_ac_port* command and specify an incorrect port. Only ports of type 'out' or 'inout' are allowed as ac ports.

**What Next**

Reexecute the *set_bsd_ac_port* command with the correct ports.

---

## UIT-1034

(error) Insufficient number of options, specify either of options : -port_list | -all

**Description**

You receive this error message when you execute the *remove_bsd_ac_port* command and doesn't specify the required options. Either of the options -all or -port_list are required for this command.

**What Next**

Reexecute the *remove_bsd_ac_port* command with the required options.

---

## UIT-1035

(error) Options -port_list and -all are mutually exclusive, specify only one of them.

**Description**

You receive this error message when you execute the *remove_bsd_ac_port* command and specified conflicting options. Options -all and -port_list are mutually exclusive.

**What Next**

Reexecute the *remove_bsd_ac_port* command with the either of -all or -port_list options.

---

## UIT-1036

(Warning) Port '%s' is not an ac port, not removing the port.

**Description**

You receive this error message when you execute the *remove_bsd_ac_port* command and specified a port which is not an AC port. You can only remove AC ports with this command.

**What Next**

Reexecute the *remove_bsd_ac_port* command with the AC ports.

Feedback

## UIT-1037

(error) No Ac Ports found on the current design.

**Description**

You receive this error message when you execute the *remove_bsd_ac_port* command and there are no AC ports to be removed. Check if the current design is correct.

**What Next**

If the current design is correct, the *remove_bsd_ac_port* command is not required as there are no AC ports to be removed.

## UIT-1038

(error) Capture value not specified for the IDCODE or USERCODE instructions.

**Description**

You receive this error message when you execute the *set_bsd_instruction* command and doesn't specify capture value. Capture value is mandatory for these instructions.

**What Next**

If the current design is correct, the *set_bsd_instruction* command with capture value.

## UIT-1039

(Warning) Instruction '%s' does not exist, could not remove the instruction.

**Description**

You receive this error message when you execute the *remove_bsd_instruction* command and specify an unexisting instruction.

**What Next**

Check for instruction name and reexecute the *remove_bsd_instruction* command with the correct instruction names.

## UIT-1040

(error) No instructions exist, cannot remove instructions.

Feedback

### Description

You receive this error message when you execute the *remove_bsd_instruction* command and there are no instructions specified for the current design.

### What Next

If the current design is correct, the *remove_bsd_instruction* command is unnecessary as there are instructions to be removed.

---

## UIT-1041

(error) Boundary Cell Types AC_1, AC_2, AC_7, AC_SELU, AC_SELX can't be used for ports which are not AC ports.

### Description

You receive this error message when you execute the *set_boundary_cell* command on specify AC BSR cells on a set of ports that are not AC ports. AC BSR cells can be used only on AC ports.

### What Next

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

---

## UIT-1042

(error) Invalid cell type '%s' specified with function '%s' for boundary scan.

### Description

You receive this error message when you execute the *set_boundary_cell* command on specify a BSR cell type that is not supported with the specified function.

Here is the list of cell types allowed for different functions.

FUNCTION BSR Cell Types ==========
input BC_1 | BC_2 | BC_4 | none input_inverted BC_1 | BC_2 | BC_4 | none
output BC_1 | BC_2 | AC_1 | AC_2 | none output_inverted BC_1 | BC_2 | AC_1 | AC_2 | none bidir BC_7 | AC_7 | none bidir_inverted BC_7 | AC_7 | none control BC_1 | BC_2 | none observe BC_4 | none receiver_p BC_4 | BC_1 | BC_2 | none receiver_n BC_4 | BC_1 | BC_2 | none ac_select AC_SELU | AC_SELX | none
==========

### What Next

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

Feedback

## UIT-1043

(error) Specified design '%s' is not a user dft design, allowed design types : %s

### Description

You receive this error message when you execute the *set_boundary_cell* command with a design name that is not of a standard DFT design type.

The list of allowed DFT design types is:

```
WC_D1   WC_D1_S   WC_S1   WC_S1_S
BC_1    BC_2      BC_4    BC_7
AC_1    AC_2      AC_7    AC_SELU   AC_SELX
```

### What Next

Fix the problem and reexecute the *set_boundary_cell* command with the correct specification.

## UIT-1044

(Warning) Option '-share' is applicable only for Control/Ac Select Boundary Cells, ignoring the option.

### Description

You receive this error message when you execute the *set_boundary_cell* command and specify option -share with an unspported function. This option can can be specified only with option -function values : control | ac_select .

### What Next

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

## UIT-1045

(error) Boundary Cell Name is mandatory for Control/Ac Select boundary cells.

### Description

You receive this error message when you execute the *set_boundary_cell* command and specify option -function with value control or ac_select and doesn't specify a name for the boundary cell. Option -name is mandatory for these function values.

Feedback

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

---

## UIT-1046

(error) Option '-ports' is mandatory with options '-class core_wrapper', '-class bsd'.

**Description**

You receive this error message when you execute the *set_boundary_cell* command and doesn't specify a list of ports with option -class values core_wrapper or bsd. Port list is mandatory for these class values.

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

---

## UIT-1047

(error) Option '-cells' is not allowed with options '-class core_wrapper', '-class bsd'.

**Description**

You receive this error message when you execute the *set_boundary_cell* command and specified a list of cells with option -class values core_wrapper or bsd. Cell list is not allowed for these class values.

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

---

## UIT-1048

(error) Options '-type' and 'design' are mutually exclusive.

**Description**

You receive this error message when you execute the *set_boundary_cell* command and specified options -type and -design. These options are mutually exclusive.

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

Feedback

## UIT-1049

(error) Invalid boundary cell type with '-class core_wrapper', allowed values : WC_D1 | WC_D1_S | WC_S1 | WC_S1_S .

**Description**

You receive this error message when you execute the *set_boundary_cell* command and specified a cell tyep not suitable for option -class value core_wrapper. Only the following cell types are allowed for this class value.

WC_D1 WC_D1_S WC_S1 WC_S1_S

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

## UIT-1050

(error) Invalid functin value with '-class core_wrapper', allowed values : input | output | control | bidir .

**Description**

You receive this error message when you execute the *set_boundary_cell* command and specified a function tyep not suitable for option -class value core_wrapper. Only the following function types are allowed for this class value.

input output control bidir

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

## UIT-1051

(error) Ports '%s' can't be specified with function '%s' .

**Description**

You receive this error message when you execute the *set_boundary_cell* command and specified a function tyep not suitable for the specifed ports.

Here is a list of functions and allowed port types.

Function Name Port Direction ========== input input | bidir input_inverted input | bidir output output | bidir output_inverted

Feedback

output | bidir bidir bidir bidir_inverted bidir control output | bidir observe input | output | bidir receiver_p input | bidir receiver_n input | bidir ac_select output | bidir
==========

**What Next**

Fix the problem and Reexecute the *set_boundary_cell* command with the correct specification.

---

## UIT-1052

(Warning) Boundary Cell '%s' overwrites an earlier specification.

**Description**

You receive this error message when you execute the *set_boundary_cell* command and the specification overwrites an earlier specification.

Here are situations where earlier specification is overwritten.

1. Option -name value is already specified for a previous Boundary Cell. Previous Boundary Cell is overwritten.
2. Option -function value is already specified for a previous Boundary Cell with common ports. Common ports are removed from the previous Boundary Cell.
3. A Boundary Cell with common ports and unspecified -function value is found. Common ports are removed from the previous Boundary Cell.
4. Option -function value is not specified and a Boundary Cell with common ports is found. Common ports are removed from the previous Boundary Cell.

**What Next**

No action is required if overwriting earlier specification is ok with you.

---

## UIT-1053

(error) %s delay time (%10.2f) is required to be less than rise time value (%10.2f) for port '%s'.

**Description**

Input/Bidirectional delay time is greater than specified rise time of the port.

**What Next**

Check your test_default_delay/test_default_bidir_delay and timing specification for the specified port.

Feedback

## UIT-1054

(error) Rise time (%10.2f) of port '%s' is required to be less than strobe time value (%10.2f).

**Description**

You have specified rise time of the specified port greater than the strobe time.

**What Next**

Check your test_default_strobe and timing specification for the specified port.

## UIT-1055

(warning) Bidir delay (%10.2f) must be less than strobe time (%10.2f), setting bidir delay to input delay (%10.2f) .

**Description**

You have specified bidirectional delay time greater than the strobe time. Bidurectional delay time is reset to input delay time.

**What Next**

Check your test_default_strobe and test_default_bidir_delay variables.

## UIT-1056

(warning) Bidir delay (%10.2f) must be less than period (%10.2f), setting bidir delay to input delay (%10.2f) .

**Description**

You have specified bidirectional delay time greater than the period. Bidurectional delay time is reset to input delay time.

**What Next**

Check your test_default_period and test_default_bidir_delay variables.

## UIT-1057

(warning) Bidir delay (%10.2f) must be less than TCK rise time (%10.2f), setting bidir delay to input delay (%10.2f) .

Feedback

**Description**

You have specified bidirectional delay time greater than the TCK rise time. Bidurectional delay time is reset to input delay time.

**What Next**

Check your test_default_bidir_delay variable and rise time of TCK.

---

## UIT-1058

(error) Invalid Paramter Type '%s' specified for parameter '%s' .

**Description**

You have specified an unsupported paramater type with *define_dft_design* command. Only the following parameter types are supported.

string

boolean

float

list string

**What Next**

Correct the specification and reissue the *define_dft_design* command.

---

## UIT-1059

(error) Invalid Paramter value '%s' specified for parameter '%s', expected value of type '%s' .

**Description**

You have specified an unsupported paramater value with *define_dft_design* command. Only the following parameter values are supported.

Parameter Type Parameter Value ========== string string

boolean true | false

float floating point number

list string list of strings ==========

**What Next**

Correct the specification and reissue the *define_dft_design* command.

Feedback

## UIT-1060

(error) Invalid List Paramter member type '%s' specified for parameter '%s' .

**Description**

You have specified an unsupported list paramater member type with *define_dft_design* command. Only the following parameter types are supported.

list string

**What Next**

Correct the specification and reissue the *define_dft_design* command.

## UIT-1061

(error) Incorrect Pin Polarity '%s' specified for pin '%s', expected polarity : high | low .

**Description**

You have specified an unsupported pin polarity value with *define_dft_design* command. Only the following polarity values are supported.

high | h

low | l

**What Next**

Correct the specification and reissue the *define_dft_design* command.

## UIT-1062

(error) Option '-params' is only allowed for dft designs of type 'PAD'.

**Description**

You have specified option '-params' for a dft design that is not of type 'PAD' with *define_dft_design* command. This option is supported only for dft designs of type 'PAD'.

**What Next**

Correct the specification and reissue the *define_dft_design* command.

## UIT-1063

(error) Invalid Pad Access Pin Type '%s' specified for the PAD design '%s'.

Feedback

### Description

You have specified an unsupported pad access pin type for a pad design with *define_dft_design* command. Only the following pad access pin types are supported.

```
Pad Type                              Allowed Access Pin Types
=============================================================================
=====

any pad                         capture_clk  capture_en  update_clk

=============================================================================
=====
```

Feedback

**What Next**

Correct the specification and reissue the *define_dft_design* command.

---

## UIT-1064a

(error) No pad type found for the PAD design '%s'.

**Description**

This error message occurs because the pad type was not specified with the *-param {$pad_type$}* option of the *define_dft_design* command.

**What Next**

Rerun the *define_dft_design* command with the *-param {$pad_type$}* option specifying a valid pad type.

---

## UIT-1064

(error) Invalid Pad type '%s' specified for the PAD design '%s'.

**Description**

You have specified an unsupported pad type for a pad design with *$pad_type$* parameter of *define_dft_design* command. Only the following pad types are supported.

input

output

tristate_output

bidirectional

open_drain_output

open_drain_bidirectional

open_source_output

open_source_bidirectional

Note that the pad types need to be specified in the following format.

define_dft_design ... -params { $pad_type$ string <pad_type> ... }

where <pad_type> is one of the pad types mentioned above.

Feedback

**What Next**

Correct the specification and reissue the *define_dft_design* command.

---

## UIT-1065

(error) Invalid Parameter '%s' of type '%s' specified, expected type '%s' .

**Description**

You have specified an unsupported parameter or unsupported parameter type for a pad design with *define_dft_design* command. Only the following parameters are supported.

Parameter Name Parameter Type ================================ $pad_type $ string $disable_res$ string | boolean $differential$ string | boolean $bsr_segment$ list string $lib_cell$ string | boolean $lp_time$ string $hp_time$ string $on_chip$ string | boolean ================================

**What Next**

Correct the specification and reissue the *define_dft_design* command.

---

## UIT-1066

(error) Invalid active_state value %s specified.

**Description**

You have specified an unsupported active_state value with *set_bsd_power_up_reset* command. Only the following active_state values are supported.

high low

**What Next**

Correct the specification and reissue the *set_bsd_power_up_reset* command.

---

## UIT-1067

(error) Incorrect number of ports/values specified with option '-pattern'.

**Description**

You have specified an insufficient number of port/value pairs with option *-pattern* of *set_bsd_compliance* command. The syntax of the compliance pattern is as follows.

{ [<port_name> <port_value>]+ }

Feedback

where <port_name> is the name of the port of the current design and <port_value> can be 0 or 1.

**What Next**

Correct the specification and reissue the *set_bsd_compliance* command.

---

## UIT-1068

(error) Specified IR width %d is not within 2-63 inclusive, ir_width specification discarded.

**Description**

You have specified an unsupported Instruction Register(IR) Width with *set_bsd_configuration* command. The IR width should be a positive number between 2 and 63.

**What Next**

Correct the specification and reissue the *set_bsd_configuration* command.

---

## UIT-1069

(error) Invalid value %s specified for option -asynchronous_reset.

**Description**

You have specified an invalid value for option *-asynchronous_reset* of *set_bsd_configuration* command. The allowed values for this option are : true | false

**What Next**

Correct the specification and reissue the *set_bsd_configuration* command.

---

## UIT-1070

(error) Invalid value %s specified for option -instruction_encoding.

**Description**

You have specified an invalid value for option *-instruction_encoding* of *set_bsd_configuration* command. The allowed values for this option are : binary | one_hot

**What Next**

Correct the specification and reissue the *set_bsd_configuration* command.

Feedback

## UIT-1071

(error) Invalid value %s specified for option -style.

**Description**

You have specified an invalid value for option *-style* of *set_bsd_configuration* command. The allowed values for this option are : synchronous | asynchronous

**What Next**

Correct the specification and reissue the *set_bsd_configuration* command.

## UIT-1072

(warning) UI option -ieee1149.1_1993 will be obsolete, please use option -std to specify the std. version.

**Description**

You have specified option -ieee1149.1_1993 with *set_bsd_configuration* command. This option is obsolete, use the new option *-std ieee1149.1_1993* to enable IEEE1149.1_1993 standard.

**What Next**

Correct the specification and reissue the *set_bsd_configuration* command.

## UIT-1073

(warning) Ignoring %s constant of pad design '%s'.

**Description**

You have specified LP_time or HP_time constants for a pad design and the value of this time constant is not valid.

The time is not valid if the time constant is less than 0.0

LP_time constant is also invalid if HP_time contant is not specified.

The time constant should be a positive real number in units of nano seconds.

**What Next**

Correct the specification and reissue the *define_dft_design* and *preview_dft*, *insert_dft* commands.

Feedback

## UIT-1074

(error) Std. Instruction '%s' is not allowed if support for ieee1149.6_2003 is not enabled.

### Description

You have specified EXTEST_PULSE or EXTEST_TRAIN instruction with *set_bsd_instruction* command, but didn't enable IEEE1149.6_2003 standard. These two instructions are supported only if IEEE1149.6_2003 standard support is enabled with option *-std ieee1149.6_2003* of *set_bsd_configuration* command.

### What Next

Correct the specification and reissue the *set_bsd_configuration* and *preview_dft*, *insert_dft* commands.

## UIT-1075

(warning) Port '%s' doesn't need an AC/DC Selector cell, not adding the selector cell for the port.

### Description

You have specified that AC/DC selector cell should be added for the specified port and the tool determined that the port doesn't need such a BSR cell. AC/DC selector cells are added to control the AC mode pin of AC BSR cells. If an AC BSR cell(AC_1, AC_2, AC_7) doesn't drive a port, no AC/DC slection BSR cell is needed for the port.

### What Next

Correct the specification and reissue the *set_boundary_cell* and *preview_dft*, *insert_dft* commands.

## UIT-1076

(error) Invalid cell type '%s' for boundary scan tristate control register of port '%s', adding default control BSR cell to the port.

### Description

You have specified an invalid BSR cell as a control BSR cell for a port with *set_oundary_cell* command. Valid control BSR cells are : BC_1 | BC_2 | none. A default BSR cell will be added as a control cell for the port. The default control BSR cell is BC_1 cell if INTEST instruction is specified, otherwise the default control cell is BC_2 BSR cell.

Feedback

### What Next

Correct the specification and reissue the *set_boundary_cell* and *preview_dft*, *insert_dft* commands.

---

## UIT-1077

(error) Invalid cell type '%s' for boundary scan ac/dc select register of port '%s', not adding any ac/dc selector BSR cell to the port.

### Description

You have specified an invalid BSR cell as a ac/dc selector BSR cell for a port with *set_oundary_cell* command. Valid ac/dc selector BSR cells are : AC_SELU | AC_SELX | none. No AC/DC selector BSR cell is added to the specified port.

### What Next

Correct the specification and reissue the *set_boundary_cell* and *preview_dft*, *insert_dft* commands.

---

## UIT-1078

(warning) BC_1 cell should be used for output control pins when INTEST is specified, using BC_1 cell for control pin of port '%s'.

### Description

You have specified BC_2 BSR cell as the control cell for a port and also specified INTEST instruction. When INTEST instruction is specified, BC_2 BSR cell can't be used as a control BSR cell, adding BC_1 BSR cell as the control cell for the specified port.

### What Next

Correct the specification and reissue the *set_boundary_cell* and *preview_dft*, *insert_dft* commands.

---

## UIT-1079

(error) Polarity '%s' is not allowed of pad access pins of type '%s'.

### Description

You have specified an incorrect polarity for a pad access pin. Here is a list of pad access pins and the allowed polaritiues for each of them.

Padd Acces Pin Type Allowed Polarites
========== port high low ac_mode high

Feedback

low shift_dr high low capture_clk high low capture_en high low update_clk high low update_en high low data_out high low ac_init_data_p high low ac_init_data_n high low ac_init_clk high low mode_in high low data_in high low mode_out high low ac_test high low mode1_inout high low mode2_inout high low enable high low highz high low

observe high low high high high si high so high receiver_p high receiver_n high
==========

**What Next**

Correct the specification and reissue the *define_dft_design* command.

---

## UIT-1080

(Warning) Port '%s' is not a linkage port, not removing the port.

**Description**

You receive this warning message when you execute the *remove_bsd_linkage_port* command and specified a port which is not a Linkage port. You can only remove Linkage ports with this command.

**What Next**

Reexecute the *remove_bsd_linkage_port* command with Linkage ports.

---

## UIT-1081

(Error) No Linkage Ports found on the current design.

**Description**

You receive this error message when you execute the *remove_bsd_linkage_port* command and no linkage ports found on the current design. You can only remove Linkage ports with this command.

**What Next**

Reexecute the *remove_bsd_linkage_port* command with Linkage ports.

---

## UIT-1082

(Error) No Power Up Reset Ports found on the current design.

Feedback

**Description**

You receive this error message when you execute the *remove_bsd_power_up_reset* command and no power up reset ports found on the current design. You can only remove Power Up Reset ports with this command.

**What Next**

Reexecute the *remove_bsd_power_up_reset* command with Power Up Reset ports.

---

## UIT-1083

(Warning) Pattern-name '%s' is not in bsd compliance, not removing pattern-name.

**Description**

You receive this warning message when you execute the *remove_bsd_compliance* command and specified a pattern-name which is not set using set_bsd_compliance. You can only remove compliance pins with this command.

**What Next**

Reexecute the *remove_bsd_compliance* command with compliance pins.

---

## UIT-1084

(Error) No Compliance Ports found on the current design.

**Description**

You receive this error message when you execute the *remove_bsd_compliance* command and no compliance pins found on the current design. You can only remove Compliance pins with this command.

**What Next**

Reexecute the *remove_bsd_compliance* command with Compliance pins.

---

## UIT-1085

(Warning) Cell '%s' is not a boundary cell IO, not removing the cell.

**Description**

You receive this warning message when you execute the *remove_boundary_cell_io* command and specified a cell which is not a Boundary Cell IO. You can only remove Boundary Cell IOs with this command.

Feedback

**What Next**

Reexecute the *remove_boundary_cell_io* command with Boundary cell IOs.

---

## UIT-1086

(Error) No Boundary Cell IOs found on the current design.

**Description**

You receive this error message when you execute the *remove_boundary_cell_io* command and no boundary cell IOs found on the current design. You can only remove Boundary IO cells with this command.

**What Next**

Reexecute the *remove_boundary_cell_io* command with Boundary cell IOs.

---

## UIT-1087

(Error) Insufficient number of options, specify either of options : -cell | -all.

**Description**

You receive this error message when you execute the *remove_boundary_cell_io* command and doesn't specify the required options. Either of the options -all or -cell are required for this command.

**What Next**

Reexecute the *remove_boundary_cell_io* command with the required options.

---

## UIT-1088

(Error) Options -cell and -all are mutually exclusive, specify only one of them.

**Description**

You receive this error message when you execute the *remove_boundary_cell_io* command and specified conflicting options. Options -all and -port_list are mutually exclusive.

**What Next**

Reexecute the *remove_boundary_cell_io* command with the either of -all or -port_list options.

Feedback

## UIT-1089

(error) Insufficient number of options, specify either of options : -name | -all

**Description**

You receive this error message when you execute the *remove_bsd_compliance* command and doesn't specify the required options. Either of the options -name or -all are required for this command.

**What Next**

Reexecute the *remove_bsd_compliance* command with the required options.

## UIT-1090

(Warning) The '-name' option is applicable only for control and ac_select boundary cells; ignoring the option.

**Description**

You receive this warning message when you execute the *set_boundary_cell* command and specify the *-name* option with an unsupported function type. The *-name* option can be specified only when the *-function* option is set to *control* or *ac_select*; as a result, it is ignored for this specification.

**What Next**

To resolve the warning, update the *set_boundary_cell* command with the correct specification.

## UIT-1091

(Warning) Option '-share' is applicable only for multiple Control/Ac Select Boundary Cells, ignoring the option.

**Description**

You receive this warning message when you execute the *set_boundary_cell* command and specify option -share with a single port in -ports option. The option -share is applicable only when used with multiple Control/Ac Select Boundary Cells.

**What Next**

Fix the problem and Re-execute the *set_boundary_cell* command with the correct specification.

Feedback

## UIT-1093

(error) Invalid value %s specified for the -rtl option.

**Description**

This error message occurs when an invalid value is specified for the *-rtl* option of the *set_bsd_configuration* command. The allowed values for this option are *enable* or *disable*.

**What Next**

Reissue the *set_bsd_configuration* command with either the *-rtl enable* or the *-rtl disable* option.

## UIT-1094

(warning) The -output option must be used with the -rtl enable option. Discarded the option.

**Description**

This warning message occurs when the *-output* option of the *set_bsd_configuration* command is specified, but the *-rtl* option is not set to *enable*. The *-output* option must be used with the *-rtl enable* option of the *set_bsd_configuration* command.

**What Next**

This is only a warning message. No action is required.

However, if the result is not what you intended, reissue the *set_bsd_configuration* command with *-rtl enable* and *-output* options.

## UIT-1095

(error) The -rtl enable option must be used with the -output option.

**Description**

This error message occurs when the the *-rtl enable* option of *set_bsd_configuration* command is specified without using the *-output* option. The *-rtl enable* option must be used with the *-output* option of the *set_bsd_configuration* command.

**What Next**

Reissue the *set_bsd_configuration* command using both the *-rtl enable* option and the *-output* option.

Feedback

## UIT-1096

(error) Test model does not exist for the design '%s'.

### Description

This error message occurs when there is no test model for the design corresponding to the design you specified in the *use_test_model* command.

### What Next

Make sure you specified the design you intended, and that the design has an attached CTL model. To see a list of designs that have test models, use the *list_test_models* command. You may need to use the *read_test_model* command to attach a test model to the design specified in the error message.

## UIT-1097

(error) Option '-test_mode' is not allowed with the other specified options.

### Description

This error message occurs when you run the *set_wrapper_configuration* command and specify the *-test_mode* option along with other options that are not allowed with this option.

The multimode wrapper configuration is specified with the *-test_mode* option.

The multimode wrapper configuration specification works only with the following options:

```
-max_length
-chain_count
-mix_cells
-input_shift_enable
-output_shift_enable
-shift_enable
```

### What Next

Rerun the *set_wrapper_configuration* command with the correct specification and options.

### See Also

- reset_wrapper_configuration

## UIT-1098

(warning) Pad Access Pin type 'ac_mode' unspecified, though pad contains '%s'.

Feedback

**Description**

You have specified one of these Pad Access Pin type: ac_init_clk, ac_test, ac_init_data_p or ac_init_data_n. But missed ac_mode. ac_mode Pad Access Pin type should be specified alongwith any of these pad access types.

**What Next**

This might result in wrong pattern generation. Correct the specification and reissue the *define_dft_design* command.

---

## UIT-1099

(warning) Streaming compression enabled will take precedence over scan compression.

**Description**

You have enabled scan compression and streaming compression simultaneously for DFT insertion. In this scenario the tool implements streaming compression in the netlist.

**What Next**

If you want to insert scan compression please disable streaming compression feature by issuing the command *set_dft_configuration -streaming_compression disable* command.

---

## UIT-1100

(Error) Invalid option value '%s'

**Description**

The value specified for the option is invalid

**What Next**

Check the value

---

## UIT-1101

(Error) Could not find valid link/reference for %s.

**Description**

You receive this error message in set_bsd_register command when the cell specified in the '-cell' option of the command does not have a valid reference. This might happen when the specified cell does not have a reference or when it has failed to link.

Feedback

**What Next**

Run the link command and fix the LINK-3 or LINK-5 errors reported on the cell.

---

## UIT-1102

(Error) Could not find valid link/reference for %s.

**Description**

You receive this error message in set_dft_signal command when the cell specified in the '-hookup_pin' option of the command does not have a valid reference. This might happen when the specified cell does not have a reference or when it has failed to link.

**What Next**

Run the link command and fix the LINK-3 or LINK-5 errors reported on the cell.

---

## UIT-1103

(Error) %s requires that %s also be enabled.

**Description**

You receive this message because the feature or option you have attempted to use requires that another feature or option also be enabled.

**What Next**

Enable the required feature.

---

## UIT-1110

(warning) DFT Hierarchy Location specification is not honored when %s is enabled.

**Description**

You receive this warning message when you execute the *set_dft_location* command and also enable the following DFT clients for DFT insertion.

Wrapper Boundary Scan Logic Bist

When these clients are specified, user specified DFT Hierarchy location is not used in DFT insertion.

**What Next**

Dft logic not added to user specified DFT Hierarchy during DFT insertion.

Feedback

## UIT-1111

(warning) DFT hierarchy location specification is ignored for test-point insertion.

**Description**

This warning message occurs when running the *set_dft_location* command and also enabling the test-point insertion during DFT insertion.

When test-point insertion is enabled, test-point DFT logic is not added to the user-specified DFT hierarchy location.

**What Next**

This is only a warning message. No action is required.

## UIT-1112

(warning) Specified hierarchy name '%s' doesn't exist in the current design '%s'; it will be created.

**Description**

You receive this warning message when you execute the *set_dft_location* command and specify a hierarchical instance name that doesn't exist in the current design. In this case, the tool creates the specified level of hierarchy for you during DFT insertion.

**What Next**

If you wanted the new hierarchy level to be created, no action is needed. If the hierarchy level was expected to already exist prior to DFT insertion, check the indicated hierarchy name specification against the design.

## UIT-1113

(error) Specified hierarchy name '%s' is not valid.

**Description**

You receive this warning message when you execute the *set_dft_location* command and specify an invalid instance name with the command.

**What Next**

Check if the specified instance name is valid and reissue the command with the correct instance name.

Feedback

## UIT-1114

(error) Specified name '%s' is not an instance of hierarchical design.

**Description**

You receive this warning message when you execute the *set_dft_location* command and specify a leaf level instance with the command.

The specified name should be an instance of a hierarchical design. Instances of black box modules, unresolved modules or library cells are not allowed as valid instance names for this command.

**What Next**

Reissue the command with a valid hierarchical instance name.

## UIT-1115

(error) Specified instance '%s' %s.

**Description**

This error message occurs when an invalid cell instance is specified with the *set_dft_location* command.

The cell specified with the *set_dft_location* command must be modifiable by DFT insertion.

The following cells are not modifiable by DFT insertion:

- CTL-modeled cells
- Interface logic model (ILM) cells
- Block abstraction cells

You cannot specify any of these cells with the *set_dft_location* command. In addition, you cannot specify hierarchical subblock cells within any of these cells.

**What Next**

Reissue the command with a valid cell instance name that is modifiable by DFT insertion.

## UIT-1130

(warning) Setting -control_cell_max_fanout to 0, since -cross_hierarchy is specified.

Feedback

### Description

This warning message occurs when running the *set_bsd_configuration* command with the *-cross_hierarchy* option, and the *-control_cell_max_fanout* option was specified earlier with a value other than 0. The tool needs to optimize the control cells when the *-cross_hierarchy* option is specified, so the command automatically sets the *-control_cell_max_fanout* value to 0.

### What Next

This is only a warning message. No action is required.

---

## UIT-1131

(error) Specified -cross_hierarchy name '%s' is not a valid hierarchical path name in the current design.

### Description

This error message occurs when running the *set_bsd_configuration* command with the *-cross_hierarchy* option value set to an invalid hierarchical path name. The command expects a valid hierarchical path name in the current design as the value for this option.

### What Next

Rerun the *set_bsd_configuration* command with the *-cross_hierarchy* option and specify a valid hierarchical path name.

---

## UIT-1132

(error) Invalid buffer direction '%s' specified for signal '%s'.

### Description

This error message occurs when attempting to run the *set_bsd_configuration* command with an invalid signal direction specified by the *-signals_to_buffer* option.

The options expects a list of signal strings where each signal string has the following format:

```
signal_name signal_direction
```

Allowed values *signal_name* are as follows:

- `clock_dr`
- `update_dr`
- `shift_dr`
- `capture_en`

Feedback

- update_en
- mode_in
- mode_out
- mode1_inout
- mode2_inout
- ac_mode
- ac_test
- ac_init_clk

The following values are allowed *signal_direction*:

```
tdi - Buffering starts from tdi
tdo = Buffering starts from tdo.
```

**What Next**

Rerun the *set_bsd_configuration* command with the correct value for the *-signals_to_buffer* option.

---

## UIT-1133

(error) Specified signal name '%s' is not a valid signal to be buffered.

**Description**

This error message occurs when attempting to run the *set_bsd_configuration* command with an invalid signal name specified by the *-signals_to_buffer* option.

The option expects a list of signal strings where each signal string has the following format:

```
signal_name signal_direction
```

Allowed values for *signal_name* are as follows:

- clock_dr
- update_dr
- shift_dr
- capture_en
- update_en
- mode_in
- mode_out
- mode1_inout
- mode2_inout
- ac_mode
- ac_test
- ac_init_clk

Feedback

The following values are allowed for *signal_direction*:

```
tdi - Buffering starts from tdi
tdo = Buffering starts from tdo
```

**What Next**

Rerun the *set_bsd_configuration* command with the correct value for the *-signals_to_buffer* option.

---

## UIT-1134

(error) Cannot specify -signals_to_buffer option without also specifying the -bsr_buffer_fanout option.

**Description**

This error message occurs when you run the *set_bsd_configuration* command and specify the *-signals_to_buffer* option without also specifying the *-bsr_buffer_fanout* option.

The *-signals_to_buffer* option adds buffers on the specified BSR control signals. The tool needs to know the number of BSR cells driven by each of the buffers. This buffer fanout is specified with the *-bsr_buffer_fanout* option.

**What Next**

Run the *set_bsd_configuration* command again and specify both *-signals_to_buffer* and *-bsr_buffer_fanout*.

---

## UIT-1135

(error) A "-port" specification is not supported for DFT signals of type '%s'; only "-hookup_pin" is supported.

**Description**

You receive this message because you attempted to define a DFT signal using the *-port* option of the *set_dft_signal* command, but that signal type only supports specifications using the *-hookup_pin* option (without the *-port* option).

**What Next**

Adjust the specification to specify the internal hookup pin using the *-hookup_pin* option.

---

## UIT-1200

(error) The -none option cannot not be used with the -all option.

Feedback

**Description**

You are advised to use the *-none* option to turn off optimizations during scan insertion and use *-all* option for performing all the optimizations during scan insertion.

**What Next**

Modify the options accordingly to the recommendations and repeat the command.

---

## UIT-1300

(Warning) Resetting wire load mode to '%s'.

**Description**

The wire load mode is set to a default value.

**What Next**

Use the *set_wire_load_mode* command to adjust.

---

## UIT-1310

(error) Core Integration of cores requires the option : -scan .

**Description**

You receive this message if you issue *set_dft_configuration -integration enable* and also specify the following option. *-scan disable* UI option *-integration* of command *set_dft_configuration* requires the option *-scan enable*. For more information, see the man page for the *set_dft_configuration* command.

**What Next**

Reissue *set_dft_configuration* command with valid options.

---

## UIT-1311

(error) Core Integration of cores is mutually exclusive with options : \n\t-fix_set | -fix_reset | -fix_bus | -fix_bidirectional | -fix_clock | -fix_xpropagation | \n\t-control_points | -observe_points | -logicbist | -mbist | -wrapper | -scan_compression .

**Description**

You receive this message if you issue *set_dft_configuration -integration enable* and also specify one of the following options. *-fix_set enable -fix_reset enable -fix_bus enable -fix_bidirectional enable -fix_clock enable -fix_xpropagation enable -control_points*

Feedback

*enable -observe_points enable -logicbist enable -mbist enable -wrapper enable -scan_compression enable*

UI option *-integration* of command *set_dft_configuration* is mutually exclusive with the above options. For more information, see the man page for the *set_dft_configuration* command.

**What Next**

Reissue *set_dft_configuration* command with valid options.

---

## UIT-1312

(error) Core Integration of cores doesn't support the options : -clock_controller .

**Description**

You receive this message if you issue *set_dft_configuration -integration enable* and also specify one of the following options. *-clock_controller enable* UI option *-integration* of command *set_dft_configuration* is mutually exclusive with the option *-clock_controller enable* when the design doesn't contain MBIST(Tech2) cores. For more information, see the man page for the *set_dft_configuration* command.

**What Next**

Reissue *set_dft_configuration* command with valid options.

---

## UIT-1313

(error) Boundary Scan Synthesis is mutually exclusive with options : \n\t-scan | -fix_set | -fix_reset | -fix_bus | -fix_bidirectional | -fix_clock | -fix_xpropagation | \n\t-control_points | -observe_points | -wrapper | -scan_compression .

**Description**

You receive this message if you issue *set_dft_configuration -bsd enable* and also specify one of the following options. *-scan enable -fix_set enable -fix_reset enable -fix_clock enable -fix_xpropagation enable -control_points enable -observe_points enable -wrapper enable -scan_compression enable*

UI option *-bsd* of command *set_dft_configuration* is mutually exclusive with the above options. For more information, see the man page for the *set_dft_configuration* command.

**What Next**

Reissue *set_dft_configuration* command with valid options.

Feedback

## UIT-1314

(error) Boundary Scan Synthesis doesn't support the options : -mbist | -logicbist | -clock_controller .

### Description

You receive this message if you issue *set_dft_configuration -bsd enable* and also specify one of the following options. *-logicbist enable -mbist enable -clock_controller enable* UI option *-bsd* of command *set_dft_configuration* is mutually exclusive with the option *-logicbist enable*. UI option *-bsd* of command *set_dft_configuration* is mutually exclusive with the option *-mbist enable* when not synthesizing MBIST(Tech1) logic. UI option *-bsd* of command *set_dft_configuration* is mutually exclusive with the option *-clock_controller enable* when not synthesizing MBIST(Tech2) logic. For more information, see the man page for the *set_dft_configuration* command.

### What Next

Reissue *set_dft_configuration* command with valid options.

## UIT-1315

(error) Boundary Scan Integration of IEEE 1500 logic requires the option : -scan .

### Description

You receive this message if you issue *set_dft_configuration -bsd enable* and also specify the following option. *-scan disable -ieee_1500 enable -integration enable*

IEEE 1500 core integration is enabled with the following UI options. *-bsd enable -scan enable -ieee_1500 enable -integration enable*

For more information, see the man page for the *set_dft_configuration* command.

### What Next

Reissue *set_dft_configuration* command with valid options.

## UIT-1316

(warning) The option -integration is not recommended and will be obsoleted in the 2007.03 release.

### Description

You receive this message if you issue *set_dft_configuration -integration enable* command in XG mode or *set_dft_configuration -core_integration* command in DB mode.

Feedback

It is not receommended to use Core Integration functionality, the functionality is going to be obsoleted in 2007.03 release.

In DB mode, core integration functionality is still supported only with *-bist* option.

**What Next**

Reissue *set_dft_configuration* command with valid options.

---

## UIT-1800

(error) '%s' is not defined as a TestMode port.

**Description**

The port defined in the *-encoding* option of the *define_test_mode* command is not defined as a *TestMode port*. The type of the port is defined by using the *set_dft_signal* command.

---

## UIT-1801

(error) The value '%s' for the TestMode port is not correct.

**Description**

The value defined for the port in the *-encoding* option must be either equal to 0 or 1.

---

## UIT-1802

(warning) The current mode already contains encoding.

**Description**

The current mode already contains encoding. The previous encoding specification will be overwritten.

---

## UIT-1803

(error) The following compliance enable port is not an input or inout port: %s.

**Description**

The *set_bsd_compliance* command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port_name value pairs. Each port name in a compliance enable specification must correspond to an input or inout port of the design.

Feedback

**What Next**

Make sure that each port in the compliance enable pattern corresponds to an input or inout port of the design.

---

## UIT-1804

(error) No patterns found to write native Verilog test bench file.

**Description**

This error is generated when the create_bsd_patterns does not generate any patterns that could be written to the native Verilog test bench.

**What Next**

Check what caused no test bench patterns to be generated.

---

## UIT-1805

(Error) Specification of hookup sense without port specification is invalid.

**Description**

You receive this message because you have specified a hookup sense for a hookup pin without specifying the port name corresponding to this hookup pin. In the particular case of an internal pin specification, you should drop both the hookup sense and the port name.

**What Next**

If you are in an internal pin flow, please drop the hookup sense specification. If you are not in an internal pin flow please specify the port name corresponding to your hookup pin. *set_dft_signal* command.

---

## UIT-1806

(error) '%s' is defined several times in the encoding definition .

**Description**

The port defined in the *-encoding* option must be defined once.

---

## UIT-1807

(warning) Schedule specification '%s' overwrites a previous specification.

Feedback

### Description

This warning is generated when a schedule name is defined with the *define_dft_schedule* command that was already defined by a previous command. The new specification overwrites the previous specification.

### What Next

If the redefinition was not intentional, choose a unique name for the both schedules and repeat the schedule definition commands.

---

## UIT-1808

(error) Instance '%s' of design '%s' has no test model.

### Description

When a core is specified for scheduling in the automatic or manual DFT scheduling flows, the core must have test model information that defines the available test modes. This error is issued when there is no test model for the design instantiated by the specified cell instance.

In the automatic DFT scheduling flow, cell instances are specified with the *-include* option of the *define_dft_schedule* command. In the manual DFT scheduling flow, cell instances are specified with the *-target* option of the *define_test_mode* command.

### What Next

Make sure you specified the intended cell instance. To see a list of designs that have test models, use the *list_test_models* command. You might need to use the *read_test_model* command to attach a test model to the design specified in the error message.

---

## UIT-1810

(warning) The '%s' option does not apply to the '%s' target.

### Description

You receive this warning message because you have specified a target/option combination with the *set_testability_configuration* command that is not supported. As a result, that option is ignored for that target.

All other valid option/target specifications are accepted.

### What Next

If you specified only a single target, then the option you specified is not supported by that target. Edit your script to remove the option.

Feedback

If you specified multiple targets and the option applies to some targets but not others, you can do any of the following:

- Ignore this warning.
- Split the *set_testability_configuration* specification into multiple commands, and then apply the option only to the targets that support it.
- Use the *suppress_message* command to suppress this warning.

# UITCL

## UITCL-100

(error) Can't get object name of multiple objects;\n \tOnly a single object collection accepted.

**Description**

This command only accepts a collection that contains only one object.

**What Next**

Try the command again with one object collection.

## UITCL-101

(error) Cannot split list elements of value '%s' for variable '%s'.

**Description**

The variable value is not a valid list. Therefore, its value cannot be processed correctly.

**What Next**

Check the value of the given variable that is printed out by the error message.

## UITCL-102

(warning) The update_script command is not supported in Tcl mode;\n \tUpdate_script is available in dcsh only.\n \tTo translate dcsh to tcl format, use the dc-transcript program.

**Description**

This command is not supported in dc_shell Tcl mode.

Feedback

# UIV

## UIV-001

(warning) Application variable '%s' is not supported

**Description**

This application variable is not supported in this tool. Setting this variable will have no effect.

**What Next**

Use *report_app_options* to determine if there is an application option providing similar control.

## UIV-002

(warning) The '%s' variable is obsolete. Please use '%s' instead.

**Description**

Application options are now used instead of variables to control tool operation.

**What Next**

Change your script to use the recommended command. If the recommendation is to use the *set_app_option* command, decide whether you want to specify the option globally (to apply to all designs in the session), or to a specific design (which allows the option setting to be saved with the design data).

# UNDO

## UNDO-001

(error) Undo is not enabled.

**Description**

This command requires that undo is enabled, however undo is not enabled.

**What Next**

Please enable undo to execute the command.

Feedback

## UNDO-002

(error) Marker '%s' not found.

**Description**

The specified undo marker either does not exist or is not visible from within the current command hierarchy.

**What Next**

Please specify the name of an existing and visible marker.

## UNDO-003

(error) Marker '%s' cannot be undone to.

**Description**

The specified undo marker corresponds to a later point in the command history, so it cannot be undone to.

**What Next**

Use the 'redo' command to restore the system state to this marker.

## UNDO-004

(error) Marker '%s' cannot be redone to.

**Description**

The specified undo marker corresponds to a previous point in the command history, so it cannot be redone to.

**What Next**

Use the 'undo' command to restore the system state to this marker.

## UNDO-005

(error) Cannot undo %i levels.

**Description**

Either there are less than the specified number of undoable commands in the undo history, or the specified number is an invalid value.

Feedback

**What Next**

Please specify a positive number of levels less than or equal to the number of undoable commands in the undo history.

---

## UNDO-006

(error) Cannot redo %i levels.

**Description**

Either there are less than the specified number of redoable commands in the latest undo history, or the specified number is an invalid value.

**What Next**

Please specify a positive number of levels less than or equal to the number of redoable commands in the latest undo history.

---

## UNDO-007

(warning) Nothing to redo.

**Description**

This command restores the system to the most recent state in the undo history, however the system is already at the most recent state. Therefore this command has no effect.

**What Next**

No action needs taken.

---

## UNDO-008

(error) Marker name cannot be empty.

**Description**

Undo marker names must not be empty.

**What Next**

Please specify a non-empty marker name.

---

## UNDO-009

(error) Marker name '%s' is in system format.

Feedback

**Description**

The specified undo marker name matches the format used internally for system-created markers, and is therefore disallowed for user-created markers.

**What Next**

Please specify a name with a different format.

---

## UNDO-010

(error) Marker '%s' already exists.

**Description**

An undo marker with the specified name already exists within the current command hierarchy.

**What Next**

Please specify a unique marker name.

---

## UNDO-011

(error) Atomic name cannot be empty.

**Description**

The atomic name of the command group must not be empty.

**What Next**

Please specify a non-empty atomic name.

---

## UNDO-012

(error) Command name cannot be empty.

**Description**

The specified command name argument value must not be empty.

**What Next**

Please specify a non-empty command name argument value.

---

## UNDO-013

(info) The command '%s' is independent of the undo system.

Feedback

**Description**

The execution of the specified command will not directly affect the undo command history.

---

## UNDO-014

(info) The command '%s' is undoable.

**Description**

The specified command can be undone.

---

## UNDO-015

(info) The command '%s' is not undoable.

**Description**

The specified command cannot be undone.

---

## UNDO-016

(info) The command '%s' cleared the undo history.

**Description**

The specified command is not undoable, therefore its execution has cleared the undo history.

---

## UNDO-017

(info) A command within an eval_with_undo command group cleared the undo history.

**Description**

One or more commands within an eval_with_undo command group is not undoable, therefore its execution has cleared the undo history.

---

# UNG

---

## UNG-1001

(information) The hierarchy %s is ungrouped due to auto_ungrouping.

Feedback

**Description**

The specified hierarchy is automatically ungrouped due to the enabling of automatic ungrouping during initial_map stage of compile_fusion.

**What Next**

Automatic ungrouping during initial_map can be controlled with the app option compile.flow.autoungroup

---

## UNG-1002

(information) The hierarchy %s is ungrouped due to set_ungroup directive.

**Description**

The specified hierarchy is ungrouped due to the enabling of set_ungroup command on a cell or a module.

---

## UNG-1003

(information) %d of %d hierarchies are ungrouped. Use report_ungroup for a list.

**Description**

The specified number of hierarchies were automatically ungrouped (or) ungrouped by user.

---

## UNG-1004

(information) The hierarchy %s is not ungrouped due to %s.

**Description**

The specified hierarchy has not ungrouped due to some restrictions on it.

---

## UNG-1005

(information) %d of %d hierarchies are not ungrouped because of restrictions. Use report_ungroup for a list.

**Description**

The specified number of hierarchies were not ungrouped due to user or internal restrictions.

Feedback

## UNG-1006

(information) %d of %d hierarchies are not met auto_ungroup criteria.

**Description**

The specified number of hierarchies were not ungrouped because they did not meet auto_ungroup threshold criteria.

## UNG-1007

(information) Ungroup Summary Report

**Description**

Reports the high-level details of hierarchies that are ungrouped due to auto_ungroup or due to set_ungroup command. Also lists the hierarchies that are not ungrouped due to different restrictions.

## UNG-1008

(warning) The auto-ungroup setting might impact QoR.

**Description**

Auto-ungroup options set by the command *set_autoungroup_options* will limit the auto-ungrouping, hence could potentially affect QoR.

# UPF

## UPF-001

(error) Leaf cell '%s' is not valid as a UPF scope.

**Description**

Within the UPF file, scope must be applied to a hierarchical cell, not leaf level cells.

**What Next**

Determine the correct cell to apply the scope to and change the UPF accordingly.

Feedback

### See Also

- get_cells
- report_cells

---

## UPF-002

(warning) Supply nets or ports '%s' and '%s' are both defined in the power state table '%s' even though they are connected together or electrically equivalent.

### Description

This warning message occurs when the specified supply nets or ports in the supply list is connected together or declared as electrically equivalent. The electrical-equivalent supplies in the supply list of power state table are redundant.

### What Next

Remove the redundant supply net(s) or port(s) from the supply list.

### See Also

- create_pst

---

## UPF-003

(error) Invalid name specified: '%s'

### Description

An invalid identifier was specified. The name violates UPF naming conventions or the requirements for a specific command.

UPF identifiers must start with a letter. All other characters of the identifier must be either an alphanumeric character, "A-Z a-z 0-9", or the underscore character, "_". UPF names are case sensitive.

### What Next

The error message will give the name causing the error, using this, check which create_command in the UPF file is responsible and change the associated name accordingly.

### See Also

- create_power_domain
- create_supply_set

Feedback

- create_supply_net
- create_supply_port
- create_pst

---

## UPF-004

(error) Invalid hierarchical name specified: '%s'

**Description**

The command option requires a simple name, with no hierarchy separator character, for example, '/'. UPF objects may have hierarchical names, but the simple name required is not permitted to contain the hierarchy separator.

**What Next**

Re-enter the command with a valid simple name specified. If you choose to deviate from IEEE Std 1801 recommendation of using simple names, you can try setting the app option mv.upf.input_enforce_simple_names to false. You will be able to continue using hierarchical names if the app option is honored by the command causing this error.

**See Also**

- get_cells
- get_nets
- mv.upf.input_enforce_simple_names

---

## UPF-005

(error) Unable to create %s '%s': %s.

**Description**

The command failed to create an object, detailed reason for the failure is given.

**What Next**

From the reason given, understand why the object was not created and determine if the command should be re-entered with different options. If an object by this name already exists, you may need to remove the old one first. If the object that failed to be created is a bias function of a supply set, make sure that the enable_bias design attribute is set to true/derived prior to supply set creation.

Feedback

### See Also

- query_objects

---

## UPF-006

(error) %s '%s' does not exist.

### Description

The specified object does not exist.

### What Next

Understand why the specified object does not exist, create if required and rerun the command again.

### See Also

- get_objects_by_location
- query_objects

---

## UPF-007

(error) Design element '%s' is not within the scope '%s'

### Description

A design element has been specified that is not contained within the specified power scope.

### What Next

All of the leaf and hierarchical instances used with the -elements or -exclude_elements option must be contained within the current power scope, or the -scope instance if specified. Use get_power_domains / report_power_domains to find the scope of the instance.

### See Also

- get_power_domains
- report_power_domains
- report_power_scopes

Feedback

## UPF-008

(error) Cell '%s' is included in power domains '%s' and '%s'.

### Description

A cell has been specified to include in two different power domains. A cell cannot belong to more than one power domain.

### What Next

Ensure the list of instances is valid for the relevant power domains by reviewing the create_power_domain statements in the UPF file. In addition you can use the get_cells command to determine the power domain associated with a cell(s).

### See Also

- create_power_domain
- get_cells

## UPF-009

(error) Incorrect number of arguments specified with the option '-function'.

### Description

This error message occurs when an invalid number of arguments is specified with the *-function* option of the *create_supply_set* command.

### What Next

Provide the correct number of arguments for the *-function* option in the following format:

```
-function {function_name supply_net_name}
```

### See Also

- create_power_domain
- create_supply_set

## UPF-010

(error) Invalid supply set handle '%s' specified.

Feedback

### Description

This error message indicates that one or more supply set handle names specified with the *-supply* option of the *create_power_domain* command are invalid.

### What Next

Provide valid supply set handle to associate the supply sets successfully.

### See Also

- create_supply_set

---

## UPF-011

(error) Incorrect number of arguments specified with '-supply' option.

### Description

This error message occurs when an invalid number of arguments are specified with the -supply option of the create_power_domain command.

### What Next

Provide the correct number of arguments for the *-supply* option in the following format:

**-supply** {*supply_set_handle supply_set_name*}

### See Also

- create_supply_set

---

## UPF-012

(error) Domain %s supply net for domain '%s' has already been specified.

### Description

This error message occurs when the domain supply nets for the power domain have already been specified. Specifying the domain supply net multiple times is not allowed.

### What Next

Check the existing domain supply nets.

Feedback

**See Also**

- create_power_domain
- create_supply_set
- report_supply_nets

---

## UPF-013

(error) Unable to update %s '%s': %s

**Description**

The UPF command with the option -update failed to update an object. The detailed reason for the failure is given.

**What Next**

Understand why the object was not updated and determine if the command should be re-entered with different option arguments.

**See Also**

- create_power_domain
- set_isolation
- set_level_shifter
- set_retention

---

## UPF-014

(error) No supply net functions have been specified with the -update option.

**Description**

The error message occurs because function names and supply net names are required when the *create_supply_set command is used with the -update option.*

**What Next**

Provide the function names to which you want to associate the function of the supply set along with the supply net names and run the command again.

**See Also**

- create_supply_set

Feedback

## UPF-015

(error) Supply set '%s' does not exist.

### Description

This error message occurs when the supply set referenced for update by the -update option to the create_supply_set command does not exist. The -update option can only be used on an already existing supply set.

### What Next

Create the supply set and then run the *-update* option.

### See Also

- create_supply_set

## UPF-016

(error) Function '%s' has been specified multiple times for this supply set.

### Description

This error message occurs when a valid *function_name* is specified multiple times with the *-function* option.

### What Next

Ensure that a valid *function_name* is specified only once with multiple *-function* arguments.

### See Also

- create_supply_set

## UPF-017

(error) Supply set handle '%s' has been specified multiple times for this power domain.

### Description

This error message occurs when the supply set handle has been specified multiple times for the specified power domain.

The *primary*, *default_retention*, and *default_isolation* handles can be specified only once with the *-supply* option of the *create_power_domain* command.

Feedback

### What Next

Correct the syntax of the command to make it consistent with the above rules.

### See Also

- create_power_domain
- create_supply_set

---

## UPF-018

(error) Cell '%s' already belongs to power domain '%s'.

### Description

The cell corresponding to the scope has previously been added to another power domain. A cell cannot be added to more than one power domain.

### What Next

From the error message you can determine which cell is causing this issue and the initial domain it is associated with. Check the UPF file to find the additional domain that is being created and causing this error and correct the UPF accordingly.

### See Also

- create_power_domain

---

## UPF-019

(error) An existing top-level domain '%s' already exists.

### Description

This error message occurs when you are trying to create a design-level power domain that covers the design top and one already exists.

### What Next

The error message will occur after the "second" top level power domain is attempted to be created and will contain the name of the original top level domain name. From this correct your UPF file such that only one top level power domain exists.

### See Also

- create_power_domain

Feedback

## UPF-020

(error) Save and restore signals '%s' and the active levels are identical for retention strategy '%s' of power domain '%s'.

### Description

This message occurs when the save and restore control signals and their active levels are identical. As a result, the save and restore events of the retention cells can be triggered at the same time.

### What Next

Check the specified save and control signals. Also check the their active levels.

### See Also

- set_retention
- set_retention_control

## UPF-021

(error) %s connection of supply port %s is already connected to supply net %s.

### Description

This error message occurs when the specified supply port already has LowConn(inside)/ HighConn(outside) connections to the specified supply net.

A supply port can be connected by only one supply net on each side (inside/outside).

### What Next

Use the *save_upf* command to check existing connections.

### See Also

- connect_supply_net

## UPF-022

(error) Invalid connection from supply net %s to supply port %s.

Feedback

### Description

This error message occurs when attempting to make a connection from a supply net that is below the scope of the supply port. A supply port can be connected only by a supply net that is at or above the scope of the supply port.

### What Next

Specify a supply net that is at or above the scope of the supply port.

### See Also

- create_supply_net
- create_supply_port

---

## UPF-023

(error) Supply net '%s' cannot be connected to pin '%s' since it is not a supply port or leaf pin.

### Description

All pins specified in option '-ports' of command *connect_supply_net* must be a supply port or leaf pg pin.

### What Next

Change to a supply port or leaf pg pin and try again. A common cause for this is specifying a pg pin of a hierarchical cell of the logical hierarchy.

### See Also

- connect_supply_net

---

## UPF-024

(Warning) Supply net '%s' cannot be connected to pin '%s' because it is already connected to '%s'.

### Description

The power and ground pin has already been connected to an existing supply net, and the specified supply net connection will be skipped.

### What Next

Check the supply net connection of the power and ground pin, contained in the message the existing connection will be given.

Feedback

**See Also**

- connect_supply_net

---

## UPF-025

(error) UPF command '%s' is not allowed after the power intent is finalized.

**Description**

The UPF command is not allowed after the UPF intent is finalized with the commit_upf command.

**What Next**

Reset the UPF constraints of the design, modify the power intent as needed and re-issue commit_upf.

**See Also**

- commit_upf
- reset_upf

---

## UPF-026

(error) Supply net '%s' cannot be connected to pin '%s' because it is not a power/ground pin.

**Description**

All pins specified in option '-ports' of command connect_supply_net must be a supply port or leaf power/ground pin.

**What Next**

Check if the supply port or leaf power/ground pin was specified correctly. If pin was correct, check if the port_type was specified correctly during library preparation.

**See Also**

- connect_supply_net

---

## UPF-027

(error) could not set related supply net(s) on pin '%s' since it is a hierarchical pin.

Feedback

**Description**

The specified pin must be a top-level signal port or leaf signal pin.

**What Next**

Ensure you only specify a top-level signal port or leaf signal pin and try again.

**See Also**

- set_related_supply_net

---

## UPF-028

(error) UPF command '%s' is not allowed outside load_upf.

**Description**

Individual UPF commands are not allowed outside load_upf.

**What Next**

Include UPF commands in a UPF file and invoke load_upf to enter UPF constraints.

**See Also**

- load_upf

---

## UPF-029

(warning) Option '%s' of UPF command '%s' is not supported and will be ignored.

**Description**

This error message occurs when an unsupported option is specified. Other specified options, if any, will be honored.

**What Next**

Check the option of the UPF command and ensure it is not necessary for power intent. Otherwise, consider specifying the intent in another manner.

**See Also**

- load_upf

Feedback

## UPF-030

(error) Inconsistent resolution type on supply net %s: previously is '%s'.

### Description

This error message occurs when the *create_supply_net* command with the *-reuse* option is specified and the *-resolve* option is inconsistent with the -resolve setting in a previous create_supply_net command for the same net.

### What Next

According to the IEEE 1801 (UPF) standard, the -resolve specification for the same net must be consistent for all supply net definitions.

### See Also

- create_supply_net

## UPF-031

(error) Supply net %s cannot be connected to the pin %s in domain %s.

### Description

A supply net can only be connected to power pins that lie within the extent (set of instances) of the power domain(s) in which the supply net is defined.

### What Next

Check if the power domain of the supply net contains the cell. Use report_supply_nets to see the power domain of the supply net. Then, check the power domain of the cell associated with the pin by using get_power_domain.

### See Also

- create_supply_net
- connect_supply_net
- get_power_domains
- get_related_supply_nets
- get_supply_nets
- report_supply_nets

Feedback

## UPF-032

(warning) Cannot set port attribute '%s' on invalid object '%s'%s.

### Description

This message occurs when port attribute are defined on invalid objects. The invalid object will be ignored.

### See Also

- set_port_attributes

## UPF-033

(warning) could not set related supply net(s) on pin '%s' since it is a power/ground pin.

### Description

The specified pin must be a signal port or leaf signal pin in order to specify the related supply net.

### What Next

Change to a signal port or leaf signal pin and try again.

### See Also

- set_related_supply_net

## UPF-034

(information) UPF constraints and voltage areas of the design have been removed.

### Description

This is an informational message indicating that the UPF intent of the design are reset. In addition, all the voltage areas of power domains are removed.

### What Next

You may need to read in the UPF constraints with load_upf and recreate the voltage areas of the design.

Feedback

### See Also

- reset_upf
- load_upf

---

## UPF-035

(error) Supply net %s cannot be connected to the pin %s which does not belong to any power domains.

### Description

A supply net can only be connected to power pins that lie within the extent of the power domain(s) in which the supply net is defined.

### What Next

Make sure the top power domain exists. Also, check the power domain of the supply net contains the cell.

### See Also

- create_supply_net
- connect_supply_net
- create_power_domain

---

## UPF-036

(error) Port state format is not acceptable: %s.

### Description

This error message occurs when the supply port state specified in the add_port_state command does not comply with the UPF standard:

add_port_state supply_port_name -state {state_name <nom | <min nom max> | off> }

### What Next

Use the correct syntax shown and rerun the command.

Correct the appropriate error:

* Do not capitalize any letters of "off" for the off state.

* Use correct voltage value for the state in correct floating point format.

Feedback

* Ensure only two parameters are supplied in the list argument for the -state option for the "off" state.

* Ensure the number of parameters supplied in the list argument for the -state option is either two or four depending on if you are specifying nominal, or minimum, nominal and maximum triplets.

* Check that the voltage triplets are specified in the order of minimum, nominal and maximum.

**See Also**

- add_port_state

---

## UPF-037

(error) Port state '%s' has been defined on supply '%s' with voltage(s) %s.

**Description**

This error message occurs when the specified port state name is already defined either on the same supply or an equivalent supply. The voltage(s) of the same or equivalent supply is(are) shown.

Examples:

UPF-037 (error) Port state 'VON' has been defined on supply 'vdd' with voltage(s) 0.8.

UPF-037 (error) Port state 'VHigh' has been defined on supply 'vdd' with voltage(s) {0.7, 0.8, 0.9}.

UPF-037 (error) Port state 'VSLEEP' has been defined on supply 'vddsw' with voltage(s) 'off'.

**What Next**

Specify a unique name for the port state and rerun the command. To redefine a port state, use reset_upf, followed by load_upf of the updated UPF file with the new add_port_state command.

**See Also**

- add_port_state

---

## UPF-038

(error) The definition of power states is incompatible with the current template.

Feedback

### Description

The definition of power states must be compatible with the template created using the *create_pst* command. For example:

```
prompt> create_pst my_pst -supplies {VDD VDDG VDDY}

prompt> add_pst_state overdrive -pst my_pst -state {HV HV}
```

In this example, the number of supplies listed in the template (3) does not match those listed in *add_pst_state* (2).

### What Next

Rerun the *add_pst_state* command listing the correct number of supplies.

### See Also

- add_pst_state
- create_pst

---

## UPF-039

(error) UPF intent has not been committed.

### Description

UPF intent has not been committed with commit_upf command. commit_upf must be used to indicate that all UPF has been loaded. MV operations cannot be performed until commit_upf runs successfully.

### What Next

Commit the UPF constraints of the design with commit_upf command and try again.
If there is an error during commit_upf, please refer to the individual man page of the associated error message.

### See Also

- commit_upf

---

## UPF-040

(warning) UPF command '%s' is not currently supported and will be ignored.

### Description

This warning message occurs when an unsupported command is specified.

Feedback

### What Next

Check the UPF command.

### See Also

- load_upf

---

## UPF-041

(error) Invalid function '%s' has been specified for supply set.

### Description

This error message occurs when an invalid function_name is specified with the -function option. Currently, only "power", "ground", "nwell" and "pwell" functions are supported.

### What Next

Ensure that a valid function_name is specified.

### See Also

- create_supply_set

---

## UPF-042

(error) Supply Set '%s' already exists.

### Description

This error message occurs when an already existing supply set is specified without the *-update* option for create_supply_set. The existing supply sets are only support with *create_supply_set* if *-update* is being specified. In other words, user is updating and existing supply set functions.

### What Next

Ensure that a new and valid *supply set name* is specified.

### See Also

- create_supply_set

---

## UPF-043

(error) %s '%s' cannot be invoked with default power domain constraints.

Feedback

### Description

This error message occurs when the specified command or option is invoked and the default power domain that is automatically created by the tool exists. That is, the currently loaded UPF is a mixture of tool-generated and user-provided intent which can lead to unintended consequences. The tool generates basic UPF for non-multivoltage designs and it is not meant to be expanded with user intent.

### What Next

Please generate a complete UPF so that no tool-generated UPF is required and the UPF remains consistent.

### See Also

- load_upf

---

## UPF-044

(error) '%s' is a tool-generated default %s that cannot be used in user-specified power intent.

### Description

This error message occurs when the specified UPF object is automatically created by the tool and the user attempts to expand the UPF with user-specified power intent. The loaded UPF cannot be a mixture of tool-generated and user-generated power intent as this can be error-prone.

### What Next

Please generate a complete UPF so that no tool-generated UPF is required and the UPF remains consistent.

### See Also

- load_upf

---

## UPF-045

(error) Supply Set '%s' is not predefined handle.

### Description

This error message occurs when the supply set specified with -handle option is not a predefined supply set handle and does not belong to a power domain or strategy. In other words, user-defined supply sets cannot be used for -handle option.

Feedback

### What Next

Ensure that a predefined and valid supply set name is specified. Check the man page on associate_supply_set for the set of acceptable predefined supply set handles (not user-defined).

### See Also

- associate_supply_set

---

## UPF-046

(error) Supply Set handle '%s' is already associated.

### Description

This error message occurs when the supply set specified with *-handle* option is already associated with another supply set. This command allows a supply set handle to be associated only once.

### What Next

Check the supply set associations. If this command was not in error, remove the previous associations by resetting the UPF.

### See Also

- associate_supply_set
- reset_upf
- load_upf

---

## UPF-047

(error) Command '%s' is not allowed to be a derived UPF constraint.

### Description

This error message occurs when a UPF command is specified as a 'derived' constraint in the UPF file. A derived constraint is one that is added by the tool to the UPF. Derived UPF commands are preceded in the UPF file with either the tcl variables "snps_upf_is_derived_constraint" or "derived_upf" set to true. These Tcl variables can be set and changed multiple times in the UPF file to indicate how the UPF commands following the variable will be treated. Derived constraints are considered as supplemental UPF.

Feedback

### What Next

Check the UPF for "snps_upf_is_derived_constraint" or "derived_upf" tcl variables. These variables are not allowed to be set to true before the specified command in the Error message. Examples of disallowed UPF commands are create_supply_set, create_power_domain, and create_power_switch. Examples of UPF commands that can be derived are set_design_attributes, set_scope and create_supply_net, which can also be applied at the command line.

### See Also

- load_upf

---

## UPF-048

(error) Supply net %s is not available in the power domain %s.

### Description

This error message occurs when the specified supply net is not defined for the specified domain. A supply net can be used only in the domains for which it has been defined.

Some examples where this error may occur are -When defining supplies for power domains, -When creating a power switch (both the input and output supplies need to be available in the power domain), -Isolation and Retention cell checks.

### What Next

First, ensure that the specified supply is the intended supply for use. If the intention is correct, use the *report_power_domains* command to see if the specified supply is available in the power domain. If the supply is not available, you must modify the UPF. Please see the man pages for the *create_supply_net* and *create_power_domain* commands for information about creating and associating supply nets to power domains.

### See Also

- report_power_domains
- create_power_domain
- create_supply_net

---

## UPF-049

(warning) Association of retention cells with retention strategies is not supported in current release.

Feedback

### Description

This message indicates that association of retention cells with UPF retention strategies is not currently supported. Instead, explicit supply net connections to the retention cells are required.

### What Next

Specify explicit supply net connections to the retention cells.

### See Also

- set_retention
- connect_supply_net

---

## UPF-050

(error) Option '%s' cannot be specified with object_type '%s'.

### Description

The specified command option cannot be used with the specified object type.

### What Next

Please see the command manpage for for more information about command option use.

### See Also

- find_objects

---

## UPF-051

(error) Supply set '%s' and supply set handle '%s' cannot be associated because they are not at the same scope.

### Description

This error message occurs during supply set association using associate_supply_set command. The supply set specified with -handle option is not at or below the scope of the specified supply set.

### What Next

Please check the UPF to ensure that the scope of the specified supply set includes the power domain of the supply set handle.

Feedback

### See Also

- associate_supply_set

---

## UPF-052

(error) Implicit supply set handle '%s' cannot be updated to supply set function '%s' using the command '%s'.

### Description

This error occurs when an implicit Supply Set handle is being updated with functions of other supply sets, without the use of associate_supply_set command. For example, using the -update option of create_supply_set to associate an implicit supply set with a new supply set function.

### What Next

The UPF needs to be changed to fix the error. To make an association between supply sets, use the associate_supply_set command.

### See Also

- create_supply_set
- associate_supply_set

---

## UPF-053

(error) Power state format is not acceptable: %s.

### Description

This error message occurs when the supply state specified in the *add_power_state* command does not comply with the UPF standard:

```
add_power_state supply_set
   -state <name> {-supply_expr <boolean function> }
prompt> add_power_state PDA.primary -state ON {-supply_expr {{power ==
 `{FULL_ON,0.8}}}}
```

### What Next

Use the correct syntax shown and rerun the command.

### See Also

- add_power_state

Feedback

## UPF-054

(error) Unable to process %s because of conflicting power state '%s' with %s.

### Description

This message occurs while attempting to update a supply net in a supply set. During the update, a power state was found with the same name as the updated supply set but is defined differently.

### What Next

Remove or rename the power state that is causing the conflict before updating or associating the supply set.

### See Also

- add_power_state
- create_supply_set
- associate_supply_set

## UPF-055

(error) Supply %s '%s' cannot be created in '%s'.

### Description

This error message occurs when a hierarchical name is specified as a supply port or supply net, but the logical instance path is invalid. The logical instance must already exist and cannot be a leaf cell.

### What Next

Use the *get_cells* command to verify that the logical instance exists. Use the *report_cell* command to ensure that the logical instance is not a leaf cell.

### See Also

- get_cells
- report_cell
- create_supply_port
- create_supply_net

Feedback

## UPF-056

(error) Conflicting power states '%s' are defined on '%s' and '%s'.

### Description

This message occurs when two conflicting power states with same name are defined.

### What Next

Remove or rename the power states that are causing the conflict.

### See Also

- add_power_state
- add_pst_state

## UPF-057

(error) %s Strategy %s has been already defined in the power domain %s.

### Description

This error occurs when a duplicated strategy name is used within the same power domain for the reported type of strategy. Name duplication is not allowed for strategies in same power domain.

### What Next

The UPF needs to be changed to fix the error. Identify the referenced duplicate strategy names associated with the referenced power domain and strategy type. If the strategy is a complete duplicate, remove one of the duplicated strategies. If the strategies are different, use a different strategy name for one of the duplicate strategies.

### See Also

- set_isolation
- set_retention
- set_level_shifter
- set_repeater

## UPF-058

(warning) Strategy element %s has direction inout which is not supported.

Feedback

### Description

This message occurs when the element's direction is inout, this is not supported, direction should be either input or output.

### What Next

Check the element name or the direction from the library. If not corrected, the element will be dropped.

### See Also

- set_level_shifter
- set_isolation
- set_repeater
- set_isolation_control

---

## UPF-059

(warning) Element %s of strategy %s is not a domain boundary port or pin of domain %s.

### Description

This warning occurs when the element object defined for the specified strategy is not a domain boundary port or pin.

### What Next

Elements specified in the message are by default dropped from the specified strategy. Check the specified element to ensure the pin or port exists and that it is on a domain boundary.

### See Also

- set_isolation
- set_level_shifter

---

## UPF-060

(warning) UPF won't be split because commit_upf has not been successfully done yet.

Feedback

### Description

This warning occurs when UPF has been loaded but commit_upf has not been run or successfully completed. IC Compiler II requires that commit_upf is run after all UPF information have been loaded to signal completion of UPF intent.

### What Next

Execute commit_upf and clean up any errors it reports before attempting to run split_constraints again.

### See Also

- commit_upf

---

## UPF-061

(warning) None of element specified in strategy '%s' in power domain '%s' is valid.

### Description

This warning message occurs when all elements specified with set_repeater/set_isolation/set_level_shifter command are illegal. As a result, the effective element list becomes empty and the strategy will not be considered for implementation. Such strategies will be deleted during commit_upf and hence will not be written out by save_upf.

### What Next

Revisit the power intent and specify valid elements for the strategy.

### See Also

- set_repeater
- set_isolation
- set_level_shifter

---

## UPF-062

(error) Strategy '%s' specified by command '%s' does not exist in power domain '%s'.

### Description

This message occurs when the strategy cannot be found in the power domain.

Feedback

### What Next

Check the domain name or the strategy name to make sure the strategy is created before this command is issued.

### See Also

- set_level_shifter
- set_isolation
- set_isolation_control
- set_retention_control
- map_retention_cell

---

## UPF-063

(warning) %s command specified library cell %s is not %s type for strategy %s.

### Description

This message occurs when the library cell type does not match the mapping command for the strategy, or is not a valid library cell view. The referenced library cell in the warning message will not be used for mapping.

### What Next

Ensure the strategy type matches with the type of cells used in the mapping list. For a level shifter strategy, the library cell should have the attribute is_level_shifter set to true. For isolation strategy, the library cell should have the attribute is_isolation set to true. For power switch cells, the library cell should have the attribute switch_cell_type set to coarse_grain. For retention cells, the library cell should have the attribute retention_cell set to certain retention cell type.

This warning can also occur when the matching library cell does not have a timing view. When the mapping list only specifies the library cell names without specifying a specific library, all libraries are searched for the library cell. In cases where a linked physical-only library contains cells with names found in the mapping list, a frame view will be retrieved. Since a frame view is not usable for optimization, this warning is issued. In such a case, the reported cell name will end with the view name "/frame".

### See Also

- map_level_shifter_cell
- map_isolation_cell

Feedback

- map_retention_cell
- map_retention_clamp_cell
- get_attribute

---

## UPF-064

(error) Power switch port '%s' is used more than once for power switch strategy %s.

**Description**

This error occurs when the same port name is specified multiple times using the -control_port or -ack_port or -input_supply_port or -output_supply_port options of create_power_switch command. Each port of a power switch instance can only be used once.

**What Next**

Ensure unique port name is used for each power switch port.

**See Also**

- create_power_switch

---

## UPF-065

(error) Power switch '%s' already exists.

**Description**

This error message occurs when an already existing power switch strategy is specified for create_power_switch command.

**What Next**

Ensure that a new and valid power switch name is specified.

**See Also**

- create_power_switch

---

## UPF-066

(error) Invalid Boolean expression '%s' in argument %s.

Feedback

### Description

The expected Boolean expression must comply with the SystemVerilog requirements.

### What Next

The Boolean expression must be a combination of instance control port names and logical or bitwise operators (!, |, ||, &, &&, ^ and ==). SystemVerilog keywords are not acceptable port names.

### See Also

- create_power_switch

---

## UPF-067

(error) Supply '%s' used in power state table '%s' is not defined.

### Description

This error occurred because the supply port or net listed in the create_pst command has not been defined in the UPF.

### What Next

Check the UPF to ensure the specified supply has been defined in the UPF. In a hierarchical block, if the supply is inside a macro or an abstract, make sure the supply is defined in the macro UPF and the macro is correctly linked in the block.

### See Also

- create_supply_net
- create_supply_port
- create_pst

---

## UPF-068

(warning) The %s name '%s' conflicts with existing signal %s name within the same scope.

### Description

This warning message occurs when the specified supply net or port name is the same as the name of a logical net or port within the same scope.

### What Next

Invoke resolve_pg_nets command to resolve the name conflict.

Feedback

This warning may occur when a PG-netlist is read before UPF is loaded, causing conflict between existing nets created by the PG-netlist and the create_supply_net or create_supply_port commands in the UPF. These warnings can be ignored when issued before commit_upf has been run.

**See Also**

- create_supply_net
- create_supply_port
- resolve_pg_nets
- commit_upf

---

## UPF-069

(error) pst_state %s of power state table %s is not fully included in lower-level power state table %s.

**Description**

This error message occurs when a pst_state defined at the higher-level power state table is not included in the power state table of a lower-level scope.

**What Next**

Remove this pst_state from higher-level power state table if it's wrongly defined or add the pst_state to the power state table in the lower-level scope.

**See Also**

- add_pst_state

---

## UPF-070

(warning) pst_state %s of power state table %s defined is ignored by implementation.

**Description**

This warning message occurs when a pst_state defined in a lower-level scope is not included or used by the higher-level power state table and therefore is ignored by implementation.

**What Next**

The referenced pst_state is ignored in the current block during optimization because the pst_state cannot occur in the current block. If the referenced pst_state is not needed in

Feedback

the current block, you can ignore this warning. If the pst_state should be used, investigate the power state table of the current block to ensure the power state tables are defined as intended.

**See Also**

- add_pst_state

---

## UPF-071

(error) Valid supply ports or PG leaf pins have not been specified.

**Description**

This error occurs when none of the object names specified with connect_supply_net are valid. Only existing leaf PG pin and supply ports can be connected to a supply net. A SEL-003 warning message will be echoed for every invalid pin and port name prior to this error.

**What Next**

Ensure the specified object exists, the object_class attribute of the object is a pin or port, and that the port_type attribute is power or ground.

**See Also**

- connect_supply_net
- get_attribute

---

## UPF-072

(information) UPF has been successfully committed.

**Description**

This message shows that the UPF has already been successfully committed.

**See Also**

- commit_upf

---

## UPF-073

(information) Total %d netlist change(s) and disconnections have been made to resolve conflicts between power intent and PG netlist.

Feedback

### Description

This message shows the number of netlist changes that have been made to resolve conflicts between power intent (based on UPF) and pg net connections (from DEF or PG netlist). UPF intent takes precedence over DEF or PG netlist connection during conflict resolution.

### What Next

Check details of changes to resolve conflicts between power intent and pg netlist by running 'resolve_pg_nets -verbose' or 'connect_pg_net -verbose'.

### See Also

- commit_upf
- resolve_pg_nets

---

## UPF-074

(Information) %s attribute '%s' is read and stored, but not used.

### Description

This message occurs when the attribute specified in set_design_attributes or set_port_attributes command is not used by the tool.

These attributes are read during load_upf, and stored in the database, and saved in the output UPF created by save_upf. But they have no impact on the tool's optimization or power intent behavior.

Typically, these attributes are either user defined, or are used by other tools. Just because ICC II does not support this attribute, it does not mean that ICC II lacks support for the feature enabled by this attribute in another tool. The implementation of that feature in ICC II may be different and not rely on an attribute setting, or may rely on a different attribute or app option setting.

### What Next

Usually no further action is needed. Check the supported attributes in man pages of set_design_attributes and set_port_attributes.

### See Also

- set_design_attributes
- set_port_attributes

Feedback

- load_upf
- save_upf

---

## UPF-075

(warning) UPF constraints and voltage areas of the design have been removed because hierarchical instance of domain root cell or power scope is deleted.

### Description

This is a warning message indicating that the UPF intent of the design are reset because of hierarchical instance of domain root cell or power scope is deleted. In addition, all the voltage areas of power domains are removed.

### What Next

You may need to read in the UPF constraints and recreate the voltage areas of the design.

### See Also

- reset_upf
- load_upf

---

## UPF-076

(information) Power intent from %sblock %s has been propagated.

### Description

This message shows that the power intent from the block has already been propagated.

---

## UPF-077

(error) '%s' is not a valid power and ground type of supply net.

### Description

This message occurs when the specified power and ground type of supply net is not valid.

### See Also

- set_design_attributes

Feedback

## UPF-078

(warning) Cannot find %s '%s' for %s attribute '%s'.

### Description

This message occurs when the object specified in the set_design_attributes and set_port_attributes command do not exist.

### What Next

Check the supported attributes in man pages of the related commands.

### See Also

- set_design_attributes
- set_port_attributes

## UPF-079

(warning) Design element %s is not on domain boundary.

### Description

This warning message occurs when attempting to specify a design element in the *-elements* option of the *set_isolation* or *set_level_shifter* or *set_repeater* command that is not a root cell of the power domain for which the strategy is being defined.

### What Next

Look at the design element in the error message, verify that it is not a root cell of the power domain, and change it to the root cell to which the strategy applies.

### See Also

- set_isolation
- set_level_shifter
- set_repeater

## UPF-080

(warning) The direction of pin/port '%s' isn't consistent with the value of '-applies_to' of strategy '%s' in power domain '%s'.

Feedback

### Description

This warning message occurs when you define an isolation strategy that combines the -applies_to and -element options, and at least one pin is listed in the -element list whose direction doesn't match with the direction implied in the -applies_to option.

### What Next

This pin will be ignored by the isolation strategy. If it is not what you want, please input another correct 'set_isolation' command line.

### See Also

- set_isolation
- set_level_shifter

---

## UPF-081

(warning) Element '%s' does not belong in power_domain '%s'.

### Description

This message occurs when the specified elements are not in the power domain where the strategy is defined.

At present, for isolation, level-shifter strategy and repeater, only the root cells of the power domain or the pins/ports on the root cells are acceptable in strategy setting.

### What Next

Use the proper elements, and run the command again.

### See Also

- set_isolation
- set_level_shifter
- set_retention
- set_repeater

---

## UPF-082

(error) Isolation or level shifter strategy '%s' will insert isolation or level shifter cells outside the scope of its power domain.

Feedback

### Description

This error message occurs when an isolation or level shifter strategy is specified with a location parent, which requires the tool to insert the power management cells outside the scope of power domain. Isolation or level shifter constraints should not refer to things outside the scope of domain to which they belong.

### What Next

Try changing the UPF such that the isolation cells are inserted within the scope of the power domain, or applying the isolation strategy after top-level integration.

---

## UPF-083

(warning) The strategy %s is conflicting with the strategy %s in power domain %s.

### Description

This error message occurs when same combination of filters (-source, -sink and/or applies_to and/or diff_supply_only and/or -applies_to_boundary) are being applied on the domain or specified elements twice. As a result, the strategy will not be considered for implementation. Such strategies will be deleted during commit_upf and hence will not be written out by save_upf.

The *set_isolation*, *set_level_shifter* and *set_repeater* commands allow you to define isolation / level shifter / repeater strategies for a power domain or its elements with different directions being specified by '-applies_to' or different source/sink supply set being specified by '-source / -sink', or different domain boundaries the strategy will apply to with '-applies_to_boundary'. But note same combination of those filters can't be redefined on the domain or same element.

For example, if you first define an isolation strategy that applies to input ports, and you secondly define an isolation strategy that applies to output ports, then you can't later define a default isolation strategy that applies to both kinds of ports, or just input or output ports.

### What Next

Define only one isolation/level-shifter/repeater strategy for a given port type or a given source/sink supply set on specified elements or domain.

### See Also

- set_isolation
- set_level_shifter
- set_repeater

Feedback

## UPF-084

(warning) For level shifter strategy %s, options %s are not permitted when option -no_shift is specified.

### Description

This warning message can occur whenever a level shifter strategy is specified with the command set_level_shifter. It signals that a level shifter strategy is specified with both the option -no_shift and one or more of the following options: -applies_to, -rule, -threshold, or -location. Such a combination is forbidden by the IEEE 1801-2009 standard, and it is handled as follows: If the options -rule, -threshold, or -location are specified, they are dropped as if the user didn't specified them. The option -applies_to is a special case as it can be useful despite its illegality. This combination of options will be supported as an extension to the standard.

### What Next

Drop one or more of the conflicting options from the source where the level shifter strategy is being specified.

### See Also

- set_level_shifter

## UPF-085

(error) %s is not a valid %s.

### Description

The specified object is not of the correct type.

### What Next

Specify the object with the correct type and rerun the command again.

## UPF-086

(warning) Isolation strategy %s in power domain %s is missing %s.

### Description

The isolation strategy is not complete, and this strategy will be skipped at insertion and association.

Feedback

### What Next

This isolation strategy will not be used in inserting and associating isolation cells. If it is not what you want, please input another correct 'set_isolation/set_isolation_control' command line.

### See Also

- set_isolation
- set_isolation_control

---

## UPF-087

(warning) Isolation strategy %s in power domain %s has force_isolation option, which is not supported right now. Option force_isolation will be ignored at insertion and association.

### Description

The isolation strategy option "force_isolation" is not supported yet.

### What Next

This isolation strategy option "force_isolation" will not be ignored at inserting isolation cells. If it is not what you want, please input another correct 'set_isolation/set_isolation_control' command line.

### See Also

- set_isolation
- set_isolation_control

---

## UPF-088

(error) Cannot associate cell %s with %s strategy, this cell will be skipped.

### Description

The isolation strategy can only be associated with isolation cell, level shifter strategy can only be associated with level shifter cells, same goes for retention cells and power switches.

### What Next

Specify correct strategy and rerun the command.

Feedback

### See Also

- get_power_strategies

---

## UPF-089

(error) Cannot find the real signal preservation of control signal '%s'.

### Description

This error message occurs when specified isolation_signal, save_signal, restore_signal or switch control signal isn't driven by a unique real driver. The real drivers include output pins of leaf level cells, input hierarchical pins and input top level design ports. In case of switch ack signal, this error occurs if ack signal is not connected to real load. The real loads include input pins of leaf level cells, output hierarchical pins and output top level design ports.

### What Next

Modify the command so that it specifies a control signal that is being driven by a real driver/load.

### See Also

- set_isolation
- set_isolation_control
- set_retention
- set_retention_control
- create_power_switch

---

## UPF-090

(warning) Clamp value of library cell %s doesn't match the clamp value of isolation strategy %s. Discarding this library cell.

### Description

This message occurs when the library cell type does not match the mapping command for the strategy.

### What Next

Clamp of library cell should match isolation strategy. If it's not corrected, the library cell will be dropped in the mapping cell list.

Feedback

### See Also

- map_isolation_cell

---

## UPF-091

(information) Related supply net, driver_supply or receiver_supply set on hierarchical pin %s is ignored.

### Description

This is an informational message indicating that the set_related_supply_net or set_port_attribute -driver_supply/-receiver_supply command on any hierarchical pins is ignored. According to the UPF language reference manual, -driver_supply and -receiver_supply specifications of the set_port_attribute statement is permitted only on top-level ports and macro leaf pins. Related supply net will be gotten from the real driver/receiver(s) when the connections are in the netlist. save_upf does not output these ignored constraints.

### See Also

- set_related_supply_net
- set_port_attributes

---

## UPF-092a

(warning) Power Domain %s strategy %s applied on pin %s applies to lower domain boundary with -location other, cannot be used for split_constraints on voltage violation path.

### Description

This error message occurs when running the split_constraints command. If there is a level-shifter violation on any pin of the block under consideration, -location other on lower domain boundary port cannot be used for split_constraints.

### What Next

Use the set_level_shifter command and specify a valid level_shifter strategy.

### See Also

- split_constraints
- set_level_shifter

Feedback

## UPF-092

(error) There is a voltage violation on the net connected to pin %s. Specify a level-shifter strategy with location parent/self or set 'no_shift'.

### Description

This error message occurs when running the split_constraints command. If there is a level-shifter violation on any pin of the block under consideration, a clear location must be specified for the level-shifter strategy with location parent/self, or set the -no_shift option for this pin.

### What Next

Use the set_level_shifter command and specify a level_shifter strategy.

### See Also

- split_constraints
- set_level_shifter

## UPF-093

(error) Combination of level shifter and isolation location on pin %s is not supported.

### Description

This error message occurs when running the split_constraints command. A combination of location parent for the level shifter and location self for isolation is not allowed for the input pin, and location self for the level shifter and location parent for isolation is not allowed for the output pin.

### What Next

Change the location combination for the level shifter and isolation strategy and run the command again.

### See Also

- split_constraints
- set_isolation
- set_level_shifter

Feedback

## UPF-094

(information) %s is set to %s.

### Description

This is a informational message indicate that Isolation or Lever Shifter cell name prefix or suffix default string is set by name_format command.

### See Also

- name_format

## UPF-095

(information) ignore %s command for creating %s %s.

### Description

This is a informational message indicating that the create_supply_port/net command in top only UPF for supply port/net in physical block is ignored. Such supply port/net should be created inside the block UPF.

### See Also

- create_supply_port
- create_supply_net

## UPF-096

(warning) supply port %s already exists, ignore create_supply_port command for creating this supply_port again.

### Description

This is a warning message indicating that the create_supply_port command is ignored because this supply port already exists.

### What Next

Remove the duplicate create_supply_port command.

### See Also

- create_supply_port

Feedback

## UPF-097

(error) Power cell %s is not associated with any power strategies or supply net connections.

### Description

This is an error message indicating that either isolation cells, level shifter cells, power switch cells, or retention cells in the design are not properly associated with any power strategies.

### What Next

There are several ways to fix this problem. First is to fix power strategies in UPF file to cover all power cells in the design. Second is to associate the cells manually with set_power_strategy command, or connect_supply_net. Last is to remove the existing power cells.

### See Also

- connect_supply_net

## UPF-098

(information) Isolation strategy '%s' specifies no elements with the -no_isolation option.

### Description

This warning message occurs because set_isolation command has no objects specified with the -no_isolation option. No isolation cells will be inserted for the strategy's power domain unless other isolation strategies explicitly specify elements for isolation.

### What Next

This is an information-only message. No action is required. However, you might want to check whether the elements should be specified.

### See Also

- set_isolation

## UPF-099

(warning) The related supply net of pin '%s' cannot be determined.

Feedback

### Description

This warning message occurs because the related supply net of the specified pin or port cannot be determined.

### What Next

Check the related PG pin of the specified pin and its supply net.

### See Also

- set_domain_supply_net
- connect_supply_net
- report_cell

---

## UPF-100

(warning) Enabled level shifter %s ignored in map_level_shifter command.

### Description

This message occurs when the library cell type is enabled level shifter instead of level shifter for map_level_shifter command.

### What Next

For level shifter strategy, we don't support enabled level shifters used as level shifter cells. Enabled level shifters can be used for isolation cells but not level shifter cells.

### See Also

- set_level_shifter
- set_isolation
- set_isolation_control

---

## UPF-101

(error) Value '%s' for %s signal sense of retention strategy '%s' of power domain '%s' is not valid. Specify one of: high, low.

### Description

This message occurs when the signal sense specified for retention strategy is not supported or invalid.

Feedback

### What Next

Check the signal sense and invoke the command again.

### See Also

- set_retention
- set_retention_control

---

## UPF-102

(error) %s has already been defined on the retention strategy '%s' of power domain '%s'.

### Description

This error message occurs when set_retention_control or map_retention_cell is issued but save/restore signals or another set_retention_control or map_retention_cell command have already been defined for this retention strategy.

### What Next

Check the *set_retention*, *set_retention_control* or *map_retention_cell* constraint.

### See Also

- set_retention
- set_retention_control
- map_retention_cell

---

## UPF-103

(error) Library cell '%s' specified by retention strategy '%s' of power domain '%s' is not a retention cell type.

### Description

This message occurs when the library cell type does not match the mapping command for the strategy.

### What Next

Check the library cell type.

### See Also

- map_retention_cell

Feedback

## UPF-104

(warning) Isolation or level shifter strategy '%s' can't insert isolation or level shifter cells inside leaf or macro cell '%s'.

### Description

This error message occurs when an isolation or level shifter strategy is specified with a location self on leaf cell or macro cell, which requires the tool to insert the power management cells inside leaf cell or macro cell.

### What Next

Try changing the location of the strategy. If not the element will be dropped.

### See Also

- set_isolation
- set_isolation_control
- set_level_shifter

## UPF-105

(warning) Strategy element %s is located on lower domain boundary of strategy '%s', which does not work with location parent or fanout.

### Description

This warning message occurs when you specify a value of *parent* or *fanout* for the *-location* option, and an element specified with the *-elements* option is on the lower-domain boundary.

### What Next

Try changing the *-location* setting. Otherwise, the command drops the element specified in the warning message.

### See Also

- set_isolation
- set_level_shifter

Feedback

## UPF-106

(error) Cannot apply UPF %s on retention strategy '%s' of power domain '%s' because -no_retention is specified.

### Description

This message occurs when set_retention_control or map_retention_cell is specified for the retention strategy with -no_retention.

### What Next

Check the specified retention strategy.

### See Also

- set_retention
- set_retention_control
- map_retention_cell

## UPF-107

(warning) Element '%s' is already an element of retention strategy '%s' of power domain '%s' and cannot be set as element of %s.

### Description

This message occurs when two different set_retention or map_retention_cell commands mention the element either explicitly in their elements list or by default (not specifying any elements and thereby defaulting to the power domain root cell).

### What Next

Check the correctness of the set_retention or map_retention_cell commands and their elements options used for the strategies, and assign the cell to one strategy only.

### See Also

- set_retention
- set_retention_control
- map_retention_cell

Feedback

## UPF-108

(error) None of library cell specified in map_%s_cell of %s strategy %s is legal.

### Description

This error message occurs when all library cells specified with map_isolation_cell or map_level_shifter_cell or map_retention_cell, or map_retention_clamp_cell are illegal.

### See Also

- map_isolation_cell
- map_level_shifter_cell
- map_retention_cell
- map_retention_clamp_cell

## UPF-109

(warning) Retention strategy %s in power domain %s is missing %s.

### Description

The retention strategy is not complete, and this strategy will be skipped for association and mapping of retention cells.

### What Next

This retention strategy will not be used in association and mapping of retention cells. If it is not what you want, please input another correct 'set_retention/set_retention_control' commands.

### See Also

- set_retention
- set_retention_control

## UPF-110

(error) Driver or receiver supply attribute of '%s' are already defined.

### Description

This error message occurs when the ports already have driver or receiver supply attribute using -driver_supply or -receiver_supply argument of set_port_attributes and

Feedback

set_related_supply_net is used on the same ports again. The driver and receiver supply attributes have higher precedence than the related_supply_net attribute.

**What Next**

Change the related supply net by using -driver_supply or -receiver_supply argument of set_port_attributes.

**See Also**

- set_port_attributes
- set_related_supply_net

---

## UPF-111

(error) Found duplicated supply name '%s' in power state table '%s'.

**Description**

This error message occurs when the duplicated supply net or port name is specified for the power state table.

**What Next**

Re-run the command without any duplicated supply net or port names.

**See Also**

- create_pst

---

## UPF-112

(warning) %s supply of %s port '%s' will be ignored.

**Description**

This message occurs when the driver or receiver supply of the port will be ignored due to the port direction.

**What Next**

Check the port direction and the driver and receiver supplies of the port.

**See Also**

- set_port_attributes

Feedback

## UPF-113

(error) Supply Set handle '%s' is already associated with supply net '%s'.

### Description

This error message occurs when the supply set specified with *-handle* option is already associated with supply net(s). This command allows a supply set handle to be associated only once. This could occur if supply set handle was updated to supply nets using -update option.

### What Next

Remove the previous associations and updates with resetting the UPF.

### See Also

- associate_supply_set
- create_supply_set

## UPF-114

(error) Associating '%s' with '%s' creates a loop of associations.

### Description

This error message occurs when the association of supply set specified by *-handle* option creates a cycle or loop of associations. This means supply sets have A->B->C->A type of associations which are not allowed.

### What Next

Remove the previous associations and updates with resetting the UPF.

### See Also

- associate_supply_set

## UPF-115

(error) Supply set reference '%s' is same as supply set handle '%s'.

### Description

This error message occurs when the supply set specified by *-handle* option is same as the supply set reference.

Feedback

### What Next

Specify a different supply set for associations.

### See Also

- associate_supply_set

---

## UPF-116

(warning) Please do 'set_app_options -global {upf.exec_logic_eco_command true}' before loading the UPFs from split_constraints, so control signal(s) can be connected to the block(s) correctly.

### Description

This message occurs when any control signal for block UPF strategy originally is not available in the block. In order to connect control signal to the block, 'create_logic_port', 'create_logic_net' and 'connect_logic_net' commands will be added to the UPFs from split_constraints. These commands are not formally supported yet. User has to set the option 'upf.exec_logic_eco_command' to true, so the commands will be executed.

### What Next

Do 'set_app_options -global {upf.exec_logic_eco_command true}' before loading UPFs generated from split_constraints.

### See Also

- set_app_options

---

## UPF-117

(error) Unable to set related supply net for %s as supply net %s is not available in the block. %s

### Description

This error message occurs when running the *split_constraints*. The supply net to be set as the related supply net for the specified pin is unavailable for use.

### What Next

Make the supply net available for use in the block and run the command again.

### See Also

- split_constraints

Feedback

## UPF-118

(warning) Unable to set related supply net of pin %s because the driver or load supply is not uniform.

### Description

This warning message occurs when running the *split_constraints* command if there are multiple drivers or loads for the pin and they are not all powered by the same supply.

### What Next

This is only a warning message. No action is required.

However, you can run the *set_related_supply_net* command manually on such pins, if needed.

### See Also

- split_constraints

## UPF-119

(error) Unable to split the UPF for block %s because domain %s is nested inside but its scope is outside the block.

### Description

This error message occurs when running the split_constraints command. Domain nested inside block has to be scoped at or inside the block.

### What Next

Change the scope of the nested domain to be at or inside the block.

### See Also

- split_constraints
- create_power_domain

## UPF-120

(Error) The power net and ground net specified in %s strategy %s come from different supply sets.

Feedback

### Description

Both power and ground implicit supply nets from the same supply set must be used simultaneously. It's an error if only the power or the ground is specified using an implicit supply net or if both nets belong to different supply sets.

### What Next

Specify the supply nets as above description.

### See Also

- set_isolation
- set_retention

---

## UPF-121

(error) %s strategy %s does not apply to cell %s, this cell will be skipped.

### Description

The isolation strategy can only be associated with isolation cell with matching location, iso clamp, sense and iso signal.

---

## UPF-122

(warning) Logic net '%s' does not have any flat driver pins.

### Description

This message occurs when the specified net does not have any flat driver pins after execute connect_logic_net command.

### What Next

Check the net connections.

### See Also

- connect_logic_net
- report_net

---

## UPF-123

(error) Due to the error(s) above, UPF can't be split. Please fix all the errors.

Feedback

### Description

This error message occurs when running the split_constraints command. No block and top only UPFs will be created if any serious error is found.

### What Next

Fix all the errors and run split_constraints again.

### See Also

- split_constraints

---

## UPF-124

(error) Cannot set related supply net for pin %s because at least two conflicting level-shifter strategies are applied to this pin: %s of domain %s and %s of domain %s.

### Description

This error message occurs when you run the *split_constraints* command and the tool cannot determine the correct related supply net for the block pin because there are at least two conflicting level-shifter strategies. For example, one strategy adds the level shifter inside the block but the other one add the level shifter outside the block.

### What Next

Fix the error and run the *split_constraints* command again.

### See Also

- split_constraints
- set_level_shifter

---

## UPF-125

(error) Power domain %s is nested inside block %s but its scope is outside the block.

### Description

This error occurs when the tool identifies a power domain that is nested inside a block, but its scope is outside the block. The scope of a power domain must be at or inside the block associated with the power domain.

### What Next

Change the scope of the nested power domain to be at or inside the block.

Feedback

### See Also

- create_power_domain

---

## UPF-126

(error) Cannot create power domain %s at the top level because it contains element %s, which is inside a block.

### Description

This error occurs when the tool detects that an element associated with a power domain is inside a block. A power domain that is nested inside block must be created in the block.

### What Next

Load the UPF that creates the power domain in the block design, rather than at the top level.

### See Also

- load_upf
- create_power_domain

---

## UPF-127

(error) Cannot accept %s '%s' for logic net connection.

### Description

This message indicates that the net is not logic or digital. connect_logic_net command should only connect a digital logic net to digital logic ports.

### What Next

Check the port name, net name and its type.

### See Also

- connect_logic_net
- UPF-374

---

## UPF-128

(error) Cannot create power domain %s at the top level.

Feedback

### Description

Block domain has to be created in the block design except scoped-parent domain for top of the block.

### What Next

Load the UPF that creates the power domain in the block design, rather than at the top level.

### See Also

- load_upf
- create_power_domain

---

## UPF-129

(error) Invalid attribute format for '%s' attribute '%s': %s.

### Description

This error message occurs when the attribute option specified in the *set_design_attributes* or *set_port_attributes* command does not follow the UPF standard.

### What Next

Use the following syntax and rerun the command:

```
set_design_attributes
   [-attribute {name value}]
set_port_attributes
   [-attribute {name value}]
```

### See Also

- set_design_attributes
- set_port_attributes

---

## UPF-130

(error) [MIM] %s UPF constraints are different in multi-instantiated block:

### Description

This error message occurs when the UPF constraints are different in multi-instantiated blocks. In such case, split_constraints won't be able to split UPF for the multi-instantiated block.

Feedback

### What Next

- Modify UPF constraints for the blocks so the blocks can share one UPF file. • You can force the creation of the multi-instantiated module (MIM) UPF by setting the app_option *mv.hierarchical.ignore_mib_checking_error*. It is even possible to select which instance is used to create the MIM UPF assigning the cell attribute *is_upf_mim_primary_instance* to the desired instance.

### See Also

- split_constraints
- mv.hierarchical.ignore_mib_checking_error
- cell_attributes
- set_attribute

## UPF-131

(error) Cannot find %s to re-associate with voltage area %s.

### Description

This error message occurs when the tool tries to re-associate voltage areas (retained after reset_upf) with power domain(s) and supply net(s) in commit_upf after new UPF is loaded, but failed to find the power domain(s) or supply net(s).

### What Next

Delete the voltage area if it is no longer needed or correct, otherwise modify UPF file to include all the objects needed for this voltage area.

### See Also

- load_upf
- reset_upf
- commit_upf
- create_voltage_area
- remove_voltage_areas

---

## UPF-132

(information) UPF constraints of the design have been removed.

Feedback

### Description

This is a informational message indicating that the UPF intent of the design are reset.

### What Next

You may need to read in the UPF constraints of the design.

### See Also

- reset_upf

---

## UPF-133

(warning) The retention cell type '%s' of the element '%s' does not match the library cell type '%s' of the retention strategy '%s'.

### Description

This message occurs when the library cell type of retention strategy does not match the library cell type of the specified element. Retention cell elements can still be associated to the retention strategy if other criteria for association passes.

### What Next

See the *map_retention_cell* command man page for information about the *-lib_cell_type* option.

### See Also

- map_retention_cell

---

## UPF-134

(warning) The library cell of the element '%s' does not match the library cells specified in the retention strategy '%s'.

### Description

This message occurs when library cell of the retention cell does not match the library cells of the strategy. Retention cell elements will be skipped during association of retention cells if their library cell does not match the library cells or library cell type specified in the retention strategy.

### What Next

See the *map_retention_cell* command man page for information about the *-lib_cells* option.

Feedback

**See Also**

- map_retention_cell

---

## UPF-135

(error) Library cell type '%s' of retention strategy '%s' is illegal.

**Description**

This error message occurs in one of the following situations.

- there are no retention registers in the library

- specified library cell type has blank space in it

- none of the retention registers in the library have the specified type

**What Next**

Check the library cell type.

**See Also**

- map_retention_cell
- report_mv_lib_cells

---

## UPF-136

(warning) Logic net '%s' has more than one flat driver pins ('%s' and '%s').

**Description**

This message occurs when the specified net has multiple flat driver pins after execute connect_logic_net command.

**What Next**

Check the net connections.

**See Also**

- report_net

Feedback

## UPF-137

(error) Supply set %s which is associated with %s is not available in block %s.

### Description

This error message occurs when running the split_constraints command. Tool cannot split UPF constraints for the block because the supply set which is needed for associate_supply_set command is not available in the block.

### What Next

Modify UPF constraints and re-run split_constraints.

### See Also

- split_constraints
- associate_supply_set

## UPF-138

(warning) The strategy %s on element %s conflicts with the strategy %s in power domain %s.

### Description

This warning message occurs when same combination of filters (-source, -sink and/or applies_to and/or diff_supply_only and/or -applies_to_boundary) are being applied on the domain or specified elements twice.

The *set_isolation*, *set_level_shifter* and *set_repeater* commands allow you to define isolation / level-shifter/repeater strategies for a power domain or its elements with different directions being specified by '-applies_to' or different source/sink supply set being specified by '-source / -sink' or different domain boundaries the strategy will apply to with '-applies_to_boundary'. But note same combination of those filters can't be redefined on same element.

For example, if you first define an isolation strategy that applies to input ports, then you can't later define another default isolation strategy that applies to both kinds of ports or just input ports.

### What Next

Define only one isolation/level-shifter/repeater strategy for a given port type or a given source/sink supply set on specified elements or domain.

Feedback

**See Also**

- set_isolation
- set_level_shifter
- set_repeater

---

## UPF-139

(warning) Strategy %s on element %s will insert cells outside the scope of its power domain.

**Description**

This error message occurs when an isolation or level shifter strategy is specified with a location parent, which requires the tool to insert the power management cells outside the scope of power domain. Isolation or level shifter constraints should not refer to things outside the scope of domain to which they belong.

**What Next**

Try changing the UPF such that the isolation/level shifter cells are inserted within the scope of the power domain.

---

## UPF-140

(error) Unable to split the UPF for block %s because it is not root cell of its domain (%s).

**Description**

This error message occurs when running the split_constraints command. Currently the tool only supports splitting UPF for block which is domain root cell.

**What Next**

Modify the UPF and run split_constraints again.

**See Also**

- split_constraints
- create_power_domain

---

## UPF-141

(error) Logic net '%s' cannot be connected to the logic port '%s'. Connection across power-domain boundaries is not allowed as per UPF semantics. No connections done.

Feedback

### Description

This error is seen when there is at least one port in the port list that does not lie within the extent of the power domain in which the net is defined. A net can only be connected to ports that lie within the extent of the power domain(s) in which the net is defined. All ports listed in port list are ignored and no connections are performed.

### What Next

Remove the non-qualifying ports and rerun this command. If the indicated logic port and net must be connected, create the appropriate logic port(s) and net(s) in the intermediate power domain(s), and then connect the logic port to the corresponding net within the same power domain.

### See Also

- create_logic_net
- create_logic_port
- connect_logic_net

---

## UPF-142

(error) %s type net '%s' cannot %s %s type net '%s' through the hierarchy pin '%s'. No connections done.

### Description

This error is seen when there is at least one hierarchical pin in the port list has an existing net connected with other side of the hierarchical pin, and the net type is illegal with specified logic net.

Below illegal connection will be checked and reported: - signal net drives tie high/low net. - tie high/low net connected with tie low/high net.

All ports listed in port list are ignored and no connections are performed.

### What Next

Remove the non-qualifying ports and rerun this command.

### See Also

- connect_logic_net

Feedback

## UPF-143

(error) Logic port '%s' is already connected to net '%s'. No connections done.

### Description

This error is seen when there is at least one port in the port list has already been connected.

All ports listed in port list are ignored and no connections are performed.

### What Next

Remove the non-qualifying ports and rerun this command. If the indicated logic port and net must be connected, try to use '-reconnect' option.

### See Also

- connect_logic_net

## UPF-144

(error) Domain %s and %s cannot be merged because %s.

### Description

This message occurs when the tool tries to merge two domains, but these two domains have conflict UPF constraints. The basic rules for two domains to be merged are:

1. Have equivalent domain primary supplies.
2. No conflict in power_switch, retention, Level-Shifter and Isolation strategies.

Note: If a child hierarchy is a root cell of top Power Domain, Tool automatically merges sub-block Power Domain into top Power Domain.

### What Next

- Fix the problem in the UPFs described in the message. Reload and commit the UPF.
- Ensure merged Power Domains have the same primary supply. If merging is not expected for child and parent hierarchies, please remove the parent Power Domain from UPF file, so Tool can reuse child Power Domain.

### See Also

- commit_upf
- create_power_domain

Feedback

## UPF-145

(error) Cannot bring control signal for %s %s to block %s because pin %s doesn't connect to any net.

### Description

This message occurs when split_constraints cannot bring a control signal to the block for strategy or power state in the block.

### What Next

Connect the pin to a net.

### See Also

- split_constraints

## UPF-146

(error) the location for isolation strategy '%s' of domain '%s' is automatic which cannot be supported in split_constraints.

### Description

This message occurs when the location of isolation strategy for the top domain of the block is automatic.

### What Next

Specify location self, parent or fanout for this isolation strategy.

### See Also

- split_constraints
- set_isolation
- set_isolation_control

## UPF-147

(error) UPF for black_box design cannot be loaded from top.

### Description

This error occurs when the tool detects UPF for black_box design is being loaded from the top. UPF for black_box design must be loaded in the black_box design.

Feedback

### What Next

Open the black_box design, load the UPF for it and then save the design.

### See Also

- load_upf

---

## UPF-148

(error) Supply net %s cannot be connected to the pin %s that is in different physical hierarchy.

### Description

A supply net cannot be connected to power pins that are in different physical hierarchy.

### What Next

Make the supply net connection in the design of the physical block instead.

### See Also

- connect_supply_net

---

## UPF-149

(error) Adding new UPF constraint into block design %s in %s view is not yet supported.

### Description

The message occurs when tool needs to add new UPF constraint (because of adding new power_switch or new feedthrough port) into block in the view type indicated in the message which is not yet supported.

### What Next

Link the blocks with only supported view type.

### See Also

- change_abstract

---

## UPF-150

(error) MV constraints cannot be added for new port %s because neither its driver supply (%s) nor its receiver supply (%s) are available in block %s.

Feedback

### Description

The message occurs when the tool cannot add correct MV constraints to new port because the supplies needed are not available in the block.

### What Next

possible actions:

- modify the UPF to make either of the supplies reported available inside block (note that this might have an impact on pg implementation)
- If possible disable feedthrough creation on the reported block (or specific net) to prevent the feedthrough port from being created.
- The created feedthrough port will not have a related supply net annotated, therefore at the block level the domain primary supplies will be used. A set_dont_touch must be applied on the net connected to the specified port at the block level, if the UPF-150 message has been ignored.

---

## UPF-152

(error) Isolation strategy '%s' of power domain '%s' uses a location of parent or fanout, but the ports identified for isolation go to both parent and fanout domains.

### Description

This error indicates a situation where an isolation strategy is defined to place the isolation cells in either a parent or fanout domain, but the ports identified for isolation go to both parent and fanout domains. As a result, the strategy cannot be fully honored due to the ambiguity in the constraint.

This situation typically happens due to 'set_design_attributes -elements {.} -attribute lower_domain_boundary' being true. When this attribute is true, the domain boundary is identified not just by the ports of the hierarchy elements where the domain is defined (upper domain boundary), but also by the ports of any nested domain hierarchies in that domain (lower domain boundary).

If set_isolation is used without -elements, then it will pick up ports belonging to both the upper and lower domain boundaries, if there are nested domains. The upper domain

Feedback

boundary goes to a parent placement location, and the lower domain boundary goes to a fanout placement location. This causes ambiguity in the strategy setting if -location parent or fanout is used, and so the error is issued.

For example, suppose there is a top domain PD_TOP, with a second domain PD_A nested inside it, and PD_A has another domain PD_B nested inside of it.

create_power_domain PD_TOP create_power_domain PD_A -elements {a} create_power_domain PD_B -elements {a/b}

Now you want to isolate the inputs of PD_A with the isolation buffers placed in PD_TOP. So you apply:

set_isolation ISO_STRATEGY -domain PD_A -applies_to inputs set_isolation_control ISO_STRATEGY -domain PD_A -location parent

If the lower_domain_boundary attribute is set true, this will cause the UPF-152 error during commit_upf. This is because the '-applies_to inputs' directive will pick up not just the ports going in to PD_A from PD_TOP, but will also pick up the ports going out of PD_B into PD_A. The '-location parent' constraint makes no sense on those ports between PD_A and PD_B, since PD_B is a fanout location of PD_A, not a parent. So the error is issued.

**What Next**

You can avoid the error in two ways. The least disruptive approach is to use 'set_isolation -elements' to more explicitly specify which ports should be isolated. In the example above, you can avoid the error by modifying the set_isolation constraint:

set_isolation ISO_STRATEGY -domain PD_A -applies_to inputs -elements {a}

This restricts the isolated ports to only those on the 'a' hierarchy, for which a parent location makes sense. The ports on the 'a/b' hierarchy which conflict with the parent location directive are now excluded. This constraint can now be committed by commit_upf.

An alternate solution to avoid the UPF-152 error is to change the lower_domain_boundary setting:

set_design_attributes -elements {.} -attribute lower_domain_boundary false

This changes domain boundary identification to not consider the lower boundary when nested domains are present. So, the ports of hierarchy 'a/b' are no longer considered boundaries of PD_A.

This solution would not work for '-location fanout' in the example given above. It also has possible side-effects on the interpretation of other UPF constraints, since it can impact the ports considered by all set_isolation and set_level_shifter '-applies_to' options. It can also impact objects returned by the find_objects command.

So, using 'set_isolation -elements' is typically the less disruptive solution to avoiding this error, rather than changing the lower_domain_boundary setting.

## UPF-153

(error) Multi-level physical hierarchy UPF design is not supported yet. %s is a physical block in this design.

### Description

This error message occurs when executing create_abstract command with -preserve_block_instance on design with physical hierarchy inside.

### What Next

Make design only one-level physical hierarchy or remove -preserve_block_instance option.

### See Also

- create_abstract

---

## UPF-154

(error) UPF design with multi-level physical hierarchy is not supported yet. This design contains more than two-level physical hierarchy. For example: %s is a physical block inside physical block %s which inside current top design.

### Description

This error message occurs when applying UPF constraints to a design with more than two-level physical hierarchy.

### What Next

Make design no more than two-level physical hierarchy.

### See Also

- commit_upf

Feedback

## UPF-155

(error) UPF cannot be applied to an ETM with the load_upf command.

### Description

This error message occurs when the load_upf command is used to apply UPF to an ETM. load_upf can only be used to apply UPF for blocks, not hard macros.

### What Next

ETM UPF is generated from the original block by running save_upf -for_etm. This UPF should then be applied in a top-level closure flow using ETM abstractions for one or more blocks. load_upf is not used to apply the UPF in this case. Instead, the constraint mapping file is used.

Specify the constraint mapping file that points to the ETM UPFs with the set_constraint_mapping_file command. This file does not have to include all constraint mapping information, just that needed for the ETM UPFs. These constraint mappings will be appended to any existing constraint mappings stored on the design. Alternately, set_constraint_mapping_file -reset can be used to remove all constraint file mappings, and then they can all be reapplied using set_constraint_mapping_file again.

The format for the constraint mapping file is as follows:

<block_reference_name> ETM_UPF <UPF_file>

The mapped ETM UPF constraints will be loaded automatically when required. Only the mapping file is saved in the design. The ETM UPFs must remain in the locations specified in the mapping file for them to be successfully loaded.

For example, suppose a block instance u_block1 in the top design is linked to an ETM reference block1_etm:

set_constraint_mapping_file etm_mapping.txt

The mapping file might contain:

block1_etm ETM_UPF ./upf/block1_etm.upf

This UPF for the ETM will be read as needed from the path specified in the mapping file.

Feedback

## UPF-156

(error) Retention strategy %s will not be implemented for cell %s in power domain %s. This cell has no mapping constraint defined using the map_retention_cell command.

### Description

This error indicates that the specified cell targeted for retention synthesis does not have mapping directive specified using the *map_retention_cell* command. As a result, the strategy will not be implemented for the specified cell. If this cell is a hierarchical cell, sequential elements inside it might remain unmapped.

### What Next

Add the specified cell to *-elements* list of the *map_retention_cell* command.

### See Also

- set_retention
- map_retention_cell

## UPF-157

(error) The element %s specified in map_retention_cell is not included in the element list of retention strategy %s in power domain %s. The retention strategy will be skipped for association and insertion.

### Description

This error indicates that the specified cell which is included in *-elements* list of *map_retention_cell* is not included in the *-elements* list of *set_retention* strategy. This is an error as per the UPF standard.

As per the UPF standard, following are the rules.

- If *map_retention_cell* has *-elements* list specified, *set_retention* must have same elements in its *-elements* list. In other words, *set_retention* cannot be domain-level strategy.

- If *set_retention* has *-elements* list specified, *map_retention_cell* need not have *-elements* list.

These rules ensure that all the elements of the strategy will have *map_retention_cell* directive.

### What Next

Make sure one of the rules specified above are met.

Feedback

### See Also

- set_retention
- map_retention_cell

---

## UPF-158

(warning) Retention strategy %s for power domain %s has no mapping constraint defined using map_retention_cell command.

### Description

This warning indicates that mapping constraints have not been defined on the retention strategy for the specified power domain using the map_retention_cell command. As a result, no retention cells will be inserted for the specified strategy during Synthesis. However, tools will associate the existing retention cell(s) with this retention strategy.

### What Next

Define the mapping constraints for the retention strategy using the map_retention_cell command.

### See Also

- set_retention
- map_retention_cell

Feedback

## UPF-165

(error) UPF for block %s cannot be split because its %s hierarchy %s is in the block list already.

### Description

These two blocks have parent-child relationship but split_constraints command cannot support multi-level-physical-hierarchy.

### What Next

Do split_constraints for multi-level-physical-hierarchy UPF two-level at a time in top-down manner.

### See Also

- split_constraints
- set_budget_options

## UPF-166

(error) For a multilevel physical hierarchy MV design, this is not supported: %s

### Description

Certain UPF design styles are not supported in the current release for multilevel physical hierarchy (MPH). This message warns of those situations. It may be encountered during the commit_upf command or the create_abstract command.

For commit_upf, there are two unsupported cases:

(1) A physical hierarchy block in the design is not a power domain root element. In simple terms, this means that a power domain is not defined at the same hierarchy level as the top hierarchy of the block. For example, if a block is called U1, both 'create_power_domain PD1 -elements {U1}' and create_power_domain PD1 -scope U1' would create a power domain where U1 is the root element. In some cases it may seem like a hierarchy would be a power domain root element, but it is not. Suppose there is a block U1 and another block inside U1 called U1/U2. If a power domain is created with 'create_power_domain PD1 -elements {U1 U1/U2}', it may appear that U1/U2 is a root element for the power domain. But because U1/U2 is contained completely inside U1, only U1 is the root element, so U1/U2 would trigger a UPF-166 error.

(2) A self-scoped physical hierarchy block has an isolation or level-shifter strategy with -location parent. Self-scoped means that the power domain root element is also the scope of the power domain. For example, 'set_scope /; create_power_domain PD1 -elements {U1}' would create a power domain PD1 at U1 hierarchy but it is scoped to the

Feedback

top hierarchy. So it is not self scoped. But, 'set_scope U1; create_power_domain PD1' would instead create a power domain U1/PD1 which exists at the U1 scope. This is a self scoped power domain. For a self-scoped power domain, using parent location for isolation or level shifter cells puts those cells outside the scope of the power domain. For two-level physical hierarchy, this is supported, but not yet for MPH.

The UPF-166 message can also be issued by the create_abstract command, under three circumstances:

(1) A block inside the abstract being created is not a domain root element. See explanation (1) above for commit_upf for a description of domain root elements.

(2) The top domain of a block inside the abstract being created is not self-scoped. All blocks inside the abstract must be self-scoped. See explanation (2) above for commit_upf for a description of self-scoped power domains.

(3) The top domain of a block inside the abstract being created cannot have any isolation or level-shifter strategies with parent location.

**What Next**

Given the restriction above for multilevel physical hierarchy designs, update the UPF constraints to match what the tool can support.

## UPF-170

(error) Terminal boundary attribute is set on non-domain boundary "%s".

### Description

This message occurs when running commit_upf command. If design attribute "terminal_boundary" is set on a cell which is not a root element of a power domain, the error will be reported.

### What Next

Modify UPF and remove the non-domain root cell from "-element" list of the command "set_design_attribute".

### See Also

- create_power_domain

---

## UPF-171

(error) Port/power state '%s' for %s is used in pst '%s' but has not been defined.

### Description

UPF statements should only reference already defined objects. If a UPF statement references an object (such as a port or power state) that has not been defined, load_upf typically gives a UPF-006 error. In the case of hierarchical design, sometimes it is expected that an object may not exist yet. For example, a top level PST table created with create_pst may reference supply nets or ports from blocks whose UPF has not been read yet. In these situations, the object name checking is deferred to allow all UPF files to be read.

This error occurs during commit_upf or change_abstract when a port state (add_port_state) for a supply port, or power state (add_power_state) for a supply set, that is referenced by UPF from a higher level of hierarchy never gets defined in the block UPF files. For example:

## Top Level UPF create_pst ... top_pst -supplies {VDD VSS U1/VDD1 U1/VSS1}
add_pst_state ... -pst top_pst {on on on1 on1}

Feedback

## Block U1 UPF create_supply_port VDD1 create_supply_port VSS1 ... add_port_state VDD1 -state {on2 0.8}

The top level UPF references power state on1 for both of the U1 block supplies in the top_pst PST table. But in the U1 block UPF, only state on2 is defined, not on1. A UPF-171 error would occur in this situation.

**What Next**

Check the top UPF add_pst_state commands, and compare the state names to those from the block UPF add_port_state and add_power_state commands. Ensure that all of the state names associated with the block supplies from the top UPF are defined in block UPF.

- commit_upf
- change_abstract

---

## UPF-172

(error) Wildcard '*' for %s is used in pst '%s' but no port/power state has been defined for this supply and its equivalent supplies.

**Description**

This message occurs when wildcard is specified in the PST for a supply but there is no port/power state has been defined for this supply and its equivalent supplies.

**What Next**

Defined the port/power state in UPF.

**See Also**

- add_port_state
- add_power_state
- add_pst_state
- commit_upf

Feedback

## UPF-173

(warning) Value of app option mv.upf.max_supply_count_without_driver is out of range. The maximum supply count without driver is 1000.

### Description

This message occurs when a value greater than 1000 is specified for app option mv.upf.max_supply_count_without_driver. UPF-177 error will be reported when the supply count without driver is over 1000.

## UPF-174

(information) Design attribute 'correlated_supply_group' is ignored because port and power state triplets are considered as correlated by default.

### Description

This message occurs when the 'correlated_supply_group' design attribute is specified. The port and power state triplets are considered as correlated by default, and so the value of the design attribute will be ignored.

### What Next

Check the voltages of the supplies.

### See Also

- set_design_attributes

## UPF-175

(error) cannot find domain '%s' for set_level_shifter %s

### Description

The power domain specified in set_level_shifter cannot be found.

### See Also

- set_level_shifter
- create_power_domain

Feedback

## UPF-176

(warning) Supply %s %s has no driver%s. This could potentially indicate missing connect_supply_net commands in the UPF.

### Description

This message, issued by commit_upf, indicates a UPF supply net that has no valid driver. Missing drivers indicate incomplete power intent, and could cause problems later in the flow. For example, two equivalent power supplies may not be detected as equivalent due to missing connect_supply_net statements, which can affect buffering decisions. Missing drivers for supply nets can also lead to incorrect or overly large full-chip PSTs, which can impact runtime.

### What Next

Check your UPF constraints related to this supply net and update them to provide a valid driver. A missing driver could be caused by several different situations.

(1) A supply net missing a supply port (create_supply_port), or unconnected to its related supply port due to missing connect_supply_net statements. (2) An input power port on a lower-level power domain not connected to the related supply net in the higher-level power domain with connect_supply_net. (3) A switched supply net that hasn't been connected to a power switch due to a missing or incorrect create_power_switch statement.

### See Also

- create_supply_net
- create_supply_port
- connect_supply_net
- commit_upf
- change_abstract

## UPF-177

(error) Max count exceeded for supply nets without a valid driver. A UPF-176 message has been issued for individuation violations.

### Description

This error message indicates the maximum count for supply nets without a valid drivers has been exceeded. A valid supply driver includes: - a supply port - out and inout P/G pin type of an instance or macro - internal P/G pin in a macro (for example: output of switch cell inside a fine-grain macro)

Feedback

If a supply cannot be associated with a driver, a UPF-176 warning messages is issued. Too many supplies without valid drivers can lead to incorrectly derived power state table (PST) , which can impact runtime, memory and cause incorrect optimization. By default the limit for supplies without drivers is set to seven (7), but it is recommended that all UPF-176 messages are investigated and resolved by the user.

**What Next**

A common reason for a UPF-176 warning is missing connect_supply_net commands in the UPF . For example, top "VDD" connects to port "U1/VDD", and net "U1/VDD". To connect VDD and U1/VDD, supplies need to be part of the connect_supply_net command, connecting to U1/VDD port. If one or both connect_supply_net are missing, top "VDD" will become a "different" supply from U1/VDD. This will cause the derived supplies to increase, which leads to increased use of resources and may cause incorrect P/G pin connections during implementation.

Another cause can be missing power switch strategies in the UPF. If shutdown power domains exist with internal supplies, a switch cell is required to drive the internal supply. User should check the create_power_switch commands to ensure UPF strategies are complete. In case where power switch cells are manually inserted (without UPF strategies), manual PG connection of the switch pins will also resolve the UPF-176 warning messages since a driver will be established.

If you are aware of the reasons for the UPF-176 messages and chose to ignored them, you can use the app_option mv.upf.max_supply_count_without_driver to change the default limit of 7 to greater value. This is generally not recommended due to implications mentioned earlier.

---

## UPF-178

(error) Full-chip derived PST for all the supplies cannot be built because there are too many derived pst_state.

Feedback

### Description

This usually caused by design has too many independent supplies which possibly caused by incomplete supply net/port connections (UPF-176) and/or incomplete power-state-state (PST) constraints for legal states between supplies.

### What Next

Add proper supply net/port connections and/or provide complete PST / pst_state.

### See Also

- create_pst
- add_pst_state
- commit_upf
- change_abstract

---

## UPF-179

(error) Location fanout isolation strategy '%s' of domain '%s' is not supported in UPF hierarchical: %s

### Description

For location fanout isolation strategy in UPF hierarchical flow, the scenario stated in the message is not yet supported:

### What Next

Update UPF constraints to match what tool can support.

### See Also

- set_isolation
- set_isolation_control
- create_power_domain

---

## UPF-180

(error) The value of "-lib_model_name" of "map_retention_cell" is not a valid format for retention strategy '%s'.

Feedback

### Description

This message occurs when the value of "-lib_model_name" of command "map_retention_cell" is not a valid format. The correct format is "<model_name> {-port <port_name> <net_ref>}*".

### What Next

See the *map_retention_cell* command man page for information about the *-lib_model_name* option.

### See Also

- map_retention_cell

---

## UPF-182

(error) The net_ref value %s is not present or has no signal driving it for retention strategy %s. The map_retention_cell constraint is ignored.

### Description

This error message is reported when,

1. You specify the *net_ref* value that is not a logic net name or supply net name from the current scope, or a symbolic reference. The symbolic reference can be one of the following:

- retention_ref.function_name {a retention supply set function, where function_name refers to the supply net corresponding to the function it provides to the retention ret_supply_net}
- primary_ref.function_name {a primary supply set function, where function_name refers to the supply net corresponding to the function it provides to the primary supply set of the domain}
- save_signal {refers to the save signal specified in the corresponding retention strategy}
- restore_signal {refers to the restore signal specified in the corresponding retention strategy}
- UPF_GENERIC_CLOCK
- UPF_GENERIC_DATA
- UPF_GENERIC_ASYNC_LOAD
- UPF_GENERIC_OUTPUT

Feedback

1. The design has a logic net present in current scope with the name specified as *net_ref*, but the logic net has no signal driving it or is dangling net.

**What Next**

Specify the correct *net_ref* value for the port connection.

**See Also**

- map_retention_cell

---

## UPF-183

(information) List of supplies grouped by equivalence - %s.

**Description**

This message shows the list of equivalent supplies.

**What Next**

This message is informational. No action is required.

**See Also**

- check_supply_equivalence

---

## UPF-184

(error) The '%s' in "-element" of "create_power_domain" is not a valid type of element for power domain.

**Description**

This message occurs when the cell of "-element" of command "create_power_domain" is not a valid type.

**What Next**

After checking the types of cells in the power domain, correct the cells of invalid types or modify the list of elements.

**See Also**

- create_power_domain

Feedback

## UPF-185

(error) Cannot reuse the domain-independent supply net '%s'.

### Description

This message occurs when a domain-independent supply net is specified to be reused in the create_supply_net command. When '-reuse' option is specified, the supply net name must have been defined for other power domain(s) by another create_supply_net command.

### What Next

Check the supply net name and make sure the existing supply net is made available for use in another domain by the '-domain' option of create_supply_net command.

### See Also

- create_supply_net

## UPF-186

(warning) None of library cell specified in map_isolation_cell of strategy '%s' in power domain '%s' is bias insulated.

### Description

This message occurs when all library cells specified with map_isolation_cell has no bias insulated. Isolation strategy will be dropped.

### See Also

- map_isolation_cell

## UPF-187

(warning) For level shifter strategy %s, option %s is not permitted when option -force_shift is specified.

### Description

This warning message can occur whenever a level shifter strategy is specified with the command set_level_shifter. It signals that a level shifter strategy is specified with both the option -force_shift and the option -threshold. Such a combination is handled as follows: If the option -threshold is specified, it is dropped as if the user didn't specified it.

Feedback

### What Next

Drop the option -threshold from the source where the level shifter strategy is being specified.

### See Also

- set_level_shifter

---

## UPF-188

(error) UPF constraints have been loaded with incomplete_upf mode turned on, without reset_upf, incomplete_upf mode cannot be turned off.

### Description

This message occurs when UPF constraints have been loaded with incomplete_upf mode turned on, and user tries to set the mode to off.

### What Next

The UPF netlist and netlist used in incomplete_upf mode is a throw-away netlist/ constraints. To turn off incomplete_upf mode, user has to start over with clean netlist and UPF constraint.

### See Also

- set_app_options
- load_upf
- commit_upf
- reset_upf

---

## UPF-189

(error) Adding leaf cell %s to the element list of domain %s in linked physical block is not supported.

### Description

This message occurs when new buffer/inverter is adding to linked physical block and assigning it to be domain root element.

### See Also

- create_power_domain

Feedback

## UPF-190

(error) Power state '%s' has already been defined on the supply set with voltage(s) %s.

### Description

This error message occurs when the specified port state name is already defined on the same supply set. The voltage(s) is(are) shown.

Examples:

UPF-190 (error) Power state 'FULL_ON' has already been defined on the supply set with voltage(s) 0.8.

UPF-190 (error) Power state 'FULL_ON' has already been defined on the supply set with voltage(s) {0.7, 0.8, 0.9}.

UPF-190 (error) Power state 'OFF' has already been defined on the supply set with voltage(s) 'OFF'.

### What Next

Specify a unique name for the power state and rerun the command. To redefine a power state, use reset_upf, followed by load_upf of the updated UPF file with the new add_power_state command.

### See Also

- add_power_state

## UPF-191

(error) No %s ports for port attribute 'feedthrough' on instance '%s' for the specified model '%s'.

### Description

This message occurs when the ports specified in set_port_attributes -model -feedthrough command are all driver ports or load ports.

### See Also

- set_port_attributes

## UPF-192

(error) Cannot set port attribute '%s' on %s%s '%s' due to %s.

Feedback

### Description

This message occurs when the attribute specified in the set_port_attributes and set_port_attributes command cannot apply to the specified object.

### See Also

- set_port_attributes

---

## UPF-193

(error) This is an internal database file and cannot be loaded.

### Description

An internal database file in the design library cannot be loaded in load_upf.

### What Next

Avoid loading the internal database UPF file

### See Also

- load_upf

---

## UPF-194

(error) Domain-dependent supply net '%s' cannot be set as equivalent supply net.

### Description

This message occurs when specified the supply net in set_equivalent command is a domain-dependent supply net. Only domain-independent supply net can be specified with 'set_equivalent -nets'.

### What Next

Check the supply net is a domain-independent supply net or not.

### See Also

- set_equivalent

---

## UPF-195

(warning) Equivalent supply '%s' does not exist and will be ignored.

Feedback

### Description

This message occurs when specified the supply net, supply port or supply set in set_equivalent command does not exist.

### What Next

Check the supply name is valid.

### See Also

- set_equivalent

---

## UPF-196

(error) The supply sets '%s' and '%s' have bias mismatch.

### Description

This error message occurs when you are trying to declare the specified supply sets with bias mismatch as equivalent supplies. The bias mismatch occurs when supply sets have different bias supplies or one of supply sets belongs to non bias blocks.

### What Next

Ensure you specify the correct supply sets.

### See Also

- create_supply_set
- create_power_domain
- set_equivalent

---

## UPF-197

(error) Supply net %s and %s are NOT equivalent and both have to be created in block %s with same name.

### Description

This message occurs when tool tries to split full-chip UPF constraints and finds two supply nets have to be created in same block with same name. This will cause supply net name conflict.

Feedback

### What Next

Check if these two supply nets should be equivalent. If yes, connect_supply_net command(s) could be missing. If not, user has to change the supply net name(s).

### See Also

- create_supply_net
- connect_supply_net
- split_constraints

---

## UPF-198

(warning) Library cell %s is %s-style isolation cell. Can't be used with isolation strategy %s. Discarding this library cell.

### Description

This message occurs when the library cell type does not match the mapping command for the strategy.

### What Next

Clamp of library cell should match isolation strategy. If it's not corrected, the library cell will be dropped in the mapping cell list.

### See Also

- map_isolation_cell

---

## UPF-199

(error) Due to the error(s) above, UPF implementation fails. Please fix all the errors.

### Description

This error message occurs during UPF implementation. Due to inconsistencies in UPF specification across instances of (a) multiply-instantiated module(s), power management logic cannot be uniformly implemented.

### What Next

Fix the UPF commands so that they are consistent across all instances of a multiply-instantiated module.

Feedback

## UPF-200

(error) The %s command/option is not supported in a bias block.

### Description

This error message occurs when set_domain_supply_net is used inside a bias block (a UPF element with 'set_design_attributes -attribute enable_bias TRUE'). set_domain_supply_net can only be used to associate the primary power and ground supply nets of a domain, and so cannot be used to set the pwell and/or nwell bias supplies.

### What Next

Instead of set_domain_supply_net, use 'create_power_domain -supply' to define the bias supplies available in the domain, or use the implicit supply set handles automatically created during create_power_domain. For bias blocks, all implicit supply sets (primary, default_isolation, and default_ground), have power, ground, nwell, and pwell functions created automatically.

### See Also

- set_design_attributes
- create_power_domain
- create_supply_set

## UPF-201

(error) The %s supply set handle and %s supply set have bias mismatch.

### Description

This error message occurs when you are trying to associate supply set with bias mismatch. The bias mismatch occurs when supply sets have different bias supplies or one of supply sets belongs to non bias blocks.

### What Next

Ensure you specify the correct supply sets.

### See Also

- create_supply_set
- create_power_domain

Feedback

## UPF-202

(error) Full-chip UPF cannot be saved because %s.

### Description

This error message indicates a failure of save_upf -full_chip to write a UPF file. This can happen for the following reasons:

* The top block is a blackbox * Any sub-block in the design is a blackbox * The top block is not an MV design * There are no valid sub-blocks with UPF intent

For the first two reasons, the general requirement for saving full-chip UPF is that all blocks must be linked to either their design view or abstract view. Full-chip UPF cannot be exported when blackboxes are present.

For the third reason, a block is considered an MV design if load_upf was used to apply UPF constraints on it. As such, if no UPF constraints were ever applied on the block, then it is not possible to write out full-chip UPF.

### What Next

Ensure that all blocks are linked to their abstract or design views, and ensure that UPF has previously been applied before attempting save full-chip UPF. Also, ensure that the design is a hierarchical design and valid sub-blocks with UPF intent are correctly specified in the save_upf command.

### See Also

- save_upf
- set_reference
- change_abstract

## UPF-203

(error) Bias block "%s" defined under non-biased block.

### Description

This message occurs when running commit_upf command. If the design attribute enable_bias is TRUE on a block which is under a non-bias block, this error occurs.

### What Next

Allowable use models are to have the top and all sub-blocks as all biased or all non-biased. Additionally, a higher level of hierarchy can be biased with a sub-block being non-biased. But, a biased block cannot exist in a lower hierarchy than a non-biased block.

Feedback

Use 'set_design_attributes -attribute enable_bias' to modify the biasing attributes in the UPF to adhere to the requirements.

**See Also**

- set_design_attributes

---

## UPF-204

(warning) The scope of power domain %s will be changed to the top of its block in the UPF generated by split_constraints.

**Description**

This scope of the domain originally is outside the its block which
is not supported in UPF hierarchical flow. Because the app_option
'mv.hierarchical.convert_scoped_outside_nested_domain' is set to 'true' by user,
split_constraints will change the scope of this domain to the top of its block in the output UPF.

**See Also**

- split_constraints
- create_power_domain

---

## UPF-205

(warning) Strategy '%s' is defined on power domain on leaf cell '%s', which is not supported.

**Description**

This message occurs when an isolation or level shifter strategy is defined on power domain on leaf cell, and this is not supported. Only no_isolation strategy is supported on power domain on leaf cell at the moment.

**What Next**

The element will be dropped.

**See Also**

- set_isolation
- set_isolation_control
- set_level_shifter

Feedback

## UPF-206

(warning) Library cell %s %s.

### Description

This message, when issued by map_power_switch, warns if either the specified power switch library cell does not exist, or if the specified cell is not a power switch.

map_retention_cell also issues this warning message when no library cells are found for the name specified in -lib_cells option.

### What Next

If the specified library cell does not exist, check the name of the cell and the library and correct it. Check for existence of library cells using the get_lib_cells command.

If the specified library cell is not a power switch, this means that the .lib attribute is_power_switch is not true. Check this attribute using either report_attributes or get_lib_cells -filter "is_power_switch==true|false". Either the library cell is not a power switch cell, or the library files need to be corrected to indicate that it is a power switch cell.

### See Also

- map_power_switch
- map_retention_cell
- get_lib_cells
- report_attributes

## UPF-207

(error) Using set_design_attributes to set '%s' '%s' must be done before other UPF commands.

### Description

This error message occurs when the set_design_attributes command is used to set the 'enable_bias' attribute after power domains or supply sets have already been created. Substrate biasing can impact available supplies in power domains and supply sets, and so must be specified before executing UPF commands like create_power_domain and create_supply_set.

### What Next

Change the order of commands in your UPF file to specify set_design_attributes before running any other UPF commands.

Feedback

**See Also**

- set_design_attributes
- create_power_domain
- create_supply_set

---

## UPF-208

(error) Bias legacy check fails for domain '%s'.

**Description**

This error message occurs because domain scope is bias enabled while one of its root cells is bias disabled.

Legacy domains are domains whose scope and all root cells are bias disabled when top design is bias enabled.

**What Next**

Specify correct scope for domain creation.

**See Also**

- create_power_domain
- set_design_attributes

---

## UPF-209

(error) The %s option is not supported in a bias block.

**Description**

This error message occurs when a UPF command option is used that is incompatible inside a bias block (a UPF element with 'set_design_attributes -attribute enable_bias TRUE').

The follow UPF command options cannot be used inside bias blocks:

1. set_isolation -isolation_power_net 2. set_isolation -isolation_ground_net 3. set_retention -retention_power_net 4. set_retention -retention_ground_net

For retention cells, the error will occur if the domain of the retention strategy is a bias block. For isolation cells, it depends on the set_isolation_control -location setting. Whether self or parent, if the insertion location for isolation cells is a bias block, then these options cannot be used.

Feedback

### What Next

For all four cases, the problem is that the bias supply nets cannot be specified using these options. For a bias flow, use supply sets instead. On set_isolation, use the -isolation_supply_set option. On set_retention, use the -retention_supply_set option.

### See Also

- set_design_attributes
- set_isolation
- set_isolation_control
- set_retention

---

## UPF-210

(warning) %s not allowed when %s feature is %s.

### Description

This warning indicates some restrictions on the command option usage or its value when the mentioned feature are turned on. commit_upf will issue an error on such usage thus invalidating UPF command having such usage.

Here are some of the restrictions current being imposed.

- Location fanout or parent is not allowed for isolation and level-shifter strategy with lower_domain_boundary feature. For isolation strategy only location self is allowed. For level-shifter strategy, only location automatic or self is allowed. commit_upf will error out on such strategies, thus making them ineffective.

### What Next

Make sure the restrictions are met.

### See Also

- set_design_attributes
- set_isolation
- set_isolation_control
- set_level_shifter
- commit_upf

Feedback

## UPF-211

(error) %s strategy %s of power domain %s cannot have location %s.

### Description

This error indicates that mentioned isolation or level-shifter strategy has location parent or fanout, which is not an allowed value when lower_domain_boundary feature is on. This restriction is because of other alternate approaches being available to achieve the same result.

### What Next

Change the location to self for isolation strategy and self/automatic for level-shifter strategy.

### See Also

- set_design_attributes
- set_isolation
- set_isolation_control
- set_level_shifter
- commit_upf

## UPF-212

(error) Cannot apply repeater supply to the object '%s'.

### Description

This error message occurs when *set_port_attributes* command is used with *-repeater_supply* argument or *repeater_power_net* and *repeater_ground_net* attributes on an object that does not meet the following criteria.

- If *-ports* argument is specified, objects in the list - must be ports or pins on the power domain root elements - can be ports of the design with direction output only - can be pins of the leaf instance with direction input only - can be pins of the hierarchical instance with direction in or out

- If *-elements* argument is specified, objects in the list - must be the power domain root elements - can be current design with *-applies_to outputs* only - can be leaf instance with *-applies_to inputs* only - can be a hierarchical instance

Feedback

### What Next

Specify the correct *-ports*, *-elements* or *-applies_to* to make sure correct value is specified for the objects.

### See Also

- set_port_attributes

---

## UPF-213

(error) Specified repeater attribute format is not correct.

### Description

This error message occurs when *set_port_attributes* command is used with wrong repeater attribute format. Here are two correct formats:

- Specify attribute *repeater_power_net* and *repeater_ground_net* together as a pair. For example, set_port_attributes -ports {P1} -attribute repeater_power_net VDD \ -attribute repeater_ground_net VSS

- Specify option *-repeater_supply* without other attributes. For example, set_port_attributes -ports {P1} -repeater_supply SS

### What Next

Specify the attribute *repeater_power_net* and *repeater_ground_net* together.

### See Also

- set_port_attributes

---

## UPF-214

(error) Cannot create non-bias power domain '%s' as bias supplies are available in the scope where it is being created.

### Description

This error message occurs because you are creating a power domain in a non-bias block, and bias supply sets are available to the power domain.

### What Next

Restrict the available supply of the power domain to non-bias supply sets only by using the -supply option of the create_power_domain command.

Feedback

### See Also

- create_power_domain

---

## UPF-215

(error) Cannot generate UPF for create_abstract because current block has other block(s) inside (listed below).

### Description

Currently for multi-level physical hierarchy MV designs, middle-level can only be design view. create_abstract will fail if the block has other block(s) inside for MV designs.

### What Next

Use design view for all middle-level blocks.

### See Also

- create_abstract

---

## UPF-216

(error) UPF is not supported when the "preserve_multiply_instantiated_module" attribute is used.

### Description

This error message occurs during UPF implementation. You have specified the "preserve_multiply_instantiated_module" attribute on one or more design modules and loaded a UPF. UPF is not supported on designs with the "preserve_multiply_instantiated_module" attribute.

### What Next

Remove the "preserve_multiply_instantiated_module" attribute on design modules using the remove_attribute command, or remove the UPF using the reset_upf command.

---

## UPF-217

(error) power_state with the following settings is not fully included in lower_level scope %s

### Description

This error message occurs when a power_state defined at the higher-level scope is not included in power_states in lower-level scope.

Feedback

### What Next

Remove this power_state from higher-level power state table if it's wrongly defined or add the power_state to the lower-level scope.

### See Also

- add_power_state

---

## UPF-218

(warning) power_state with the following settings in scope %s is ignored by implementation.

### Description

This warning message occurs when a power_state defined in a lower-level scope is not included or used by the higher-level power state and therefore is ignored by implementation.

### What Next

The referenced power_state is ignored in the current block during implementation because the power_state cannot occur in the current block. If the referenced power_state is not needed in the current block, you can ignore this warning. If the power_state should be used, investigate the power states of the current block to ensure the power states are defined as intended.

### See Also

- add_power_state

---

## UPF-219

(error) could not set related supply net(s) on pin '%s' from top since it is inside different physical hierarchy.

### Description

Related_supply_net for a pin cannot be set across physical hierarchy.

### What Next

Open the block design view which contains the pin and set the related_supply_net. Re-create abstract if it's needed.

Feedback

**See Also**

- set_related_supply_net

---

## UPF-220

(error) Cannot resolve power_state_group '%s' state '%s'.

**Description**

This error message occurs when the state defined in power_state_group includes undefined supply set state or undefined group state, or another unresolvable group state.

**What Next**

Define the supply state or resolve the unresolvable group state referred to.

**See Also**

- add_power_state

---

## UPF-221

(error) add_power_state command supply set object cannot be found when -supply is specified.

**Description**

This error message occurs when -supply is specified in add_power_state command but supply set is not specified or object cannot be found(not created yet).

**What Next**

Define the supply set correctly.

**See Also**

- add_power_state
- create_supply_set

---

## UPF-222

(error) add_power_state command has conflict with both %s and %s options specified.

Feedback

### Description

This error message occurs because those options cannot be issued in the meantime for add_power_state command.

### What Next

Correct the options for the command.

### See Also

- add_power_state

---

## UPF-223

(error) add_power_state and create_pst commands' version has conflict.

### Description

This error message occurs because UPF3.0 version of add_power_state command is used in the meantime with UPF2.0 version. e.g create_pst command and add_power_state -group command cannot be used together. create_pst command cannot be supported with add_power_state -supply usage.

### What Next

ICC II cannot support conflict version of add_power_state command. Select to use one version for the entire flow.

### See Also

- add_power_state
- create_pst

---

## UPF-224

(error) Power state group %s in add_power_state -group command is not defined yet.

### Description

This error message occurs when the power state group is not defined yet for add_power_state -group option.

### What Next

Create the power state group in the right scope.

Feedback

### See Also

- create_power_state_group

---

## UPF-225

(error) Power state group '%s' has already been defined in the scope %s.

### Description

This error message occurs when the specified port state group is already defined in the scope.

### What Next

Specify a unique name for the power state group in the specified scope. And make sure only create once.

### See Also

- set_scope
- add_power_state

---

## UPF-226

(error) add_power_state command requires -update for new state definition of power state group.

### Description

This error message occurs when power state group already has a state defined, adding new state definition does not have '-update' option in the command line. For the first state definition, this is not required, but any new state definition in a separate add_power_state command requires -update option. For the command line with multiple -state definition, -update is also not required.

### What Next

Add -update in the command line.

### See Also

- add_power_state

---

## UPF-227

(information) Incomplete UPF support is enabled.

Feedback

### Description

This message shows the incomplete_UPF mode is enabled.

### What Next

This message is informational. No action is required.

### See Also

- set_app_options

---

## UPF-228

(information) Total %s modifications have been made for incomplete UPF support.

%s.

### Description

This message shows the total number of modifications have been made for incomplete UPF support.

### What Next

This message is informational. User can use report_incomplete_upf command to report details.

### See Also

- report_incomplete_upf

---

## UPF-229

(error) Unable to set related supply net for %s as this pin is driven by NOR/NAND style isolation, but the driver of the isolation signal for isolation strategy %s of domain %s cannot be found.

### Description

This error message occurs when running the *split_constraints*. The supply net to be set as the related supply net for the specified pin cannot be got from the control signal's driver of NOR/NAND style isolation strategy.

### What Next

Specify valid isolation signal with legal driver in the NOR/NAND style isolation strategy and run the command again.

Feedback

**See Also**

- split_constraints
- set_isolation
- set_isolation_control

---

## UPF-230

(error) Unable to declare the supplies '%s' and '%s' to be electrically equivalent: supply %s.

**Description**

This error message occurs when when the *set_equivalent* command is unable to establish electrical equivalence relationship on the specified supplies.

Electrical equivalence may only be defined in a limited set of circumstances:

- Each supply is driven only by a top-level supply port;
- Each supply is driven only by an output or internal PG pin on the same macro cell;
- Each supply is driven only by an output supply port on the same blackbox cell;
- Each supply is driven only by an output of a pad cell;
- Each supply is already physically connected to the others.

**What Next**

Consider using the *-function_only* argument to *set_equivalent*.

**See Also**

- set_equivalent

---

## UPF-231

(error) Supply net '%s' state '%s' voltage not defined.

**Description**

This error message occurs when when the supply state is defined but no voltage specified.

**What Next**

Specify voltage for the supply state by add_power_state -update

Feedback

**See Also**

- add_power_state

---

## UPF-232

(warning) setting related supply net for pin(s) not in current block, the constraint will be session only and will not be saved.

**Description**

When setting supply net for pin(s) not in current block but inside different physical hierarchy, the constraint is not part of current block, so it will be session only and won't be saved.

**What Next**

If the constraint needs to be saved into the block contains the pin(s), user has to open the block design view and set the related_supply_net. Re-create abstract if it's needed.

**See Also**

- set_related_supply_net

---

## UPF-233

(error) Pins specified are in different physical hierarchies.

**Description**

The error happens when some of the pins specified for set_related_supply_net command are in current block, some are in other physical hierarchy.

**What Next**

Use separated commands to set the related supply net for these pins.

**See Also**

- set_related_supply_net

---

## UPF-234

(error) MV strategies have not be associated to mv cells yet.

Feedback

### Description

The error happens when CTS doing splitting or merging operation while the MV strategies have not be associated to mv cells yet.

### What Next

Do associate_mv_cells or commit_upf before CTS.

### See Also

- associate_mv_cells
- commit_upf

---

## UPF-235

(Information) The app option mv.upf.allow_unresolved_supply is set to true but the resolved supply checks cannot be skipped since the netlist is mapped.

### Description

This information occurs when the app option mv.upf.allow_unresolved_supply is set to true for allowing unresolved supplies in the commands. But unresolved supplies are not allowed when the netlist is mapped, indicating that the command could have issued from backend flow.

### What Next

If you are sure that you are in frontend flow or you want to use unresolved supplies (deliberately knowing the consequences), you need to set the app option mv.upf.allow_unresolved_supply_in_mapped_netlist to true along with the above app option.

### See Also

- commit_upf

---

## UPF-236

(warning) Crosstool app option is set to true, UPF may not match Verilog or SPEF.

### Description

This Warning message occurs when the app option mv.upf.write_crosstool_wrappers is set to true. The app option mv.upf.write_crosstool_wrappers is needed for exporting UPF for tools that do not support the use of power domain on instance (PDOI) in UPF. With the app option set to true, instances that are PDOI are grouped under derived hierarchical

Feedback

modules to resolved compatibility issues with other tools. The derived hierarchies are only added during ASCII output and are not represented in the block. The ASCII outputs that are affected are Verilog and SPEC from write_verilog and write_parasitics commands. The app option does not impact the output of save_upf command. That means logical mismatches can exist between the UPF from save_upf command and SPEF or Verilog netlist.

To write a compatible UPF that includes the hierarchical wrappers, use the write_verilog command. When the app option is set to true, write_verilog will write a Verilog netlist and a compatible UPF at the same time. The UPF will have the same name as the Verilog file with the added extension ".SNPS.upf".

**What Next**

If you have a multi-voltage design and are allowing physical feedthrough buffers (opt.common.allow_physical_feedthroughset is true) to be added during optimization and CTS, then you should use the compatible UPF created by the write_verilog command for ASCII import to other tools.

If you are not allowing any physical feedthrough buffers during optimization and CTS, you can ignore this warning or set the app option mv.upf.write_crosstool_wrappers to false to avoid this message.

**See Also**

- write_verilog
- write_parasitics
- save_upf
- opt.common.allow_physical_feedthrough
- mv.upf.write_crosstool_wrappers

---

## UPF-237

(warning) Cannot specify -no_retention option: %s.

**Description**

This warning occurs when the retention strategy is defined with -no_retention option but a retention element list or an element of a retention element list is specified as an element of the strategy. The strategy will be discarded.

**What Next**

Check the -no_retention option is intentional.

Feedback

**See Also**

- set_retention
- set_retention_elements

---

## UPF-238

(error) Cell '%s' of retention element list '%s' is not retained when other element(s) in the element list are retained.

**Description**

This error occurs when the element of specified retention element list is not retained when other elements of the same retention element list are retained.

**What Next**

Make sure the retention strategies of the design include the specific cell.

**See Also**

- set_retention
- set_retention_elements

---

## UPF-239

(error) Cell '%s' of retention element list '%s' is not retained when other cell(s) in the same power domain '%s' are retained.

**Description**

This error occurs when the element of specified retention element list is not retained when other cells in the same power domain are retained.

**What Next**

Make sure the retention strategies of the design include the specific cell.

**See Also**

- set_retention
- set_retention_elements

Feedback

## UPF-240

(error) Element '%s' has a no_retention strategy applied to it and cannot be part of the retention element list '%s'.

### Description

This error occurs when the specified cell cannot be part of a retention element list because it is already defined as an element of a retention strategy with -no_retention option.

### What Next

Check the -no_retention option of the retention strategy is intentional.

### See Also

- set_retention
- set_retention_elements

## UPF-241

(warning) The cell '%s' is not a sequential element.

### Description

This message occurs when the cell specified in set_retention_elements command is not a sequential element and so it won't be mapped to a retention cell.

### What Next

Check whether the cell should be part of the retention element list.

### See Also

- set_retention_elements

## UPF-242

(Warning) NOR/NAND style isolation cell %s is not associated with any isolation strategies nor supply net connections.

### Description

This is a warning message indicating that either NOR or NAND style isolation cells in the design are not properly associated with any isolation strategies.

Feedback

### What Next

Although NOR/NAND isolation cell is not properly associated with any isolation strategy. But as NOR/NAND style isolation cell normally use domain primary as isolation power, this maybe not be a problem. It is user's responsibility to make sure it is used properly.

### See Also

- connect_supply_net

---

## UPF-243

(error) UPF constraints cannot be uncommitted because the block(s) is(are) not immediate child block of current top: %s

### Description

This error occurs when user is trying to uncommit block which is not immediate child of current top on MV design.

### What Next

User has to uncommit Multi-Level-Physical-Hierarchy (MPH) MV design level-by-level bottom-up.

### See Also

- uncommit_block

---

## UPF-244

(information) Skipped power state table '%s' because none of the specified supplies are defined in the table.

### Description

This message occurs when the supplies specified by users are not defined in the power state table and so the table is skipped in the report.

### What Next

Check whether the supply names are correct.

### See Also

- report_pst

Feedback

## UPF-245

(warning) set_isolation_control command specified different '%s' from set_isolation command for isolation strategy '%s'.

### Description

This message occurs when the set_isolation_control specified different isolation_signal/sense/location from set_isolation command.

### What Next

set_isolation_control command will be dropped.

### See Also

- set_isolation
- set_isolation_control

## UPF-246

(warning) Cannot add set_related_supply_net constraint for %s and all other feedthrough ports on the same path because this path is driven by a ground net!

### Description

This message occurs when tool tries to add set_related_supply_net constraints for new feedthrough ports, but the path is driven by a ground net. For such path, tool won't be able to add any set_related_supply_net for new ports on this path.

### See Also

- place_pins
- set_related_supply_net

## UPF-247

(error) Failed to write out strategy %s

### Description

This message occurs when tool tries to write out the strategy shown in the message.

### What Next

Check if the strategy is supported for the command.

Feedback

**See Also**

- split_constraints

---

## UPF-248

(error) Supply net '%s' is not visible in the power domain '%s'.

**Description**

This error message occurs when the specified supply net is not visible for the given domain. A supply net can only be visible at the scope it is defined or scopes below.

**What Next**

Please specify a supply net that is visible in the scope of given power domain.

**See Also**

- report_power_domains
- create_power_domain
- create_supply_net

---

## UPF-249

(warning) UPF constraint tracking has been disabled due to name changes.

**Description**

This is a message indicating that the UPF constraint tracking is disabled due to name changes. So, the UPF commands written out by the tool may be different from the original input UPF.

**See Also**

- save_upf

---

## UPF-250

(information) %s strategy '%s' is invalid, and will not be used to %s cell association and insertion.

**Description**

This information message appears when specified strategy is specified with incomplete information. Missing information could be power supply or control signal.

Feedback

### What Next

Fix the UPF and specify all the required information needed for a power strategy.

### See Also

- set_isolation
- set_isolation_control
- set_retention
- set_retention_control

---

## UPF-251a

(Warning) Disconnecting non-constant net '%s' and connecting net '%s' to the port/pin '%s'. This is not IEEE 1801 compliant.

### Description

The warning message is issued when a non-constant net is disconnected and a new net is connected using *connect_logic_net -reconnect*. The tool supports disconnection of non-constant net, but it does not comply with the IEEE 1801 (UPF) standard.

### What Next

This is only a warning message. No action is required.

### See Also

- connect_logic_net

---

## UPF-251b

(Error) Cannot reconnect port/pin '%s' as its connected to a non-constant net '%s'.

### Description

This error message is reported when reconnection is requested for a port/pin which is connected to a non-constant net. By default, reconnection is allowed for both constant and non-constant connections. But if upf_reconnect_non_constant_net is set to FALSE, then reconnecting a non-constant net is not allowed.

### What Next

Unset upf_reconnect_non_constant_net, to allow reconnection.

Feedback

### See Also

- connect_logic_net

---

## UPF-251

(information) Disconnecting constant net '%s' driven by constant value %d and connecting net '%s' to the port/pin '%s'.

### Description

The information messages is issued when an existing net that is a constant, is disconnected from the port/pin and a new net is connected to it using *connect_logic_net -reconnect*.

### What Next

This is just an information message. No action is required.

### See Also

- connect_logic_net

---

## UPF-252

(Information) Connecting net '%s' to dangling port/pin '%s'.

### Description

The information messages is issued when *connect_logic_net -reconnect* is used to connect a net to an undriven port/pin.

### See Also

- connect_logic_net

---

## UPF-253

(Information) Net '%s' is already connected to port/pin '%s'.

### Description

The information messages is issued when *connect_logic_net* command is used to connect the same net to the specified port/pin, that it is already connected to. It's a no-op scenario.

### What Next

This is just an information message. No action is required.

Feedback

**See Also**

- connect_logic_net

---

## UPF-254

(error) Only 2 parameters "netname" and "sense" are supported for option '%s'.

**Description**

This error message occurs when the number of parameters specified with the assert_mutex option is wrong.

**What Next**

Check the parameter and invoke the command again.

**See Also**

- set_retention
- set_retention_control

---

## UPF-255

(error) Supply set %s is not visible in the power domain %s.

**Description**

This error message occurs when the specified supply set is not visible for the specified domain. A supply set is visible only at the scope where it is defined or scopes below.

**What Next**

See the man pages for the *create_supply_set* and *create_power_domain* commands for information about creating and associating supply sets to power domains.

**See Also**

- report_power_domains
- create_power_domain
- create_supply_set

---

## UPF-256

(warning) '%s' '%s' already exists%s.

Feedback

### Description

A net/port/pin with the specified name already exists. Two nets/ports/pins cannot have the same name in the same cell.

### What Next

Specify a different name for the net/port/pin.

---

## UPF-257

(error) Value supplemental is not allowed when Golden UPF mode is off.

### Description

This error message indicates that *save_upf -format supplemental* can only be used when Golden UPF mode is active.

### What Next

Turn on Golden UPF mode by using the following setting. *set_app_options -list {mv.upf.enable_golden_upf true}*

### See Also

- mv.upf.enable_golden_upf

---

## UPF-258

(error) UPF constraint tracking has been disabled and '-format' option is not allowed.

### Description

This message occurs when '-format' option is specified and UPF constraint tracking is disabled due to name changes.

### What Next

Invoke the command without '-format' option.

### See Also

- save_upf
- UPF-249

Feedback

## UPF-259

(error) Only one element should be specified for the contains_switches design attribute

**Description**

This error message indicates that command set_design_attribute is specifying multiple elements for the contain_switches attribute. Only one element should be specified.

**What Next**

Modify the set_design_attribute command to specify only one element.

## UPF-260

(Warning) Location specified for power switch %s is not one of the root cells of its power domain. Creating this switch in its scope hierarchy.

**Description**

This warning message indicates that command set_design_attribute command has specified a location for the switch using the contains_switches attribute but the location is not one of the root cells of the power domain of the switch. The power domain of the switch is specified using the -domain argument to the create_power_switch command.

In this case, the switch cell will be created in the hierarchy representing the scope of the switch.

**What Next**

Modify the set_design_attribute command specifying the location of the switch in one of the root cells of switch's domain.

## UPF-262

(error) Resolution function '%s' defined on supply net '%s' is different from resolution function '%s' of supply net '%s'.

**Description**

This message occurs when attempting to connect the supply net to a supply port that is already connected to another supply net with different resolution function. It's an error that connected supply nets have different resolution functions.

**What Next**

Check the resolve type of the specified supply nets.

Feedback

**See Also**

- connect_supply_net
- create_supply_net

---

## UPF-263

(Information) Created place holder cell %s for upf power switch %s

**Description**

This message indicates that a placeholder cell has been created for upf power switch.

---

## UPF-264

(Information) Removed the switch place holder cell %s.

**Description**

This message indicates that a placeholder cell for power switch has been removed.

---

## UPF-265

(error) UPF constraints cannot be uncommitted because %s

**Description**

This error occurs when user is trying to uncommit block(s) but it cannot be done because of the reason listed.

**What Next**

Such kind of block cannot be uncommitted.

**See Also**

- uncommit_block

---

## UPF-266

(error) Only '-format supplemental' is allowed for save_upf in Golden UPF mode.

**Description**

This message occurs when other value is specified in '-format' option and Golden UPF mode is turned on. In Golden UPF mode, only supplemental UPF could be dumped by '-format supplemental' or by default without '-format' option specified.

Feedback

### What Next

Invoke the command with supplemental format only.

### See Also

- save_upf

---

## UPF-267

(Warning) Crosstool wrapper option is not compatible with golden UPF flow. Ignoring the golden UPF setting.

### Description

This warning occurs when the app options mv.upf.write_crosstool_wrappers and mv.upf.enable_golden_upf are both set to true. The crosstool app options modifies both the Verilog and UPF to remove power domain on instances (PDOI). The removal of PDOI may require modification of the golden UPF content, therefore the two app option are not compatible. When the crosstool app option is enabled, UPF created by write_verilog command will ignore the mv.upf.enable_golden_upf setting and will always write a UPF" to match the Verilog output.

### What Next

You will need to avoid one of these 2 conditions: 1. Use a UPF" flow instead a golden UPF flow (mv.upf.enable_golden_upf false) 2. Avoid using physical feedthroughs during optimization (opt.common.allow_physical_feedthrough false & mv.upf.write_crosstool_wrappers false)

### See Also

- mv.upf.enable_golden_upf
- opt.common.allow_physical_feedthrough
- mv.upf.write_crosstool_wrappers

---

## UPF-268

(Information) Command '%s' is disabled for Golden UPF reapplication and will be ignored.

### Description

This message occurs in Golden UPF reapplication when you load the golden upf and it has a command that is only supported on initial application, so it will not be applied again.

Feedback

### What Next

This is only an information message, no action is required.

### See Also

- mv.upf.enable_golden_upf
- create_logic_port
- create_logic_net
- connect_logic_net

---

## UPF-269

(error) Option '%s' of UPF command '%s' is not supported and will be ignored.

### Description

This error message occurs when an unsupported option is specified. Other specified options, if any, will be honored.

### What Next

Check the option of the UPF command and ensure it is not necessary for power intent. Otherwise, consider specifying the intent in another manner.

### See Also

- load_upf

---

## UPF-270

(error) The keyword 'extra_supplies' must be followed by "".

### Description

This error message occurs because it is required that the keyword *extra_supplies* be followed by *""* (two sets of double quotation marks).

### What Next

Ensure that *extra_supplies* is followed by *""* and rerun the script.

### See Also

- create_power_domain

Feedback

## UPF-271

(error) create_power_state_group is not supported when power state propagation is enabled

### Description

create_power_state_group command is disallowed when power state propagation is enabled.

### See Also

- add_power_state
- create_pst

## UPF-272

(warning) Dropping port attribute '%s' since %s.

### Description

This message occurs when a port attribute, specified through the set port attributes command, is being dropped for the given reason.

### See Also

- set_port_attributes

## UPF-273

(error) Design is not in incomplete_upf mode.

### Description

This message indicates that the design is not incomplete_upf mode. Command report_incomplete_upf will not report any information related to incomplete_upf.

### What Next

User need enable the app_option 'mv.incomplete_upf.enable" before executing the command report_incomplete_upf. And incomplete_upf mode will not be available if DCM mode is enabled with set_early_data_check_policy.

Feedback

### See Also

- report_incomplete_upf
- set_early_data_check_policy

---

## UPF-274

(error) UPF constraints have been loaded with incomplete_upf missing_va mode turned on, without reset_upf, incomplete_upf missing_va mode cannot be changed.

### Description

This message occurs when UPF constraints have been loaded with incomplete_upf missing_va mode turned on, and user tries to change the mode.

### What Next

To turn off incomplete_upf missing_va mode, user has to start over with clean netlist and UPF constraint.

### See Also

- set_app_options
- load_upf
- commit_upf
- reset_upf

---

## UPF-275

(error) The unpropagated power state %s can not be used in add_pst_state

### Description

This message occurs when the power states of the supply set are not propagated to its functions ( its nets) but they are then used in add_pst_state.

To propagate the power states of the supply state, the upf design attribute enable_state_propagation_in_add_power_state should be set to true at or above the scope of the supply set

### What Next

If the power state of a supply set is to be used in add_pst_state, set enable_state_propagation_in_add_power_state upf attribute to true at or above the scope of the supply set.

Feedback

Example:

**See Also**

- set_design_attributes
- create_supply_set
- add_pst_state

---

## UPF-276

(error) The power state %s can not have more than one supply state

**Description**

This message occurs when the power states of the supply set are propagated to its functions ( its nets) and the user tries to have more than one supply states in a power state of this supply set.

If the power states of the supply set are propagated, each power state of this supply state should not have more than one supply state.

**What Next**

If more than one supply states are desired in the power state of a supply set, then state propagation should not be enabled. Please disable it using upf design attribute enable_state_propagation_in_add_power_state

**See Also**

- set_design_attributes
- create_supply_set
- add_pst_state

---

## UPF-277

(error) Attribute value cannot be changed for %s, as this scope already has supply set states.

**Description**

This error message occurs when the design attribute enable_state_propagation_in_add_power_state cannot be set to a different value at a particular scope. This happens when the scope already contains supply set states

Feedback

or groups. Once supply set states or groups are defined at a particular scope, it is not allowed to change the value of the attribute.

**See Also**

- set_design_attributes
- add_pst_state
- create_supply_set

---

## UPF-278

(error) '%s' has an %s ('%s') with the attribute value as %s. This is not a supported flow

**Description**

This error message occurs when an invalid configuration of the design attribute enable_state_propagation_in_add_power_state is detected. The valid attribute configurations are the following - 1. Attribute is set to FALSE for the entire design. 2. Attribute is set to TRUE for the entire design. 3. Attribute is set to TRUE for the block, and set to FALSE for the top design.

**See Also**

- set_design_attributes
- add_pst_state
- create_supply_set

---

## UPF-279

(warning) UPF constraints have been loaded with incomplete_upf missing_va mode turned off, commit_upf needs to be done after incomplete_upf missing_va mode is enabled.

**Description**

This message occurs when UPF constraints have been loaded with incomplete_upf missing_va mode turned off, and user tries to change the mode.

**What Next**

Do commit_upf after enabling incomplete_upf missing_va mode.

Feedback

**See Also**

- set_app_options
- commit_upf

---

## UPF-280

(error) The %s voltage specification is not supported for %s supplies.

**Description**

This error message occurs when a negative voltage is specified for a power supply net or a non-zero value for a ground supply net.

**What Next**

Please specify a valid voltage value.

**See Also**

- add_power_state
- add_port_state

---

## UPF-281

(error) The supply set %s , with negative voltage in power or non-zero in ground, cannot be used as domain primary or in strategies.

**Description**

This error message occurs when negative voltage is specified for power or non-zero for ground function for a supply set that is being used for as a domain primary. Also, this supply set cannot be used in any of the strategies for the same reason.

**What Next**

Please specify a valid voltage value.

**See Also**

- add_power_state
- add_port_state

Feedback

## UPF-282

(error) The non-zero voltage specification is not supported for ground net %s.

**Description**

This error message occurs when non-zero voltage is specified for ground supply net.

**What Next**

Please specify a valid voltage value.

**See Also**

- add_power_state
- add_port_state

## UPF-283

(error) The %s supply net %s, with a negative voltage, is connected to the PG pin %s. And that PG pin is not one of the following: %s.

**Description**

This error message occurs when a supply net with a negative voltage is connected to a PG pin which does not meet the specified requirements.

**What Next**

Check the connections.

**See Also**

- add_power_state
- add_port_state
- connect_supply_net
- set_related_supply_net

## UPF-284

(error) The group power state %s is empty

Feedback

### Description

This message occurs when the UPF creates a group power states and does not specify any states for it.

### What Next

Specify states for it using add_power_state command. add_power_state -update can also be used if the add_power_state was already used for this group but that command did not specify any states.

### See Also

- add_power_state
- create_power_state_group

---

## UPF-285

(error) The state %s of group power state %s is empty

### Description

This message occurs when the UPF creates a group power states and then uses add_power_state to add states to it but leaves those states empty.

### What Next

Specify the logic expression of the state using the add_power_state -update command for this state.

### See Also

- add_power_state
- create_power_state_group

---

## UPF-286

(error) The state %s of supply set %s is empty

### Description

This message occurs when the UPF creates a supply set state using add_power_state but then leaves it empty.

Feedback

### What Next

Specify the supply expression of the state using the add_power_state -update command for this state.

### See Also

- add_power_state

---

## UPF-287

(error) mv.upf.upf_enable_state_propagation_in_add_power_state can not be set to true. Design already has supply set states or group states.

### Description

This message occurs when the user tries to set the app option mv.upf.upf_enable_state_propagation_in_add_power_state to true after the supply set states or group power states have already been created.

### What Next

change the flow to set this app option before any supply set states or group states are created.

### See Also

- add_power_state
- create_power_state_group

---

## UPF-288

(warning) Supply '%s' is already available in Power Domain '%s'. It will be ignored.

### Description

The supply was previously made available in the given power domain.

### What Next

No further action is required.

### See Also

- create_power_domain

Feedback

## UPF-289

(warning) The logic expression in the supply set state is ignored

### Description

This message occurs when the add_power_state is used to specify a state for a supply set and the state includes a logic_expr. The logic expression for supply sets states is ignored

### See Also

- add_power_state

## UPF-290

(Information) Usage of add_power_state -update will be made mandatory in a future release.

### Description

This message occurs when the add_power_state is used to define a supply set state for a supply set and that supply set already has other power states defined for it. -update should be used to define power states for supply set if it already has other power states

### What Next

-update option of add_power_state command should be used to define power states for supply set if it already has other power states

### See Also

- add_power_state

## UPF-291

(Error) Illegal power state %s cannot be used in a legal state.

### Description

This message occurs when an illegal power state is used in a legal state. A legal state is one that is defined either by using the add_pst_state command or by using the add_power_state command without the -illegal option.

### What Next

Rewrite the add_pst_state or add_power_state command without using states that are defined as illegal.

Feedback

### See Also

- add_power_state

---

## UPF-292

(Error) All state of group/domain %s are declared illegal.

### Description

This message occurs when the add_power_state is used to define a power state for a group/domain and all the states are defined with the option illegal. All states of group/domain can not be declared illegal.

### What Next

Rewrite the add_power_state command without declaring all state of a group/domain illegal.

### See Also

- add_power_state

---

## UPF-293

(Error) Power domain '%s' has already been defined in the scope %s

### Description

This message occurs when the UPF is trying to create a power state group and the name of the power state group is same as an existing power domain. Power state groups and power domains can not have same name.

### What Next

Rewrite the UPF so that power state groups and power domains do not have conflicting names.

### See Also

- create_power_state_group
- create_power_domain

---

## UPF-294

(Error) Ambiguous supply name %s. %s is both a power domain supply handle and a supply set

Feedback

### Description

This message occurs when the add_power_state command is used to define a power state for a power domain. If the logic expression uses a supply name that is the supply handle of the power domain and a declared supply set, then we can not be sure if the command is referring to the power domain supply handle or supply set name.

For Example, in the UPF below, we can not tell whether add_power_state command is referring to my_handle the supply_set or my_handle the supply handle of PD. In this case we will get this error.

```
create_supply_set my_handle
create_power_domain PD -supply {my_handle}
add_power_state -domain PD -state s1 {-logic_expr {my_handle == .....
```

### What Next

Rewrite the UPF so that power state groups and power domains do not have conflicting names.

### See Also

- create_power_state_group
- create_power_domain

---

## UPF-295

(Error) Found %d bias rail order violations.

### Description

This is a summary message stating the number of bias rail order violations found. A bias rail order violation occurs when the bias supplies of a design element are less always-on than its power/ground supplies.

### What Next

Fix the sources of any UPF-297 or UPF-298 errors.

### See Also

- UPF-297
- UPF-298

---

## UPF-296

(Error) simstate update for %s is not correct.

Feedback

### Description

This message occurs when the add_power_state command is used to update the simstate for a supply set power state. When add_power_state -update is used to specify a simstate, only following changes are supported.

1. If the simstate was previously not defined for a state, then -update may be used to specify any type of simstate. 1. If the simstate was previously defined as NOT_NORMAL, then -update may be used to specify and simstate other than NORMAL.

all other changes to the simstate of a state are not supported.

### What Next

Modify the UPF to follow the rules above.

### See Also

- add_power_state
- create_power_domain

---

## UPF-297

(Error) %s bias function of power domain %s is less-on than the power/ground supply of the %s %s strategy.

### Description

Tool requires that bias supplies of the power domain where the reported strategy would be implemented have to be ON when the power and ground supplies of the reported strategy are ON, unless library cells with insulated wells are provided.

This error message is issued when the bias supplies of a power domain do not meet the above condition and no library cells with insulated wells are found in the map_isolation_cell (or map_retention_cell) command instance associated to the reported isolation (or retention) strategy

### What Next

Provide insulated cells on the map_isolation_cells (or map_retention_cell) command associated to the reported strategy.

### See Also

- set_isolation
- map_isolation_cell

Feedback

- map_retention_cell
- set_retention
- create_supply_set
- add_power_state

## UPF-298

(Error) Supply set %s's bias %s function is less always-on than its power/ground function.

**Description**

This error message appears when a bias rail order violation is found between a supply set's functions. The nWell(pWell) function of a supply set is required to be ON when both power and ground are ON.

**What Next**

Review the UPF and remove these violations.

**See Also**

- create_supply_set
- add_power_state

## UPF-299

(Information) Created power switch cell %s for upf power switch %s

**Description**

This message indicates that a power switch cell has been created for upf power switch.

## UPF-300

(Information) -repeater_supply option is deprecated in the standard. Consider using set_repeater.

**Description**

This information message occurs when you run *set_port_attributes -repeater_supply* command. *-repeater_supply* is deprecated in the standard. But tool will still honor *-repeater_supply*. For better compliance with the standard, you may want to migrate all *set_port_attributes -repeater_supply* usages to *set_repeater*.

Feedback

### What Next

This is an information message. If you don't want to see this message, use *set_repeater* instead of *set_port_attributes -repeater_supply*.

### See Also

- set_port_attributes
- set_repeater

---

## UPF-301

(Error) Found domain boundary port/pin %s with both repeater strategy %s and repeater_supply port attribute setting.

### Description

This error message occurs when the port/pin has both repeater strategy and repeater_supply port attribute applicable to it. Application is checked irrespective of whether it is on HighConn or LowConn side and irrespective of the granularity of the strategy/attribute.

In the following example, commit_upf will show error because mid/in has both repeater_supply attribute and repeater strategy setting on it:

```
prompt> create_power_domain PD_MID \
                -elements {mid}
prompt> set_port_attributes -ports mid/in \
                -repeater_supply SS1
prompt> set_repeater RP -domain PD_MID \
                -repeater_supply SS1
```

In the following example, commit_upf will show error because mid/in has both repeater_supply attribute and repeater strategy setting on it:

```
prompt> set_design_attributes -element {.} \
               -attribute lower_domain_boundary TRUE
prompt> create_power_domain PD_TOP
prompt> create_power_domain PD_MID \
                -elements {mid}
prompt> set_port_attributes -ports mid/in \
                -repeater_supply SS1
prompt> set_repeater RP -domain PD_TOP \
                -elements {mid} \
                -repeater_supply SS1 \
                -applies_to output
```

Feedback

### What Next

Make sure port/pin has only one of the settings.

### See Also

- set_port_attributes
- set_repeater

---

## UPF-302

(Warning) The specified vct name '%s' already exists.

### Description

This warning message occurs when the specified vct name is predefined or has been used by other user vcts.

### What Next

Ensure that a new and valid *vct name* is specified.

### See Also

- create_upf2hdl_vct
- create_hdl2upf_vct

---

## UPF-303

(error) The specified vct '%s' doesn't exist.

### Description

This error message occurs when the specified vct is neither predefined nor user created vct.

### What Next

Ensure that a valid existing vct is specified.

### See Also

- create_upf2hdl_vct
- create_hdl2upf_vct
- connect_supply_net

Feedback

## UPF-304

(error) Incorrect -hdl_type specification for the commands *create_upf2hdl_vct* and *create_hdl2upf_vct*.

### Description

The error message issues when tool encounters an illegal specification for *-hdl_type*.

### What Next

Check the man page of *create_upf2hdl_vct* and *create_hdl2upf_vct*.

### See Also

- create_upf2hdl_vct
- create_hdl2upf_vct

## UPF-305

(warning) UPF for this ETM has been loaded and applied to all instantiations already. Ignore this UPF file!

### Description

This message occurs when ETM UPF has been loaded before for instance of same ETM cell, but user tried to load ETM UPF again.

### What Next

Skip loading this UPF.

### See Also

- load_upf

## UPF-306

(Warning) State %s of power state group or domain %s is not reachable due to conflicts.

### Description

This message indicates the upf has specified a power state using add_power_state -group/-domain that is not reachable. This can happen when reaching the that state requires a supply net or connected supply nets to be at different voltages or on/off states. Consider the example below

Feedback

```
add_power_state SS1 -state SS1_1 {-supply_expr {power == {FULL_ON 1.0} &&
 ground == {OFF}}}
add_power_state SS2 -state SS2_1 {-supply_expr {power == {FULL_ON 1.0} &&
 ground == {FULL_ON 0}}}

create_supply_set SS1 -function {ground SS2.ground} -update

add_power_state -domain TOP -state TOP_S1 { -logic_expr {SS1 == SS1_1 &&
 SS2 == SS2_1}}
```

The state TOP_S1 of the domain TOP is not reachable because it will require SS1.ground to be OFF and SS2.ground to be at 0 volts. This is not possible because SS2.ground and SS1.ground are same net because of the create_supply_set -update command given.

---

## UPF-307

(Warning) State %s of power state group or domain %s is not reachable due to conflicts with other power state groups and/or psts.

### Description

This message indicates the upf has specified a power state using add_power_state -group/-domain that is not reachable. This can happen when the UPF has other power state groups and or psts defined and another group or pst or their combination is incompatible with this state.

In the example below, the state TOP_S1 of TOP is in conflict with the group G. Group G requires that SS1 be at SS1_0 all the times because in all of its states, SS1 is set to SS1_0.

However states G_S1 and G_S2 are reachable because TOP has a state (TOP_S2), that allows SS1 to be in any state.

By similar logic, state G_S2 is in conflict with the domain state TOP.

```
add_power_state SS1 -state SS1_1 {-supply_expr {power == {FULL_ON 1.0} &&
 ground == {OFF}}}
add_power_state SS1 -state SS1_0 {-supply_expr {power == {FULL_ON 1.2} &&
 ground == {OFF}}}
add_power_state SS2 -state SS2_1 {-supply_expr {power == {FULL_ON 1.0} &&
 ground == {FULL_ON 0}}}
add_power_state SS2 -state SS2_2 {-supply_expr {power == {FULL_ON 1.5} &&
 ground == {FULL_ON 0}}}

add_power_state -domain TOP -state TOP_S1 { -logic_expr {SS1 == SS1_1 &&
 SS2 == SS2_1}} \
                             -state TOP_S2 {-logic_expr { SS2 == SS2_1}
create_power_state_group G
```

Feedback

```
add_power_state G -state G_S1 { -logic_expr {SS1 == SS1_0 && SS2 ==
 SS2_1}} \
                  -state G_S2 { -logic_expr {SS1 == SS1_0 && SS2 ==
 SS2_2}
```

The state TOP_S1 of the domain TOP is not reachable because it will require SS1.ground to be OFF and SS2.ground to be at 0 volts. This is not possible because SS2.ground and SS1.ground are same net because of the create_supply_set -update command given.

---

## UPF-308

(Warning) Illegal states are not supported and will not be honored during the creation of system PST.

### Description

This warning message is to inform user that tool supports only the syntax of -illegal option but not its semantics. i.e. Illegal states will not be explicitly discarded from system PST. However, the illegal states will be written out in UPF'.

### What Next

Make sure that the legal states are defined such that they never include states which are marked illegal.

### See Also

- add_power_state

---

## UPF-309

(Warning) State %s of pst %s is not reachable due to conflicts with other power state groups and/or psts or some of the power states were reconciled.

### Description

This message indicates the upf has specified a pst state using add_pst_state that is not reachable. This can happen when the UPF has other power state groups and or psts defined and another group or pst or their combination is incompatible with this state. If the design attributes upf_reconciliation_automatic or upf_reconcile_boundary were set, some power states may have been modified leaving this state unreachable.

---

## UPF-310

(warning) Strategy '%s' has same precedence as strategy '%s' of same power domain '%s', and can't be resolved on power domain boundary port '%s'.

Feedback

### Description

This error message occurs when a strategy defined has same precedence as another same type strategy from same power domain, and tool can't resolve which one to use.

### What Next

Change either strategy and make strategy with different precedence.

### See Also

- set_isolation
- set_isolation_control
- set_level_shifter
- set_repeater
- commit_upf
- associate_mv_cells
- create_mv_cells

---

## UPF-311

(warning) Isolation strategy '%s' can't be implemented on power domain boundary port '%s' with location '%s' to isolate '%s'.

### Description

This error message occurs when a strategy defined can't implemented due of location of the strategy.

### What Next

Change either strategy with different location, or add another strategy with different location for the load.

### See Also

- set_isolation
- set_isolation_control
- create_mv_cells

Feedback

## UPF-312

(information) Repeater strategy %s belonging to power domain %s is ignored for implementation.

### Description

This information message is issued when the repeater strategy doesn't have a valid element list or the repeater supply is not visible inside the domain. The strategy will not be used for repeater cell association and insertion.

### What Next

Fix the repeater strategy and run the command again.

### See Also

- set_repeater

## UPF-313

(information) Domain %s will be treated as an Always-On Block Synthesis Domain, since the main_rail supply is specified.

### Description

This message indicates that the given domain will be treated as an Always-On Block Synthesis Domain, meaning it will be synthesized with dual-rail cells with primary PG pin connected to the main_rail supply and backup PG pin connected to the primary supply of the domain.

### What Next

This is an information-only message. No action is required. If user intention was to only create a regular user supply set of name 'main_rail', please change the name to something else. "main_rail" keyword is reserved for AO Block Synthesis Domains.

### See Also

- create_power_domain

## UPF-314

(warning) Multiple drivers on unresolved supply net '%s'

Feedback

### Description

This message occurs when multiple power sources are connected to a net specified as unresolved with the create_supply_net command -resolve option.

### What Next

Supply nets specified as unresolved may receive only one driver. Either disconnect other sources or specify the supply net as parallel.

### See Also

- create_supply_net

---

## UPF-315

(error) Update of tool-derived strategy %s of domain %s is not allowed.

### Description

This error is issued when you attempt to update a tool derived isolation, retention or level-shifter strategy. Updating the UPF constraint that was generated by the tool is not allowed.

### What Next

Create a new strategy instead of updating the existing tool-derived strategy.

### See Also

- set_isolation
- set_retention
- set_level_shifter

---

## UPF-316

(warning) Repeater strategy '%s' cannot be applied to the object '%s'.

### Description

This warning message occurs when a repeater strategy is specified on macro cell, which requires the tool to insert the repeater cells inside macro cell.

### What Next

This is just a warning message. No action is required.

Feedback

**See Also**

- set_repeater

---

## UPF-317

(error) Detected circular references to the file %s while loading the UPF file %s.

**Description**

This error message occurs when you load a UPF file that references itself. This results in a circular reference, which is illegal. An example of a circular reference is as follows :-

File 1.upf: load_upf 2.upf

File 2.upf load_upf 2.upf

**What Next**

Remove the load_upf command that causes the circular reference.

**See Also**

- load_upf

---

## UPF-318

(error) UPF for this ETM has been loaded already and cannot be loaded again.

**Description**

This message occurs when UPF for this ETM has been loaded, but user tried to load UPF again.

**What Next**

User has to do reset_upf if different ETM UPF file has to be loaded.

**See Also**

- load_upf
- reset_upf

---

## UPF-319

(error) Supply state '%s' does not exist on supply '%s'. It has not been propagated from supply set.

Feedback

### Description

This error occurs when the user tries to use a non existent supply state in add_pst_state command. The state name is present on one of the connected supply sets but has not been propagated to the supply nets and ports. The propagation of the power states from the supply sets to connected supply nets and ports can be enabled using the design attribute enable_state_propagation_in_add_power_state on the scope of the supply set.

### What Next

Please enable the propagation of the power states from supply sets to connected supply nets and ports using the design attribute enable_state_propagation_in_add_power_state.

### See Also

- set_design_attributes

---

## UPF-321

(error) Associated supply sets are resolved to different supply nets %s(%s) and %s(%s) in same scope.

### Description

For associated supply sets in the same scope, they must be resolved to the same explicit supply net if resolved.

### What Next

Ensure associated supply sets in the same scope are resolved to the same explicit supply net.

### See Also

- create_supply_set
- create_power_domain

---

## UPF-322

(error) Supply sets cannot be associated because there is no supply set in common ancestor scope.

### Description

For associated supply sets, the supply set list must contain a supply set which is defined in their common ancester scope.

Feedback

### What Next

Ensure associated supply sets contains a supply set in their common ancestor scope.

### See Also

- create_supply_set

---

## UPF-323

(error) The state %s of supply set %s doesn't have a -supply_expr defined, when this supply state is used in group %s.

### Description

This message occurs when a supply set state is used in a group, and it doesn't have a -supply_expr defined. E.g., it just has -simstate or just has -logic_expr.

### What Next

Specify the supply expression of the state using the add_power_state -update command for this state.

### See Also

- add_power_state

---

## UPF-324

(warning) The app_option "mv.upf.enable_missing_voltage_area" will not take effect until incomplete_upf mode is turned on".

### Description

This message occurs when "mv.incomplete_upf.enable" is off and "mv.upf.enable_missing_voltage_area" is set.

### What Next

Turn on "mv.incomplete_upf.enable" to make it work

### See Also

- set_app_options
- mv.incomplete_upf.enable

Feedback

## UPF-325

(error) The value "auto" of app_option "mv.incomplete_upf.missing_va" cannot be set, when app_option "mv.upf.enable_missing_voltage_area" is enabled.

### Description

This message occurs when "mv.upf.enable_missing_voltage_area" is on, and the value "auto" is used to set the app_option "mv.incomplete_upf.missing_va".

### What Next

Turn off or don't set "mv.upf.enable_missing_voltage_area" and set "mv.incomplete_upf.missing_va" again

### See Also

- set_app_options
- mv.incomplete_upf.missing_va

## UPF-326

(error) The option "-force_bias_connections" is not supported in bias mode or designs.

### Description

This message occurs when running connect_pg_net command with option "-force_bias_connections" and the design attribute "enable_bias" is TRUE, The option "-force_bias_connections" is used to connect nwell and pwell pg pins to the domain primary power and ground respectively, it is not allowed in bias pin connection support design.

### What Next

Check if the design is supporting bias and there is bias supplies in the UPF.

Use 'set_design_attributes -attribute enable_bias' to modify the biasing attributes in the UPF to adhere to the requirements.

### See Also

- connect_pg_net
- set_design_attributes

Feedback

## UPF-327

(warning) pst_state %s of power state table %s defined is ignored by implementation because supply %s and %s have voltage conflict in this pst_state, but they become equivalent because both are connected to same supply %s outside the block.

### Description

This warning message occurs when a pst_state defined in PST from linked block has equivalent supplies with voltage conflict, but these supplies become equivalent because they are connected to the same supply outside the block.

### What Next

Make sure these supplies are made equivalent outside the block intentionally.

### See Also

- add_pst_state
- connect_supply_net

## UPF-328

(Error) Reference-only supply %s cannot be used in this option %s of the command %s.

### Description

This error message appears when a reference-only supply net or supply set is specified in the option that doesn't support for reference-only supplies.

Reference-only supply is marked by: set_design_attribute -element {.} -attribute reference_only {supply_net_or_supply_set}

### What Next

Rewrite the UPF to avoid using reference-only supply in the option.

## UPF-329

(information) UPF constraints in database contains non-standard hierarchical name(s), and app option "mv.upf.input_enforce_simple_names" is automatically set to false for this design.

### Description

Based on IEEE Std 1801, some UPF command options require a simple name with no hierarchy separator character. This is an informational message that

Feedback

some hierarchical names in the UPF constraints of the database deviate from IEEE Std 1801 recommendation. The tools have automatically set the app option "mv.upf.input_enforce_simple_names" to false for backward compatibility.

**What Next**

Review the UPF constraints of the design and consider to change the hierarchical names to simple names.

**See Also**

- mv.upf.input_enforce_simple_names

---

## UPF-330

(information) Ignore internal design attribute '%s': %s '%s' does not exist.

**Description**

This message occurs when the object name specified in the internal attribute does not exist.

**What Next**

This message is informational. No action is required.

---

## UPF-331

(warning) Supply set '%s' does not exist and will be ignored.

**Description**

This message occurs when specified supply set in associate_supply_set command does not exist.

**What Next**

Check the supply set name is valid.

**See Also**

- associate_supply_set

---

## UPF-335

(error) Retention cell insertion is not supported in AO-Block Synthesis domain %s.

Feedback

### Description

The domain for which this map_retention strategy is specified is an AO-Block Synthesis Domain and retention cell insertion is not supported in such domains.

### See Also

- create_power_domain

---

## UPF-336

(Warning) Name space conflict with %s type object '%s' while create %s object.

### Description

This warning message occurs when an UPF command creates an UPF object or a design object with the name of an existing UPF object or design object, for the current design.

The warning could happen for below cases and the object creation is skipped:

- A logic net with the same name as a logic net
- A logic port with the same name as a logic port

The warning also happens when opening an old block which contains name conflict according to the new rules, but for backward compatibility consideration, we report warning only.

### What Next

This is only a warning message. No action is required. For backward compatibility, you can turn off mv.upf.object_namespace_checks to skip this name space check. Nevertheless, is advised to avoid name space conflicts altogether by renaming affected UPF or design objects.

### See Also

- UPF-337
- mv.upf.object_namespace_checks

---

## UPF-337

(Error) Name space conflict with %s type object '%s' while create %s object.

### Description

This error message occurs when an UPF command creates an UPF object or a design object with the name of an existing UPF object or design object, for the current design.

Feedback

There are two allowed exceptions:

- A logic or supply net with the same name as a logic or supply port
- A logic or supply port with the same name as a logic or supply net

Normally this condition is an error and the object creation is aborted. By setting app option *mv.upf.object_namespace_checks* to false, the complete name space conflict check is turned off.

**What Next**

Ensure that objects specified in your UPF file are not identical to the existing objects in the given name space.

---

## UPF-338

(error) Invalid '%s' name specified: '%s'.

**Description**

There are some keywords that are predefined in VCS-NLP: UNDEFINED_STATE, INVALID, illegal_state, DEFAULT_NORMAL, DEFAULT_CORRUPT.

1. The port state of any port cannot have the name UNDEFINED_STATE. 2. Power switch cannot have a state with the name INVALID. 3. PST cannot have a state with the name illegal_state. 4. Supply set cannot have a power state with the name DEFAULT_NORMAL or DEFAULT_CORRUPT.

**What Next**

Change the state name to avoid these keywords.

**See Also**

- add_port_state
- create_power_switch
- add_pst_state
- add_power_state

---

## UPF-339

(error) Cannot find supply pin %s in cell %s.

Feedback

### Description

This error message occurs when the connect_supply_net attempts to connect a specific supply pin of a given library cell to a supply net. In this case, the pin must exist in the interface.

### What Next

Check the interface of the library cell and correct the pin name.

### See Also

- connect_supply_net

---

## UPF-340

(warning) Command '%s' executed on ETM or power model scope is skipped.

### Description

This message occurs when specified command is skipped when it is executed on ETM or power model scope.

### What Next

Check the command is valid on ETM or power model scope.

### See Also

- set_scope

---

## UPF-341

(warning) set_scope .. is not supported nested inside ETM or power model.

### Description

This message occurs when set_scope .. is executed when the current scope is nested under ETM or power model.

### What Next

Use full hierarchical name starting with "/" instead of ".."

### See Also

- set_scope

Feedback

## UPF-342

(error) The app_option "mv.upf.upf_add_power_state_21_syntax" can not be set if power states have already been created

### Description

The app option mv.upf.upf_add_power_state_21_syntax can not be set after power states are created. Power states are created using add_power_state commands.

### What Next

Please set mv.upf.upf_add_power_state_21_syntax before any power states are created.

### See Also

- set_app_options
- add_power_state

## UPF-343

(warning) That UPF command '%s' is inputted through interactive shell will not be preserved "as-is" by save_upf.

### Description

This warning message occurs when the UPF command is inputted through interactive shell, not by load_upf. Now the implementation tools allow all UPF commands to be loaded outside load_upf. However, when it's interactively inputted, save_upf won't preserve the command as what it is.

### What Next

It's just a warning message. If it's not what you want, reload the command by load_upf.

### See Also

- load_upf

## UPF-345

(error) Power switch state '%s' is used more than once for power switch strategy %s.

Feedback

### Description

This error occurs when the same state name is specified multiple times using the -on_state or -error_state or -off_state or -on_partial_state options of create_power_switch command. State name should be unique in this power switch strategy definition.

### What Next

Ensure unique state name is used in the same power switch.

### See Also

- create_power_switch

---

## UPF-346

(error) Incorrect "set_port_attributes -attribute function" setting because: %s

### Description

This error message is shown when there is a non sintatic issue with a usage instance of the "-attribute function" option of the "set_port_attributes" command.

### What Next

Please review any "set_port_attributes -attribute function" settings involving the objects referenced in the error message

### See Also

- set_port_attributes

---

## UPF-347

(information) Implementation tool will read and ignore this command.

### Description

This command is only applicable for simulation and does not have impact on implementation tool. It won't be preserved by save_upf as well.

### What Next

Just an information message.

Feedback

**See Also**

- sim_assertion_control
- sim_replay_control
- set_simstate_behavior

## UPF-348

(warning) Specified %s supply does not exist. Related %s supply will be determined from the related PG pin found in the reference library model.

**Description**

This message occurs when a non-exist supply is used by set_related_supply_net in ETM or power model scope. If the specified supply cannot be found, then the related supply will be determined from the related PG pin found in the reference library model.

## UPF-349

(error) The specified use_interface_cell strategy %s already exists in the power domain %s.

**Description**

This message occurs when the specified use_interface_cell strategy already exists. Please check the existing use_interface_cell command(s), or use another use_interface_cell strategy name.

**See Also**

- use_interface_cell

## UPF-350

(warning) Using both use_interface_cell and map_isolation_cell/map_level_shifter_cell commands are not allowed in a single power domain. The tool only uses the specification from use_interface_cell.

**Description**

This message occurs when both use_interface_cell and map_isolation_cell/ map_level_shifter_cell specified for a single power domain. Only the specification from use_interface_cell is used.

Feedback

### See Also

- use_interface_cell

---

## UPF-351

(Error) Find error in the option -strategy. %s

### Description

Only one isolation strategy, one level-shifter strategy, or a pair of isolation and level-shifter strategies can be used in the option -strategy. This message occurs when more than one isolations strategy, more than one level-shifter strategy, or none strategy is specified in the option -strategy.

### What Next

Please fix the -strategy option accordingly.

### See Also

- use_interface_cell

---

## UPF-352

(error) The syntax used for add_power_state -state is inconsistent with previous syntax used for object %s

### Description

This error occurs when the add_power_state was used to define a power state for the object but the syntax used for the -state option is not consistent with the previously define power_states for the object. For example, this error will occur if first add_power_state used 2.0 syntax to define -state for supply set SS1 and then the next add_power_state command used 2.1 syntax

```
#this command uses 2.0 syntax for -state
add_power_state -supply SS1 -state S1 {-supply_expr {power == {OFF}}}

#this command uses 2.1 syntax for -state and will cause UPF-352 error.
add_power_state -supply SS1 -state {S0 -supply_expr {power == {OFF}}}
```

### What Next

Please make sure all add_power_state commands for the object in question uses the consistent syntax for -state option ( either user 2.0 syntax everywhere or 2.1 syntax everywhere)

Feedback

### See Also

- add_power_state

---

## UPF-353

(error) The syntax used for -state must be consistent throughout the command. Mixing syntax in the same command is not allowed.

### Description

This error happens when the add_power_state command has multiple -state argument and the syntax used to specify -state is not consistent throughout the command. This error happens if some -state arguments are using UPF 2.0 syntax (i.e. -state has two value, one for state name and the other for state definition) and some -state arguments are using UPF 2.1 syntax (i.e. -state has only value combining state name and state definition in one string)

For example, in the following command, state S1 is specified using UPF 2.0 syntax and S2 is specified using UPF 2.1 syntax. This is not supported.

```
add_power_state SS1 -state S1 {-supply_expr {power == {FULL_ON, 1}}} \\
   -state {S2 -supply_expr {power == {FULL_ON, 0.9}}}
```

### What Next

Please modify the add_power_state command to make sure -state uses either UPF 2.1 or UPF 2.0 consistently throughout the command.

### See Also

- add_power_state

---

## UPF-354

(error) Supply net reconnection failed because existing supply net on pin already has power states declared

### Description

This error happens if the connect_supply_net command is trying to reconnect a new net to a pin. If the existing net connected to the pin already has power/port states declared on it ( or if something connected to it has power/port states declared on it), then the reconnection is not allowed

Feedback

### What Next

Please modify the UPF to put the connect_supply_net command before any power states or ports states are added to the existing net of the port or pin where reconnection is being attempted.

### See Also

- add_power_state

---

## UPF-355

(Information) The lower_domain_boundary design attribute will be made obsolete in future. Consider using -applies_to_boundary option of set_isolation/set_level_shifter/set_repeater strategy commands.

### Description

This information message is issued when user specifies lower_domain_boundary design attribute to make isolation/level-shifter strategies apply to the lower boundary of the power domain. This attribute will soon be made obsolete and it is suggested that the -applies_to_boundary option of set_level_shifter/set_isolation/set_repeater commands be used instead. If the -applies_to_boundary option is not specified, strategies will by default only apply to the upper domain boundary. For strategies to apply on the lower domain boundary or on both boundaries, -applies_to_boundary can be set to lower and both respectively.

### What Next

Please make use of the -applies_to_boundary option of strategy commands.

### See Also

- set_isolation
- set_level_shifter
- set_repeater

---

## UPF-356

(Error) State %s of power state group or domain %s is not reachable due to conflicts within it.

### Description

This message indicates the upf has specified a power state using add_power_state -group/-domain that is not reachable due to conflicts within this state. this can happen

Feedback

if the state can only be reached by putting same supply two different supplies that are connected together in two different states.

```
add_power_state SS1 -state SS1_1 {-supply_expr {power == {FULL_ON 1.0} &&
 ground == {OFF}}}
add_power_state SS2 -state SS2_1 {-supply_expr {power == {FULL_ON 1.0} &&
 ground == {FULL_ON 0}}}

create_supply_set SS1 -function {ground SS2.ground} -update

add_power_state -domain TOP -state TOP_S1 { -logic_expr {SS1 == SS1_1 &&
 SS2 == SS2_1}}
```

The state TOP_S1 of the domain TOP is not reachable because it will require SS1.ground to be OFF and SS2.ground to be at 0 volts. This is not possible because SS2.ground and SS1.ground are same net because of the create_supply_set -update command given.

---

## UPF-357

(Error) State %s of pst %s is not reachable due to conflicts within it

### Description

This message indicates that a pst state is not possible because it specifies conflicting states for a supply. This can happen if pst state supplies include connected nets or ports and it then specifies conflicting states for them.

for example imagine a pst supplies include supply port SP1 and SP2 and SP1 and SP2 are connected together. If the PST state specifies that SP1 should be at 0.7 volt and SP2 should be at 0.9 volt, then it is a conflict. This means that this pst state is not possible.

### What Next

Please see if the conflict is due to a mistake in UPF. If not then please remove the conflicting pst state.

---

## UPF-358

(error) The cell '%s' has no valid power domain. This cell is being excluded in the power domain: '%s'.

### Description

This error message occurs when the specified cell is on the *-exclude_elements* list of a power domain and is left with no valid power domain. A cell being excluded from a power domain will have the domain of the parent hierarchy, if the cell is being excluded from that domain too or there is no parent hierarchy domain, the cell will have no domain. The

Feedback

cell with no domain can be specified as a root cell of another domain which is not being excluded for it to have a domain.

### What Next

Please include the specified cell in a power domain with *-elements* option. Here is an example:

```
prompt> create_power_domain PD_TOP -elements {.} -exclude_elements {u1}
prompt> create_power_domain PD_MID -elements {u1}
```

### See Also

- create_power_domain

---

## UPF-360

(error) Power domain '%s' has no elements.

### Description

This error message occurs when you are trying to create a power domain which is not the top-level power domain of a scope and the power domain does not have any elements specified. Only the top-level power domain of a scope can have no elements specified.

### What Next

Please update the power domain with -elements and -update options. Here is an example:

```
prompt> create_power_domain PD_TOP -include_scope
prompt> create_power_domain PD_MID -elements { }
prompt> set_level_shifter LS_STG -domain PD_MID -elements {u1 u2}
prompt> create_power_domain PD_MID -elements {u1 u2} -update
```

### See Also

- create_power_domain

---

## UPF-361

(warning) %s '%s' does not exist.

### Description

The specified object does not exist.

Feedback

### What Next

Understand why the specified object does not exist, create if required and rerun the command again.

### See Also

- get_objects_by_location
- query_objects

---

## UPF-362

(error) None of library cell specified in %s of %s strategy '%s' is legal.

### Description

This error message occurs when all library cells specified for isolation or level-shifter strategy are illegal.

### See Also

- use_interface_cell
- map_isolation_cell
- map_level_shifter_cell

---

## UPF-363

(warning) %s is not on the %s boundary of domain %s, and will be dropped.

### Description

This warning message occurs when given element is not on the upper (lower) domain boundary of the specified domain, and when -applies_to_boundary lower (upper) is specified in the strategy.

### What Next

Check the applies_to_boundary option of the specified strategy.

### See Also

- set_level_shifter
- set_isolation
- set_repeater

Feedback

## UPF-364

(Information) Power State %s defined using %s syntax for -state.

### Description

This information message notifies the user about the syntax used for -state in the add_power_state command.

### See Also

- add_power_state

## UPF-365

(Warning) The %s library cell setting, by the previous use_interface_cell %s command, is replaced by the current use_interface_cell %s command.

### Description

The message occurs when the current use_interface_cell command is trying to set up library cells on an isolation or a level-shifter strategy, but this strategy already has library cell setting by a previous use_interface_cell command. The current use_interface_cell command is overwriting the previous one.

### What Next

This is only a warning message.

### See Also

- use_interface_cell

## UPF-366

(warning) The use of the '%c' to match the hierarchy separator is only allowed with glob type matching; it is not allowed with -regexp.

### Description

This warning message occurs when you are specifying a matching pattern with hierarchical separator in the find_objects command with -regexp option.

### What Next

Check whether the matching pattern is correct or not.

Feedback

**See Also**

- find_objects

---

## UPF-367

(error) UPF cannot be saved because this is not a MV design.

**Description**

This error occurs when user tries to save_upf with -for_empty_blackbox on a non-MV design.

**What Next**

Load and commit UPF for the design.

**See Also**

- load_upf
- commit_upf

---

## UPF-369

(warning) Element '%s' of isolation strategy '%s' in power domain '%s' is connected with strategy control signal '%s', and will be dropped.

**Description**

This warning message occurs when the element defined in an isolation strategy will also be used as control signal in the same strategy. The element will be dropped from the isolation strategy.

**What Next**

Review the issued strategy for the self dependency definition.

**See Also**

- set_isolation
- set_isolation_control

---

## UPF-370

(warning) Isolation supply of strategy %s in domain %s cannot be made available to power domain %s.

Feedback

### Description

This warning message occurs when the specified isolation supply net cannot be made available for the domain where isolation cell will be inserted. Isolation cells will not be inserted with this warning message.

### What Next

First, ensure that the supply specified is the intended supply for use. If the intention is correct, use the *report_power_domains* command to see if the specified supply is available in the power domain. If the supply is not available, you must modify the UPF. See the man pages for the *create_supply_net* and *create_power_domain* commands for information about creating and associating supply nets to power domains.

### See Also

- report_power_domains
- set_isolation
- set_isolation_control

---

## UPF-371

(information) default_pst (one pst_state with all possible port_state/power_state for all supplies) has been applied to the design since there is no PST/power_state_group created in top scope.

### Description

When there is no PST/power_state_group created in the top scope, tool will automatically apply default_pst (one pst_state with all possible port_state/power_state for all supplies) to the design.

### See Also

- create_pst
- commit_upf

---

## UPF-372

(warning) Design has no PST or power_state_group in the top scope, and default_pst generation is disabled. Optimization can possibly create MV violations that cannot be detected without a proper PST.

Feedback

### Description

When design has no PST or power_state_group in the top scope and mv.upf.apply_default_pst has been set to be false, tool won't apply default_pst (one pst_state with all possible port_state/power_state for all supplies) to the design and will assume there is no MV violation (voltage, on-off/off-on) between any pair of supplies regardless of whether any port/power state is defined or not, and regardless of any PST/power_state_group defined in sub-scope or not. This means check_mv_design will not be able to detect any MV violation, buffering engine will assume all paths have no MV violation, and all supplies will be 'pst-equivalent'.

### What Next

Create proper PST or power_state_group in the top scope, or set mv.upf.apply_default_pst to be true, so tool can apply default_pst to the design

### See Also

- create_pst
- commit_upf

---

## UPF-373

(Error) Failed to set main_rail supply on domain '%s' since its always-on strategy is single_power.

### Description

When the always-on strategy has been set on a power domain as single_power, that power domain can't be marked as AO-Block Domain.

### What Next

You can change the power domain's always-on strategy to dual_power before you update the power domain as AO-Block Domain.

### See Also

- create_power_domain
- set_power_domain_constraints

---

## UPF-374

(warning) Net '%s' is connected to analog pin '%s'. The net will be derived as analog net.

Feedback

### Description

This message occurs when a net is connected to an analog pin. The net will be derived as analog net after this connection.

### What Next

Check the name and type of net or connected pin.

### See Also

- connect_logic_net
- connect_power_switch

---

## UPF-375

(error) Can't %s%s in %s because it violates the power intent of power model '%s'.

### Description

User tries to run a UPF command in the specified scope to which a power model has already been applied. However, tool cannot execute the UPF command because it will modify or create UPF objects in the specified scope and therefore violate the integrity of the power model.

Example:

```
define_power_model MODEL {
  create_power_domain PD_MACRO
}
apply_power_model MODEL -elements {macro_0}
set_level_shifter LS_STG -domain macro_0/PD_MACRO -location self
```

Error: Can't create level shifter strategy LS_STG in macro_0 because it violates the power intent of power model 'MODEL'. (UPF-375)

### What Next

Remove or modify the specified UPF command in order to keep the integrity of the power model intact.

### See Also

- define_power_model
- apply_power_model
- set_level_shifter

Feedback

- set_isolation
- set_retention

---

## UPF-376

(warning) Skipped power model '%s' from %s because it has already been defined in %s.

### Description

User has defined a power model in a file specified in power model search path through app option *mv.upf.power_model_search_path* and power model library through app option *mv.upf.power_model_library*. However, an existing power model with the same name has already been created. Duplicated power model is not allowed.

### What Next

Use a different name for the duplicated power model.

### See Also

- define_power_model
- apply_power_model
- mv.upf.power_model_search_path
- mv.upf.power_model_library

---

## UPF-377

(error) Cannot apply power model '%s' to cell '%s' because UPF commands have already been run in cell's power scope.

### Description

User tries to apply the specified power model to the specified cell through the *apply_power_model* command. However, tool cannot apply the specified power model because UPF commands have already been run in cell's power scope through the *load_upf* command. Power model can be applied to a cell only if no *load_upf* command has been run in the cell's power scope.

Example:

```
define_power_model MODEL -for {lib_cell} {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
```

Feedback

```
}
load_upf -scope u1/macro macro.upf
apply_power_model MODEL -elements {u1/macro}

Error: Cannot apply power model 'MODEL' to cell 'u1/macro' because UPF
commands have already been run in cell's power scope. (UPF-377)
```

### What Next

Do not run the *load_upf* command in the specified cell's power scope but include commands from the UPF file in the specified power model.

### See Also

- define_power_model
- apply_power_model
- load_upf

---

## UPF-378

(warning) Cannot apply power model%s%s to cell '%s' because design attribute 'UPF_is_%s_macro' is %s.

### Description

User tries to apply the specified power model to the specified cell through the *apply_power_model* command. However, tool cannot apply the specified power model because the design attribute *UPF_is_hard_macro* or *UPF_is_soft_macro* is not set on the specified cell or it is set to false.

### What Next

Please assign design attribute *UPF_is_hard_macro* or *UPF_is_soft_macro* to the specified cell through the *set_design_attributes* command.

Example:

```
define_power_model model -for {lib_cell_1 lib_cell_2} {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
set_design_attributes -models {lib_cell_1 lib_cell_2}
                      -attribute UPF_is_hard_macro true
apply_power_model model -elements {u1/macro u2/macro}
```

Feedback

### See Also

- define_power_model
- apply_power_model

---

## UPF-379

(error) Cannot apply design attribute 'UPF_is_%s_macro' or -is_%s_macro option to library cell '%s' because it is not a %s macro.

### Description

User set design attribute *UPF_is_hard_macro* or *UPF_is_soft_macro* (or use *-is_hard_macro*/*-is_soft_macro* options) to the specified library cell through the *set_design_attributes* command, However, tool cannot apply the design attribute because the specified library cell is not a hard or soft macro.

### What Next

Correct the design attribute assignment so that it is applied to the correct hard or soft macro.

### See Also

- define_power_model
- apply_power_model

---

## UPF-380

(warning) Power model '%s' contains no UPF commands.

### Description

User created a power model through the *define_power_model* command but the command does not contain any UPF commands. The power model is therefore empty.

### What Next

Include UPF commands in curly braces using the *define_power_model* command.

Example:

```
      define_power_model model -for {lib_cell_1 lib_cell_2} {
create_supply_net VDD
create_supply_net VSS
create_supply_set SS -function {power VDD} -function {ground VSS}
create_power_domain PD_TOP -supply {primary SS} -include_scope
```

Feedback

```
}
```

### See Also

- define_power_model
- apply_power_model

---

## UPF-381

(warning) Duplicated %s '%s' found in %s option to %s command on power model '%s'.

### Description

User specified a library cell, supply net, or supply port multiple times in the specified option to a define_power_model or apply_power_model command on the specified power model. Only one instance of each object can be included in the specified option. Duplicated objects will be dropped from the command option.

Example 1:

```
define_power_model MODEL -for {lib_cell_1 lib_cell_1} {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
Warning: Duplicated library cell 'lib_cell_1' found in -for option to
define_power_model command on power model 'MODEL'. (UPF-381)
```

Example 2:

```
apply_power_model MODEL -elements {macro_u1} \\
   -supply_map {{VDD VDD1_TOP} {VDD VDD2_TOP}}
Warning: Duplicated supply net 'VDD' found in -supply_map option to
apply_power_model command on power model 'MODEL' (UPF-381)
```

### What Next

Remove duplicated object from the command option.

### See Also

- define_power_model
- apply_power_model

Feedback

## UPF-382

(error) Power model '%s' has already been defined in %s.

### Description

User tries to create a new power model through the *define_power_model* command in the specified scope. However, an existing power model with the same name has already been created. Duplicated power model is not allowed.

Example:

```
set_scope /
define_power_model MODEL -for {lib_cell_1} {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
define_power_model MODEL -for {lib_cell_2} {
  create_power_domain PD_TOP
}

Error: Power model 'MODEL' has already been defined in top scope.
 (UPF-382)
```

### What Next

Correct the name of the new power model.

### See Also

- define_power_model
- apply_power_model

## UPF-383

(error) Can't find power model '%s' specified in apply_power_model command.

### Description

User tries to apply a power model through the *apply_power_model* command. However, an existing power model with the specified name cannot be found.

Example:

```
define_power_model MODEL -for {lib_cell_1} {
  create_supply_net VDD
  create_supply_net VSS
```

Feedback

```
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
apply_power_model MODEL_2 -elements {u1/macro}

Error: Can't find power model 'MODEL_2' specified in apply_power_model
 command.
```

### What Next

- Correct the power model name specified in apply_power_model command.
- Check that define_power_model command is run before apply_power_model command.
- Make sure that the power model file <model_name.upf> is specified in app option mv.upf.power_model_library. For example:

  ```
  set_app_options -as_user_default
                  -name mv.upf.power_model_library
                  -value "MODEL.upf"
  ```

- Make sure that the power model search path is specified correctly in app option mv.upf.power_model_search_path. For example:

  ```
  set_app_options -as_user_default
                  -name mv.upf.power_model_search_path
                  -value "/usr/library/power_models"
  ```

## UPF-384

(error) Can't apply power model '%s' to '%s' because power model '%s' has already been applied.

### Description

User tries to apply a power model through the *apply_power_model* command to the specified cell. However, an existing power model has already been applied to the same cell through a previous *apply_power_model* command.

Example:

```
define_power_model MODEL_1 -for {lib_cell_1} {
  create_power_domain PD_TOP
}
define_power_model MODEL_2 -for {lib_cell_1} {
  create_power_domain PD_TOP
}
apply_power_model MODEL_1 -elements {u1/macro}
apply_power_model MODEL_2 -elements {u1/macro}
```

Error: Can't apply power model 'MODEL_2' to 'u1/macro' because power model 'MODEL_1' has already been applied.

### What Next

Change that only one power model is applied to the specified cell.

### See Also

- define_power_model
- apply_power_model

---

## UPF-385

(warning) Can't apply power model%s%s to any cells in %s.

### Description

User tries to apply a power model through the *apply_power_model* command without *-elements* option. However, tool cannot find any cell such that:

```
1. no power model has been applied to the cell; and
2. the cell uses a library cell matching -for option
 to define_power_model command
or if -for option is not specified, the name of the specified power
 model; and
3. the library cell does not have UPF_is_hard_macro attribute set to
 false.
```

As a result, tool cannot determine which cells should the power model be applied to.

Example:

```
set_scope /
define_power_model MODEL {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
```

Feedback

```
}
apply_power_model MODEL
```

Warning: Can't apply power model MODEL to any cells in top scope. (UPF-385)

### What Next

Specify *-elements* option to *apply_power_model* command or specify *-for* option to *define_power_model* command.

### See Also

- define_power_model
- apply_power_model

---

## UPF-386

(error) Can't apply power model '%s' because %s '%s' specified in %s cannot be found.

### Description

User tries to apply a power model through the *apply_power_model* command with *-supply_map* or *-port_map* option. However, tool cannot find the specified supply set, supply net, or logic net in the current scope. It can also be because tool cannot find the specified logic port in the power model as logic port cannot be generated in a hard-macro.

Example:

```
create_supply_set TOP_SS
define_power_model MODEL {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
apply_power_model MODEL -supply_map {{SS TOP_SS_2}}
```

Error: Can't apply power model 'MODEL' because supply set 'TOP_SS_2' specified in -supply_map cannot be found. (UPF-386)

### What Next

Correct the specified supply set, supply net, logic net, or logic port in *-supply_map* or *-port_map* option to *apply_power_model* command.

Feedback

### See Also

- define_power_model
- apply_power_model

---

## UPF-387

(error) Can't apply power model '%s' to cell '%s' because cell %s.

### Description

User tries to apply a power model through the *apply_power_model* command with a cell specified in *-elements* option. However, tool cannot apply the power model because the specified cell is not a hard macro. In this version of the tool, power model can only be applied to hard macro cells.

Example:

```
define_power_model MODEL {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
apply_power_model MODEL -elements {non_hard_macro_instance}
```

Error: Can't apply power model 'MODEL' to cell 'non_hard_macro_instance' because cell is not a hard macro. (UPF-387)

### What Next

Include a hard macro cell in *-elements* option to *apply_power_model* command.

### See Also

- define_power_model
- apply_power_model

---

## UPF-388

(error) Can't apply power model '%s' to cell '%s' because its reference library cell is not included in the power model.

### Description

User tries to apply a power model through the *apply_power_model* command with a cell specified in *-elements* option. However, tool cannot apply the power model because

Feedback

the specified cell is using a reference library cell which is not included in *-for* option of *define_power_model* command.

Example:

```
define_power_model MODEL -for {lib_cell_1} {
  create_supply_net VDD
  create_supply_net VSS
  create_supply_set SS -function {power VDD} -function {ground VSS}
  create_power_domain PD_TOP -supply {primary SS} -include_scope
}
apply_power_model MODEL -elements {an_instance_not_using_lib_cell_1}
```

Error: Can't apply power model 'MODEL' to cell 'an_instance_not_using_lib_cell_1' because its reference library cell is not included in the power model. (UPF-388)

### What Next

Include the reference library cell used by the specified cell in *-for* option to *define_power_model* command.

### See Also

- define_power_model
- apply_power_model

---

## UPF-389

(error) Can't create power model '%s' because it is defined inside another power model '%s'.

### Description

User tries to create a power model through the *define_power_model* command. However, tool cannot create the power model because it is defined inside another existing power model. Nested power models are not allowed.

Example:

```
define_power_model MODEL {
  create_power_domain PD_TOP
  define_power_model SUB_MODEL {
    create_power_domain PD_SUB
  }
  apply_power_model SUB_MODEL -elements {u1/macro}
}
apply_power_model MODEL -elements {u0/macro}
```

Feedback

Error: Can't create power model 'SUB_MODEL' because it is defined inside another power model 'MODEL'. (UPF-389)

**What Next**

Move the specified *define_power_model* command outside of the existing power model.

**See Also**

- define_power_model
- apply_power_model

---

## UPF-390

(error) Can't add parameter '%s' because add_parameter command is not executed inside a power model.

**Description**

User tries to add a parameter through the *add_parameter* command. However, tool cannot add the parameter because the *add_parameter* command can only be executed inside a power model (through the *define_power_model* command).

Example:

```
define_power_model MODEL {
  create_power_domain PD_TOP
}
add_parameter VAR -default_value 1 -description "a parameter"
```

Error: Can't add parameter 'VAR' because add_parameter command is not executed inside a power model. (UPF-390)

**What Next**

Move the specified *add_parameter* command inside an existing power model.

**See Also**

- define_power_model
- apply_power_model

---

## UPF-391

(warning) Found duplicated parameter '%s' defined in power model '%s'.

Feedback

### Description

User tries to add a parameter through the *add_parameter* command. However, user has already added another parameter with the same name in the power model. The duplicated add_parameter command will be ignored.

Example:

```
        define_power_model MODEL {
  add_parameter VAR -default_value 1 -description "a parameter"
  add_parameter VAR -default_value 2 -description "duplicated parameter"
}
```

Error: Found duplicated parameter 'VAR' defined in power model 'MODEL'. (UPF-391)

### What Next

Remove the duplicated *add_parameter* command inside the specified power model.

### See Also

- define_power_model
- apply_power_model

---

## UPF-392

(error) Parameter '%s' specified in -parameters of apply_power_model command is not defined in power model '%s'.

### Description

User specified a parameter through the *-parameters* option to *apply_power_model* command. However, the specified parameter is not defined through any *add_parameter* command in the specified power model. A parameter needs to be defined inside a power model before it can be used in *apply_power_model* command.

Example:

```
define_power_model MODEL {
  add_parameter VAR_1 -default_value 1 -description "a parameter"
}
apply_power_model MODEL -parameters {{VAR_1 1} {VAR_2 2}}
```

Error: Parameter 'VAR_2' specified in -parameters of apply_power_model command is not defined in power model 'MODEL'.

Feedback

### What Next

Add the missing *add_parameter* command inside the specified power model.

### See Also

- define_power_model
- apply_power_model

---

## UPF-393

(error) Can't set_scope into '%s' because a power model has already been applied to the scope.

### Description

User tries to change the current scope to the specified scope through the *set_scope* command. However, a power model has already been applied to the specified scope. It is illegal to set_scope into a scope which already has a power model applied.

Example:

```
define_power_model MODEL {
  create_power_domain PD_BLK
}
apply_power_model MODEL -elements {macro_0 macro_1}
set_scope macro_0
```

Error: Can't set_scope into 'macro_0' because a power model has already been applied to the scope. (UFP-393)

### What Next

Remove the illegal *set_scope* command.

### See Also

- define_power_model
- apply_power_model

---

## UPF-394

(warning) Can't implement -location parent(other) option for %s strategy '%s' because %s cells cannot be inserted outside of a power model.

Feedback

### Description

User specifies an isolation or level shifter strategy through the *set_isolation* or *set_level_shifter* command with *-location parent(other)* option inside a power model. However, the strategy applies to a cell or pin on the boundary of the power model. Because tool is not allowed to insert an isolation or level shifter cell outside of a power model, it cannot implement the specified isolation or level shifter strategy.

Example:

```
define_power_model MODEL {
  create_power_domain PD_MACRO_TOP
  set_level_shifter LS_STG -domain PD_MACRO_TOP -location parent
}
apply_power_model MODEL -elements {macro_0 macro_1}
```

Warning: Can't implement -location parent option for level shifter strategy 'LS_STG' because level shifter cells cannot be inserted outside of a power model. (UPF-394)

### What Next

Move the specified isolation or level shifter strategy outside of the power model.

Example:

```
define_power_model MODEL {
  create_power_domain PD_MACRO_TOP
}
apply_power_model MODEL -elements {macro_0 macro_1}
set_level_shifter LS_STG1 -domain macro_0/PD_MACRO_TOP -location parent
set_level_shifter LS_STG2 -domain macro_1/PD_MACRO_TOP -location parent
```

### See Also

- define_power_model
- apply_power_model
- set_level_shifter
- set_isolation
- set_isolation_control

---

## UPF-395

(information) Read power model file "%s" %s.

Feedback

### Description

user specified a power model search path through app option *mv.upf.power_model_search_path* and power model library through app option *mv.upf.power_model_library*. Tool reads the specified power model file successfully or with errors.

### What Next

No action needed if the specified power model file is read successfully.

### See Also

- define_power_model
- apply_power_model
- mv.upf.power_model_search_path
- mv.upf.power_model_library

---

## UPF-396

(Error) apply_power_model with -all_hard_macros option has already been run in %s.

### Description

User executed an *apply_power_model* command with the *-all_hard_macros* option in the specified power scope. However, the same command with the same option has already been run in the specified power scope. The *apply_power_model* command with the *-all_hard_macros* option can only be run once per power scope.

### What Next

Remove the extra *apply_power_model* command with the *-all_hard_macros* option.

### See Also

- define_power_model
- apply_power_model

---

## UPF-397

(error) Can't apply power model '%s': %s port '%s' cannot be connected to %s net '%s' according to -port_map because %s.

Feedback

### Description

User tries to apply a power model through the *apply_power_model* command with *-port_map* option. However, tool cannot connected the specified supply/logic port to the specified supply/logic net mentioned in the *-port_map* option.

### What Next

Correct the specified supply/logic net or supply/logic port in *-port_map* option to *apply_power_model* command.

### See Also

- define_power_model
- apply_power_model

---

## UPF-398

(information) Applied power model '%s' in %s to %d instance%s.

### Description

User applied a power model through the *apply_power_model* command in the specified scope. This message shows how many instances to which the specified power model has been applied.

Example:

```
set_scope /
define_power_model MODEL {
  create_power_domain PD_MACRO_TOP
}
apply_power_model MODEL -elements {macro_0 macro_1}
```

Information: Applied power model 'MODEL' in top scope to 2 instances. (UPF-398)

### What Next

No action is needed.

### See Also

- define_power_model
- apply_power_model

Feedback

## UPF-399

(error) Can't apply power model '%s' to cell '%s' because cell is not in the current physical block.

### Description

User tries to apply a power model through the *apply_power_model* command with a cell specified in *-elements* option. However, tool cannot apply the power model because the specified cell is from a physical block which is different from the current block.

### What Next

Do not include the specified cell in *-elements* option of the *apply_power_model* command.

### See Also

- define_power_model
- apply_power_model

## UPF-400

(warning) Element list '%s' in the strategy '%s' of power domain '%s' is redundant since all the instances of the element list are present in conflicting state with some other strategy(s).

### Description

This message occurs when all the individual elements of an element list in any strategy are in a conflicting state with some other strategy. This means that the elements of the element list are used as an instance in some other retention strategy(s).

### What Next

Check the correctness of set_retention and set_retention_elements commands and their elements used for the strategy, and assign the cell to one strategy only. If possible, remove the element list from the mentioned strategy.

### See Also

- set_retention
- set_retention_elements

Feedback

## UPF-401

(error) Signal level power domain '%s' is specified more than once with the same signal net '%s' inside the macro scope in power model.

### Description

This error occurs when user creates a signal level power domain inside a macro scope in a power model where the power domain with the same name and signal net is already present.

Example:

```
define_power_model MODEL {
   create_power_domain PD1 -elements {S1}
   create_power_domain PD1 -elements {S2 S1}
}
apply_power_model MODEL -elements {u0/macro}
```

### What Next

Please delete the second (and so) create_power_domain command with the domain name for which this error message is generated.

### See Also

- create_power_domain

## UPF-402

(error) Signal level power domain '%s' is already specified on the signal net '%s' inside the macro scope in power model and hence cannot be specified in the new domain '%s'.

### Description

This error occurs when user creates a signal level power domain inside a macro scope in a power model with a signal net but a power domain is already created on that signal net.

Example:

```
define_power_model MODEL {
   create_power_domain PD1 -elements {S1}
   create_power_domain PD2 -elements {S1}
}
apply_power_model MODEL -elements {u0/macro}
```

Feedback

### What Next

Please delete the second (and so) create_power_domain command with the signal net for which this error message is generated.

### See Also

- create_power_domain

---

## UPF-403

(error) The retention strategy '%s' with the element '%s' belonging to the power domain '%s' is errored out because a different power domain '%s' is defined on the same signal.

### Description

This error occurs when user gives a retention strategy on a signal in macro is defined in a power domain where the signal doesn't belong to. A different signal level power domain is created on the signal.

Example:

```
define_power_model MODEL {
   create_power_domain PD1 -elements {S1}
   create_power_domain PD2 -elements {S2}
   set_retention -domain PD1 -elements {S2} -retention_supply TOP.primary
}
apply_power_model MODEL -elements {u0/macro}
```

### What Next

Please make sure that the domain on which the signal is defined matches with the domain in which the retention strategy is specified.

### See Also

- create_power_domain
- set_retention

---

## UPF-404

(warning) The domain '%s' cannot be used for '%s' strategy '%s' because it is defined inside hard macro via a power model.

Feedback

### Description

The power domain specified in the strategy is not a valid power domain. It may be a power domain on signal level.

### What Next

Please remove the path based strategy defined on the power domain. Only retention strategies is applicable on these domains.

### See Also

- set_isolation
- set_repeater
- set_level_shifter
- create_power_domain

---

## UPF-405

(error) Can not accept mixed UPF 2.0/2.1 style %s attribute in one command.

### Description

This error message occurs when the attribute option specified in the *set_design_attributes* or *set_port_attributes* command has mixed style usage in one command.

In UPF 2.1 style, -attribute option will accept 1 value, the syntax looks like:

```
set_design_attributes
   [-attribute {name value}]
set_port_attributes
   [-attribute {name value}]
```

In UPF 2.0 style, -attribute option will accept 2 value, the syntax looks like:

```
set_design_attributes
   [-attribute name value]
set_port_attributes
   [-attribute name value]
```

### What Next

Use consistent syntax and rerun the command.

Feedback

### See Also

- set_design_attributes
- set_port_attributes

---

## UPF-406

(error) Error while reading the UPF file : %s. Use error_info command for more information.

### Description

This error message is generated by the load_upf command when a syntax error occurs while reading a UPF file. These kind of syntax errors are caught in the TCL interpreter. The text of the message shows the specific error.

Example:

```
        create_power_domain mid -elements {MID
Error: Error while reading the UPF file : missing close-brace. Use
 error_info command for more information (UPF-406)
```

### What Next

Use the error_info command to see the file name and the line number of the syntax error. See what error message is printed with this message ID.

### See Also

- load_upf

---

## UPF-407

(warning) The cells specified in the retention strategy %s for power domain %s will be mapped to a non retention library cell as no mapping constraint is defined for the strategy using map_retention_cell command.

### Description

This warning indicates that mapping constraints have not been defined on the retention strategy for the specified power domain using the map_retention_cell command. As a result, tool will go ahead and map the cells specified in set_retention with the best available non retention library cell.

Feedback

### What Next

Define the mapping constraints for the retention strategy using the map_retention_cell command.

### See Also

- set_retention
- map_retention_cell
- report_power_domain

---

## UPF-408

(information) Converting control signal net specified in the strategy '%s' to its driver pin '%s' as the net seems to be deleted.

### Description

This information message occurs when you specify a net or hierarchical pin as the control signal using the set_isolation_control or set_retention_control command. Tool then uses the driver pin of the net as the control signal.

### What Next

This is only an information message. No action is required.

### See Also

- set_retention_control
- set_isolation_control

---

## UPF-410

(information) Applying power model '%s' in %s to %s.

### Description

User applied a power model through the *apply_power_model* command in the specified scope. This message shows that the tool is applying the specified model to the specified instance. This message is printed when the app option *mv.upf.power_model_verbose* is set to TRUE.

Example:

```
set_app_options -as_user_default -list {mv.upf.power_model_verbose TRUE}
set_scope /
```

Feedback

```
define_power_model MODEL {
  create_power_domain PD_MACRO_TOP
  create_supply_net VDD
}
apply_power_model MODEL -elements {macro_0 macro_1}

Information: Applying power model 'MODEL' in top scope to macro_0.
 (UPF-410)
set_scope macro_0
create_power_model PD_MACRO_TOP
create_supply_net VDD
set_scope /
Information: Applying power model 'MODEL' in top scope to macro_1.
 (UPF-410)
set_scope macro_1
create_power_model PD_MACRO_TOP
create_supply_net VDD
set_scope /
Information: Applied power model 'MODEL' in top scope to 2 instances.
 (UPF-398)
```

### What Next

No action is needed.

### See Also

- define_power_model
- apply_power_model
- mv.upf.power_model_verbose

---

## UPF-411

(Error) Applied power model '%s' in %s to %s with user errors.

### Description

User applied a power model through the *apply_power_model* command in the specified scope. The power model is applied to the specified instance but errors are encountered during the application.

### What Next

Check the messages above UPF-411 to find out the reasons why the specified power model is applied with errors.

Please run *reset_upf* command before applying another power model to the same instance.

Feedback

### See Also

- define_power_model
- apply_power_model
- report_power_model
- mv.upf.power_model_verbose

---

## UPF-412

(warning) Disconnected %s '%s' from %s '%s' and connected it to %s '%s' because apply_power_model %s -port_map has higher priority.

### Description

User tries to apply a power model through the *apply_power_model* command with *-port_map* option. However, tool finds that the specified supply/logic port is already connected to another supply/logic net. Because *apply_power_model -port_map* has higher priority than existing connections, tool disconnected the specified supply/logic port and reconnected it to the specified supply/logic net according to *apply_power_model -port_map*.

### What Next

Correct the specified supply/logic net or supply/logic port in *-port_map* option to *apply_power_model* command if the supply/logic port connection is not the design intention.

### See Also

- define_power_model
- apply_power_model

---

## UPF-413

(error) Can't apply power model '%s' to '%s' because power model '%s' has already been applied to the same library cell '%s'.

### Description

User tries to apply a power model through the *apply_power_model* command to the specified cell. However, an existing power model has already been applied to the same reference library cell used by the specified cell through a previous *apply_power_model* command.

Feedback

For example, assume that u1/macro and u2/macro are instantiations of the same library cell lib_cell_1:

```
define_power_model MODEL_1 -for {lib_cell_1} {
  create_power_domain PD_TOP_1
}
define_power_model MODEL_2 -for {lib_cell_1} {
  create_power_domain PD_TOP_2
}
apply_power_model MODEL_1 -elements {u1/macro}
apply_power_model MODEL_2 -elements {u2/macro}
```

Error: Can't apply power model 'MODEL_2' to 'u2/macro' because power model 'MODEL_1' has already been applied to the same library cell 'lib_cell_1'. (UPF-413)

**What Next**

Change that only one power model is applied to the specified library cell.

**See Also**

- define_power_model
- apply_power_model

---

## UPF-420

(error) State '%s' referred in transition '%s' option '%s' is not defined on object '%s'.

**Description**

This message occurs when the power state specified in state transition mismatch with the specified object.

**What Next**

Specify power state match with the object specified in state transition.

**See Also**

- describe_state_transition
- add_state_transition

---

## UPF-421

(error) Transition '%s' specified as -legal, while final state '%s' is illegal.

Feedback

**Description**

This message occurs when -legal is specified for a transition where final state is illegal.

**What Next**

Specify a legal final state for the transition.

**See Also**

- describe_state_transition
- add_state_transition

---

## UPF-422

(error) State '%s' is specified in both the from state and the to state of transition '%s'.

**Description**

This message occurs when the same state is specified as both the from state and the to state.

**What Next**

Specify different state for from and to state for the transition.

**See Also**

- describe_state_transition
- add_state_transition

---

## UPF-423

(error) Invalid transition format for transition '%s': %s.

**Description**

This message occurs when syntax format issue detected in the specified transition.

**What Next**

Check the man page of the command to follow transition format.

**See Also**

- add_state_transition

Feedback

## UPF-424

(error) Supply net '%s' [%s] has lower voltage than supply net '%s' [%s], while the former used as power and the latter used as ground in supply set %s.

### Description

This message occurs when turn on relative PG support, and there is power ground pair voltage conflict in a supply set.

### What Next

Check the pst voltage defined for both supply net.

### See Also

- create_supply_set
- report_supply_nets
- report_pst

## UPF-425

(error) Power domain '%s' use relative supply as primary while it contains element '%s' which is not leaf cell support relative supply.

### Description

When turn on relative PG support, it is allow to use relative supply as domain primary. However, the domain should not contain instance that do not have relative PG pin.

### What Next

Check domain primary supply and elements.

### See Also

- create_power_domain
- report_power_domain

## UPF-426

(error) %s strategy '%s' use relative supply as %s.

Feedback

### Description

This message occurs when relative supply nets or supply sets are used by power strategies.

### What Next

Check the strategy definition.

### See Also

- set_isolation
- set_level_shifter
- set_repeater
- set_retention
- create_power_switch

---

## UPF-427

(warning) Dropping library cell %s from map_retention_cell command of retention strategy %s belonging to power domain %s as the library cell is not suitable when -use_retention_as_primary is %s.

### Description

The warning message is issued :- 1. The retention strategy is specified with -use_retention_as_primary option but the library cell mentioned above has its data output pin not related with the backup PG pin. 2. The retention strategy is not specified with -use_retention_as_primary option but the library cell mentioned above has its data output pin related with the backup PG pin

This library cell will be dropped from the map_retention_cell command and will not be used from mapping.

### What Next

Please specify proper library cells in map_retention_cell command which has its data output pin related with the backup PG pin if -use_retention_as_primary is specified. If not specified, normal retention cell i.e. whose data output pin related with the primary PG pin should be used.

### See Also

- set_retention
- map_retention_cell

Feedback

## UPF-429

(error) An existing %s strategy with the same name '%s' already exists in the same power domain %s inside power model scope.

### Description

This error occurs when a duplicated strategy name is used within the same power domain for the reported type of strategy inside power model scope Name duplication is not allowed for strategies in same power domain.

### What Next

The UPF needs to be changed to fix the error. Identify the referenced duplicate strategy names associated with the referenced power domain and strategy type. If the strategy is a complete duplicate, remove one of the duplicated strategies. If the strategies are different, use a different strategy name for one of the duplicate strategies.

- set_repeater

## UPF-430

(error) There are power domains with missing voltage areas in the design.

### Description

This message occurs when compile runs in the legal-handoff mode, and there are power domains in the design with missing voltage areas,

### What Next

Use the "create_voltage_area" command to assign voltage areas to power domains, or turn on the "mv.incomplete_upf.enable" and "mv.upf.enable_missing_voltage_area" app_options to enable incomplete UPF missing VA flow to make the tool automatically assign voltage areas to power domains.

Feedback

**See Also**

- create_voltage_area
- set_app_options
- mv.incomplete_upf.enable
- mv.upf.enable_missing_voltage_area

---

## UPF-431

(warning) UPF command '%s' is not supported in hierarchical flow, and will be dropped.

**Description**

This warning message occurs when an UPF command which is not supporting hierarchical flow is found by related commands. It will not be preserved in UPF saved during hierarchical flow.

**What Next**

check the UPF command.

**See Also**

- split_constraints
- save_upf
- uncommit_block
- add_state_transition
- describe_state_transition

---

## UPF-432

(Error) Failed to mark reference-only on supply %s because %s.

**Description**

This error message appears when set_design_attribute fails to mark a supply net or supply set as reference-only.

Reference-only supply is marked by: set_design_attribute -element {.} -attribute reference_only {supply_net_or_supply_set}

When a supply has been set as domain primary, isolation supply, repeater supply or retention supply, it can't be marked as reference-only.

Feedback

### What Next

Rewrite the UPF to avoid using the supplies as reference-only.

---

## UPF-433

(information) The grouped cell %s contains leaf cell %s. Will follow the regular split_constraints procedure.

### Description

This message occurs when the grouped cell contains at least one leaf cell. In this case, we will following the regular procedure to perform split_constraints.

### See Also

- split_constraints

---

## UPF-434

(error) Cannot change scope of domain %s into block %s because %s

### Description

This message occurs when try to split_constraints on blocks with outside-block nested power domains, and we cannot change the scope of nested power domain into the block due to the given reason. Split_constraints will thus fail.

### See Also

- split_constraints

---

## UPF-435

(information) The grouped cell %s contains non-domain-root cell %s.

### Description

This message occurs when the grouped cell contains at least one non-domain-root cell (i.e. the cell is not the root element of power domain). In this case, we will not limit the supplies in this block UPF. And the primary of the top domain of this block will be the same as the parent domain of this block before split_constraints.

### See Also

- split_constraints

Feedback

## UPF-436

(Warning) Strategy %s in power domain %s is applied to the lower boundary. Will follow the regular split_constraints procedure.

### Description

This message occurs when a strategy is applied to the lower boundary from the top domain. In this case, we will follow the regular procedure to perform split_constraints.

### See Also

- split_constraints

## UPF-437

(warning) The split hierarchy %s is the root element of a power domain. Will follow the regular split_constraints procedure.

### Description

This message occurs when the target split hierarchy is the root element of a power domain. This case is currently not supported by the new split_constraints feature. Therefore, we will follow the regular procedure to perform split_constraints.

### See Also

- split_constraints

## UPF-438

(warning) The primary supply of user-selected power domain %s is not available by the new power domain on the grouped cell %s.

### Description

This message occurs when the user selects a power domain and applies its primary supply to the new power domain on the grouped cell but the primary supply of the selected power domain is not available by the new power domain created on the grouped cell.

### See Also

- split_constraints

Feedback

## UPF-439

(information) The sub-domains under the grouped cell %s have different primary supplies.

### Description

The information message is issued when the sub-domains under the grouped cell don't have the same primary supply

### See Also

- split_constraints

## UPF-440

(information) Use the primary supply of power domain %s as the primary of the new power domain on the grouped cell %s.

### Description

The information message is issued when the tool determines the primary supply of the new power domain on the grouped cell during limit-supply flow of split_constraints.

### See Also

- split_constraints

## UPF-441

(warning) The primary supplies of the all power domains under the hierarchy of grouped cell %s are not available by the new power domain. Apply the primary supply of the top domain %s.

### Description

This message occurs when none of the primary supplies of the sub-domains under the hierarchy of the grouped cell is available by the new power domain. In this case, we will apply the primary supply of the top domain as the primary supply of the new domain.

### See Also

- split_constraints

Feedback

## UPF-442

(error) The name pair %s has syntax error. The legal expression is {group_cell_name sub_pd_name}.

### Description

During the limit-supply flow of split_constraints, when users define group_cell-power_domain pairs (i.e. applying the primary supply of the power_domain to the new power domain created on the group_cell), each pair should follow the format {group_cell_name sub_pd_name}. Otherwise an error will be issued and the user-defined pair list will be ignored.

### What Next

Check the new_pd_primary_name_list app option for any syntax error.

### See Also

- split_constraints

## UPF-443

(error) Unable to split the UPF for block %s because partial power domain list of shared_voltage_area attribute is specified and domain '%s' is not inside the block.

### Description

This error message occurs when running the split_constraints command. The block cannot contain only partial power domain list of shared_voltage_area attribute.

### What Next

Check the shared_voltage_area attribute.

### See Also

- split_constraints

## UPF-444

(warning) set_equivalent pattern %s matched supply net and supply port/pg pin %s. The supply port or pg pin will be ignored.

Feedback

### Description

The pattern given in set_equivalent matched a supply net and either a supply port or pg pin of the same name, and they are not directly connected. Only the supply net will be selected for the set_equivalent command.

### What Next

This is only a warning message. No action is required.

### See Also

- set_equivalent

---

## UPF-445

(warning) set_design_attribute -exclude_elements option is not supported by all tools in the SNPS flow.

### Description

This command is only applicable for simulation and does not have impact on implementation tool. Option -exclude_elements should go together with option -elements and attribute ret_mode. It will be preserved by save_upf as well.

---

## UPF-446

(error) set_design_attribute -exclude_elements option is not supported by all tools in the SNPS flow. The option is only for attribute ret_mode.

### Description

This command is only applicable for simulation attribute ret_mode, Option -exclude_elements should go together with option -elements and attribute ret_mode. The command will error out for other attribute except attribute ret_mode.

### See Also

- UPF-445

---

## UPF-447

(warning) %s attribute '%s' has been set more than once by one command.

Feedback

### Description

This warning message occurs when the same attribute specified in the *set_design_attributes* or *set_port_attributes* command more than once in one command.

The attribute value that is set later override the attribute value that is set first. In other words, the last value setting for the same attribute will take effect.

### What Next

Please check if the attribute value is expected. Remove the unnecessary setting.

### See Also

- set_design_attributes
- set_port_attributes

---

## UPF-448

(warning) Invalid hierarchical name specified: '%s'

### Description

The design attribute reference_only requires the supply object specified with a simple name.

UPF objects may have hierarchical names, but the simple name required is not permitted to contain the hierarchy separator.

### What Next

Re-enter the command with a valid simple name specified.

### See Also

- set_design_attributes

---

## UPF-449

(warning) The library cell %s specified in command %s is marked as dont_use.

### Description

This warning message occurs when a library cell is used as mapped cell for a strategy and that library cell is marked as dont_use or excluded for power.

Feedback

### What Next

Change library cell setting or just avoid using that library cell mapping for the specified strategy.

### See Also

- map_retention_clamp_cell

---

## UPF-450

(information) Explicit supply net connections to isolation and retention cells will be written out. Use mv.upf.save_upf_include_supply_exceptions_for_iso_retn to control this.

### Description

This information message informs that explicit supply net connections to PG pins of isolation and retention cells will be written out by save_upf. If this behavior is not desired, it can be turned off by setting the app option *mv.upf.save_upf_include_supply_exceptions_for_iso_retn* to false.

### What Next

No action is required.

### See Also

- save_upf
- mv.upf.save_upf_include_supply_exceptions_for_iso_retn

---

## UPF-451

(warning) Removed control signal %s from %s strategy %s. Deleting it will remove the corresponding %s control command.

### Description

This warning message occurs when objects that are used as a reference for a UPF control signal are removed. As a result, the related UPF constraint is also removed. Design objects such as ports and pins can be removed by direct commands such as the remove_design command.

### What Next

This is only a warning message. No action is required.

Feedback

However, to avoid this warning message, apply UPF constraints after each modification to the design. The design object can be found while loading the UPF constraints.

**See Also**

- set_retention
- set_retention_control
- set_isolation
- set_isolation_control
- create_power_switch

## UPF-453

(warning) Design attribute 'shared_voltage_area' is ignored.

**Description**

This message occurs when the 'shared_voltage_area' design attribute is specified and will be ignored. The 'shared_voltage_area' design attribute is applicable only when 'mv.upf.multi_pd_shared_voltage_area_flow' app option is set to 'new'.

**What Next**

Check the 'shared_voltage_area' design attribute and 'mv.upf.multi_pd_shared_voltage_area_flow' app option.

**See Also**

- set_design_attributes

## UPF-455

(error) Required argument '-golden_upf_files' was not found. Argument is required when 'mv.upf.enable_golden_upf' is true.

**Description**

This error message indicates that a required argument is missing and needs to be provided for successful execution of the command.

**What Next**

Provide the required argument.

Feedback

## UPF-456

(error) Unable to ungroup cell %s because %s.

### Description

This message occurs when the check for UPF restructuring during ungroup_cells. This message specifies the cell that cannot be ungrouped due to the UPF restructuring check failure. In order to continue ungrouping the cell, the user should fix the problem listed in this message.

### See Also

- ungroup_cells

## UPF-457

(error) Invalid boolean expression '%s' in logic expression for retention %s.

### Description

Invalid boolean expression in logic expression for retention strategy.

### What Next

The boolean expression must be a combination of UPF generic references, logic nets and ports, and logical or bitwise operators (!, |, ||, &, &&, ^, ~, ==, !=). SystemVerilog keywords are not acceptable ports.

### See Also

- set_retention

## UPF-458

(warning) Boolean logic expression '%s' of %s cannot resolve object reference, and will be dropped.

### Description

This warning message occurs when an object reference in a boolean logic expression cannot be updated because the object was removed.

### What Next

Check the object references in the boolean expression.

Feedback

**See Also**

- set_retention
- save_upf

---

## UPF-460

(warning) The '-traverse_macros' option would implicitly set '-transitive' as true.

**Description**

This warning message occurs when you are specifying '-traverse_macros' with '-transitive false'.

**What Next**

Check whether the specified options are correct.

**See Also**

- find_objects

---

## UPF-461

(error) Adding user-defined %s '%s' with tool-derived power domain '%s' is not allowed.

**Description**

This error is issued when you attempt to add a user-defined constraints with a tool-derived power domain.

**What Next**

Check whether the power domain and the specified constraint should be tool-derived or not.

**See Also**

- create_power_domain

---

## UPF-462

(error) The application option "mv.upf.preserve_logic_in_boolean_expr" cannot be set if constraints have already been loaded

Feedback

### Description

The application option mv.upf.preserve_logic_in_boolean_expr cannot be set after constraints are loaded.

### What Next

Set mv.upf.preserve_logic_in_boolean_expr before any constraints are loaded.

### See Also

- set_app_options

---

## UPF-465

(error) Cell '%s' is already included in power domain '%s'.

### Description

A cell has been specified that is already included in a power domain. A cell cannot belong to more than one power domain.

### What Next

Ensure the list of instances is valid for the relevant power domains by reviewing the create_power_domain statements in the UPF file. In addition you can use the get_cells command to determine the power domain associated with a cell(s).

### See Also

- create_power_domain
- get_cells

---

## UPF-466

(Error) Issue found with '%s' %s attribute setting on '%s': %s.

### Description

This message occurs when a conflict is found with an existing port or design attribute setting in the reported object.

### See Also

- set_port_attributes
- set_design_attributes

Feedback

## UPF-467

(information) Related supplies are not explicitly specified on %d port(s) and primary supplies (%s, %s) of top power domain will be assumed as the related supply.

### Description

This informational message is printed when primary supplies of top power domain are assumed as related supply of ports.

### What Next

You can query the ports using the Tcl attribute 'related_supply_default_primary' and check whether related supply or driver/receiver supply are supposed to be explicitly specified on them.

### See Also

- set_related_supply_net
- set_port_attributes
- get_related_supply_nets

## UPF-468

(information) Reference-only supply %s has been removed and related supply of %d ports are reset.

### Description

This informational message is to show the number of ports that their related supply net or driver/receiver supplies are reset by the command due to deletion of the specified reference-only supply.

### What Next

This message is informational. No action is required.

### See Also

- remove_reference_only_related_supply

## UPF-469

(Error) Reference-only supply %s cannot be removed : %s.

Feedback

### Description

This error message is printed when the reference-only supply cannot be removed.

### What Next

Please check the reason why the reference-only related supply cannot be removed.

### See Also

- remove_reference_only_related_supply

---

## UPF-470

(warning) UPF on the grouped cell %s can't split because it belongs to a MIM %s whose instances have different power constraints

### Description

This message is issued after group_cells, when the grouped cell is MIM and will fail split_constraints due to different power constraints on instances of this MIM. Note that this message is just the result of MIM split checking; no split_constraints is performed at this stage. If users want to split_constraints on this grouped cell later, they should modify the UPF to meet the following conditions:

- UPF constraints on all instances of the MIM must be identical. This includes the name and arguments of all declared power objects and power strategies;
- There must be a level shifter strategy at the MIM boundary if there is voltage violation;
- Boundary conditions must be identical. This includes that the driver and receiver supplies of isolation source/sink strategies, level shifter strategies and all feedthrough paths must be identical;
- Matching power ports on all instances must be connected to the same external supply;
- PVT of all MIM instances must be identical;

### See Also

- group_cells
- split_constraints

---

## UPF-471

(error) Can't move cell %s to %s, because %s

Feedback

### Description

This message occurs during reparent_cells when moving the cell violates the following UPF constraints: (1) moving a cell to another domain root cell; (2) moving a cell to another power scope. The detailed reason is listed in this message.

### See Also

- reparent_cells

---

## UPF-472

(warning) UPF intent of blackbox design '%s' will not be captured in the full-chip UPF.

### Description

This warning message indicates that the UPF intent of the design is not captured in the full-chip UPF because the design is a blackbox. The general requirement for saving full-chip UPF is that all blocks must be linked to either their design view or abstract view.

### What Next

Ensure that the block is linked to abstract or design view.

### See Also

- save_upf
- set_reference
- change_abstract

---

## UPF-473

(Error) Mismatch in the %s design attribute value between top design and block design.

### Description

This Error message indicates that there is a mismatch in the value of the design attribute between the top design and the block design.

### What Next

Ensure that the top design and block Design has same design attribute value.

---

## UPF-474

(Error)Cannot create the power domain %s because the legacy block criteria is violated.

Feedback

### Description

This error message occurs during create power domain when the *legacy_block* attribute specified using the *set_design_attribute* command to a cell does not satisfy the legacy block criteria. The cell must satisfy the following criteria to be considered a legacy block:

1. Domain-independent supply nets or supply sets are not defined or used.
2. Implicit supply handles of a power domain cannot be used.
3. All parts of the legacy block must belong to power domains scoped within the block.

   Example:

   ```
   prompt> create_power_domain PD1 -elements {mid1 mid2 mid3}
   prompt> set_design_attributes -elements {mid1 mid2} -attribute
    legacy_block true
   ```

   Error: cannot create the power domain PD1 because multiple elements are specified in the element list while creating a power domain corresponding to a legacy block.

   To correct this error, specify only one element in the -elements option of create_power_domain command while creating power domain corresponding to a legacy block.

   ```
   prompt> set_design_attribute -elements {mid1 mid2 mid3} -attribute
    legacy_block TRUE
   ```

### What Next

Ensure that the legacy block criteria is satisfied.

### See Also

- create_power_domain

---

## UPF-475

(error) Cannot specify a domain-independent supply net or supply set with UPF command %s for legacy block/domain.

### Description

This error message occurs when a UPF command, such as *create_supply_net*, *create_supply_set*, *associate_supply_set*, *set_domain_supply_net*,*connect_supply_net*, *set_isolation*, or *set_retention*, using a domain-independent supply net or supply set in its arguments is applied to a cell with a *legacy_block* design attribute, or a legacy power domain.

Feedback

### What Next

Please remove any domain-independent supply net or supply set from the argument list of the UPF command before applying it on a legacy_block, or an element inside a legacy block.

### See Also

- create_supply_net
- create_supply_set
- set_domain_supply_net
- connect_supply_net
- set_isolation
- set_retention

---

## UPF-476

(error) Cannot use external supply handles in a power domain in a legacy block.

### Description

This error message occurs when a *create_power_domain* command attempts to specify an external supply set for a power domain in a legacy block. All power domains in a legacy block must be fully-restricted.

### What Next

Please remove the use of external supply handles with the *create_power_domain* command in a legacy block.

### See Also

- create_power_domain

---

## UPF-477

(error) Cannot connect the domain-independent supply net to a pin or a port which is inside a legacy block.

### Description

This error message occurs when you use the *connect_supply_net* command to connect a domain-independent supply net to a port/pin which is inside a legacy block. The only exception is when the supply port is at the boundary of a legacy block.

Feedback

Example:

```
prompt> create_supply_net di_net
prompt> create_power_domain PD1 -elements {B1}
prompt> create_supply_net dd_net -domain PD1
prompt> connect_supply_net di_net PD1/dd_net
```

Error:Cannot connect the domain-independent supply net to a pin or a port which is inside a legacy block.(UPF-477)

The *connect_supply_net* command generates a UPF-477 error message, as it attempts to connect a domain-independent supply net (di_net) to a domain-dependent supply net ( PD1/dd_net).

**What Next**

Set the *legacy_block* design attribute on the cell connected to the supply port:

Example:

```
prompt> set_design_attributes -elements B1 -attribute legacy_block true
```

or Specify the supply nets that have consistent domain dependency.

**See Also**

- connect_supply_net
- create_supply_net

---

## UPF-478

(Error) %s strategy must contain -%s_power_net and -%s_ground_net options and should not contain -source/-sink options if it belongs to a legacy block power domain.

**Description**

This error message is printed because the %s strategy is specified in a power domain inside a legacy block, but the -%s_power_net and -%s_ground net options are not used and if -source or -sink options are used.

**What Next**

Ensure that the %s strategy has -%s_power_net and -%s_ground_net options specified and remove -source or -sink options if specified.

Feedback

**See Also**

- set_isolation
- set_retention

---

## UPF-479

(warning) Ignore user's name (%s) for the new domain. The domain name should be a simple name.

**Description**

This messages occurs when user specify the name of the new domain on the grouped cell during split_constraints with the app option mv.hierarchical.new_pd_name_on_group_cell. It is required that the provided name is simple. Otherwise, the provided name will be ignored and this warning message is issued.

**See Also**

- split_constraints

---

## UPF-480

(Error) Cannot set legacy block attribute on %s.

**Description**

This error message is printed due to the following reasons. 1) User tries to set legacy block attribute on a leaf cell. 2) The element specified in the set_design_attribute belongs to a power domain which has domain independent supplies defined in the current scope. 3) Legacy block attribute value is set to false on an element that belongs to a legacy block.

**What Next**

Ensure that legacy block attribute is set correctly.

---

## UPF-481

(error) The command '%s' is supported only when mv.upf.multi_pd_shared_voltage_area_flow is set to 'new'.

**Description**

This message occurs when the command is executed and the app option 'mv.upf.multi_pd_shared_voltage_area_flow' is not set to 'new'. It is supported only when the value of 'mv.upf.multi_pd_shared_voltage_area_flow' is set to 'new'.

Feedback

### What Next

Check the app option value of 'mv.upf.multi_pd_shared_voltage_area_flow'.

### See Also

- mv.upf.multi_pd_shared_voltage_area_flow

---

## UPF-482

(information) Power domain '%s' is skipped because %s.

### Description

This message occurs when the get_equivalent_power_domains or check_equivalent_power_domains command skip the power domain due to the specified reason.

### What Next

Check the specified power domain.

### See Also

- get_equivalent_power_domains
- check_equivalent_power_domains

---

## UPF-483

(information) List of equivalent power domains - %s.

### Description

This message shows the list of equivalent power domains that satisfy the criteria to share a primary voltage area.

### What Next

This message is informational. No action is required.

### See Also

- check_equivalent_power_domains

---

## UPF-484

(warning) cannot automatically add SPA/SRSN for the punched port %s, because %s

Feedback

### Description

This message occurs during split_constraints when the tool fails to add SPA/SRSN for the punched port automatically. Next step: check the reason of failure; then either adding the SPA/SRSN manually to the split UPF or modify the original UPF to avoid the condition.

### See Also

- split_constraints

---

## UPF-487

(error) UPF constraints have been loaded with DCM check policy set to 'tolerate' or 'repair'. Without reset_upf, the policy can not be changed to 'error'.

### Description

This message occurs when UPF constraints have been loaded with DCM check policy set to 'tolerate' or 'repair', and user tries change the policy to 'error'.

### What Next

The UPF netlist and netlist used in tolerate/repair mode is a throw-away netlist/constraints. To changed to tape_out mode, user has to start over with clean netlist and UPF constraint.

### See Also

- load_upf
- commit_upf
- reset_upf

---

## UPF-488

(Information) -location fanout option will be deprecated in future release.

### Description

This information message occurs when you run *set_isolation -location fanout* command. *-location fanout* will be deprecated in future release.

### What Next

This is an information message.

### See Also

- set_isolation

Feedback

## UPF-489

(warning) Current design is not a UPF design

### Description

Current design is not upf design. this command should be run on the UPF designs. Please load the UPF for the design.

### What Next

```
Please load the UPF for the design.
```

## UPF-490

(error) %s failed because the legacy block setting is violated.

### Description

This error message occurs in *%s* if the legacy block setting is violated due to one of the following reasons:

1. Element marked as legacy block does not have a self-scoped power domain defined on it.
2. The scope to which the legacy block's power domain belongs has a domain independent supply defined in it.

### What Next

Please define a self-scoped power domain on the legacy block or remove the domain independent supply within the scope of legacy block.

### See Also

- create_power_domain

## UPF-491

(Error) split_constraints was not successful because rule for splitting a legacy block was violated.

### Description

This error message is printed when user attempts split_constraints at the boundary of a legacy block or on a block which is inside a legacy block.

Feedback

### What Next

Ensure that elements specified in set_budget_options command adheres to legacy block rules.

### See Also

- set_budget_options
- split_constraints

---

## UPF-492

(Warning) Isolation strategies with -location fanout is not supported in a legacy block.

### Description

This warning message is printed when the user defines a isolation strategy with -location option as fanout in the presence of a legacy block in the design.

### What Next

Ensure that isolation strategies does not have fanout as their location when the design contains a legacy block.

### See Also

- set_isolation

---

## UPF-493

(Warning) Supply net '%s' is reconnected to pin '%s' that was previously connected to supply net '%s'.

### Description

The power and ground pin had existing explicit supply net connection, and it is reconnected to a different supply net specified by the command.

### What Next

Check the power and ground pin to ensure that its supply net connection is correct.

Feedback

**See Also**

- connect_supply_net
- get_supply_nets
- mv.upf.enable_pg_pin_reconnection

---

## UPF-494

(warning) The design element %s is not on the boundary of the power domain. The %s might not %s.

**Description**

This error message occurs when you specify a design element in the *-elements* or *-exclude_elements* option of *set_port_attributes* command that is not on the upper or lower boundary of the power domain.

**What Next**

If the design element is at the boundary of the power domain before running the *commit_upf*, *create_mv_cells*, or any other action commands, no action is required. Otherwise, specify the correct design element for the command.

**See Also**

- set_port_attributes

---

## UPF-495

(Warning) The design element %s is not on power domain boundary. The %s supply attribute has been dropped for pin %s.

**Description**

This warning message occurs when you specify with *-elements* or *-ports* option of the *set_port_attributes* command, a black-box cell or pin that is not on power domain boundary.

**What Next**

Verify that the design element mentioned in the error message is not on the power domain boundary. Specify black-box design elements that are on power domain boundary, for *set_port_attributes* command.

Feedback

**See Also**

- set_port_attributes

---

## UPF-496

(warning) The 'set_port_attributes %s %s' setting on macro pin %s is not functionally equivalent to the related supplies derived from its liberty model (%s - %s).

**Description**

This message occurs when a set_port_attributes -receiver_supply (or -driver_supply) defined at the scope of a hard macro input (or ouput) pin is found to not be functionally equivalent to the power supplies that can be derived from the related PG pin data on its liberty model.

The purposes of the message is to show an inconsistency between the UPF at the macro scope and its liberty model. For implementation purposes, the related supplies derived from the liberty model will be used

**What Next**

Review the UPF to make sure the setting is correct.

**See Also**

- set_port_attributes

---

## UPF-497

(error) The macro_as_domain_boundary attribute cannot be set on the %s %s.

**Description**

The message occurs when the set_design_attribute command is trying to set macro_as_domain_boundary attribute on an instance, which has neither of these two properties: 1. Liberty attribute is_macro_cell set to TRUE, and 2. Design attribute UPF_is_hard_macro set to TRUE.

**What Next**

This is an error message. Please revisit your UPF intent and make the necessary change.

---

## UPF-498

(error) Value '%s' for %s signal sense of isolation strategy '%s' of power domain '%s' is not valid. Specify one of: high, low.

Feedback

### Description

This message occurs when the signal sense specified for isolation strategy is not supported or invalid.

### What Next

Check the signal sense and invoke the command again.

### See Also

- set_isolation

---

## UPF-499

(warning) option %s is specified without %s in set_isolation, and it will be ignored.

### Description

This error message occurs when set_isolation options -async_set_reset/-async_clamp_value are not all specified.

### See Also

- set_isolation

---

## UPF-500

(Information) Usage of -model will be made mandatory with -is_analog in a future release.

### Description

This information message occurs when is_analog attribute is set on pins/ports without -model option. Use of set_port_attributes -is_analog without this option will cause downstream tools to fail.

### See Also

- set_port_attributes

---

## UPF-502

(Information) Propagating is_analog setting on port(s) %sof %s from block %s to top. At top level, all instances of the model will get this is_analog setting.

Feedback

### Description

This information message indicates that is_analog setting on library cell is being propagated from block to top. At top level, all instances of this model will have the same is_analog setting.

### See Also

- set_port_attributes

---

## UPF-503

(error) Equivalent supplies %s and %s in block %s have mismatched drivers.

### Description

This message occurs when tool tries to split full-chip UPF constraints and finds two supply nets in the block with mismatched drivers to be declared as equivalent.

### What Next

Check if these two supply nets should be equivalent.

### See Also

- split_constraints

---

## UPF-504

(error) Unable to split/merge the UPF for block, because the design attribute enable_state_propagation_in_add_power_state is set true above the block, and the same attribute is set false inside the block.

### Description

This error message occurs when running the split_constraints or link command.

### What Next

Check and revise the design attribute enable_state_propagation_in_add_power_state, and rerun the design.

### See Also

- split_constraints

Feedback

## UPF-505

(error) Supply net connections to both HighConn and LowConn side of supply port '%s' of direction 'internal' is not supported.

**Description**

Check the supply net connection(s) to the supply port.

**See Also**

- create_supply_port
- connect_supply_net

## UPF-506

(error) Specifying additional UPF constraints to the scope of hard macro '%s' after domain merging is not allowed.

**Description**

Check whether the domain of the scope should be merged.

**What Next**

Specify complete UPF constraints of the scope before commit_upf.

**See Also**

- load_upf
- create_power_domain
- commit_upf

## UPF-507

(warning) Domain merging for %s is not allowed and will be skipped.

**Description**

This message occurs when domain merging is not allowed for the specified instance.

**What Next**

Check whether domain merging is expected.

Feedback

**See Also**

- commit_upf
- create_power_domain

---

## UPF-508

(error) PST state %s of PST %s refers to state %s which has conflicting definitions on %s.

**Description**

This message occurs when a given supply state is not uniquely defined on a netgroup and has conflicting voltage values.

**What Next**

Check the supply states defined in the UPF to identify and fix the conflict.

**See Also**

- commit_upf
- add_pst_state
- add_port_state
- add_supply_state

---

## UPF-509

(warning) Retention strategy %s for power domain %s will not result in ZPR insertion, as its control singals are not from same source. map_retention_clamp_cell will not take effect until next design setup is fixed.

**Description**

This message occurs when retention strategy has different save/restore signal, and map_retention_clamp_cell specified.

**What Next**

Check whether ZPR and clamp cell insertion is expected.

**See Also**

- map_retention_clamp_cell

Feedback

## UPF-510

(warning) Retention strategy %s for power domain %s will not result in ZPR insertion, as its mapping constraint does not have zero-pin library cell. map_retention_clamp_cell will not take effect until next design setup is fixed.

### Description

This message occurs when retention strategy does not have zero-pin lib cell specified in map_retention_cell, but with map_retention_clamp_cell specified.

### What Next

Check whether ZPR and clamp cell insertion is expected.

### See Also

- map_retention_clamp_cell

## UPF-511

(error) Unable to set related supply net for %s based on the isolation strategy %s defined on it.

### Description

This error message occurs when running the *split_constraints* command. The supply net to be set as the related supply net for the specified pin could not be determined from the isolation strategy defined on the pin.

### What Next

Check the isolation strategies defined and re-run split_constraints.

### See Also

- split_constraints

## UPF-512

(warning) The related supply set of %s '%s' cannot be determined.

### Description

This warning message occurs because the related power and ground supply nets of the specified pin or port cannot be resolved to an available supply set of its parent domain.

Feedback

### What Next

Check the related PG pin of the specified pin and its supply net. Check the available supplies of the parent domain of the pin or port.

### See Also

- set_domain_supply_net
- report_power_domain

---

## UPF-513

(warning) Cannot determine the related supply for any of the referenced pins and ports

### Description

This warning message occurs because the related power and ground supply nets of the specified pins and ports cannot be resolved to an available supply set of its parent domain.

### What Next

Check the related PG pin of the specified pins and its supply nets Check the available supplies of the parent domain of the pins and ports.

### See Also

- set_domain_supply_net
- report_power_domain

---

## UPF-515

(error) Attribute value specified %s is invalid. Supported values for enable_bias attribute are : true, false, derived.

### Description

This error message indicates incorrect attribute value setting for enable_bias attribute.

### What Next

Check the enable_bias attribute setting.

### See Also

- set_design_attributes

Feedback

## UPF-516

(information) Supply net '%s' has connections to macro internal pg pin(s).

### Description

This informational message is printed when the specified supply net has connections to macro internal pg pins. Connection to macro internal pg pins can change the supply availability and whether the supply net and its connected/associated supply nets should be implemented in netlist.

### What Next

Please check the connections and supply availability of the specified supply net and its connected or associated supply net(s).

### See Also

- connect_supply_net

## UPF-517

(error) Tools does not support design attribute "hetero_fanout_isolation" with value false.

### Description

This message occurs when design attribute "hetero_fanout_isolation" is set to false. This attribute will be dropped.

### What Next

Use the following syntax and rerun the command:

```
set_design_attributes
   [-attribute {name value}]
```

### See Also

- set_design_attributes

## UPF-518

(Information) The design attribute "hetero_fanout_isolation" is not set. Tool will insert isolation cells on hetero-fanout path. It is recommended to set the attribute "hetero_fanout_isolation" to TRUE in the input UPF to ensure cross tool consistency for path based isolation cell insertion on heterogeneous fanouts.

Feedback

### Description

This information message is issued when design attribute "hetero_fanout_isolation" is not set in input UPF and UPF has isolation strategy with -sink/-diff_supply_only. Tool will insert isolation cells on hetero-fanout path. It's recommended to set the attribute "hetero_fanout_isolation" to TRUE in the input UPF to ensure cross tool consistency for path based isolation cell insertion on heterogeneous fanouts.

## UPF-519e

(information) DCM mode is enabled, app options "mv.incomplete_upf.ao_infer_csn_rule" will not be ignored. Use corresponding DCM check "mv.cells.ao_missing_csn" to set CSN infer rule.

### Description

This message indicates that the design is in DCM mode,and app options "mv.incomplete_upf.ao_infer_csn_rule" will not be effective.

### What Next

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM checks.

### See Also

- set_early_data_check_policy

## UPF-520

(error) Supply Net '%s' does not have a voltage defined on corner '%s'.

### Description

This error is reported when the specified Supply Net has no voltage defined in the mentioned corner.

All the supply nets defined in the design must have an operating voltage defined for synthesis to proceed further.

### What Next

- If the specified corner is *default*, assign the operating voltage using *set_voltage* for the Supply Net. If not, use *set_voltage -corner* on the specified corner.

### See Also

- set_voltage

## UPF-521

(error) Supply Net '%s' has a voltage '%s' defined in corner '%s' which is out of the range of its valid states.

Feedback

### Description

This message is reported when the assigned Supply Net has an operating voltage higher or lower than the range defined in the Power State of the by the command *add_power_state*.

### What Next

- Set operating voltage in the valid range with command *set_voltage*. • Update the voltage range defined in the Power State.

### See Also

- add_power_state
- set_voltage

---

## UPF-522

(error) Supply voltage on supply net '%s' and its connected supply nets are not consistent in corner '%s'.

### Description

This error message occurs when you attempt to specify an operating voltage that differs from the operating voltages of other supply nets connected to it as a single metal(through supply ports and by association).

All supply nets connected together as a single metal must share common operating voltages. Supply nets having different operating voltages cannot be connected together.

### What Next

- If you have previously used the *set_voltage* command on several supply nets connected together, apply the *set_voltage* command on these supply nets simultaneously to change their operating voltages.
- To apply the *set_voltage* command, specify multiple supply nets with the *-object_list* option.

### See Also

- set_voltage

---

## UPF-523

(information) DCM mode is enabled, app options "mv.upf.enable_missing_voltage_area" will be ignored.

Feedback

### Description

This message indicates that the design is in DCM mode,and app options "mv.upf.enable_missing_voltage_area" will not be effective.

### What Next

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM check "mv.va.missing_voltage_area".

### See Also

- set_early_data_check_policy

---

## UPF-525

(information) DCM mode is enabled, app options "mv.incomplete_upf.iso_infer_csn_rule" will be ignored. Use corresponding DCM check "mv.cells.iso_missing_csn" to set CSN infer rule.

### Description

This message indicates that the design is in DCM mode,and app options "mv.incomplete_upf.iso_infer_csn_rule" will not be effective.

### What Next

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM checks.

### See Also

- set_early_data_check_policy

---

## UPF-526

(information) DCM mode is enabled, app options "mv.incomplete_upf.ls_infer_csn_rule" will be ignored. Use corresponding DCM check "mv.cells.ls_missing_csn" to set CSN infer rule.

### Description

This message indicates that the design is in DCM mode,and app options "mv.incomplete_upf.ls_infer_csn_rule" will not be effective.

Feedback

### What Next

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM checks.

### See Also

- set_early_data_check_policy

---

## UPF-527

(information) DCM mode is enabled, app options "mv.incomplete_upf.ret_infer_csn_rule" will be ignored. Use corresponding DCM check "mv.cells.ret_missing_csn" to set CSN infer rule.

### Description

This message indicates that the design is in DCM mode,and app options "mv.incomplete_upf.ret_infer_csn_rule" will not be effective.

### What Next

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM checks.

### See Also

- set_early_data_check_policy

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM checks.

### See Also

- set_early_data_check_policy

## UPF-530

(information) DCM mode is enabled, app options "mv.incomplete_upf.optimization_control" will be ignored. Use corresponding DCM check "mv.buf.mv_violation" to set buffering rule.

### Description

This message indicates that the design is in DCM mode,and app options "mv.incomplete_upf.optimization_control" will not be effective.

### What Next

DCM mode is enabled with set_early_data_check_policy, set option with corresponding DCM checks.

### See Also

- set_early_data_check_policy

## UPF-531

(warning) Block instance '%s' is skipped because it is not immediate child block of current design and higher-level block instance '%s' is not included in the full-chip UPF output.

### Description

This message indicates that the specified block instance is excluded from the full-chip upf output because higher-level block instance is not specified or included in the full-chip UPF.

Feedback

### What Next

Ensure that the all higher-level block instance(s) are specified to be included in the full-chip UPF.

### See Also

- save_upf

---

## UPF-532

(information) Summary of UPF Cells

### Description

This informational message is printed at the postlude to summarize the UPF information like number of power domain(s), supply net(s), voltage area info and MV cells summary.

### See Also

- connect_supply_net

---

## UPF-533

(information) Design has all mapped instances, create_mv_cells in mapped mode.

### Description

This informational message is printed if all the instances are mapped at the create_mv_cells step

### See Also

- create_mv_cells

---

## UPF-534

(information) Design has unmapped instance(s), create_mv_cells in %s mode.

### Description

This informational message is printed if there is any unmapped instance(s) in the design after running create_mv_cells.

### What Next

Please use check_mv_design to see more details.

Feedback

**See Also**

- create_mv_cells
- check_mv_design

---

## UPF-535

(information) Please run check_mv_design for more details.

**Description**

This informational message is printed if there is any MV violation flagged at postlude MV Check.

**What Next**

Please run check_mv_design to see more details of the violation.

**See Also**

- check_mv_design

---

## UPF-539

(error) Number of derived PST states is over limit %d. Derived PST reported is not complete.

**Description**

This error message occurs when the number of derived PST states is over the preset limit.

**What Next**

Please either increase the state limit through option '-pst_state_limit' or limit the number of supplies through option '-supplies'.

**See Also**

- report_pst

---

## UPF-540

(error) System power state table buidling time is over the limit.

Feedback

### Description

This error message occurs when the building time of system-level power state table is over the preset limit. The system power state table is incomplete and may result in false isolation/level shifter violations. This is usually due to system has large number of independent supply nets.

### What Next

Please check if design supply network is fully connected to reduce the number of independent supply nets or increase the time limit for building system power state table.

### See Also

- report_supply_net_groups
- mv.upf.system_pst_building_time_limit

---

## UPF-570

(error) The correlated supply group "%s" is invalid because %s.

### Description

This error message occurs when you run the *set_design_attributes* command with the *correlated_supply_group* attribute, but the group list is invalid.

Example: Invalid correlated supply groups

```
prompt> set_design_attributes -elements {.} -attribute
 correlated_supply_group ""
prompt> set_design_attributes -elements {.} -attribute
 correlated_supply_group "{ }"
prompt> set_design_attributes -elements {.} -attribute
 correlated_supply_group "VDD1 VDD2 VSS"
prompt> set_design_attributes -elements {.} -attribute
 correlated_supply_group "{VDD1 VDD2} VSS"
prompt> set_design_attributes -elements {.} -attribute
 correlated_supply_group "{VDD1 VDD2 VSS} { }"
```

### What Next

Specify a valid list of the supply groups with the *correlated_supply_group* attribute.

Example:

```
• set_design_attributes -elements {.} -attribute \
       correlated_supply_group "{VDD1 VDD2 VSS1} {VDD3 VDD4 VSS2}"
```

Feedback

```
• set_design_attributes -elements {.} -attribute \
      correlated_supply_group "*"
```

**See Also**

- set_design_attributes

---

## UPF-571

(error) The supply net %s is included multiple times in the correlated supply group {%s}.

**Description**

This error message occurs when you run the *set_design_attributes* command with the *correlated_supply_group* attribute and a supply net is included multiple times in the same correlated supply group.

In the following example, VDD1 is included twice in a correlated supply group:

```
prompt> set_design_attributes -elements {.} \
                  -attribute correlated_supply_group "{VDD1 VDD1 VSS}"
```

Error: The supply net VDD1 is included multiple times in the correlated supply group. (UPF-571)

**What Next**

Remove all duplicate entries of the supply net from the correlated supply group and rerun the command.

**See Also**

- set_design_attributes

---

## UPF-572

(warning) The operating voltage (%s=%.2f) for the supply net %s does not match any of its power states.

**Description**

For a specified power state of the supply net, the operating voltage must be one of the maximum, minimum, or nominal voltages. This warning message occurs when specify a

Feedback

operating voltage for the supply net that does not match any of its power states, as shown in the following example:

Example:

```
prompt> create_supply_net VDD
prompt> create_supply_port VDD
prompt> connect_supply_net VDD -ports { VDD }
prompt> add_port_state VDD -state { ON 0.85 0.90 0.95 }
prompt> set_voltage 0.70 -object_list { VDD }
prompt> check_mv_design
```

Warning: The operating voltage (max=0.70) for the supply net VDD does not match any of its power states.(UPF-572)

### What Next

1. Use the **set_voltage** command to assign an appropriate operating voltage to the supply net, or
2. Add a new port or power state that matches the operating voltage of the supply net.

### See Also

- set_voltage
- add_port_state
- add_power_state

---

## UPF-573

(Information) Correlated supply groups %s and %s are merged.

### Description

This information message occurs when you run the *set_design_attributes* command with the *correlated_supply_group* attribute and some supply nets in the group list belong to the same netgroup. Therefore, the correlated supply groups of these supply nets are merged.

Two supply nets belong to the same netgroup if any one of the following conditions are met:

- they are connected through a supply port by the **connect_supply_net** command.
- they belong to two supply sets that are associated because of **associate_supply_set** command.
- one belongs to a supply set whose function is updated to the other by **create_supply_set -update** command.

Feedback

• one belongs to a supply set and the other belongs to a supply set handle of
a power domain; and the supply set and supply handle are associated
by the **create_power_domain -supply** command.

### What Next

This is an information message. No action is required.

### See Also

- set_design_attributes
- connect_supply_net
- associate_supply_set
- create_supply_set
- create_power_domain

---

## UPF-574

(error) The correlated supply groups %s are set in an invalid scope '%s' because the scope does not have its own power domain.

### Description

This error message occurs when you specify the *correlated_supply_group* attribute with the *set_design_attributes* command in the specified scope. However, the scope does not have its own power domain. The *correlated_supply_group* attribute can only be set in the top scope of a power domain.

### What Next

Create a power domain in the specified scope.

### See Also

- set_design_attributes

---

## UPF-575

(error) Cannot propagate correlated supply group %s from scope '%s' because some supply nets are in different correlated supply groups in the top-level scope.

Feedback

### Description

The commit_upf command failed because it cannot propagate design attribute *correlated_supply_group* from the specified scope to the top-level scope. Two or more supply nets appear in the same correlated supply group in the specified scope but they appear in different correlated supply groups in the top-level scope.

### What Next

Correct the design attribute *correlated_supply_group* in the top-level scope so that the conflicting supply nets appear in the same correlated supply group.

---

## UPF-576

(error) Correlated supply group has already been set up in scope '%s'.

### Description

The set_design_attribute command failed because it tries to set up correlated supply group in the specified scope but another correlated supply group has already been set up in that scope.

Here is an example:

```
prompt> set_scope /U1
prompt> set_design_attribute -elements {.} \\
   -attribute correlated_supply_group "{VDD1 VDD2}"
prompt> set_scope /U1
prompt> set_design_attribute -elements {.} \\
   -attribute correlated_supply_group "{VDD3 VDD4}"
Error: Correlated supply group has already been set up in scope 'U1'.
 (UPF-576)
```

### What Next

Delete one of the correlated supply groups or combine them into one correlated supply group for the specified scope.

For the above example, we can combine the two correlated supply groups into one:

```
prompt> set_scope /U1
prompt> set_design_attribute -elements {.} \\
   -attribute correlated_supply_group "{VDD1 VDD2} {VDD3 VDD4}"
```

---

## UPF-578

(error) For Supply set handle %s, Invalid number of supply sets specified.

Feedback

### Description

This error message indicates that for one or more supply set handles, more than one supply sets are specified. The supply handles and their associated supply sets are specified using the *-supply* option of the *create_power_domain* command .

### What Next

Provide only one supply set for each supply handle

### See Also

- create_supply_set
- create_power_domain

---

## UPF-579

(error) %s Strategy with name %s has been already defined in the power domain %s.

### Description

This error occurs when a duplicated strategy name is used within the same power domain for strategy of isolation, level_shifter or retention. Name duplication is not allowed for strategies in same power domain.

### What Next

The UPF needs to be changed to fix the error. Identify the referenced duplicate strategy names associated with the referenced power domain, make sure to use a different strategy names.

### See Also

- set_isolation
- set_isolation_control
- set_level_shifter

---

## UPF-580

(error) The string specified in -elements is invalid for the %s attribute '%s'. %s

Feedback

### Description

This error message indicates that command set_design_attributes or set_port_attributes is specifying invalid elements for given attribute according to its rule.

### What Next

Modify the set_design_attributes/set_port_attributes command to specify correct element according to given attribute. For example, design attribute may require one '.' or hierarchical cell as element, port attribute may require power domain root cell as element.

### See Also

- set_design_attributes
- set_port_attributes

---

## UPF-581

(error) Resolution conflicts on net %s (%s) and net %s (%s).

### Description

This error message indicates that two nets in the same netgroup having conflicting net resolution. Those two nets could be connected through connect_supply_net, set_equivalent or associate_supply_set command.

### What Next

Use same resolution for nets in the same netgroup.

### See Also

- create_supply_net

---

## UPF-582

(Error) Retention strategy %s of domain %s is not applicable to any of the elements specified in the element list of the strategy.

### Description

This error message occur when the elements in the element list of set_retention command are either not part of the domain or another retention strategy applies to them.

### What Next

Make sure element list contain at least one valid element.

Feedback

### See Also

- set_retention

---

## UPF-583

(Warning) The cell(s) specified with map_retention_cell -elements for retention strategy %s will be ignored.

### Description

The tool ignores -elements option of map_retention_cell. Effectively, map_retention_cell will be applicable to all the cells of the corresponding retention strategy. Since tool ignores -elements option of map_retention_cell, save_upf will not write out this option.

### What Next

This is only a warning message. No action is required.

### See Also

- set_retention

---

## UPF-584

(error) Invalid boolean expression '%s' in supply set state %s logic expression.

### Description

Invalid boolean expression '%s' in logic expression for supply set state.

### What Next

```
The boolean expression must be a combination of instance control  ports
and  logical  or bitwise operators (!, |, ||, &, &&, ^ ). SystemVerilog
keywords are not acceptable ports.
```

---

## UPF-585

(information) add_power_state global -simstate outside of individual state curly braces will be obsolete in a near future release.

### Description

add_power_state -simstate outside of individual state curly braces will be obsolete in a near future release, customer should specify -simstate in individual state curly braces.

Feedback

### What Next

```
stop using -simstate globally for add_power_state
```

## UPF-586

(warning) Multiple set_variation %s. Keeping value %.2f, discarding value %.2f.

### Description

multiple set_variation command issued for same supply net or globally, the latest value is kept, the previous value is discarded

Example:

### What Next

```
make sure the right value is specified for supply voltage tolerance.
```

## UPF-587

(Error) %s value specified in set_variation command -tolerance option.

### Description

set_variation command -tolerance option accept one or two positive values. cannot specify negative value or more than two values.

Example:

### What Next

```
make sure the right value is specified for supply voltage tolerance.
```

### See Also

- set_variation

## UPF-588

(error) set_port_attributes terminates for the following reason: '%s%s'.

### Description

This message occurs when the command set_port_attribute cannot procced further because of the specified reason on the message.

Feedback

**See Also**

- set_port_attributes

---

## UPF-590

(error) The top power domain %s of soft macro instance %s is scoped above itself.

**Description**

This message occurs when a soft macro instance does not have its own top-level power domain.

**What Next**

Define a top-level power domain for the soft macro (e.g., *create_power_domain -elements {.}* .

**See Also**

- create_power_domain

---

## UPF-591

(warning) set_variation command only supported in top design UPF.

**Description**

This occurs when the tool detects set_variation command in block level UPF. supply variation for voltage reconciliation can be only set in top level UPF. The command in block level UPF will be ignored.

**What Next**

set_variation in top level UPF.

**See Also**

- load_upf

---

## UPF-592

(warning) set_scope command %s crosses soft macro boundary.

**Description**

This message occurs when *set_scope ..* is executed at the top scope of a soft macro, or when *set_scope /* is executed anywhere inside a soft macro.

Feedback

### What Next

No action required. This is a warning message.

### See Also

- set_scope

---

## UPF-593

(error) Conflict upf_reconcile_boundary setting for module : %s.

### Description

This message occurs when conflict upf_reconcile_boundary setting is done for the same module.

### See Also

- report_pst

---

## UPF-594

(error) Cannot implement %s strategy '%s' because it is defined inside a soft macro, but accesses or inserts objects outside of the soft macro.

### Description

User specifies an isolation, level shifter or retention strategy through a *set_isolation*, *set_level_shifter*, or *set_retention* command inside a soft macro, but accesses or inserts objects outside of the soft macro.

Examples: 1. use of *-location parent* or-*location fanout* on a boundary pin of the soft macro. 2. references a control signal outside of the soft macro.

### What Next

Move the specified isolation or level shifter strategy outside of the soft macro.

### See Also

- set_design_attributes
- set_level_shifter
- set_isolation

Feedback

- set_isolation_control
- set_retention

---

## UPF-595

(information) Voltage reconciliation tolerance setting from supply net %s, other setting(s) on the same netgroup will be ignored.

### Description

set_variation for supply net reconciliation voltage tolerance can be set from top level design or block level design. If set from top level supply net, all other settings in block level will be ignored. If no top level setting is done, first setting from block level will be taken, all other settings in other blocks will be ignored. The tolerance will be applied to entire netgroup.

### What Next

### See Also

- set_variation
- report_pst

---

## UPF-596

(error) Conflict voltage reconciliation tolerance setting from : %s.

### Description

set_variation for supply net reconciliation voltage tolerance can be set from top level design or block level design. you get this Error message because conflict tolerances are set for same level supply nets in the netgroup, or conflict tolerances are set for equivalent supplies, this is considered as conflict, the settings are dropped.

### What Next

```
Resolve the conflict by eliminating settings from different blocks, or
 set the desired tolerance from higher hierarchical level,
or set only from one block or top design.
```

Feedback

**See Also**

- set_variation
- report_pst
- set_equivalent

## UPF-597

(error) Cannot connect supply net %s to supply port %s because %s is inside a soft macro.

**Description**

This error message occurs when the specified supply port is inside a soft macro, and the specified supply net is not.

Supply net connections cannot cross soft macro boundaries.

**See Also**

- connect_supply_net

## UPF-598

(error) Cannot associate supply set %s to supply handle %s because the association crosses a soft macro boundary.

**Description**

This error message occurs when the specified supply handle is inside a soft macro, and the specified supply set is not, or vice versa.

Supply set association cannot cross soft macro boundaries.

**See Also**

- associate_supply_set

## UPF-599

(error) set_isolation_control -location command cannot be used after set_isolation -location -update.

Feedback

### Description

This message occurs when the set_isolation_control -location is used on a strategy that already has the location set with set_isolation -location -update.

### What Next

set_isolation_control command will be dropped.

### See Also

- set_isolation
- set_isolation_control

---

## UPF-600

(warning) The level-shifter strategy %s of power domain %s cannot be applied with location other on Upper domain boundary.

### Description

This message occurs when *set_level_shifter ..* is set for top domain upper boundary port with -location other, tool will not insert level shifter cell outside the scope of this power domain.

### What Next

This is a warning message. Check the set_level_shifter command.

### See Also

- set_level_shifter

---

## UPF-601

(warning) The level-shifter strategy %s of power domain %s cannot be applied with location other on hard macro lower domain boundary port %s.

### Description

This message occurs when *set_level_shifter ..* is set for lower boundary port with -location other, the lower domain element is hard macro, level shifter cell cannot be inserted.

### What Next

This is a warning message. Check the set_level_shifter command.

Feedback

### See Also

- set_level_shifter

---

## UPF-602

(warning) The pin '%s' has already been inserted in the strategy '%s' and will not be inserted in the strategy '%s' of type '%s'.

### Description

This warning happens when a pin has more than one set_dft_isolation setting and ends up with more than one valid set_isolation_strategy. The pin will be added to only one strategy to avoid resolutions conflict.

### What Next

Please check that your set_dft_isolations settings are correct.

### See Also

- check_isolation_coverage

---

## UPF-603

(error) The pin %s is not an analog macro pin and is connected to a negative ground supply.

### Description

This error message occurs when a pin with a negative ground supply is connected to a non-analog and/or non-macro pin.

### What Next

Check the connections.

### See Also

- add_power_state
- add_port_state
- connect_supply_net
- set_related_supply_net

Feedback

## UPF-604

(warning) The user defined attribute '%s' has the following issue: %s.

### Description

This warning message occursduring commit_upf when an user defined attribute that is being used in UPF does not meet the specified restriction.

### What Next

Check the reason of the issue described in the message.

### See Also

- define_user_attribute
- set_attribute

## UPF-605

(warning) Uniquification of instance '%s' of module '%s' was triggered because: %s.

### Description

This warning message occurs when a multiple instanciated module is uniquified during commit_upf or load_upf and that uniquification was not prevented because of the given reason.

### What Next

Check the reason of the issue described in the message.

### See Also

- commit_upf
- load_upf

## UPF-908

(information) All %s cells can be %s.

### Description

For current design and UPF, tool will be able to map all isolation/enable level shifter cells, or all level shifter cells can be inserted to fix voltage violation. If -element specified in the command, the report is specific to the element pin, port, cell or net.

Feedback

**See Also**

- analyze_mv_feasibility

---

## UPF-909a

(warning) Not all level shifter cells can be inserted to fix voltage violation, refer to the summary for general issue.

**Description**

For current design and UPF specified, tool will not be able to insert level shifter cell to fix voltage violation on some path. Please refer to the output of this command or do analyze_mv_feasiblity for more detail information.

**See Also**

- analyze_mv_feasibility

---

## UPF-909

(error) Not all the %s cells can be %s.

**Description**

For current design and UPF specified, tool will not be able to map all the isolation and/or enable level shifter elements to technology library cells, or level shifter cell canot be inserted to fix the voltage violation for some path. Please refer to the output of this command analyze_mv_feasiblity and/or the HTML report generated with -format html for details on which elements cannot be mapped or inserted and why.

**See Also**

- analyze_mv_feasibility

---

## UPF-910

(error) Element '%s' in the extent of atomic power domain '%s' has been defined as root cell of another power domain '%s'. Applied strategies will be re-evaluated once this error is addressed.

**Description**

This error occurs when a cell in the extent of an atomic power domain is not excluded from the power domain and the cells belongs to a different power domain than the atomic one.

Feedback

### What Next

Please exclude the specified cell of the atomic power domain with *-update* option. Here is an example:

```
prompt> create_power_domain PD_TOP -elements {m2 m1/b1} -include_scope
prompt> create_power_domain PD_MID -elements {m1} -atomic
prompt> create_power_domain PD_MID -exclude_elements {m1/b1}
```

### See Also

- create_power_domain

---

## UPF-911

(error) Unable to merge domain '%s' and '%s' because '%s' is atomic but '%s' is not atomic.

### Description

This warning occurs when a block domain tries to merge to a TOP domain but they do not share the same -atomic setting. Atomic power domains can only be merged to other atomic domains.

### What Next

Add the atomic option to the domain which is missing the setting to keep the domains as atomic.

### See Also

- create_power_domain

---

## UPF-912

(warning) Element '%s' in the extent of the atomic power domain '%s' but belongs to another power domain '%s'.

### Description

This warning occurs when a block domain is propagated from the block to TOP and elements of this domain are in the extent of an atomic domain.

### What Next

Exclude this instances from the atomic domain and run commit_upf to validate the change.

Feedback

**See Also**

- create_power_domain

---

## UPF-913

(error) Set_isolation strategy '%s' with multiple control signals failed because: %s.

**Description**

When defining a set_isolation strategy with multiple -isolation_signal, -isolation_sense, -clamp_value or -isolation_supply. The strategy can only be applying inside a hard macro and, if specified, all the mentioned options must have the same number of elements as the others or only one.

**See Also**

- set_isolation

---

## UPF-914

(error) The command "%s" can only be used before any MV object is created.

**Description**

The specified command needs to be called before any MV objects like supply ports, supply nets, supply sets and power domains are created.

**What Next**

Move the command before the creation of any MV objects.

**See Also**

- set_design_attributes

---

## UPF-915

(warning) Update to the option '%s' of implemented %s strategy '%s' found.

**Description**

Updates to elements list (e.g. -elements, -exclude_elements) or filtering options (-applies_to, -source, -sink, etc) of power management strategies can cause already implemented power management cells to change or lose their currently associated strategy. Thuis can lead to reimplementation or removal of existing power management cell.

Feedback

### What Next

If changes to power management strategy association is not desired please refrain from performing updates after implementation.

# UR

## UR-001

(Error) No regions associated with the flat-voltage-area %s.

Feedback

**Description**

The flat-voltage-area does not have any regions defined. Utilization can not be calculated for the voltage-area with no regions.

---

## UR-002

(Warning) Capacity area is zero

**Description**

The accumulated area of all the exclusion regions covers the entire capacity region.

---

## UR-003

(Error) No regions associated with the move-bound %s.

**Description**

The move-bound has no regions defined. Utilization cannot be defined for the move-bound with no regions.

---

## UR-004

(Error) Move bound %s completely overlaps with other exclusive move bounds.

**Description**

All the regions associated with the given move bound overlap with other exclusive move bounds. Capacity of a move bound is the effective region in the move bound, after deducting the regions overlapping with other exclusive move bounds. In this case, the capacity of the given move bound is zero.

---

## UR-005

(Error) Effective shapes of site-array %s is not defined.

**Description**

The given site-array does not have the effective shapes defined. Utilization of this site-array cannot be reported.

---

## UR-006

(Error) Site-array not defined for block %s.

Feedback

**Description**

Site-array has not been defined for the block. Utilization report cannot be based on site-array.

---

## UR-007

(Error) Utilization configuration '%s' does not exist.

**Description**

The requested utilization configuration is not defined.

**What Next**

Please provide a valid configuration name

**See Also**

- create_utilization_configuration
- get_utilization_configurations

---

## UR-008

(Warning) A configuration with name '%s' already exists.

**Description**

A utilization configuration with the same name already exists. Use '-force' option to overwrite the values in the existing configuration.

**See Also**

- create_utilization_configuration

---

## UR-009

(Warning) Existing configuration '%s' has same values for capacity and inclusions/exclusions.

**Description**

An existing configuraiton has same capacity and inclusion/exclusion values. Use '-force' option to overwrite the configuration name.

Feedback

**See Also**

- create_utilization_configuration

---

## UR-010

(Error) Could not find the utilization configuration in the given scope.

**Description**

The requested utilization configuration was not found in the given scope. Use 'get_utilization_configurations -scope <scope>' to get the available configs in the given scope.

**See Also**

- get_utilization_configurations

---

## UR-011

(Error) Cannot store utilization configurations in %s '%s', as it is %s.

**Description**

The given library is read-only and cannot be used to store the utilization configurations. Use a writable library or choose another scope.

**See Also**

- create_utilization_configuration

---

## UR-012

(Error) Cannot delete utilization configuration(s) in %s '%s', as it is %s.

**Description**

The given utilization configuration is associated with a read-only library(or tech) and hence cannot be deleted.

**See Also**

- create_utilization_configuration

Feedback

## UR-013

(Error) Block '%s' does not have any site-rows.

**Description**

Site-rows have not been defined for the block. Utilization report cannot be based on site-row.

## UR-014

(Error) Cannot store utilization configurations in tech '%s', as it is associated with a read-only library '%s'.

**Description**

The given tech is read-only and cannot be used to store the utilization configurations.

**See Also**

- create_utilization_configuration

## UR-015

(Error) Cannot modify the utilization configuration '%s', as it is associated with a read-only %s

**Description**

The utilization-configuration belongs to a read-only library/tech and it cannot be modified.

**See Also**

- create_utilization_configuration

## UR-016

(error) Category '%s' cannot be specified in both '-include' and '-exclude' options.

**Description**

Inclusion and exclusion categories must be distinct.

**What Next**

Correct the option value to avoid repeatation of the same category.

Feedback

**See Also**

- create_utilization_configuration

---

## UR-017

(Information) Using user default configuration with name '%s' in scope %s for utilization reporting.

**Description**

Reports the user defined configuration implicitly used for utilization computation.

**See Also**

- create_utilization_configuration

---

## UR-018

(Error) The minimum grid size must be 3 times the height %0.4f of placement site_def '%s'.

**Description**

The specified value of "-grid_size" option is incorrect. Please specify a value at-least 3 times the height of the reported site_def of minimum height.

---

## UR-019

(Error) Effective shapes of site-array %s doesn't overlap with the user specified region.

**Description**

The user specified region is completely outside the capacity of the reported site-array. Utilization of the site-array cannot be reported for the specified region.

**What Next**

Please correct the user specified region to overlap with the default or bottom-most site-array for utilization of capacity_type site_array.

---

## UR-020

(Error) The specified grid size %0.4f results in %u sub-regions which is too high.

Feedback

**Description**

Utilization of these many sub-regions seems impractical as the reporting would be difficult to analyze and comprehend.

**What Next**

Please reduce the number of sub-regions by increasing the grid-size or use the -region option to speficy a smaller region of reasonable area.

---

## UR-021

(Error) %s '%s' and %s '%s' are not same.

**Description**

In hybrid mode, width of composite site-def and corresponding elementary site-defs should be same. Also, height of composite site-def and sum of elementary site-defs should be same.

**What Next**

Rectify the input data as per details in error message.

---

# VER

---

## VER-1

(warning) %s The value %s is too large for the numeric data type being used

**Description**

This is an overflow condition detected during constant evaluations of the RTL when non-zero bits carry beyond the numeric precision (width) of the expression's data type.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-2

(warning) %s Unknown debug option %s

**Description**

This is a syntax error.

Feedback

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-3

(error) %s always_comb do not support RP(Relative Placement) registerbank, please remove RP directive '%s'.

**Description**

This error message occurs when relative placement register bank directives are put inside *always_comb*.

**What Next**

Remove the relative placement directives that are inside *always_comb*.

---

## VER-4

(warning) %s Incompatible port connection, port %d of instance %s in module %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-5

(warning) %s Mismatch in number of ports for instance %s

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-6

(warning) %s The unsized Verilog number %s was left-truncated from %d bits to 32 bits, which can be prevented with sized %d%s.

Feedback

**Description**

During analysis of the Verilog or SystemVerilog RTL a based literal constant without an explicit size constant before the apostrophe was encountered for which the requested digits would need more than 32 bits to represent. The leftmost bits were truncated to fit into the default size of 32 bits.

**What Next**

Insert an explicit size specifier before the apostrophe.

---

## VER-7

(information) %s %s.

**Description**

This informational message is issued when analyzing or reading Verilog or SystemVerilog RTL when the variable hdlin_analyze_verbose_mode is overridden to a positive value. For an explanation of how that variable works, please see its man page.

**What Next**

This is an informational message. If you would prefer that it not be issued, please examine the current setting of hdlin_analyze_verbose_mode.

---

## VER-8

(warning) %s Hierarchical component name %s is a macromodule and not expandable.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-9

(warning) %s Illegal synopsys label pragma, it will be ignored.

**Description**

When synopsys label pragma is put wrong place, this warnning message will be dumped. Presto ignores this label pragma.

Feedback

**What Next**

Put the label pragma into right place.

---

## VER-12

(error) %s Hierarchical component name %s is not a module, task, function, or block

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-15

(error) %s The call to '%s' does not have enough arguments to satisfy all format specifiers.

**Description**

This error message occurs if you supply a format string when using the '$display' (or similar) system function, and there are not enough subsequent parameters to supply each token in the specifier.

In the following example, the format specifier "%s%s%d" contains three tokens and requires at least three values, which are a, b, and c.

```
$display ("%s%s%d", a, b, c);
```

**What Next**

Correct any occurrences of insufficient parameters for the specified format string in the Verilog code.

---

## VER-16

(error) %s First parameter of $dumpvars must be an integer

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

Feedback

## VER-17

(error) %s Incompatible number of arguments, usage versus declaration.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-18

(error) %s Bounds %s for vector %s must be integer.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-19

(error) %s +liborder and +librescan conflict; only one can be specified.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-20

(error) %s Package %s does not export the name '%s'.

**Description**

This message issues when the System Verilog scope operator (::) tries to extract content from the specified package, but the name was either not found in the global scope of that package, or its package-level definition is marked as not exportable.

Feedback

### What Next

Check that the package name is correct and that the source code with the desired definition has been analyzed without errors more recently than any other package with the same name. If the supplying package is at fault, re-analyze it and also the present file. If the consuming reference is not correct, adjust the RTL and re-analyze. The setting of hdlin_sv_packages can also affect whether names imported into a package can be re-exported.

### See Also

- VER-26
- VER-934

---

## VER-21

(error) %s Multiple conflicting definitions of '%s' are available via wildcard imports.

### Description

This message issues when you use a name which you have not previously declared that has more than one distinct definition supplied through several wildcard import routes ( import pkg_A::*, pkg_B::*; ) into the same surrounding scope.

When all imported packages are analyzed with hdlin_sv_packages set to *dont_chain*, this error corresponds to the prohibition in section 19.2.1 of IEEE-1800-2005: a name may come from at most one wildcarded package. Packages analyzed with hdlin_sv_packages set to *chain* or *enable*, may also export names that they imported from elsewhere. Thus a single common definition for name might arrive via several paths, VER-21 issues only when multiple source definitions are import candidates, and no import is more local than the others at the point of use.

### What Next

There are many RTL source code adjustments of the import statements and/or the name reference that could clear this condition: You could place the wildcard imports at different levels in the scope stack so that the prefered supplier shadows the unwanted supplier. You could add an explicit "import desired_supplier::name;" you could prefix the package scope extraction operator "desired_supplier::" to the name reference to indicate the desired package. You might delete the import of an unused package that causes the conflict. You could correct a spelling to avoid the collision. You could supply a missing local declaration of the name in the overloaded scope to override the wildcard imports. You could explicitly declare the name with a local meaning.

If you believe the RTL as written is correct, check that the current search_path reaches .pvk files that were produced by successfully analyzing the current versions

Feedback

of these packages' source files. The setting of *hdlin_sv_packages at the time those packages were analyzed can also affect whether names imported into them will be re-exported, which might be either producing or exposing the observed name conflict.*

**See Also**

- ELAB-106

---

## VER-22

(error) %s Too many parameters found on task %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-23

(error) %s The %s parameter is not completely writable and it is being passed to an OUTPUT or INOUT formal parameter.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-25

(error) %s Module '%s' is redefined.

**Description**

You receive this message to inform you that during execution of the *analyze* or *read* command the compiler has encountered in your design a module declaration that has the same name as a previously defined module. Each module name must be unique.

**What Next**

Rename one of the modules so that all modules have unique names.

Feedback

## VER-26

(warning) %s The package %s has already been analyzed. It is being replaced.

### Description

You receive this warning message if a package with the same name was analyzed by a previous read or analyze command, possibly during a different DC shell session. This can occur in three possible ways:

- The file currently being analyzed has already been analyzed.
- A package with the same name is declared in another file analyzed in the current work directory.
- You have modified the package's source file and are reanalyzing it.

The previous package contents are removed, and possibly overwritten by the declaration currently being analyzed.

### What Next

This is only a warning message.

However, you can check the overwritten file. If the result is not what you intended, change the package name and run the command again.

All references to a revised package should be re-analyzed to insure that they are coherent. Failure to do this is one source of ELAB-106 warnings, VER-20, and various type-mismatch errors.

### See Also

- ELAB-106
- VER-20
- VER-930

## VER-27

(error) %s Package %s has already been used or declared during this command.

### Description

This error issues if a package is used before being (re)declared within the same analyze or read command. There are many ways this condition can arise. In addition to use-before-declaration or name collision within a single file: the file currently being analyzed, a copy of that file, or another file declaring or using a package with the same name may

Feedback

have appeared earlier in the file list of this command, been `include'd there, or been indirectly imported by earlier package reference(s).

**What Next**

Arrange your command line(s) so that every package is analyzed or read exactly once before its first use. Conditional compilations such as the following allow declarations to be parsed just once.

```
`ifndef PKG_X
`define PKG_X
package X;
   . . .
endpackage
`endif
```

Use a separate analyze command to update or change a package's definition. All references to a re-analyzed package should also be re-analyzed to insure that they are coherent. Failure to do this is one source of ELAB-106 ("homograph") warnings and type-mismatch errors.

---

## VER-28

(warning) %s The configuration %s has already been analyzed; it is being replaced.

**Description**

You receive this warning message if a SystemVerilog config with the same name as the one cited was analyzed by a previous read or analyze command, possibly during a different DC shell session. This can occur in three possible ways:

- The file currently being read or analyzed has already been read or analyzed.
- A config with the same name is declared in another file analyzed into the current work directory.
- You have modified the config's source file and are now reanalyzing it.

The previous configuration description is removed; if the current description is successfully analyzed, it will replace the defunct version. If it fails to analyze, no configuration of this name will exist come elaborate.

**What Next**

This is only a warning message.

However, you can check the overwritten file. If the result is not what you intended, change the one of the configuration names and re-analyze the config you destroyed.

Feedback

## VER-29

(error) %s Configuration %s has already been declared.

### Description

This error issues if more than one config with the cited name is declared within the same analyze or read command. There are many ways this condition can arise. In addition to a blatant name collision in the same source file: the file currently being analyzed, a copy of that file, or another file declaring or using a package with the same name may have appeared earlier in the file list of this command or been `include'd by some earlier file.

### What Next

Arrange your command line(s) and/or `include(s) so that configurations enter the input stream no more than once. Conditional compilation directives could help to prevent repetition of the same declarations.

Use a separate analyze command to update or change a configuration.

## VER-30

(error) %s Stack overflow. %s

### Description

This error message occurs when RTL compilation cannot complete because the internal stack overflowed. All applications and tools need an internal stack to execute. This stack can grow up to a limit set by the "limit" command on csh interpreters, or the "ulimit" command on sh interpreters.

The following conditions may cause the internal stack to overflow:

- Your design has an infinite or very long iterative loop and you set a high value for the *hdlin_while_loop_iterations* variable.
- Your design has a deeply nested construct, such as a deeply parenthesized expression. This occurs with code generated by other tools, but not with hand coded sources.

Note that this message may be shown for loops that finish in simulation, but are infinite in synthesis. One example of an infinite loop, and so is unsupported, is this design:

```
module sum (input [3:0] in, output reg [7:0] out);
reg [3:0] i;
always @* begin
  i = in;
  out = 0 ;
  while (i>0) begin
```

Feedback

```
    out = out + i;
    i = i - 1;
  end
end
endmodule
```

This example will not finish in synthesis because the terminating condition depends on a port and so is never a proper constant.

**What Next**

Review your code and ensure that the terminating condition of an iterative loop will eventually be constant true. It is always difficult to determine if an iterative loop will eventually finish, but this message is usually shown when it is infinite.

In very unusual cases, the VER-30 message is shown because the stack size limit is not big enough. Check the current stack size limit with the "limit stacksize" command on csh interpreters, or the "ulimit -s" command on sh interpreters. Increase the stack size significantly, for example with the "limit stacksize 100m" command on csh interpreters, or the "ulimit -S -s 104857600" command on sh interpreters. Restart Design Compiler. Analyze and elaborate your design again. If the message persists or the current stack size is unlimited, re-evaluate the possibility of an infinite loop.

Note that if your design has an infinite loop and the stack size limit is increased, Design Compiler will also take more time to show the stack overflow message.

If your design has been generated by another tool, this error message may be due to a deeply nested construct. In this case increase the stack size limit as described above, restart Design Compiler, and analyze and elaborate your design again.

## VER-35

(warning) %s Register (%s) is the target of both blocking and nonblocking assignments in the same process.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

Feedback

## VER-36

(error) %s Internal error: %s, in %s at line %d

### Description

This message issues when RTL compilation cannot complete because the compiler reached some detectably invalid internal state. Internal cross-checks are used extensively in the Presto RTL compilers to prevent software bugs from producing erroneous results - often called "bad logic". RTL code which conforms closely to the IEEE standards ( 1364, 1800, or 1076 ) and lies within the synthesizable subsets of those languages should, of course, not encounter internal compiler errors.

### What Next

Contact Synopsys support who can help you further diagnose this problem and can often help you find a coding workaround, or a compiler release where the bug has been fixed.

If you encounter an internal error when using the most recent release from Synopsys, submit a testcase that reproduces the problem to the Synopsys Support Center by using Enter A Call at http://solvnet.synopsys.com/EnterACall.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at http://solvnet.synopsys.com/ReleaseLibrary.

For information about creating, packaging, and sending a testcase, go to http://www.synopsys.com/testcase.

### See Also

- ELAB-255
- VER-37

## VER-37

(error) %s Internal assertion failure.

### Description

This error message occurs if the HDL Compiler encounters an internal assertion failure and cannot proceed. The command shell is not affected and there is no loss of data.

The HDL Compiler contains thousands of internal checks on its operation designed to catch miscompilation problems as close as possible to their source and to prevent the production of incorrect results.

Feedback

**What Next**

If you encounter an internal assertion failure when using the most recent release from Synopsys, submit a testcase that reproduces the problem to the Synopsys Support Center by using Enter A Call at http://solvnet.synopsys.com/EnterACall.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at http://solvnet.synopsys.com/ReleaseLibrary.

For information about creating, packaging, and sending a testcase, go to http://www.synopsys.com/testcase.

---

## VER-38

(error) %s Internal error: %s

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-40

(error) %s Too many errors; can't continue.

**Description**

The Presto HDL Compiler issues this error from the read, analyze, or elaborate commands when it has encountered too many errors to continue the compilation.

**What Next**

Correct all of the errors reported before this one, and repeat the command.

---

## VER-41

(error) %s Unable to open file `%s': %s.

**Description**

This error message occurs when you issue a *read* or *analyze* command on a file that cannot be opened for reading or writing.

Feedback

**What Next**

To write to a file, make sure that the directory named by the *hdlin_output_dir* variable is writable, or change *hdlin_output_dir* to point to a writable directory. To read a file, make sure the file exists.

---

## VER-43

(error) %s Out of memory.

**Description**

This may indicate syntax errors.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-44

(warning) %s Little argument or return value checking implemented for system task or function %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-51

(error) %s internal error: %s

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-55

(error) %s Illegal character in module, interface, or package name.

Feedback

**Description**

You receive this error message when the name you specified for a module, interface, or package cannot be directly used to name a file in the host file system. This is usually due to some reserved characters, such as '/' or ':'. Names in the standard *definitions name space* exist as file system objects and must conform to host or network naming conventions in addition to Verilog lexical rules.

For example, \a/b/c is an invalid module name.

**What Next**

Change the module name in the relevant code to conform to the rules for file names in the host file system and run the command again.

---

## VER-59

(error) %s Array index out of bounds %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-60

(error) %s Array index out of bounds %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-61

(warning) %s Statement unreachable %s.

**Description**

This warning is issued when statements inside of conditional branches can't be reached, because the condition is always false or a previous condition is always true.

Feedback

**What Next**

Check the conditions of conditional statements like: if, case, when, ?, ...

---

## VER-64

(warning) %s Overwriting existing design element '%s' with newer version.

**Description**

You receive this message to inform you that during execution of the *analyze* or *read* command the compiler has encountered in your design a module or interface declaration that has the same name as a previously defined module or interface. This is non-standard according to 3.13(a) of IEEE Std 1800-2017. An identifier defined within a namespace is unique to that namespace and cannot be redefined within that namespace.

**What Next**

Rename one of the modules so that all modules have unique names, or guard definitions with an `ifndef compiler directive.

---

## VER-65

(error) %s Option 'hdlin_decoder_min_use_percentage' must be in the range 0..100 (currently %d).

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-66

(warning) %s Won't infer decoders with input width > %d; option '%s' set too large.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

Feedback

## VER-86

(warning) %s Comparison against 'x' values not inside a casex is always false.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-87

(warning) %s Begin instance %s... with a design identifier.

**Description**

This warning issues when the hierarchical path given for an instance clause does not begin with one of the design identifiers listed by the configuration. No topmost or hierarchical use of the config can apply this instance clause as written. That is probably not what you intend.

**What Next**

Change the indicated code to conform to IEEE Stds 1364-2005 or 1800-2005 or later.

## VER-97

(error) %s No input files specified.

**Description**

You receive this error message because no input files were specified with the *analyze* or *read* command for the Presto HDL Compiler. These commands require that one or more input files be specified.

**What Next**

Execute the *analyze* or *read* command and specify one or more input files.

## VER-98

(error) %s Relative placement group '%s' is defined multiple times.

**Description**

This error message occurs when a relative placement group is defined multiple times.

Feedback

**What Next**

Remove the duplicate relative placement group and run the command again.

---

## VER-99

(error) %s The column or row of relative placement group should be integer, not `%s'.

**Description**

This error message occurs when the column or row of the relative placement group is not an integer.

**What Next**

Specify the correct column or row for the relative placement group and run the command again.

---

## VER-100

(error) %s Cell %s was placed outside of the boundaries of rp_group %s at column %d row %d.

**Description**

This error message occurs when the user defines an explicit size of the rp_group (column and row) using the synopsys rp_group pragma, an later at least one cell was placed outside of the predefined boundaries.

**What Next**

There are three ways to solve this error: 1) Specify the correct column and row size of the group modifying the rp_group definition to a size big enough to allocate all RP placed cells. 2) Specify or modify the rp_fill pragma to ensure all cells are placed within the boundaries of the defined RP group. 3) Remove the rp_group size definition to allow RP to freely allocate the cells without a hardcoded limit that triggers the error.

---

## VER-102

(warning) %s Variable '%s' does not accept the value '%d'. The value has been reset to a compatible value.

**Description**

This warning message occurs when a variable uses a value that is not supported by the current flow. The variable is reset to a compatible value as documented in the man page of the variable.

Feedback

### What Next

Verify that the value for the variable is within the allowed range, and that the value matches your design requirement.

---

## VER-103

(warning) %s Pragma is obsolete or not implemented. It will be ignored.

### Description

A pragma is a compiler directive in the source code. The Presto HDL compiler does not implement certain pragmas that the Synopsys HDL Compiler does. This warning, which has occurred during *analyze* or *read* command activity, notifies you that the pragma in the design will not have the same effect it would have if you were to compile the design using the Synopsys HDL Compiler.

The Presto HDL compiler implements most of the commonly used compiler directives, but not some of the less frequently used ones.

### What Next

If your design requires the use of the pragma the message refers to, use the Synopsys HDL Compiler to analyze and elaborate your design.

---

## VER-104

(warning) %s The '%s' construct is not supported. It will be ignored.

### Description

This warning message occurs during an *analyze* or *read* command activity, and notifies you that the given construct in your design is not supported for synthesis.

### What Next

Check your design to verify that it still functions correctly, even though the construct the message refers to is ignored.

To avoid this warning, surround the construct with the following compiler directives:

```
`ifndef SYNTHESIS

     <construct>

`endif
```

When the Presto HDL Compiler sees these compiler directives, it does not interpret the construct.

Feedback

## VER-105

(warning) %s Call to function '%s' with no parameters is not standard Verilog.

### Description

You receive this message because, during a *read* or *analyze* command activity, the compiler encountered a call to a function or functions that used parentheses to indicate an empty parameter list.

IEEE standard Verilog requires that a function have at least one input argument. The Presto HDL compiler accepts functions with no arguments; however, many Verilog tools do not.

```
...
     x = f();  // non-standard call to zero-argument function
   ...
```

### What Next

Consider adding at least one input argument to the function in question to conform to IEEE standards.

### See Also

- VER-175

## VER-106

(error) %s Function declaration redeclares symbol '%s'.

### Description

You see this message because you have assigned a function declaration to a symbol that has already been defined.

In the following example, which demonstrates such a situation, the symbol *f* is declared twice: first as a register and then as a function:

```
reg f;          // initial declaration of 'f'

   function f;     // illegal redeclaration of 'f'
   ...
   endfunction
```

The example elicits the VER-106 message.

Feedback

### What Next

Rename either the function declaration or the other declaration and all corresponding uses of the symbol.

---

## VER-107

(error) %s Functions cannot contain blocking delays.

### Description

You are seeing this message because, during the execution of the *read* or *analyze* command, the compiler has encountered blocking delays in your design. The Verilog standard states that functions execute in one (simulation) time unit and cannot contain time-controlling statements, such as blocking delays.

The following example demonstrates the incorrect use of blocking delays in a function body:

```
...
  function f;
   input a;
   begin
    #10;       // illegal use of blocking delay inside a function
    f = a;
   end
  endfunction
  ...
```

### What Next

For synthesis, remove the the blocking delays because the compiler does not accept them and terminates with this error.

---

## VER-108

(error) %s Functions cannot contain event control statements.

### Description

You receive this error message because you have attempted to use an event control statement inside of a function. According to the Verilog standard, functions shall execute in one simulation time unit, and are not allowed to contain time-controlling statements. Therefore, event control statements are not allowed inside functions.

Feedback

The following example demonstrates the illegal use of an event control statement in a function body:

```
...
  function f;
   input a;
   begin
    @(posedge clk);   // illegal use of an event control statement in a
 function.
    f = a;
   end
  endfunction
  ...
```

**What Next**

Rewrite the source code so that the functions do not contain any time-controlling statements.

---

## VER-109

(error) %s Function arguments cannot be declared as 'inout'.

**Description**

You receive this error message because you have declared a function argument as 'inout'. According to the Verilog standard, functions can have arguments declared as 'input' only. Declaring a function argument as 'inout', as illustrated in the following example, results in this error message.

```
...
  function f;
   inout a;    // illegal declaration of a function argument as 'inout'.
   ...
  endfunction
  ...
```

**What Next**

Rewrite the code so that the function has 'input' arguments only. If you cannot avoid using 'inout' arguments, consider using a task instead of a function.

---

## VER-110

(error) %s Function '%s' not defined.

**Description**

You receive this error message because no function with the given name has been defined.

Feedback

### What Next

Check to see if the specified function name was misspelled. If not, add a function declaration to define the missing function.

---

## VER-111

(error) %s Function arguments cannot be declared as 'output'.

### Description

You receive this error message because, according to IEEE Std 1364, functions can only have arguments declared as 'input'. Declaring a function argument as 'output', as illustrated in the following example, results in this error message.

```
...
  function f;
   output a;    // illegal declaration of a function argument as
 'output'.
   ...
  endfunction
  ...
```

### What Next

Rewrite the code so that the function only has 'input' arguments. If you cannot avoid using 'output' arguments, consider using a task instead of a function.

---

## VER-112

(error) %s Illegal function declaration using empty parameter list.

### Description

You receive this error message because the function declaration was written with an empty parameter list.

The following example shows a function declaration that would generate this error.

```
function foo();
   ...
   endfunction
```

The correct function declaration:

```
function foo;
   ...
   endfunction
```

Feedback

### What Next

Rewrite the function declaration as shown in the example.

---

## VER-113

(error) %s Functions cannot enable tasks.

### Description

You receive this error message because you attempted to enable a task from a function. According to the IEEE Std 1364, tasks cannot be enabled from functions. The following is an example of this situation.

```
task t;
    ...
  endtask

  function f;
    ...
    t;          // error: tasks cannot be enabled from functions.
  endfunction
```

### What Next

Rewrite the source code so that tasks are enabled only from processes or other tasks.

---

## VER-114

(error) %s Functions cannot contain 'wait' statements.

### Description

You receive this error message when you attempt to use a 'wait' statement inside of a function. According to the IEEE Verilog Standard 1364, functions shall execute in one simulation time unit and are not allowed to contain time-controlling statements. Therefore, 'wait' statements are not allowed inside functions.

The following example demonstrates the illegal use of a 'wait' statement in a function body.

```
...
  function f;
    input a;
    begin
      wait (!a) f = a;   // 'wait' not allowed inside a function.
    end
  endfunction
  ...
```

Feedback

### What Next

Rewrite the Verilog source code so that functions do not contain any time-controlling statements.

---

## VER-115

(error) %s Redefinition of compiler directive '%s' not supported.

### Description

Redefining compiler directives using 'define' is not allowed. The following example is the illegal attempt to redefine the compiler directive 'define' itself:

```
`define define 2      // error: illegal redefinition of a
                         // compiler directive
```

### What Next

If a redefinition of the the original directive was not intended, just rename the symbol such that it does not collide with a compiler directive.

---

## VER-116

(error) %s Redeclaration of symbol '%s' as parameter.

### Description

You receive this message if a symbol in a parameter declaration has already been declared, either as a parameter or as something else. In the following example, "in" is first declared as an input, then erroneously redeclared as a parameter.

```
input in;
 ...
 parameter in = 1'b0;     // erroneous redeclaration of input 'in'
                          // as a parameter.
```

### What Next

Decide which of the declarations is the intended one and remove or change the name in the other declaration. If you change the name in a declaration, ensure that you change all occurrences of that name.

---

## VER-117

(error) %s Read-only expression '%s' passed to 'output' or 'inout' argument of a task or function.

Feedback

### Description

Task (or SV function) arguments declared with direction 'output' or 'inout' must receive an actual register, selection within a register, or other legal target of an assignment statement.

For example, the following two task calls are incorrect because neither an input nor a wire are registers, so they are not valid arguments to task output or inout parameters.

```
input a;
   wire b;

   task t;
     output x;
     begin
       x = 1'b0;
     end
   endtask

  always @(posedge clk)
    begin
      t(a);       // error: input is not a register
      t(b);       // error: wire is not a register
    end
```

### What Next

Check the argument name or its positional order. If the task or function definition does not assign to the formal argument, restrict its direction to 'input'. Otherwise change the calling RTL to receive the task's (or function's) assignment into a register variable.

### See Also

- VER-118

---

## VER-118

(error) %s Constant passed to an 'output' or 'inout' argument of a task or function.

### Description

Task (or SV function) arguments declared with direction 'output' or 'inout' must receive an actual register, selection within a register, or other legal target of an assignment statement.

The following task call is illegal because 1b0 is a constant value and not a valid argument to a task output or inout parameter.

```
task t;
    output x;
    ...
   endtask
```

Feedback

```
...

t(1'b0);     // error: passing a constant value to an
             // 'output' parameter
```

### What Next

Check the argument name or its positional order. If the task or function definition does not assign to the formal argument, restrict its direction to 'input'. Otherwise change the calling RTL to receive the task's (or function's) assignment into a register variable.

### See Also

- VER-117

---

## VER-119

(error) %s Wrong number of arguments in call to function or task '%s'.

### Description

You receive this error message because the actual number of arguments in the function or task call does not match the number of formal arguments expected by the corresponding function or task.

### What Next

Specify the correct number of arguments. Refer to the function or task declaration to determine the number and order of the expected arguments.

---

## VER-120

(error) %s Port '%s' not declared as 'input', 'output' or 'inout'.

### Description

The IEEE Verilog Standard 1364 requires that each port listed in a module port list be declared as input, output, or inout.

You receive this error because a port listed in the module port list is not declared subsequently as input, output, or inout.

The following example shows a correct port declaration:

```
module m (i, o);
     input i;       // omitting this input declaration is an error.
     output o;
     reg o;

     always ...
```

Feedback

```
    endmodule
```

If the input declaration of port *i* is not present, an error is issued.

**What Next**

Add the missing port declaration, as either input, output, or inout.

---

## VER-121

(error) %s Redeclaration of port '%s' is not allowed.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected that the same port is declared twice inside the same function, task, or module. Following is an example that illustrates this type of error:

```
function f;
   input a;
   input a;      // redeclaration of already declared port
    ...
  endfunction;
```

**What Next**

Remove or rename as appropriate one of these ports.

---

## VER-122

(error) %s Redeclaration of symbol '%s' as a real number is not allowed.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected a symbol declared twice, which is not valid.

In the following example, "r" is declared both as an integer and as a real number.

```
integer r;
   real r;   // error: invalid redeclaration of "r" as a real number
```

**What Next**

Remove or rename as appropriate one of the declarations.

Feedback

## VER-123

(error) %s Redeclaration of symbol '%s' not allowed.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-124

(error) %s Task or function argument must be specified.

**Description**

This message issues when the Presto HDL Compiler parses an incomplete parameter list, or one with empty comma-delimited positions. It is an error to omit a parameter (argument) in the list used to enable (invoke) a task or function (unless, in SystemVerilog, the corresponding formal argument was declared with a default value initializer). Default initializers are not yet supported by Presto HDL.

The following example demonstrates a correct and an incorrect task call:

```
task not;
   input a;
   output y;
   ...
  endtask

  ...
  not(,o);        // error: incomplete parameter list: first argument
 missing
  not(a,b);       // correct task call
  ...
```

**What Next**

Check the location of commas in this argument list. Specify any missing arguments.

## VER-125

(error) %s Called function (or task) '%s' not defined as a function (or task).

Feedback

### Description

This syntax error issues from *analyze* or *read* commands when no suitable definition of a named function or task can be found in the lexical scopes immediately enclosing the cited invocation of that function or task.

The function or task name is either not defined at all, defined as something other than a function (or task), defined as a task but being used as a function, or vice versa.

You may be seeing this error due to a language restriction (in the synthesis subset). Verilog and SystemVerilog simulators support a larger scope for invoking function and task definitions; they include all scopes in the instance hierarchy above the call site (i.e. the definition can reach references made in the same scope where it is defined, in any module instance in that scope, and recursively in any modules they may instantiate). But in synthesis by separate-compilation, that hierarchy may be edited, expanded, and/or relinked long after the function or task call has been elaborated. So-called "hierarchical" tasks and functions are not supported, except that they can be invoked lexically-before they are defined within a single scope, or its lexically-nested scopes.

In Verilog-2005 and SystemVerilog standards, functions (or tasks) defined within anonymously scoped generate blocks are not accessible outside that block. For example:

```
module m #(parameter P=32) (output o);
    generate
      if (P>16)
        function f (input i);
           f = 1'b0 ;
        endfunction
      else
        function f (input i);
           f = 1'b1 ;
        endfunction
    endgenerate

    assign o = f(1'b0);          /* Function 'f' is not visible  */
                                 /* outside the generate block */
  endmodule
```

### What Next

Check that the name of the function (or task) is spelled correctly, and that the name is a valid definition of the function (or task).

If the identifier refers to a function or task defined elsewhere in the design hierarchy, copy or move the definition to a location that can be made commmon to all call sites. In Verilog, that would be an `include file brought into each module scope that needs the definition. In SystemVerilog it could additionally be a package from which the definition is imported, an interface instantiated by (or ported into) the calling modules, or the $unit scope of the input stream preceding all the call sites. Only the interface option allows signals from the

Feedback

defining scope to be used in the function, and these may also need to be listed individually in modports of the interface which are used to import the function or task defininion.

---

## VER-126

(error) %s Called task '%s' not defined as a task.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected a task that is not properly defined.

The task, which a task call refers to, is not defined at all or it is defined as something other than a task.

**What Next**

Check to verify that the name of the task is spelled correctly. If it is, then you need to supply a different (correct) definition of the task.

---

## VER-127

(error) %s Called task '%s' not defined as a task.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected a task that is not properly defined.

The task, which a task call refers to, is not defined at all or it is defined as something other than a task.

**What Next**

Check to verify that the name of the task is spelled correctly. If it is, then you need to supply a different (correct) definition of the task.

---

## VER-128

(error) %s Parameterless task call to task '%s' should not have parentheses.

**Description**

Task calls that do not pass any parameters should not use parentheses to indicate an empty parameter list.

Feedback

The following example demonstrates the right and the wrong way to call a task without parameters:

```
task t;
   ...
  endtask

  ...
   t();          // error: incorrect syntax for empty parameter list
   t;            // correct syntax without parentheses
  ...
```

**What Next**

Rewrite the task call as shown in the example above.

---

## VER-129

(warning) %s Intraassignment delays for blocking assignments are ignored.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected an intraassignment delay specified for a blocking assignment. Such delays have no meaning in synthesis, and the compiler ignores them.

Following is an example of an intraassignment delay.

```
y = #10 a;
```

**What Next**

Synthesis ignores intraassignment delays for blocking assignments, so it is acceptable to remove them in instances such as this.

---

## VER-130

(warning) %s Intraassignment delays for nonblocking assignments are ignored.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected an intraassignment delay specified for a nonblocking assignment. Such delays have no meaning in synthesis, and the compiler ignores them.

Following is an example of an intraassignment delay.

```
y = #10 a;
```

Feedback

### What Next

Synthesis ignores intraassignment delays for nonblocking assignments, so it is acceptable to remove them in instances such as this.

---

## VER-131

(error) %s Intra-assignment events for blocking assignments are unsupported in synthesis.

### Description

This error message occurs because intra-assignment events in blocking assignments are not supported for synthesis. For example:

```
y = @(posedge clk) a;
```

### What Next

Rewrite the block so it does not use an intra-assignment event.

---

## VER-132

(error) %s Intra-assignment events for non-blocking assignments are not supported.

### Description

Intraassignment events for non-blocking assignments are not supported during synthesis. For example:

```
y <= @(posedge clk) a;
```

The correct synthesizable version is:

```
y <= a;
```

### What Next

Remove the intraassignment event as shown above.

---

## VER-133

(warning) %s Intra-assignment repeat-event controls for blocking assignments are ignored.

Feedback

### Description

Intra-assignment repeat-event for blocking assignments do not have a meaning for synthesis and are ignored. For example:

```
y = repeat(3) @(posedge clk) a;
```

The correct synthesizable version is:

```
y = a;
```

### What Next

Take out the repeat event specification as shown above.

---

## VER-134

(error) %s Variable '%s' is the target of both blocking and nonblocking assignments in the same always block.

### Description

Mixing of blocking and nonblocking assignments to the same variable in the same always block is not supported in synthesis. For example:

```
always @(...) begin
    y <= a;
    y = a;
  end
```

Verilog simulator performance is not improved by the mixing of blocking and nonblocking assignments in the same always block.

### What Next

If the always block represents combinational logic, rewrite the always block to use only blocking assignments. If the always block represents sequential logic, rewrite the always block to use only nonblocking assignments.

---

## VER-135

(warning) %s Intra-assignment repeat-event controls for non-blocking assignment are ignored.

### Description

Intra-assignment repeat-event for non-blocking assignments do not have a meaning for synthesis and are ignored. For example:

```
y <= repeat(3) @(posedge clk) a;
```

Feedback

The correct synthesizable version is:

```
y <= a;
```

**What Next**

Take out the repeat event specification as shown above.

---

## VER-136

(warning) %s Function '%s' with non-empty body is mapped to '%s'; body will be ignored.

**Description**

By mapping a function to a module, the module (instead of the function body) determines the implementation of the function. This warning is given to remind you the body of the function will be ignored.

The following example contains a function for which this warning message will be issued:

```
function f;     // synopsys map_to_module add
   input a;
   input b;
   begin
    f = a+b;      // function body will be ignored.
   end
  endfunction
```

**What Next**

Make sure that the body of the function is indeed intended to be ignored in favor of the module the function is mapped to.

---

## VER-137

(error) %s Return port name '%s' conflicts with names of function input parameters.

**Description**

The return port name specified by the 'return_port_name' pragma must be different from all formal parameters of the function the pragma is attached to. This error indicates that there is a conflict with one of the formal parameter names.

In the following example such a conflict is demonstrated: The return port name is specified to be "a", but a function parameter with the same name exists.

```
function f;
        // synopsys map_to_module down
        // synopsys return_port_name a
   input a;
```

Feedback

```
   ...
  endfunction
```

To resolve this error, the name of the function parameter is changed to "b" in the following example:

```
function f;
        // synopsys map_to_module down
        // synopsys return_port_name a
   input b;
   ...
  endfunction
```

**What Next**

Change the name of the conflicting function parameter or the port name of the module the function is mapped to so that they don't conflict.

---

## VER-138

(warning) %s Extraneous argument for system function or task '%s' ignored.

**Description**

The system function has been passed an unexpected additional argument. This argument will be ignored.

**What Next**

Remove the extra argument from the call. Refer to the function/task declaration to find out which arguments are actually required.

---

## VER-139

(warning) %s Parameterless call to function '%s' should not have parentheses.

**Description**

In Verilog, calls to functions without parameters should not use parentheses to indicate an empty parameter list; only the function identifier is used to call the function.

The following example indicates the correct and incorrect way to write a parameterless Verilog function call:

```
...
     x = f();    // incorrect syntax: using parentheses
     x = f;      // correct syntax: using the function identifier only
   ...
```

Feedback

### What Next

Remove the parentheses as shown in the example above.

---

## VER-140

(warning) %s Nonblocking assignments and blocking delays in the same process; potential simulation or synthesis mismatch.

### Description

This warning message occurs during *analyze* or *read* command activity, when the Presto HDL Compiler detects a nonblocking assignment and a blocking delay in the same process. This can cause simulation or synthesis mismatches.

The following is an example that causes the warning message:

```
always @(posedge clk) begin
     #10;              // blocking delay is ignored
     out <= in;        // nonblocking assignment
   end
```

### What Next

Review the code carefully to explore the potential for a simulation or synthesis mismatch.

---

## VER-141

(error) %s Blocking delays and nonblocking assignments are not allowed in the same process.

### Description

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected a nonblocking assignment and a blocking delay in the same process, which is invalid for synthesis.

Even though synthesis ignores blocking delays, it is important to recognize them in the two forms in which they occur. Blocking delays can stand alone or as part of an intra-assignment delay. The following example shows an instance of each form:

```
always @(posedge clk) begin
     a <= x;         // nonblocking assignment
     #10;            // blocking delay, not allowed with nonblocking
 assignment
     b = #10 y;    // intraassignment delay, not allowed with nonblocking
 assignment
   end
```

Feedback

### What Next

Synthesis ignores blocking delays, so it is acceptable to remove them in instances such as this.

---

## VER-142

(error) %s Nonblocking assignments and blocking delays are not allowed in the same process.

### Description

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected a nonblocking assignment and a blocking delay in the same process.

The following example demonstrates this invalid description:

```
always @(posedge clk) begin
     #10;            // blocking delay
     out <= in;      // nonblocking assignment, not allowed with blocking
 delay
   end
```

### What Next

Synthesis ignores blocking delays, so it is acceptable to remove them in instances such as this.

---

## VER-143

(error) %s Blocking delays and nonblocking assignments are not allowed in the same process.

### Description

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected a nonblocking assignment and a blocking delay in the same process, which is invalid for synthesis.

Even though synthesis ignores blocking delays, it is important to recognize them in the two forms in which they occur. Blocking delays can stand alone or as part of an intra-assignment delay. The following example shows an instance of each form:

```
always @(posedge clk) begin
     a <= x;         // nonblocking assignment
     #10;            // blocking delay, not allowed with nonblocking
 assignment
```

Feedback

```
    b = #10 y;   // intraassignment delay, not allowed with nonblocking
assignment
  end
```

**What Next**

Synthesis ignores blocking delays, so it is acceptable to remove them in instances such as this.

---

## VER-144

(error) %s Incorrect naming of port found.

**Description**

You receive this message because the *read* or *analyze* command has detected an incorrect port name. A missing port name after '.' can cause the problem, as shown in the following example:

```
module test(a, . (b), c);
      input a, b;
      output c;

    endmodule
```

**What Next**

Make sure the port name is complete.

---

## VER-145

(error) %s Declarations are supported in named blocks only

**Description**

This error message occurs because declarations are allowed only in named blocks.

**What Next**

Correct the code by either removing the declarations inside the block, or giving the block a name.

---

## VER-146

(warning) %s Time precision is less precise than the time unit.

Feedback

**Description**

This warning message advises you that time precision is usually more precise than the time unit.

**What Next**

This is a warning message only. No action is required on your part.

However, it is best practice to check the code and change the time precision to be more precise than the time unit where necessary.

---

## VER-147

(error) %s Instantiation %s has mixed ordered and named port connections

**Description**

This error message occurs because instantiation is using both ordered port connections and named port connections. Mixed ordered and port connections are not supported.

**What Next**

Change the code to use only ordered or only port connections.

---

## VER-148

(error) %s Gate output %s must be a net

**Description**

This error message occurs when the variable type for gate output is not set to net.

**What Next**

Change the variable type to net in the code.

---

## VER-149

(error) %s Symbol %s not included in portlist

**Description**

This error message occurs when the symbol declared in input and output lists is not included in the port list.

**What Next**

Add the missing input and output lists in the port list to the code.

Feedback

## VER-150

(error) %s Net assignment %s found in net declaration list.

### Description

You receive this message because the *read* or *analyze* command has detected a net assignment in a net declaration, a construct that the Presto HDL Compiler does not support.

The following is one example that can cause the problem:

```
module test( a, b, c);
      input a, b;
      output c;
      wire d, e=a;

    endmodule
```

### What Next

Check your design for invalid constructs like this and correct them.

## VER-151

(warning) %s port %s have inconsistent declarations.

### Description

You receive this message because the *read_verilog* or *analyze* command has detected an inconsistency of the port type.

The following is one example that can cause the problem:

```
`define N 4

   module m1 (a,b) ;
   input [`N-1:0] a, b ;
   parameter P = `N ;
   wire [`N-1:0] a ;
   wire [P-1:0] b ;
   endmodule
```

This a mismatch for b, because the parameter P could be overridden, so it cannot be assumed to have its default value.

Another example that can cause the problem is:

```
module m2 (a,b);

   parameter A=2;
```

Feedback

```
   parameter B=A;

   input [A:0] a;
   input [B:0] b;

   wire [B:0] a;
   wire [A:0] b;

   endmodule
```

Even though B has the same default value as A, that value can be overridden.

### What Next

Use identical expressions in corresponding pairs of port and signal declarations.

### See Also

- read_verilog

---

## VER-152

(error) %s Vector or memory size mismatch on port %s using last declaration.

### Description

You receive this message because the *read_verilog* or *analyze* command has detected vector or memory size mismatches.

The following is one example that can cause the problem:

```
`define N 4

   module m1 (a,b) ;
   input [`N-1:0] a, b ;
   parameter P = `N+1 ;
   wire [`N-1:0] a ;
   wire [P-1:0] b ;
   endmodule
```

This a mismatch for b, because the parameter P's default value is not the same as `N. As a result, the width of array can not be determined.

Another example that can cause the problem is:

```
module m2 (a,b);

   parameter A=2;
   parameter B=A;
```

Feedback

```
input [A:0] a;
input [B:0] b;

wire [B:0] a;
wire [A:0] b;

endmodule

module top(a, b);
input [2:0] a;
output [3:0] b;

m2 #(.B(3)) inst2(a, b);
emdmodule
```

```
Even though B has the same default value as A, that value is overridden
in the module instantiation when design top is evaluated.
As a result, the port a and b in module m2
has mismatched sizes in their declarations.
```

### What Next

Use identical expressions in corresponding pairs of port and signal declarations.

### See Also

- read_verilog

---

## VER-153

(error) %s Port %s occurs more than once in instance %s of module %s.

### Description

You see this message because during *read* or *analyze* command activity, the compiler has detected that you have used the same port name more than once in an instantiation, which is not valid.

The following is one example that can cause the problem:

```
module test( a, b, c);
    input a, b;
    output c;

    my_test c1(.p1(a), .p1(b), .p2(c));

    endmodule
```

### What Next

Check your design for duplicate port names and correct them.

Feedback

## VER-154

(error) %s Gate instance with too few ports

**Description**

This error message occurs when there are not enough ports in the gate instance.

**What Next**

Change the code to use the correct number of ports for the gate instance.

## VER-155

(warning) %s non constant assignment to specparam %s.

**Description**

This warning message occurs when a non constant is assigned to the *specparam* variable and may not be accepted by other simulators.

**What Next**

This is a warning message only. No action is required on your part.

However, it is best practice to assign a constant expression to the *specparam* variable.

## VER-156

(error) %s UDP initialization value %s is not 0, 1, or X.

**Description**

This error message occurs when the user-defined primitive (UDP) initialization value is not assigned as 0, 1, or X.

**What Next**

Assign 0, 1, or X to the UDP initialization value and run the command again.

## VER-157

(error) %s UDP initialization variable %s must be output.

**Description**

This error message occurs when the user-defined primitive (UDP) initialization variable is not output.

Feedback

**What Next**

The UDP initialization statement specifies the value of the output port when simulation begins. Use output port as the UDP initialization variable and run the command again.

---

## VER-158

(error) %s too few input entries in table specification.

**Description**

This error message occurs when there are not enough input entries in the table specification. The number of input entries must be equal to the number of input variables.

**What Next**

Modify the table specification, ensuring that the number of input entries is equal to the number of input variables, and then run the command again.

---

## VER-159

(error) %s too many input entries in the table specification.

**Description**

This error message occurs when there are too many input entries in the table specification. The number of input entries must be equal to the number of input variables.

**What Next**

Modify the table specification, ensuring that the number of input entries is equal to the number of input variables, and then run the command again.

---

## VER-160

(error) %s vector declaration %s not supported in UDPs.

**Description**

This error message occurs because vector declaration is not supported in user-defined primitives (UDPs).

**What Next**

Do not use vector declaration in UDPs, or use the Synopsys compiler directives *translate_off* and *translate_on* to comment it out as shown in the following example.

Feedback

```
/* synopsys translate_off */
Vector declaration
/* synopsys translate_on */
```

After making corrections, run the command again.

## VER-161

(error) %s path element %s should be wire.

**Description**

This error message occurs if the path element is not wire.

**What Next**

Change the specified path element to wire and run the command again.

## VER-162

(error) %s module path source %s not port.

**Description**

This error message occurs if the module path source is not port.

**What Next**

Change the module path source to port and run the command again.

## VER-163

(error) %s module path destination %s not port.

**Description**

This error message occurs if the module path destination is not port.

**What Next**

Change the module path destination to port and run the command again.

## VER-164

(error) %s path pulse source %s not defined.

**Description**

This error message occurs if the path pulse source is not defined.

Feedback

**What Next**

Define the specified path pulse source and run the command again.

---

## VER-165

(error) %s path pulse destination %s is not defined.

**Description**

This error message occurs if the specified path pulse destination is not defined.

**What Next**

Define a valid path pulse destination and rerun the command.

---

## VER-166

(error) %s path pulse source %s is not a port.

**Description**

This error message occurs when the path pulse source should be a port.

**What Next**

Change the specified path pulse source to an input port and rerun the command.

---

## VER-167

(error) %s path pulse destination %s is not a port.

**Description**

This error message occurs when the path pulse destination should be a port.

**What Next**

Change the specified path pulse destination to an output port and rerun the command.

---

## VER-168

(error) %s timing notifier malformed.

**Description**

This error message occurs when an expression (instead of an identifier) is used as a timing modifier.

Feedback

**What Next**

Change the timing notifier to use an identifier and rerun the command.

---

## VER-169

(error) %s illegal reference event: expressions are not allowed.

**Description**

This error message occurs when an expression is used as a reference event. An expression cannot be used as a reference event.

**What Next**

Use a legal reference event and rerun the command.

---

## VER-170

(error) %s timing notifier %s should be a reg.

**Description**

This error message occurs because the timing notifier should be a *reg*.

**What Next**

Correct the timing notifier to use a *reg* and rerun the command.

---

## VER-171

(error) %s timing function %s has an incorrect number of parameters.

**Description**

This error message occurs when the timing function has an incorrect number of parameters.

**What Next**

Modify the timing function so that it has the correct number of parameters and rerun the command.

---

## VER-172

(error) %s wire (%s) is connected to both the input and output of a built-in gate.

Feedback

**Description**

This error message occurs when the same wire is connected to both the input and the output of a built-in gate, resulting in combinational feedback.

**What Next**

Modify the design so that the same wire is not connected to both the input and output of the built-in gate, and then run the command again.

---

## VER-173

(warning) %s delays for continuous assignment are ignored.

**Description**

This warning message advises that delays for continuous assignment are ignored in synthesis.

**What Next**

This is a warning message only. No action is required on your part.

However, it is best practice to ensure that the ignored delay is not integral to the functionality of the design.

---

## VER-174

(error) %s '%s' is listed more than once in port list.

**Description**

This error message occurs when the specified port name is used more than once in a port list.

**What Next**

Correct the code to use a port name only once in each port list and then rerun the command.

---

## VER-175

(warning) %s Function '%s' should have at least one input argument.

**Description**

You receive this message because, during *read* or *analyze* command activity, the compiler encountered a function that has no input arguments. The IEEE standard for Verilog (1364-1995) requires that a function have at least one input argument.

Feedback

For example, the following function would trigger this warning:

```
function [0:2] f;
       begin
         f = 3'b101;
       end
     endfunction
```

The Presto HDL compiler accepts functions with no arguments; however, many tools do not.

**What Next**

Consider adding at least one input argument to the function in question to conform to IEEE standards.

**See Also**

- VER-105

---

## VER-176

(warning) %s delay controls are ignored for synthesis.

**Description**

This warning message occurs because your RTL description contains a delay control. Delay controls are ignored for synthesis.

The following is an example of a delay control.

```
module foo;
  ...
  always
  #(5)   // delay control, will be ignored.
     b = a;
endmodule
```

**What Next**

This is a warning message only. No action is required on your part. You can leave the delay controls in your description, but be aware that the delay controls have no meaning for synthesis.

---

## VER-177

(error) %s real declarations are not supported by synthesis.

Feedback

### Description

This error message occurs because the real data type is not supported by synthesis.

The following example shows a real declaration.

```
module foo;
  real r;          // data type real not supported by synthesis
endmodule
```

### What Next

Rewrite your RTL code so that it does not contain real data types. Depending on your specific design, you may need to use integer types instead of real types. Rerun the command after making the changes.

---

## VER-178

(error) %s realtime declarations are not supported by synthesis.

### Description

This error message occurs because the realtime data type is not supported by synthesis.

The following example shows a realtime declaration.

```
module foo;
  realtime r;       // data type realtime not supported by synthesis
endmodule
```

### What Next

Realtime variables do not have a meaning in synthesis. Rewrite your RTL code so that it does not use realtime data types. Rerun the command after making the changes.

---

## VER-179

(error) %s triand declarations are not supported by synthesis.

### Description

This error message occurs because your RTL description contains triand declarations, which are not supported by synthesis.

The following example shows a triand declaration.

```
module foo;
  triand d;
endmodule
```

Feedback

### What Next

Rewrite your design so that it does not use triand declarations. Since triand nets imply an and logic function, one solution is to explicitly describe the logic in your RTL code. Rerun the command after making your changes.

---

## VER-180

(error) %s trior declarations are not supported by synthesis.

### Description

This error message occurs because your RTL description contains trior declarations, which are not supported by synthesis.

The following example shows a trior declaration.

```
module foo;
  trior d;
endmodule
```

### What Next

Rewrite your design so that it does not use trior declarations. Since trior nets imply an or logic function, one solution is to explicitly describe the logic in the RTL code. Rerun the command after making the changes.

---

## VER-181

(error) %s tri0 declarations are not supported by synthesis.

### Description

This error message occurs because your RTL description contains tri0 declarations, which are not supported by synthesis.

The following example shows a tri0 declaration:

```
module foo;
  tri0 d;
endmodule
```

### What Next

Rewrite your design such that it does not use tri0 declarations and then rerun the command.

Feedback

## VER-182

(error) %s tri1 declarations are not supported by synthesis.

### Description

This error message occurs because your RTL description contains tri1 declarations, which are not supported by synthesis.

The following example shows a tri1 declaration:

```
module foo;
  tri1 d;
endmodule
```

### What Next

Rewrite your design so that it does not use tri1 declarations and run the command again.

## VER-183

(error) %s trireg declarations are not supported by synthesis.

### Description

This error message occurs because your RTL description contains trireg declarations, which are not supported by synthesis.

The following example shows a trireg declaration.

```
module foo;
  trireg d;
endmodule
```

### What Next

Rewrite your design so that it does not use trireg declarations and run the command again.

## VER-184

(error) %s pulldown declarations are not supported by synthesis.

### Description

This error message occurs because your RTL description contains pulldown declarations, which are not supported by synthesis.

The following example shows a pulldown declaration.

Feedback

```
module foo (c);
  output c;
  ..
  pulldown c1(c);
endmodule
```

**What Next**

Rewrite your design so that it does not use pulldown declarations and then run the command again.

---

## VER-185

(error) %s pullup declarations are not supported by synthesis.

**Description**

This error message occurs because your RTL description contains pullup declarations, which are not supported by synthesis.

The following example shows a pullup declaration.

```
module foo (c);
  output c;
  ..
  pullup c1(c);
endmodule
```

**What Next**

Rewrite your design so that it does not use pullup declarations and then run the command again.

---

## VER-186

(error) %s user-defined primitives (UDPs) are not supported by synthesis.

**Description**

This error message occurs because user-defined primitives (UDPs) are not supported by synthesis.

**What Next**

Enclose the UDPs in the following statement and run the command again.

```
`ifndef SYNTHESIS
  ...
`endif
```

Feedback

## VER-187

(error) %s fork and join constructs are not supported by synthesis.

**Description**

This error message occurs because fork and join constructs are not supported by synthesis.

**What Next**

Enclose the fork-join construct as follows and rerun the command.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-188

(error) %s wait statements are not supported by synthesis.

**Description**

This error message occurs because wait statements are not supported by synthesis.

**What Next**

Enclose the wait statements as follows and run the command again.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-189

(error) %s case equality (===) is not supported by synthesis.

**Description**

This error message occurs because case equality (===) is not supported by synthesis.

**What Next**

If the statement containing === is for synthesis, try replacing === with ==, if it does not change the semantics.

If the statement containing === is not for synthesis, enclose the statement as follows.

```
`ifndef SYNTHESIS
 ...
`endif
```

Feedback

After making your changes, run the command again.

## VER-190

(error) %s case inequality (!==) is not supported by synthesis.

**Description**

This error message occurs because case inequality (!==) is not supported by synthesis.

**What Next**

If the statement containing !== is for synthesis, try replacing !== with !=, if it does not change the semantics.

If the statement containing !== is not for synthesis, enclose the statement with the following.

```
`ifndef SYNTHESIS
 ...
`endif
```

After making the changes, run the command again.

## VER-191

(error) %s time declarations are not supported by synthesis.

**Description**

This error message occurs because time declarations are not supported by synthesis.

**What Next**

Enclose the time declarations with the following and then run the command again.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-192

(warning) %s In initial block, only $power and $retain are supported, other statements are ignored.

**Description**

This warning message advises you that in initial block, only $power and $retain calls are supported in synthesis. All other statements are not supported in synthesis.

Feedback

### What Next

This is a warning message only. No action is required on your part.

However, to avoid receiving this warning message, you can suppress the message, or enclose the initial block with the following.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-193

(error) %s event triggers are not supported.

### Description

This error message occurs because event triggers are not supported.

### What Next

Enclose the event trigger with the following and then rerun the command.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-194

(error) %s Base of subscript operator %s must be a vector.

### Description

You receive this message because during *read* or *analyze* command activity, the compiler has detected a subscript operator whose base is not a vector, which is invalid.

The following is one example that can cause the problem:

```
module test(a, b);
        input a;
        output b;
        reg b;

        always
          b = a[0];

        endmodule
```

### What Next

Check your design for invalid constructs like this and correct them.

Feedback

## VER-195

(error) %s Illegal digit %c in based number.

**Description**

You see this message because during *read* or *analyze* activity, the compiler has detected an invalid digit in a based number.

**What Next**

Check your design for invalid digits in based numbers and correct them.

## VER-196

(error) %s Unable to open %s for writing: %s

**Description**

This I/O error issues when the attempt to write a result file (usually into the current design library) fails. The file system's explanation for the error is given at the end of the message. The file name usually identifies the RTL module template, interface, package, etc. being written.

**What Next**

Check that the parent directories all exist and offer write permission to the current user. Address any other concerns raised by the I/O subsystem portion of this message.

## VER-197

(information) %s writing module %s to file %s.

**Description**

This information message advises you that the tool is writing the specified module to an analyzed file format (.pvl) file.

**What Next**

This is an informational message only. No action is required on your part.

## VER-198

(error) %s mixed direction ports %s must be nets.

Feedback

**Description**

This error message occurs because the code contains mixed direction ports that should be net-types.

**What Next**

Rewrite code so that the ports with mixed direction are net-types and then rerun the command.

---

## VER-199

(error) %s UDP table has invalid edge specification.

**Description**

This error message occurs when the UDP table has an invalid edge specification, such as (0 0), (1 1) or (X X). The two level symbols in the edge indicator should be different. So (0 0), (1 1) and (X X) are invalid, while (1 0) is valid.

**What Next**

Change the invalid edge indicator to a valid one and run the command again.

---

## VER-200

(error) %s port %s must be declared as input.

**Description**

This error message occurs because the port must be declared as an input port.

**What Next**

Correct the RTL code to declare the port as input port and then run the command again.

---

## VER-201

(error) %s port %s must be declared as output.

**Description**

This error message occurs when the port must be declared as an output port.

**What Next**

Correct the RTL code to declare the port as an output port and then run the command again.

Feedback

## VER-202

(error) %s path element %s should be reg or wire.

**Description**

This error message occurs because the path element should be either reg or wire.

**What Next**

Correct the code to declare the path element as either reg or wire and run the command again.

## VER-203

(error) %s pulse limit for path not defined.

**Description**

This error message occurs because the pulse limit for path is not defined. The valid *specparam* assignment format is one of the following.

```
specparam_identifier = constant_mintypmax_expression

specparam_identifier = pulse_control_specparam
```

The *pulse_control_specparam* format is as follows.

```
$PATHPULSE$... = (reject_limit_value, [, error_limit_value]).
```

You receive this error message when the required *reject_limit_value* is missing.

**What Next**

Add the *reject_limit_value* to the code and then run the command again.

## VER-204

(error) %s timing reference event %s not port.

**Description**

This error message occurs because the timing reference event specified is not port.

**What Next**

Change the timing reference event to port and run the command again.

Feedback

## VER-205

(error) %s timing reference event %s should have edge identifier.

**Description**

This error message occurs because the timing reference event requires an edge identifier.

**What Next**

Add an edge identifier to the timing reference event and run the command again.

## VER-206

(error) %s Too many parameters passed to system task '%s'.

**Description**

The given system task is passed more arguments than expected.

**What Next**

Find out how which arguments the system task expects. Remove the extraneous arguments from the task call.

## VER-207

(error) %s The %s systask parameter must be writable.

**Description**

Actual parameters passed to 'output' or 'inout' formal task parameters must be writable (because they are conceptually used as left-hand-side values of assignments). In the following example a constant is passed as an argument to the system function '$random', which indeed expects the argument to be writable:

```
...
   r = $random(3);      // error: constant "3" is not writable.
   ...
```

**What Next**

Make sure the actual argument in question is writable, eg. a 'register'.

## VER-208

(warning) %s Register '%s' is the target of both blocking and non-blocking assignments in the same process.

Feedback

**Description**

Presto does allow mixing blocking and non-blocking assignments in the same process. However, this coding style can lead to unexpected results and the code may be hard to comprehend.

This warning is informational only. It tells you that targets assigned by both kinds of assignments actually exist.

**What Next**

Make sure the mixture of blocking and non-blocking assignments is really what you intended.

---

## VER-209

(warning) %s Little argument or return value checking implemented for system task or function '%s'.

**Description**

Argument and return value checking for system tasks and functions is limited. This is a warning message indicating that some errors potentially remain uncaught because of incomplete checking.

**What Next**

The user should check system task or function all carefully to make sure the argument and return value are correct.

---

## VER-210

(error) %s timing reference event %s has wrong edge.

**Description**

This error message occurs when the wrong edge is specified in the timing reference event.

**What Next**

Specify the edge as either posedge or negedge and then run the command again.

---

## VER-211

(error) %s timing limit malformed.

Feedback

### Description

This error message occurs when the timing limit is malformed because both the event and the normal condition exist in the timing limit. Only one of these conditions is allowed.

### What Next

Remove either the event or the normal condition and then run the command again.

---

## VER-212

(error) %s timing limit should be positive.

### Description

This error message occurs when the timing check limit should be positive.

### What Next

Specify blocks are not supported in synthesis. Prevent the block from being read by enclosing it in the following compiler directives.

```
`ifndef SYNTHESIS
 ...
`endif
```

After making the changes, run the command again.

---

## VER-213

(error) %s timing event malformed.

### Description

This error message occurs when the timing check event is malformed.

### What Next

Specify blocks are not supported in synthesis. Prevent the specify block from being read by enclosing it in the following compiler directives.

```
`ifndef SYNTHESIS
 ...
`endif
```

After making the changes, run the command again.

---

## VER-214

(error) %s timing notifier %s malformed.

Feedback

### Description

This error message occurs when the optional notifier on the timing check is malformed.

### What Next

Specify blocks are not supported in synthesis. Prevent the specify block from being read by enclosing it in the following compiler directives.

```
`ifndef SYNTHESIS
 ...
`endif
```

After making the changes, run the command again.

---

## VER-215

(error) %s timing reference event %s is not input or inout port.

### Description

This error message occurs because the reference event for a timing check must be an input or inout port.

### What Next

Specify blocks are not supported in synthesis. Prevent the specify block from being read by enclosing the block in the following compiler directives.

```
`ifndef SYNTHESIS
 ...
`endif

After making the changes, run the command again.
```

---

## VER-216

(error) %s %s is not a parameter in module %s

### Description

You receive this error message because the name used in module instantiation (component instantiation in VHDL) or DEFPARAM is not a parameter in the specified module.

### What Next

Change the name in the instantiation to a supported parameter.

Feedback

## VER-217

(error) %s wrong number of ports in UDP instantiation, not the same as declaration.

**Description**

This error message occurs when the number of ports in the UDP instantiation is different than the number of ports in the UDP declaration.

**What Next**

UDPs are not supported in synthesis. Modify the code so it does not use UDPs and then rerun the command.

## VER-219

(error) %s Non-standard replication constant is not supported.

**Description**

This message is a follow-up to the ELAB-364 warning message, but is issued with "Error" severity, so that violations of the prevailing language standard halt compilation.

**What Next**

Change the relevant code to conform to the level of IEEE Std 1364 selected by hdlin_vrlg_std, or choose a different value for hdlin_repeat_count_0.

## VER-220

(error) %s Unresolved hierarchical name %s in module %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-221

(error) %s Module %s to be elaborated is not defined in analyzed source files.

**Description**

This is a syntax error.

Feedback

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-222

(warning) %s Assignment output %s should be a register.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-223

(warning) %s Task %s is not implemented; statement skipped.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-224

(error) %s Package '%s' has not been analyzed for import or content extraction.

**Description**

This syntax error issues when a reference to the given package is analyzed before its declaration has been analyzed. Successfully analyzed packages leave a <identifier>.pvk file in DC shell's working directory. This file must be found and read when the package is later referenced for import or to extract its contents. Note that packages may never refer to each other in a cycle of dependence.

**What Next**

Compare the spelling of the package identifier in the reference to its intended declaration. Remove cycles of package reference for which no analyze ordering is possible. Insure that the source file containing the package declaration is analyzed before the the source files that refer to it, or that the package declaration precedes all uses within the same source file. Check DC shell's search paths to insure that packages analyzed by other DC shell sessions can be found by this session. Inspect file and directory search permissions to

Feedback

be certain you can access the package. Check whether an intervening read or analyze command reported a syntax error within a package of the same name, thereby removing the good package's .pvk file.

## VER-225

(warning) %s Recommend parentheses when a reduction-or follows bitwise-or.

**Description**

A reduction-or operator follows a bitwise-or operator in the Verilog source. This is often a typographical error, when a space is inserted between the two characters in '||' (logical-or), resulting in '| |' (bitwise-or followed by reduction-or). Furthermore, some Verilog tools do not accept this syntax.

**What Next**

If you intended to use a reduction-or, surround it with parentheses to inhibit this warning.

## VER-226

(warning) %s Single element concatenation has unsized number.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-227

(error) %s Package '%s' directly or indirectly refers to the current package '%s'.

**Description**

This syntax error issues within a package if a cyclic reference is made (by scope-extraction operator) to a package whose definition appears to depend upon the package currently being analyzed. This error is reported aggressively, based upon any mention of the current package in the source of the target package or recursively in the packages to which it may refer, regardless of whether an actual cycle of definitional dependence is being formed. Aggressive enforcement prevents VER-224 errors when all the packages are re-analyzed in an empty work directory; i.e. it prevents incremental closure of package reference cycles which would make it impossible to analyze them in an acyclic order.

Feedback

### What Next

You might not be extracting from the right package. See the VER-224 help page for suggestions related to this contingency.

Perhaps you chose a name for your package that matches another package name deeper in the supply-chain of the package libraries you are using. Choose a unique package name.

If you are analyzing a older library package that used to work, perhaps the tree of packages upon which it depends has grown to include a package name which collides with this one. Since VER-227 is reported for any name collision in the transitive closure of scope extractions, it could take a while to track down by trial and error. Use 'strings *.pvk | fgrep my-package' or similar search tools to locate uses of the current package name in the *.pvk (or the package source files) of your project. Once located, the remedy may involve renaming one or the other package, or splitting either one so that the supply trees are disjoint (have no name collisions).

---

## VER-228

(error) %s Import symbol %s has already been defined.

### Description

This error message issues when you attempt to import a name that is already declared in the immediately surrounding scope.

### What Next

Edit the RTL source to remove or rename whatever has been declared or imported with the same name, or to enclose the import statement and all references to the name in a more local sequential block. Rerun the command.

---

## VER-229

(error) %s Value '%s' for enumerated type '%s' should be an integer or sized constant.

### Description

You receive this error message when a parameter declaration with an attached 'synopsys enum' pragma declares a parameter whose value is not an integer or sized constant. For example:

```
parameter [2:0] /* synopsys enum colors */ red = 3'b001,
                                           green = 3'b010,
                                           yellow = "YELLOW";
```

The third value in this example would result in this error message.

Feedback

**What Next**

Modify the design so that all parameters declared as members of an enumerated type are given an integer value or sized constant value.

---

## VER-230

(warning) %s Recommend parentheses when a reduction-and follows bitwise-and.

**Description**

A reduction-and operator follows a bitwise-and operator in the Verilog source. This is often a typographical error, when a space is inserted between the two ampersands in '&&' (logical-and), resulting in '& &' (bitwise-and followed by reduction-and). Furthermore, some Verilog tools do not accept this syntax.

**What Next**

If you intended to use a reduction-and, surround it with parentheses to inhibit this warning.

---

## VER-231

(warning) %s Range ignored for integer variables.

**Description**

This is a syntax error. The range will be ignored. In future releases this usage may be disallowed.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-232

(warning) %s Specifying strengths with the 'strength' keyword is archaic.

**Description**

This message notifies you that during *read* or *analyze* command activity, the compiler has detected use of 'strength' as a keyword. This word is archaic and may not be supported by some Verilog tools. Synthesis ignores all drive strengths, including one specified in this way.

**What Next**

Avoid the use of the 'strength' keyword.

Feedback

## VER-233

(error) %s Symbol '%s' cannot be used as an argument to the 'disable' statement because it is not a task or named block identifier.

### Description

You receive this message because, during *analyze* or *read* command activity, the compiler has detected an invalid argument to a disable statement. The invalid argument is a symbol that does not refer to a task or named block. In the following example, the symbol *x* does not refer to a named block and will trigger this error.

```
module test(in1);
       input in1;
       reg x;

       always begin : block
          if(in1)
             disable x;
       end
    endmodule
```

### What Next

Correct the *disable* statement to refer to a named block or task.

## VER-234

(error) %s Strengths highz0 and highz1 cannot be paired together in a strength specification.

### Description

You receive this error message because, during *read* or *analyze* command activity, the compiler has detected a strength specification that uses both highz0 and highz1 strengths, which is invalid. Furthermore, all strength specifications are ignored for synthesis.

### What Next

Correct the strength specification so that it does not use both highz1 and highz0.

## VER-235

(error) %s Strength %s for pullup/pulldown must be a strength0.

Feedback

### Description

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected an invalid strength value in a position that requires a *strength0* value.

Synthesis ignores all strength specifications and does not support pullup and pulldown gates.

### What Next

Replace the invalid value with a *strength0* value. Acceptable are *supply0*, *strong0*, *pull0*, *weak0*, and *highz0*.

---

## VER-236

(error) %s Strength %s for pullup/pulldown must be a strength1.

### Description

You receive this message because the *read* or *analyze* command has detected an invalid strength value in a position that requires a strength1 value. Synthesis ignores all strength specifications, and does not support pullup and pulldown gates.

### What Next

Replace the strength value with a strength1 value. Acceptable values are *supply1*, *strong1*, *pull1*, *weak1*, and *highz1*.

---

## VER-237

(error) %s Strength specifications must have strength0 and strength1 components.

### Description

You receive this error message because you have specified a strength that does not have one strength0 and one strength1 component. With the exception of 'pullup' and 'pulldown' gates, a strength must have one strength0 and one strength1 component.

Note that all strength specifications are ignored for synthesis.

In the example below, both strengths are from the strength1 category, resulting in this error message.

```
wire  x, y, z;
   and (weak1,strong1) a1 (x, y, z);
```

### What Next

Specify a strength from the strength0 category and a strength from the strength1 category.

Feedback

## VER-238

(error) %s Strength declaration in incorrect place.

### Description

There is a syntax error in the Verilog source because a strength declaration appears at an incorrect place. Often, this indicates a second strength specification in a gate instantiation.

For example, in the following code segment, the second strength specification will trigger this error because it is not valid Verilog.

```
wire  a, b, c, x, y, z;
   and (weak1,weak0) a1(a, b, c), (weak1,weak0) a2(x, y, z);
```

### What Next

Examine the given file and line to determine which strength specification needs to be moved or deleted.

## VER-239

(error) %s A wire declaration cannot have a drive strength, at symbol '%s'.

### Description

A wire declaration contained a drive strength. A drive strength can only be specified in a net assignment.

### What Next

Remove the drive strength from the declaration.

## VER-240

(warning) %s Strength %s for pullup is redundant.

### Description

A 'pullup' gate has only a strength0 specified, and no strength1. This is likely an error, because strength0 specifications are ignored for 'pullup' gates.

Note, however, that 'pullup' gates are not supported for synthesis, and drive strengths are ignored for synthesis.

### What Next

Check if you intended to specify a strength1 for the pullup gate instead of a strength0. If not, ignore the warning.

Feedback

## VER-241

(warning) %s Strength %s for pulldown is redundant. 0-strength defaulting to strong0.

### Description

A 'pulldown' gate has only a strength1 specified, and no strength0. This is likely an error, because strength1 specifications are ignored for 'pulldown' gates.

Note, however, that 'pulldown' gates are not supported for synthesis, and drive strengths are ignored for synthesis.

### What Next

Check if you intended to specify a strength0 for the pulldown gate instead of a strength1. If not, ignore the warning.

## VER-242

(error) %s Enumerated type '%s' needs a size specification.

### Description

You receive this error message because a parameter declaration that is being used to declare an enumerated type using the 'synopsys enum' pragma is missing a size specification. The following declaration results in this error message.

```
parameter /* synopsys enum colors */ red = 3'b001,
                                       green = 3'b010,
                                       yellow = 3'b100;
```

### What Next

Add a size specification to the declaration. The above example can be corrected as follows:

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
                                              green = 3'b010,
                                              yellow = 3'b100;
```

## VER-244

(error) %s Enumerated type '%s' has not been declared.

### Description

You receive this error message because the design has declared a symbol as a member of an enumerated type using the 'synopsys enum' pragma, but the enumerated type has not been declared.

Feedback

### What Next

Declare each enumerated type before using it. If you have declared the enumerated type, verify that no errors occurred while processing it.

---

## VER-245

(warning) %s Enumerated type '%s' is not compatible with this declaration.

### Description

The design declares a symbol as a member of an enumerated type using the 'synopsys enum' pragma, but the enumerated type has a different underlying type than the symbol. In the following example, the declaration of 'current_state' would trigger this error because its type is not '[0:2]'.

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
                                               green = 3'b010,
                                               yellow = 3'b100;

    reg [0:3] /* synopsys enum colors */ y;
```

### What Next

If it is typo, correct the type of either the enumerated type declaration or the symbol declaration so that they match. A corrected declaration for 'y' in the above example would change its bounds to '[0:2]':

```
reg [0:2] /* synopsys enum colors */ y;
```

If user intends to let the symbol and the enumerated type have different type, the user have to make sure that the synthesis behavior is what the user wants.

---

## VER-246

(error) %s Port %s declared as being two different enums.

### Description

This error occurs when port has both a port declaration determining its direction, and a register declaration, and has a different enumerated type attached to the two declarations, using the 'synopsys enum' pragma. In the following example, the two declarations of 'y' would cause this error to be issued:

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
                                               green = 3'b010,
                                               yellow = 3'b100;
    parameter [0:2] /* synopsys enum numbers */ one = 3'b001,
                                                   two = 3'b010;
```

Feedback

```
output [0:2] /* synopsys enum colors */ y;
reg [0:2] /* synopsys enum numbers */ y;
```

**What Next**

Choose one enumerated type for the port in question, and correct the declaration.

---

## VER-247

(error) %s Enumerated type '%s' has multiple declarations.

**Description**

You receive this error message because the same enumerated type is declared twice. The following example illustrates this situation.

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
                                           green = 3'b010,
                                           yellow = 3'b100;

parameter [0:4] /* synopsys enum colors */ brown = 5'b001,
                                           black = 5'b010,
                                           gray = 5'b100;
```

**What Next**

Specify a new name for one of the enumerated types.

---

## VER-248

(error) %s Encoding '%s' for '%s' is the wrong size for this enumerated type.

**Description**

You receive this error message because a value given for an enumerated type has a different size than the enumerated type itself.

In the following example, the state values given are 8 bits, while the enumerated type is declared as 12 bits. This difference will result in this error message.

```
parameter [11:0] /* synopsys enum states */ state1 = 8'b00000001,
                                                state2 = 8'b00000010;
```

**What Next**

Modify the values or the type declaration so that they are the same size.

Feedback

## VER-249

(error) %s force output %s must be a register or a net.

### Description

This error message occurs because a force statement can only be used to assign to a variable or a net.

### What Next

Force statements are not supported in synthesis. Enclose the force statement in the following compiler directives to prevent the statement from being read.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-251

(error) %s Expecting a pair of bounds [msb:lsb].

### Description

This error message occurs when an array dimension has not specified exactly two bounds. Verilog bit vectors, Verilog memories, and all packed dimensions of SystemVerilog array types must be declared using the subscript values for both the most and the least significant bits as shown in the following example:

```
reg [ most_significant_bit_index : least_significant_bit_index ]
 packed_vector;
```

### What Next

Adjust the bounds syntax. Or, in SystemVerilog, move the dimension brackets to the right of the array or type identifier to specify that this dimension should be treated as unpacked.

## VER-252

(error) %s illegal use of identifier %s.

### Description

This error message occurs when an identifier that is defined as a function is being used as a task.

Feedback

**What Next**

Modify the source code to change the call to a function call and then run the command again.

---

## VER-253

(error) %s Illegal reference to memory %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-254

(error) %s invalid symbol %s found in activation expression.

**Description**

This error message occurs when there is an invalid symbol in an activation expression. The symbol in an activation expression should be a net, variable or event.

**What Next**

Change the symbol in the activation expression to a net, variable or event, and then rerun the command.

---

## VER-255

(error) %s invalid symbol %s found in expression.

**Description**

This error message occurs when there is an invalid symbol in an expression. The symbol in an expression should be a net or variable.

**What Next**

Change the symbol in the activation expression to a net or variable and then rerun the command.

---

## VER-256

(error) %s illegal part selection has been found.

Feedback

**Description**

This error message occurs when an illegal part selection is found. The index of a vector in part selection should be constant valued, and its sign bit cannot be Z or X value.

**What Next**

Check the indexes of vectors in the part selection and correct the offending index. Run the command again.

---

## VER-257

(error) %s invalid symbol %s found as system task argument.

**Description**

This error message occurs when there is an invalid symbol in a system task argument list. The symbol used as a system task argument should be a net, variable, instance, module, event, or function.

**What Next**

Change the symbol in the system task argument list to a net, variable, instance, module, event, or function.

---

## VER-258

(error) %s no semicolon at end of module name.

**Description**

This error message occurs when the semicolon is missing from the end of a module name.

**What Next**

Add a semicolon to the end of the module name and run the command again.

---

## VER-259

(error) %s multiple delays found.

**Description**

This error message occurs when the tool finds multiple delays. Only one delay is allowed.

**What Next**

Correct the code to ensure that there is only one delay, and then run the command again.

Feedback

## VER-260

(error) %s symbol %s must be a constant or parameter.

### Description

This error message occurs because the symbol indicated in the error message must be a constant or a parameter, as required by the language.

In the example below, the expression in the generate case statement is required to evaluate to a constant value at elaboration time. The use of an input port in that expression violates this requirement.

```
module m (a);
    input a;

    generate
      case (a)         // error: not constant
      ...
    endgenerate
  endmodule
```

### What Next

Change the specified symbol to a constant or a parameter and then run the command again.

## VER-261

(error) %s continuous assignment output %s must be a net.

### Description

This error message occurs because the output of a continuous assignment must be a net.

### What Next

Change the output of the continuous assignment to net and then run the command again.

## VER-262

(error) %s net symbol %s has already been defined.

### Description

This error message occurs when the redeclaration of a net symbol is detected. A net can only be declared once.

Feedback

**What Next**

Remove or rename the nets declared with the same name and then run the command again.

---

## VER-263

(error) %s bit- or part-selected destination of a force %s must be a net.

**Description**

This error message occurs because the bit-selected or part-selected destination of a force statement must be a net and not a variable.

**What Next**

Change the destination of the force statement from a variable to a net and run the command again.

---

## VER-264

(error) %s bad hierarchical name (%s).

**Description**

For Verilog, hierarchical references are not supported for synthesis.

For SystemVerilog, the preceding expression does not evaluate to a struct or union.

**What Next**

For Verilog, exclude the code from synthesis by enclosing the hierarchical reference in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

For SystemVerilog, if the name is a struct or union member, make sure the preceding expression evaluates to a struct or union. If the name is not a struct or union, follow the instructions in the previous paragraph, and enclose the code in the conditional compilation directives.

---

## VER-265

(error) %s RCMOS switches are not supported.

Feedback

### Description

This error message occurs because RCMOS switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-266

(error) %s RNMOS switches are not supported.

### Description

This error message occurs because RNMOS switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-267

(error) %s RPMOS switches are not supported.

### Description

This error message occurs because RPMOS switches are not supported for synthesis.

### What Next

Exclude the code from synthesis bvy enclosing the code in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-268

(error) %s RTRAN switches are not supported.

Feedback

### Description

This error message occurs because RTRAN switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-269

(error) %s RTRANIF0 switches are not supported.

### Description

This error message occurs because RTRANIF0 switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-270

(error) %s RTRANIF1 switches are not supported.

### Description

This error message occurs because RTRANIF1 switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-271

(error) %s TRAN switches are not supported.

Feedback

### Description

This error message occurs because TRAN switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the following conditional compilation directives.

```
`ifndef SYNTHESIS
 ...
`endif
```

---

## VER-272

(error) %s TRANIF0 switches are not supported.

### Description

This error message occurs because TRANIF0 switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the following conditional compilation directives

```
`ifndef SYNTHESIS
 ...
`endif
```

---

## VER-273

(error) %s TRANIF1 switches are not supported.

### Description

This error message occurs because TRANIF1 switches are not supported for synthesis.

### What Next

Exclude the code from synthesis by enclosing the code in the following conditional compilation directives

```
`ifndef SYNTHESIS
 ...
`endif
```

---

## VER-274

(warning) %s Unsupported system task '%s' will be ignored for synthesis.

Feedback

### Description

Many system tasks are used only for simulation or testbench purposes; they are not supported for synthesis, and are ignored. This warning alerts you that your design contains an unsupported system task (or unsupported system function whose result is discarded).

### What Next

If your design functions correctly without the system task, then no action is needed.

---

## VER-275

(error) %s User-defined primitives (UDP's) are not supported.

### Description

User-defined primitives (UDP's) are not supported.

### What Next

Change your source file to remove UDPs or enclose them with translate on and translate off, or enclose them with `ifndef SYNTHESIS ... `endif.

---

## VER-276

(error) %s Specify blocks are not supported.

### Description

This error message occurs because specify blocks are not supported for synthesis.

### What Next

Exclude the specify blocks from the synthesis source code by enclosing the blocks in conditional compilation directives as shown below.

```
`ifndef SYNTHESIS
     specify
        ...      /* specparams that interfere with synthesis */
     endspecify
  `endif
```

---

## VER-277

(warning) %s Charge strengths are ignored.

Feedback

### Description

Charge strengths are ignored for synthesis.

### What Next

No further action required.

---

## VER-278

(error) %s Array bounds must be of integer type.

### Description

You receive this error message because you have not provided the correct value for array bounds. For synthesis, array bounds must be of integer type.

### Examples

The following erroneous example tries to declare an array with a float value as an array bound:

```
...
   reg [3.0:0] r;   /* ERROR: '3.0' is not an integer bound */
   ...
```

### What Next

Correct the values of the array bounds in your design so that they are expressed as integers.

---

## VER-279

(error) %s Syntax error in parameter value list at or near token '%s' (string position %d).

### Description

This error message occurs when there is a syntax error in a parameter value list given by the *elaborate* command *-parameters* argument.

### What Next

Correct the syntax error in the parameter value list and then run the *elaborate* command again.

See the man page for the *elaborate* command for information on the accepted parameter list syntax.

Feedback

## VER-280

(warning) %s In UPF shell mode, the RTL power construct $isolate, $power and $retain are ignored.

### Description

This warning message advises you that in UPF mode, the $isolate, $power and $retain statements are ignored.

### What Next

This is a only a warning message. No action is required.

However, to prevent this warning message, remove the $isolate, $power and $retain power constructs from the RTL code.

## VER-281

(warning) %s The statements in initial blocks are ignored.

### Description

This warning message advises you that initial blocks are not supported in synthesis.

### What Next

This is a warning message only. No action is required on your part.

However, to avoid receiving this warning message, you can enclose the initial block with the following:

```
`ifndef SYNTHESIS
 ...
`endif
```

## VER-282

(warning) All isolation_upf and retention_upf pragmas are ignored.

### Description

This warning message advises you that all isolation_upf and retention_upf pragmas are ignored.

### What Next

This is only a warning message. No action is required.

Feedback

However, to prevent this warning message, remove the isolation_upf and retention_upf pragmas from input Verilog.

---

## VER-286

(warning) %s 'event' declarations are not supported by synthesis.

**Description**

The Verilog 'event' declaration is not supported for synthesis.

**What Next**

Rewrite your design so that it does not use the 'event' declaration.

---

## VER-287

(error) %s In UPF shell mode, the RTL power construct $isolate, $power and $retain are not supported.

**Description**

This error message advises you that in UPF shell mode, the $isolate, $power and $retain statements are not supported.

**What Next**

Remove the specified line of code which contains the $isolate, $power or $retain constructs, and correct the design correspondingly. Or, you may set hdlin_upf_allow_legacy_construct to true to let the tool strip off the logic for you.

---

## VER-288

(error) %s Block name symbol %s already defined.

**Description**

This error message occurs when the name used for the block label has been previously used as an object name or a block label.

For example:

```
module test (input in, output reg out1, out2);
always @(in) begin:BLK
  out1 = in;
end
always @(in) begin:BLK
  out2 = in;
```

Feedback

```
end
endmodule
```

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-289

(error) %s Instance name symbol %s already defined.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-290

(error) %s Error in edge control specifier.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-291

(error) %s Event symbol %s already defined.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE std 1364.

---

## VER-292

(error) %s Unable to open file `%s': %s.

Feedback

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-293

(error) %s `%s' is not a regular file.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-294

(error) %s Syntax error at or near token '%s'%s.

**Description**

You receive this error message because your code contains a syntax error or there's a syntax error in a /* Synopsys */ comment.

**What Next**

Review your code and make appropriate corrections.

---

## VER-295

(error) %s CMOS switches are not supported.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-296

(error) %s NMOS switches are not supported.

Feedback

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-297

(error) %s PMOS switches are not supported.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-298

(warning) %s Keyword vectored is ignored.

**Description**

This warning message advises you that *vectored* is an optional advisory keyword. Presto warns about IEEE-1364 conforming uses of this net accessibility specification, but it is otherwise ignored for synthesis.

The following example shows the declaration of a vectored net. Since Presto ignores the keyword *vectored*, the effect is the same as if the keyword had been omitted.

```
...
  wire vectored [1:0] x;
  ...
```

**What Next**

This is a warning message only. No action is required on your part.

---

## VER-299

(error) %s Illegal use of event '%s' as module connection.

Feedback

### Description

You receive this message because the *read_verilog* or *elaborate* command detects an event in a module connection list. Events cannot be module connections in a module instantiation statement.

The IEEE 1364 Standard defines the term "module connection" as an element connected to a port of the instantiated module. Expressions in a parenthesized list in a module instantiation statement are valid module connections.

The following example shows an invalid attempt to use an event as a module connection:

```
event e;
  ...
  SUBMODULE my_submodule(e);  /* error: event used as module connection
 */
```

### What Next

Determine the original intent of the module connection and replace the event with an element that correctly connects to a module.

### See Also

- read_verilog

---

## VER-300

(error) %s Illegal attempt to declare hierarchical reference '%s'.

### Description

Hierarchical names are illegal in contexts where they would introduce or declare a new name in the current scope.

For example it is illegal to do a cross module declaration, as shown in the following code fragment:

```
reg a.b; /* illegal to declare a register in another scope */
```

### What Next

Check if this is a typo, where a period should be a comma. Check that the names in the hierarchical reference are properly declared and accessible in the current scope. Reduce cross-module references by adding explicit ports to carry signals between modules.

---

## VER-301

(error) %s Specparam symbol '%s' already defined.

Feedback

### Description

You receive this error message if you attempt to redefine an already defined symbol as a specification parameter.

### Examples

The following example demonstrates a case that results in this error message.

```
reg x;                    /* declaration of 'x' as a register */
  ...
  specify
    specparam x = 1;      /* illegal attempt to redeclare 'x' */
    ...
  endspecify
```

### What Next

Rename the original symbol or the specification parameter and all corresponding uses so that there is no conflict.

---

## VER-302

(warning) %s Pragma '%s' for object '%s' will be ignored because the object could not be found.

### Description

A pragma is a compiler directive in the source code. This warning appears because, during *read* or *analyze* command activity, the symbol used in an *infer_multibit* pragma is not declared in the source code.

### What Next

Possibly you misspelled the name of the symbol or the symbol you used exists only in an old version of the source code and is no longer valid. Correct the symbol name or consider removing the pragma.

---

## VER-305

(warning) %s Drive strength specifications for gate instantiations are ignored.

### Description

You receive this warning message because a drive strength specification has been found in a gate instantiation statement. Drive strength specifications have no meaning for synthesis and are ignored.

Feedback

### Examples

The following example shows a gate instantiation statement containing a drive strength specification, which results in this warning message.

```
not (highz1, strong0) n1 (a,y);  /* highz1 and strong0 are drive
 strengths */
```

### What Next

The drive strength specification is ignored during synthesis. If the code is intended for synthesis purposes only, consider removing the drive strength specification.

---

## VER-306

(warning) %s Drive strength specification for tri-state gate instantiation is ignored.

### Description

You receive this warning message because a drive strength specification has been found in a tristate gate instantiation statement. Drive strength specifications have no meaning for synthesis and are ignored.

### Examples

The following example shows a gate instantiation statement containing a drive strength specification that results in this warning message.

```
bufif (highz1, strong0) b1 (y,a,c);  /* highz1 and strong0 are drive
 strengths */
```

### What Next

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

---

## VER-307

(warning) %s Drive strength specification for pull gate instantiation is ignored.

### Description

You receive this warning message because a drive strength specification has been found in a pull gate instantiation statement. Be aware that drive strength specifications have no meaning for synthesis and are ignored.

### Examples

The following example shows a gate instantiation statement containing a drive strength specification that results in this warning message.

Feedback

```
pullup (strong1) p1 (y);    /* highz1 and strong0 are drive strengths */
```

**What Next**

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

---

## VER-308

(warning) %s Drive strength specification for module instantiation is ignored.

**Description**

You receive this warning message because a drive strength specification has been found in a module instantiation statement. Drive strength specifications have no meaning for synthesis and are ignored.

**Examples**

The following example shows a module instantiation statement containing a drive strength specification that results in this warning message.

```
...
 down (strong1, strong0) d (a,y);  /* module instantiation with drive
 strengths */
 ...
```

**What Next**

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

---

## VER-309

(warning) %s Drive strength specification for continuous assignment is ignored.

**Description**

You receive this warning message because a drive strength specification has been found in a continuous assignment statement. Be aware that the drive strength specifications have no meaning for synthesis and are ignored.

**Examples**

The following example shows a continuous assignment statement containing a drive strength specification that results in this warning message.

Feedback

```
...
 assign (strong1, strong0) y = a; /* containing assignment with drive
 strengths */
 ...
```

**What Next**

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

---

## VER-310

(warning) %s Keyword scalared is ignored.

**Description**

This warning message advises you that *scalared* is an optional advisory keyword. Presto warns about IEEE-1364 conforming uses of this net accessibility specification, but it is otherwise ignored for synthesis.

The following example shows the declaration of a scalared net. Since Presto ignores the keyword *scalared*, the effect is the same as if the keyword had been omitted.

```
...
  wire scalared [1:0] x;
  ...
```

**What Next**

This is a warning message only. No action is required on your part.

---

## VER-311

(warning) %s Parameter range specification is new feature of Verilog 2001. Synthesis and non-Verilog 2001 compatible simulation may have different results.

**Description**

This warning appears during *read* or *analyze* command activity to let you know that some simulators might ignore the range specification in the parameter declaration of your design and expand the parameter to 32 bits. It is thus possible that the circuit synthesized by the Presto HDL Compiler and the non-Verilog 2001 compatible simulation results will not match.

In the following example, the value of *out* from the simulator might be 0, but Presto HDL Compiler gives the value 16.

*Verilog*

Feedback

```
output [4:0] out;
        parameter [3:0] a = 0;

        assign out = {1'b1, a};
```

In the following example, the value of *a* from the simulator might be 10, but the Presto HDL Compiler gives the value 2. The bit on the left is ignored.

*Verilog*

parameter [2:0] a = 4'b1010;

**What Next**

Check accordance between synthesis and simulation at the location in the source code that refers to the bit width of the parameter.

---

## VER-312

(error) %s Cannot write architecture file %s: %s.

**Description**

You receive this error when, during a *read* or *analyze* command, the Presto HDL compiler cannot open or write a file describing the source language (and for VHDL, the architecture) of the module or entity being analyzed.

**What Next**

Make sure that the output directory is writable.

---

## VER-313

(warning) %s Verilog 'signed' data types are present; Verilog 'integer' data types become signed as well.

**Description**

You receive this warning when you use the Verilog 2000 'signed' keyword to declare signed data types, using the Presto HDL Compiler in release 2000.11-1 and subsequent releases. Using signed types causes signed logic for 'integer' types to be generated, as well (that is, any arithmetic using the variable of type integer will generate signed GTECH components in your netlist.)

Ordinarily the interpretation of integers as signed or unsigned data types in generated logic is controlled by the variable hdlin_unsigned_integers. However, when any variables in your design are declared using the 'signed' keyword, the variable is ignored, and integers are always interpreted as signed quantities.

Feedback

This is a departure from releases of Presto prior to 2000.11-1, and from the default HDL Compiler in all previous releases. In earlier releases, the integer data type was not considered a hardware data type, but instead was intended only for compile-time calculations, such as counting loop iterations. As such, the integer data type generated unsigned logic.

This change reflects a reclassification of the integer data type under the Synopsys synthesis subset and conforms more closely to the IEEE Standard 1364-1995.

If you use integer data types to produce logic in your design, you might see a difference between designs compiled with earlier Presto HDL Compiler or HDL Compiler versions, as compared to Presto HDL Compiler version 2000.11-1 and subsequent versions. Make sure that expressions involving integer data types that produce logic are correctly computed when using signed arithmetic.

**What Next**

Ensure that your use of the integer data type is consistent with signed arithmetic.

---

## VER-314

(warning) %s Starting with the 2000.11-1 release, the Presto Verilog reader treats Verilog 'integer' types as signed; synthesized result may not match earlier versions of HDL Compiler.

**Description**

You receive this warning when you use the Verilog 'integer' data type, when compiling your design with the Presto HDL Compiler, in release 2000.11-1 and subsequent releases.

By default, when expressions involving integer variables produce logic in the netlist, signed logic for will be generated (that is, any arithmetic using the variable of type integer will generate signed GTECH components in your netlist.)

This is a departure from Presto HDL Compiler in releases before 2000.11-1 and from the default HDL Compiler in all releases before 2001.08. In those earlier releases, the integer data type was not considered a hardware data type, but instead was intended only for compile-time calculations, such as counting loop iterations. As such, the integer data type generated unsigned logic.

This change reflects a reclassification of the integer data type under the Synopsys synthesis subset and conforms more closely to the IEEE Standard 1364-2001.

If you use integer data types to produce logic in your design, make sure that expressions involving integer data types that produce logic are correctly computed when using signed arithmetic.

Feedback

The interpretation of integers as signed or unsigned data types in generated logic is controlled by the variable hdlin_unsigned_integers. However, when any variables in your design are declared using the 'signed' keyword, the variable is ignored, and integers are always interpreted as signed quantities.

**What Next**

Ensure that your use of the integer data type is consistent with signed arithmetic. If your design requires unsigned arithmetic generated by integer datatypes, and your design does not use Verilog 2000 'signed' types, consider setting hdlin_unsigned_integers to true.

---

## VER-315

(warning) %s Module '%s' was renamed to '%s' with architecture '%s'.

**Description**

You receive this warning because the named module contains the special separator string "__" and was thus renamed to include the module and architecture. This warning informs you of the situation and this man page instructs you what to do if you did *not* intend the renaming.

When a Verilog module name contains the special separator string "__" (two underscores), and the *hdlin_module_arch_name_splitting* variable is set to *true*, Presto HDL Compiler interprets the module name as specifying both a module and a specific architecture or implementation for that module. The portion of the original module name before the separator string becomes the new module name, and the portion after becomes the architecture.

For example, a module named "mod__impl" would be renamed to "mod" and marked as having architecture "impl".

If the variable *hdlin_module_arch_name_splitting* is set to *false*, this renaming never occurs and modules always retain their original names. If it is set to *true*, the "__" is used to divide the module name into module and architecture, as described above.

This capability exists primarily to allow the creation of synthetic libraries using Verilog, with multiple architectures per module.

**What Next**

If you did not intend to specify a module and architecture pair separated by "__", either set *hdlin_module_arch_name_splitting* to *false* or rename your module so that it doesn't contain the separator string.

If you intended to imply a specific architecture, no further action on your part is required.

Feedback

## VER-316

(error) %s The aggregated port expression in the declaration for port '%s' has a mixed direction.

### Description

This error indicates that the compiler has found a port declaration with an aggregated port expression that has a mixed direction.

Modules with mixed-direction port declarations are not supported in synthesis.

In Verilog, port directions are not declared directly, but are instead implied by the directions declared for port identifiers within port expressions.

When the port expression is a concatenation and the port identifiers within it are declared with different directions, the port has a mixed direction.

```
module mixed_direction (.p({a,e})) ;
   input a;
   output e;
   not(e,a);
   endmodule
```

### What Next

If you did not intend to specify a port with a mixed direction, change the expression in the port declaration or change the directions of some the identifiers it uses. If you intended to specify a port expression with mixed direction, split the port into smaller ports that do not have mixed directions.

## VER-318

(warning) %s %s to %s %s occurs.

### Description

You receive this warning message when the Presto HDL Compiler performs one of the following conversions or assignments:

- Implicitly converts an unsigned expression to a signed expression
- Implicitly converts a signed expression to an unsigned expression
- Assigns an unsigned right side to a signed left side
- Assigns a signed right side to an unsigned left side.

Feedback

The following is an example of implicit signed/unsigned conversion:

```
reg signed [3:0] a;
reg [7:0] c;

a = 4'sb1010;
c = a+7'b0101011;
```

According to Verilog standard 2001, the tool converts the signed operand *a* to an unsigned value in the second assignment. The *a* operand is not sign-extended and the Presto HDL Compiler issues the following warning message:

```
signed to unsigned conversion occurs
```

However, if the operand being converted is a constant with leading zeros (in this case, converting between signed and unsigned does not change logic), the Presto HDL Compiler does not issue a warning. For example:

```
c = 5'sb01101+7'b0101011;
```

The first operand on the right side is implicitly converted to an unsigned value, but no warning is issued since the msb of the operand is 0.

Explicit type casting might also disable warnings about conversions. In the example above, Presto HDL Compiler does not issue any warnings if *a* is coerced to be unsigned; for example, by assigning *c* as follows:

```
c = $unsigned(a)+7'b0101011;
```

The following is an example of a signed/unsigned assignment:

```
reg [7:0] a;

a = 4'sb1010;
```

The Presto HDL Compiler issues the following warning message:

```
signed to unsigned assignment occurs
```

Although the left side is unsigned, the right side is still sign-extended, so after the assignment, *a* equals 8'b11111010.

**What Next**

This is a warning message only. No action is required on your part if you want to have signed/unsigned conversions or assignments. However, you can avoid implicit conversion or signed/unsigned assignments by changing your Verilog code.

---

## VER-319

(error) %s defparam to local parameter '%s' inside generate block not supported.

Feedback

### Description

You receive this error message because parameter overwrites inside *generate* blocks to local parameters are not supported by synthesis.

```
module m ();
    parameter p = 1;
    generate
      defparam p = 2;      // not allowed
    endgenerate
  endmodule
```

### What Next

Rewrite your source file, removing the parameter overwrites inside the generate blocks to local parameters, and then run the command again.

### See Also

- read_verilog

---

## VER-320

(warning) %s right hand side of defparam statement should only contain constants or references to parameters.

### Description

You receive this warning message because according to the Verilog standard, the right side of a defparam statement should be a constant expression involving only numbers and references to parameters.

```
module m ();
    genvar i;

    generate
      for (i=0; i<10; i=i+1) begin : B1
        defparam p = i;   // warning: genvar is not allowed on the RHS
      end;
    endgenerate
  endmodule
```

### What Next

No action is required on your part.

However, to strictly comply with the language standard, you should rewrite your code to use only constants or references to parameters on the right side of defparam statements.

You can avoid the warning message by changing the source file so that the defparam statements conform to the Verilog standard.

Feedback

### See Also

- read_verilog

---

## VER-321

(error) %s genvar '%s' used outside generate loop.

### Description

You receive this error message because a genvar can only be used inside the generate loop that uses the genvar as a loop index variable. Using the genvar outside of this loop is not permitted.

```
module m ();
    genvar i;

    generate
      for (i=0; i<10; i=i+1) begin : B1
      ...
      end;
      assign y = i;   // use pf genvar outside generate loop.
    endgenerate
  endmodule
```

### What Next

Change your source file so that all genvars are only used inside the generate loop that uses the genvar as a loop index variable, and then run the command again.

### See Also

- read_verilog

---

## VER-322

(error) %s A packed object cannot contain unpacked data: %s.

### Description

This error message occurs because a structure or union declared as packed cannot contain an unpacked member; an array with packed dimensions cannot have elements whose type is unpacked; or a Verilog-style concatenation cannot include unpacked ingredients.

```
struct packed {
    struct {
    } a;        // error: unpacked structure inside packed structure
  } b;
```

Feedback

```
struct { byte car, cdr } cons;       // This unpacked type cannot be:
cons [12] register_file;             // on a packed dimension, or
register_file = {12{ cons'{0,0} }};  // in a packed concatenation.
```

### What Next

Change your source file so that either the element (and all of its subelements) are declared as packed, or else declare all outer structs and/or unions as unpacked, and write outer array dimensions to the right of their variable name (which connotes an unpacked data arrangement).

In concatenations, you can rewrite the code to treat unpacked data in a separate structure. If this is not possible, then cast the concatenation to the appropriate unpacked type. As a final option, you can cast the offending element to a packed type of the correct width.

---

## VER-323

(error) %s Trying to redeclare typename '%s'.

### Description

You receive this error message because an identifier declared as a typename can't be redeclared later.

```
typedef logic SPOCK;
  ...
  reg SPOCK     // error: 'SPOCK' already declared as a typename
```

### What Next

Change your source file by renaming either the typename or the identifier causing the name clash to a new name.

### See Also

- read_verilog

---

## VER-324

(error) %s Illegal slice name.

### Description

You receive this error message because you are applying more than one slice to an array or the slice is not the last element in the select chain.

The example below demonstrates legal and illegal situations.

Feedback

```
reg [0:3] [4:7] [8:11] a;

  ... = a[1:2];      // legal: only one slice at the end of the select
 chain
  ... = a[2][5:6];   // legal: only one slice at the end of the select
 chain

  ... = a[1:2][4];   // illegal: slice not last element of select chain
  ... = a[1:2]5:6];  // illegal: more than one slice in select chain
```

**What Next**

Change your source file to use select chains with only one slice per select chain and make sure the slice is always the last element in the select chain.

---

## VER-325

(error) %s This structure constructor is missing a value for member '%s'.

**Description**

This error message occurs because structure construction expressions must specify a value for every member of the structure. The cited member was not mentioned in the list of member:value specifications, and none of the type:value or default:value specifications could be applied successfully.

**What Next**

Check the nesting of curly braces around this source line. Check the declaration of the structure type(s) and typedef names involved. After making the necessary changes, run the command again.

---

## VER-326

(error) %s conditionally generated declaration of port '%s'.

**Description**

You receive this error message because the declaration of a port is conditionally generated. All 3 port declarations in the following example are illegal because they are either fully or partly contained in a conditional generate region.

```
module m (a, b, c);
 reg c;
 output b;

 generate
  if (...)
   output a;
   reg a;
```

Feedback

```
   reg b;
   output c;
 endgenerate
endmodule
```

**What Next**

Check the nesting of curly braces around this source line. Check the declaration of the structure type(s) and typedef names involved.

---

## VER-327

(error) %s Non-constant index expression on left hand side of continuous assignment '%s'.

**Description**

You receive this error message because the left hand side of a continuous assignment contains a non-constant index expression. This is not legal Verilog.

```
module m (a, b);
 reg [0:7] a;
 integer b;

 assign a[b] = 1'b0;    // error, 'b' is non-constant

endmodule
```

**What Next**

Rewrite the design such that all left hand sides of continuous assignments contain only constant index expressions. Depending on the context one way of achieving this is to turn the continuous assignment into a nonblocking assignment inside a combinational always block.

---

## VER-328

(error) %s Syntax error on apparent Verilog 2001 construct.

**Description**

You receive this error message because hdlin_vrlg_std has been set to 1995, but the Verilog code apparently contains a Verilog 2001 construct.

**What Next**

Either rewrite the code so that it does not use Verilog 2001 constructs or do not override the default value of hdlin_vrlg_std.

Feedback

## VER-329

(warning) %s Parameter keyword used in local parameter declaration.

### Description

This warning issues when the 'parameter' keyword is used to declare a strictly local parameter. Since this coding style often repeats, only one citation occurs for each locale.

According to the 2nd paragraph of 3.11.1 in the Verilog-2001 LRM, "If any param_assignments appear in a module_parameter_port_list, then any param_assignments that appear in the module become local parameters and shall not be overridden by any method." For example, because p2 in the following is a local parameter:

```
module bottom #(parameter p1 = 13) (output [31:0] o) ;
  parameter p2 = 17 ;
  assign o = p1 + p2 ;
  endmodule
```

an instantiation that attempted to override it would be disallowed:

```
module top (output [31:0] o) ;
  bottom #(.p2(29)) bot ( o ) ;
  endmodule
```

In SystemVerilog there are several additional scope contexts in which the parameter keyword is a synonym for the localparam keyword. According to 6.3.2 in the IEEE SystemVerilog LRM, "Unlike nonlocal parameters, local parameters can be declared in a generate block, in a package, or in a compilation-unit scope. In these contexts, the parameter keyword can be used as a synonym for the localparam keyword."

### What Next

If there is no need to override the parameters in a module or interface declaration either do nothing or use the 'localparam' keyword instead. If there is a need to override the parameter in this declaration, declare them in the list_of_parameter_declarations instead.

The parameters in a package, compilation-unit scope or generate block are always local parameters and cannot be overridden.

## VER-330

(warning) %s No operator for pragma label %s

### Description

In the statement, there is no operator to which the label could be applied.

Feedback

**Verilog**

```
a = b ; // synopsys label my_oper
```

A label can be associated only with an infix operator, such as +, or with a task or function call.

**What Next**

Modify the Verilog source code to remove the pragma or to introduce an operator for the label.

---

## VER-331

(warning) %s Redeclaration of port '%s'.

**Description**

You receive this message because, during *analyze* or *read* command activity, the Presto HDL Compiler has detected that a port previously declared using an ANSI-style port declaration (12.3.4 in the Verilog 2001 LRM) has been redeclared in the body of the module.

Following is an example that illustrates this type of problem:

```
module m ( input a, output b);
    wire a; // redeclaration of input port
    reg b; // redeclaration of ouput port
   endmodule
```

**What Next**

Remove the redeclaration and move any additional information it contains into the ANSI-style port declaration.

---

## VER-332

(warning) %s The '%s' pragma is ignored when applied to 'if' statements.

**Description**

This warning message occurs during *analyze* or *read* command activity when the compiler finds a full_case or parallel_case pragma applied to an "if" statement.

The full_case or parallel_case pragmas are only effective when applied to case statements.

The infer_mux pragma is meaningful when applied to "if" statements.

Feedback

### What Next

Remove any full_case or parallel_case pragmas from "if" statements in your design.

---

## VER-333

(error) %s Widths of ports on 'tran' instantiation are inconsistent.

### Description

This error message occurs when a Verilog "tran" instance has an input and output port that have different widths.

The following module produces this error message because the widths of "a" and "b" are not equal.

```
module E (a, b);

  input [2:0] a;
  output [3:0] b;

  tran (a, b);

endmodule
```

### What Next

Correct the widths of the ports so that they are consistent and then invoke the compiler again.

---

## VER-334

(error) %s Width of interface port is not consistent with width of expression.

### Description

This error message occurs when the design being compiled contains an interface instantiation in which the declared width of the interface's modport does not match the width of the connection in the interface instantiation.

### What Next

Correct the width of the ports so that they are consistent and then invoke the compiler again.

---

## VER-335

(error) %s 'defparam' is not supported inside generate blocks

Feedback

### Description

You receive this error message when running the *read* or the *elaborate* command if your design contains a *defparam* statement within a *generate* block.

Presto HDL Compiler does not support *defparam* parameter value override assignments within *generate* blocks.

The following example demonstrates a supported coding style for parameter value override assignments.

```
module sub (...);
   PARAMETER P1 = 10;
   ...
endmodule

module top (...);

  ...
  generate if(1) begin: blk
    sub u1 (...) ;           //error: defparams not supported
    defparam u1.P1 = 20;     //       inside generate blocks.
  end

  ...

  generate if(1) begin: blk2
    sub #(20) u1 (...) ;    //supported method to assign parameter
  end                       //value overrides

  ...
endmodule
```

### What Next

Rewrite the parameter value assignment as shown in the example above.

---

## VER-336

(warning) %s 'defparam' that accesses a hierarchical name may be ignored.

### Description

The *read* or the *analyze* command issues this message when your design contains a *defparam* statement that modifies a parameter through hierarchical reference.

Presto HDL Compiler ignores *defparam* overrides of parameters inside functions, tasks or named blocks. Since the actual target is not known at the point where the defparam statement is analyzed, this message is just a warning and may be a false negative indication.

Feedback

**What Next**

You may ignore this message if the defparam overrides a parameter which will later be declared in the top level of a module instantiated from within the current design. Otherwise, recode the design and try again.

---

## VER-337

(error) %s PARAMETER assignment statement has same LHS and RHS '%s'.

**Description**

This error message occurs when the PARAMETER assignment statement has the same LHS and RHS. For example: parameter P0 = P0.

**What Next**

Correct the PARAMETER assignment statement and make sure RHS is constant.

---

## VER-338

(warning) %s Net '%s' was renamed to '%s' in module '%s'.

**Description**

This warning message occurs when the Verilog Netlist Reader renames a net to prevent possible name conflicts with other objects.

**What Next**

This is only a warning message. No action is required.

However, if you did not want the Verilog file to be processed by the Netlist Reader, use the *read* command with the *-rtl* option to force it to use Presto HDL Compiler instead.

---

## VER-339

(error) %s Delay, event, or process control is prohibitted in always_comb

**Description**

Issues when a statement within an always_comb block tries to manage the sequence of simulation events. Examples include @*, fork, or disable. Explicit delays may also be flagged as errors when in always_comb, since do not describe combinational logic.

**What Next**

Perhaps you meant to use a traditional always block which is not guaranteed to produce combinational logic. contains error hence latches are inferred unexpectedly.

Feedback

## VER-400

(error) %s Bad format character in template_naming_style or template_parameter_style.

**Description**

Bad format character in template_naming_style or template_parameter_style.

**What Next**

Change the relevant code to conform to the IEEE Std.

## VER-401

(warning) %s Formality does not support %s .

**Description**

Formality does not support this feature now, please do not use it, otherwise, mismatch will happen.

## VER-402

(error) %s Improper usage of internally defined macros: %s

**Description**

Following are Presto Verilog Compiler specific macros, DC, PRESTO, VERILOG_1995, VERILOG_2000, VERILOG_2001 and SYSTEMVERILOG. SYNTHESIS is a reserved macro in IEEE Verilog synthesizable subset. All of the above have a pre-defined value of "". They should only be used with `ifdef, `ifndef and `elsif.

## VER-403

(warning) %s Improper usage of internally defined macros: %s

**Description**

Following are Presto Verilog Compiler specific macros, DC, PRESTO, VERILOG_1995, VERILOG_2000, VERILOG_2001, VERILOG_2005 and SYSTEMVERILOG. SYNTHESIS is a reserved macro in IEEE Verilog synthesizable subset. All of the above have a pre-defined value of "". They should only be used with `ifdef, `ifndef and `elsif.

## VER-404

(error) %s Incorrect value for hdlin.verilog.standard. Valid values are 1995, 2001, or 2005.

Feedback

**Description**

This error message occurs when a nonexistent version of the Verilog standard is requested.

**What Next**

Set the value of *hdlin.verilog.standard* to the intended version and run the command again.

---

## VER-405

(error) %s A non-locally static choice must be the single choice, file support call for workaround.

**Description**

A non-locally static choice must be the single choice, file support call for workaround.

---

## VER-406

(warning) %s A non-locally static choice has more than one choice may not be supported correctly, you need to make sure the generated design is correct.

**Description**

A non-locally static choice has more than one choice may not be supported correctly, you need to make sure the generated design is correct.

---

## VER-407

(error) %s Return port name of type function must be '%s'.

**Description**

You receive this error message because the return port name of the type function is not as required .

**What Next**

Correct the return port name for the type function by using -- pragma *return_port_name*.

---

## VER-408

(error) %s Bad clock expression: '%s'.

Feedback

**Description**

This error message occurs when the clock expression is unacceptable due to the specified issue.

When the specified problem is an unsupported clock expression, be aware that in VHDL only simple constants are supported; for example:

```
generic ( CLK_EDGE: std_logic := '1' );
 ...
 if (clk'event and clk = CLK_EDGE)
 ...
```

However, the following valid code is not simple enough to be supported:

```
generic( CLK_EDGE: std_logic := 1 );
 ...
 constant CLK_EDGE2 : std_logic := CLK_EDGE;
 if (clk'event and clk = CLK_EDGE2)  -- not simple enough
 ...
```

Constant clock expressions that are not simple will be supported in a future release.

**What Next**

Use only simple constants in clock expressions.

---

## VER-409

(error) %s Attributes with non-locally static values on integer/constants are not supported.

**Description**

Attributes with non-locally static values on integer/constants are not supported.

**What Next**

Change the relevant code to conform to the IEEE Std.

---

## VER-410

(warning) %s Expecting explicit event control immediately after always_ff.

**Description**

Expecting explicit event control immediately after always_ff.

---

## VER-411

(error) %s Interface instance is expected here : %s

Feedback

**Description**

Failed to get the expected interface instance.

The most likely cause of this error message is that an interface has been instantiated before declaration. In synthesis, interfaces, unlike modules, must be declared before they are instantiated.

**What Next**

Please check your RTL for typographical errors, or that you have declared the interface before instantiating it and try again.

---

## VER-412

(error) %s Illegal digit %c in unbased number.

**Description**

The digit should be one of the four basic values (0, 1, x, z).

**What Next**

Check your design for invalid digits in unbased numbers and correct them.

---

## VER-413

(error) %s Invalid argument for system task or function : %s

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std.

---

## VER-414

(warning) %s Unsupported hdlin_field_naming_style : %s.

**Description**

Unsupported hdlin_field_naming_style encountered when analyzing/reading SystemVerilog RTL with Presto HDL Compiler.

The hdlin_field_naming_stle variable defines the parts of the net names that Presto HDL Compiler generates corresponding to the fields in VHDL records and SystemVerilog structs.

Feedback

By default, the hdlin_field_naming_style is derived from the bus_naming_style and bus_dimension_separator_style. But when these are "%s[%d]" and "][" or are "%s<%d>" and "><", then it is possible to specify an independent hdlin_field_naming_style, such as "%s<%s>", "%s[%s]", or "%s.%s", in which the first %s stands for the name up to the field and the second %s stands for the field. The hdlin_field_naming_style must be of the form "%sX%s" or "%sX%sY", where X and Y are (possibly identical) non-whitespace characters.

**What Next**

Modify the bus_naming_style, bus_dimension_separator_style, and/or hdlin_field_naming_style.

---

## VER-415

(error) %s POLICY WARNING: missing constant expression in clk event.

**Description**

POLICY WARNING: missing constant expression in clk event.

---

## VER-416

(warning) %s The -preserve command-line option contains the %s hierarchical name.

**Description**

This warning message occurs when the *-preserve* option specifies a hierarchical name. Only simple names are allowed when the *-preserve* option is used with the *analyze*, *read_file*, *read_verilog*, or *read_vhdl* command.

**What Next**

This is only a warning message. No action is required.

However, if the result is not what you intended, change the hierarchical name to a simple name in the relevant script.

**See Also**

- read_verilog

---

## VER-418

(error) %s Empty string used as bus_dimension_separator_style.

Feedback

**Description**

An empty bus_dimension_separator_style string ("") was encountered when elaborating a multidimensional bus.

**What Next**

Do not override the bus_dimension_separator_style to the empty string ("").

---

## VER-419

(warning) %s Empty string used as bus_dimension_separator_style.

**Description**

An empty bus_dimension_separator_style string ("") was encountered when elaborating a multidimensional bus.

**What Next**

Do not override the bus_dimension_separator_style to the empty string ("").

---

## VER-441

(warning) %s Port number %d of '%s' was named '%s'.

**Description**

You receive this warning when a complex port such as the third port in

```
module m(clk, out, .P({a,b}));
```

is declared without an explicit port name, as in

```
module m(clk, out, {a,b});
```

**What Next**

If you want to control the naming of the port, add an explicit name to the port declaration.

---

## VER-444

(error) %s Incorrect value for hdlin_sverilog_std. Valid values are 2005, 2009, 2012, or 2017.

**Description**

You receive this error message when a nonexistent version of the SystemVerilog standard is requested.

Feedback

**What Next**

Set the value of *hdlin_sverilog_std* to the intended version.

---

## VER-445

(error) %s Incorrect value for hdlin_vhdl_std. Valid values are 1987, 1993 or 2008.

**Description**

This error message occurs when a nonexistent version of the VHDL standard is requested.

**What Next**

Set the value of *hdlin_vhdl_std* to *1987*, *1993* or *2008*.

---

## VER-446

(warning) %s The variable hdlin_vhdl_87 is obsolete and will not take effect.

**Description**

This warning message occurs when you use the *hdlin_vhdl_87* variable in your script, The variable is obsolete and will not take effect. Please update your script by replacing occurrences of *hdlin_vhdl_87* with the new *hdlin_vhdl_std* variable. The *hdlin_vhdl_std* default setting is *1993*. To use the 1987 VHDL standard, set *hdlin_vhdl_std* to *1987*.

**What Next**

To avoid this message, replace the *hdlin_vhdl_87* variable in your script with the new *hdlin_vhdl_std* variable.

---

## VER-500

(error) %s %s

**Description**

A syntax or internal error has surfaced during verilog traversering. The message specifies where the error appeared and why it was issued.

**What Next**

Internal errors indicate a problem which should be reported to your Synopsys representitive.

Feedback

## VER-501

(error) %s Redundant %s directives on a chain of if-else-if statements.

### Description

You receive this error message when running the *read* or the *elaborate* command if your SystemVerilog design contains a chain of if-else-if statements with redundant *unique* or *priority* or *unique0* keywords. For example:

```
unique if ( x == 0 )
    y = 1;
  else unique if ( x == 1 )
    y = 2;
```

The second *unique* keyword is not permitted. Only the top if statement should be labeled.

### What Next

Verify that you intend to use a unique or priority or unique0 chain of if statements, and remove the redundant directive.

## VER-502

(error) %s Conflicting directives on a chain of if-else-if statements; outer statements are labeled '%s', inner statement '%s'.

### Description

You receive this error message when running the *read* or the *elaborate* command when your SystemVerilog design contains a chain of if-else-if statements with conflicting *unique* or *priority* or *unique0* keywords. For example:

```
unique if ( x == 0 )
    y = 1;
  else if (x == 1)
    y = 2;
  else priority if ( z == 0 )
    y = 2;
  else if ( z == 0 )
    y = 3;
```

The inner if statement is labeled with a conflicting directive, which is not permitted. Use a directive only on the top if statement.

### What Next

If you want to start a new, separate chain of if-else-if statements inside the final else branch of the outer chain, use a block around the inner chain as shown below.

Feedback

```
unique if ( x == 0 )
    y = 1;
  else if (x == 1)
    y = 2;
  else
    begin
      priority if ( z == 1 )
        y = 2;
      else if ( z == 0 )
        y = 3;
    end
```

Otherwise, decide whether you intend to use a *unique* or *priority* or *unique0* chain of if statements, and label only the top level if statement, removing all other directives in the chain of if-else-if statements.

---

## VER-503

(warning) %s Case statement marked unique has overlapping conditions.

### Description

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a *unique* case statement with overlapping branches. This means that more than one condition can be true at the same time, which contradicts the definition of unique case.

For example, the following case is not unique because the third branch matches any value of c, including the values matched by the first two branches. Therefore, the case requires priority encoding for correct execution.

```
unique casex ( c )
    2'bx1: y = 2;
    2'b1x: y = 1;
    2'bxx: y = 3;
  endcase
```

The synthesis tool may make optimizations based on the *unique* keyword so that the priority encoding logic is simplified. However, this may bring simulation/synthesis mismatch.

If you are unsure whether or not a case is *unique*, do not mark it *unique*.

### What Next

Check the case statement conditions. Make sure that the case labels are intended to overlap. Otherwise, either correct the conditions so that they do not overlap, or remove the *unique* keyword.

Feedback

## VER-504

(warning) %s Case statement marked %s does not cover all possible conditions.

### Description

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a *unique* or *priority* case statement, where it is possible that no branch condition will evaluate to true. This means the case statement may execute, but no branch is taken, which contradicts the definition of *unique* and *priority* case statements.

For example, the following case is not a *unique* or *priority* case, because when c is 3'b011, 3'b010, or 3'b001, no branch is executed.

```
unique casex ( c )
    3'b111: y = 5;
    3'b11x: y = 4;
    3'b1xx: y = 3;
    3'b000: y = 2;
  endcase
```

However, based on your knowledge of the design, you may know that only the listed values will occur. In this case, you can ignore this warning.

The synthesis tool cannot check all *unique* and *priority* case statements for this condition. If a case is marked *unique* or *priority*, but the case statement may execute without having any branch taken, your design may produce unexpected results.

If you are unsure whether or not a case statement is a *unique* or *priority* case statement, do not mark it unique.

### What Next

Check the case statement conditions. Based on your knowledge of the design, if you know that any values that are omitted from the case conditions cannot occur, you may ignore the warning. Otherwise, either add branches to cover the missing values, add a default branch, or remove the *unique* or *priority* keyword.

## VER-505

(warning) %s If statement marked unique has overlapping conditions.

### Description

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a *unique* if statement whose branches overlap. This means that more than one condition can be true at the same time, which contradicts the definition of a *unique* statement.

Feedback

For example, the following if statement is not *unique* because the third branch overlaps with the first. Therefore, the if statement requires *priority* encoding for correct execution.

```
unique if ( c == 2'b01 )
    y = 2;
  else if ( c == 2'b10 )
    y = 1;
  else if ( c == 2'b11 || c == 2'b01 )
     y = 3;
```

The synthesis tool may make optimizations based on the *unique* keyword so that the priority encoding logic is simplified. However, this may bring simulation/synthesis mismatch.

If you are unsure whether or not an if statement is *unique*, do not mark it *unique*.

**What Next**

Check the if statement conditions. Make sure that the case labels are intended to overlap. Otherwise, either correct the conditions so that they do not overlap, or remove the *unique* keyword.

---

## VER-506

(warning) %s If statement marked %s does not cover all possible conditions.

**Description**

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a *unique* or *priority* if statement where it is possible that no branch condition will evaluate to true. This means that the if statement may execute, but no branch is taken, which contradicts the definition of *unique* and *priority* if statements.

For example, the following if chain is not a *unique* or *priority* if statement because only two of the eight possible values of c are checked.

```
priority if ( c == 3'b111 )
    y = 5;
  else if ( c == 3'b110 )
    y = 4;
```

However, based on your knowledge, you may know that only those two values will occur. In this case, you may ignore this warning.

The synthesis tool cannot check all *unique* and *priority* if statements for this error. If an if statement is marked *unique* or *priority*, but the statement may execute without having any branch taken, your design may produce unexpected results.

Feedback

If you are unsure whether or not an if statement is a *unique* or *priority* if statement, do not mark it as *unique* or *priority*.

**What Next**

Check the if statement conditions. Based on your knowledge of the design, if you know that any values that are omitted from the if conditions cannot occur, you may ignore the warning. Otherwise, either add branches to cover the missing values, add a final else branch, or remove the *unique* or *priority* keyword.

---

## VER-507

(error) %s Enumerated type member %s does not match size of type; (size %d, expecting %d).

**Description**

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration, and a member of the enumerated type is the wrong size.

A value can be the wrong size because it will not fit into an explicitly declared data type, or because it does not match the size of a previous enum member that has a sized value.

```
enum short { red = 600000, blue = 2, green = 1} e; // red is too large to
 fit

enum { red = 5'd4, blue = 4'd3, green } e; // blue's size does not match
 red's
```

Consult the SystemVerilog language reference manual for more information on how values are assigned to members of enumerated types.

**What Next**

Examine the members of the enumerated type, and make the changes needed to ensure that each member has the same size.

---

## VER-508

(error) %s Enumerated type member %s duplicates a previously seen value %s.

**Description**

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration, and two members of the enumerated type are assigned to the same value.

Feedback

The error is issued either for members that have an explicit value assigned to them, or for members whose value is determined automatically from the values of the preceding members.

Values of SystemVerilog enumerated type members are determined as follows.

- If an explicit value is given, then that value is used.
- If no explicit value is given, and the member is the first in the enumerated type, it is assigned to 0.
- If no explicit value is given, and the member is not the first in the enumerated type, then it is given a value 1 greater than that of the previous member.

In the following example red and green are explicitly assigned the same value.

```
enum { red = 1, blue = 2, green = 1} e;
```

In the next example, red is assigned explicitly to 2, while green is given the value 2 because the previous member is given the value 1.

```
enum { red = 2, blue = 1, green } e;
```

Consult the SystemVerilog language reference manual for more information on how values are assigned to members of enumerated types.

**What Next**

Examine the members of the enumerated type, and make the changes needed to ensure that each member has a unique value.

---

## VER-509

(error) %s Enumerated type member %s cannot be assigned a four-state value (%s).

**Description**

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration, the data type of the enumerated type is a two-state type, and a member of the enumerated type is assigned to a four-state value.

In the first example below, the int type is a two-state type and cannot represent x or z values, so red cannot be assigned to 3'bxxx. If no data type is specified for the enumerated type, then it defaults to int, which is a two-state type.

```
enum int { red = 3'bxxx, blue = 2, green = 1} e;   // error

enum { red1 = 3'bxxx, blue1 = 2, green1 = 1} e;   // error since default
 is int
```

Feedback

To use four-state values in enumerated types, choose a data type as shown below.

```
enum integer { red = 3'bxxx, blue = 2, green = 1} e;   // OK with integer
```

Consult the SystemVerilog language reference manual for more information on how values are assigned to members of enumerated types.

**What Next**

Either use a four-state data type, or remove any four-state values from the list of enumerated type members.

---

## VER-510

(error) %s Value of enumerated type member %s cannot be determined since previous value was four-state.

**Description**

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration, the specified member of the type is not explicitly assigned a value, and the previous member of the enumerated type is assigned to a four-state value.

Values of SystemVerilog enumerated type members are determined as follows.

- If an explicit value is given, then that value is used.
- If no explicit value is given, and the member is the first in the enumerated type, it is assigned to 0.
- If no explicit value is given, and the member is not the first in the enumerated type, then it is given a value 1 greater than that of the previous member.

When the value of a member of the enumerated type contains x or z, then it is an error not to specify an explicit value for the following member.

In the following example, red contains x, so blue must be explicitly assigned a value.

```
enum int { red = 3'bxxx, blue, green = 1} e;   // error
```

**What Next**

Supply an explicit value for any enumerated type member that follows a member with a four-state value.

---

## VER-511

(error) %s Subscript or range expression of the enum member %s is not a literal constant.

Feedback

### Description

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration that uses a subscript or range expression to produce a series of values in the type, and the subscript or range expression does not consist solely of constants.

The Presto HDL Compiler supports only a literal constant in such subscript or range expressions. For example, the following design fragment generates an error, because a parameter is used in a subscript expression for an enumerated type member.

```
parameter n = 8;
  typedef enum { state[n] } states;
```

The following example showns an acceptable declaration.

```
typedef enum { state[8] } states;
```

### What Next

Supply a constant value for all subscript or range expressions in enumerated type declarations.

---

## VER-512

(error) %s Only integer types or one dimensional packed arrays are permitted as the underlying type of an enumeration.

### Description

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration that specifies an underlying data type, and the underlying data type is not permitted.

Only integer types or one dimensional packed arrays are permitted as the underlying type of an enumeration. The following is an example of an unacceptable declaration.

```
/* Not acceptable */
  typedef enum logic signed [0:0][0:0] { state1, state2, state3, state4 }
 states;
```

This example shows an acceptable declaration.

```
typedef enum logic signed [1:0] { state1, state2, state3, state4 }
 states;
```

### What Next

Correct the design to use an integer type or one dimensional packed array as the underlying type of the enumeration.

Feedback

## VER-513

(error) %s redeclaration of symbol %s as constant.

### Description

You receive this error message if a symbol in a constant declaration has already been declared, either as a constant or as something else. In the following example, in is first declared as an input, then erroneously redeclared as a constant.

```
input in;
 ...
 const in = 1'b0;       // erroneous redeclaration of input 'in'
                        // as a constant
```

### What Next

Decide which of the declarations is the intended one and remove or change the name in the other declaration, and then run the command again.

## VER-514

(error) %s Return statement in non-void function %s requires an expression as return value.

### Description

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog contains a function with a non-void return type, and a return statement occurs without an expression to use as the return type.

When a function is declared with a return type, all return statements must be accompanied by an expression.

### What Next

Supply a return value in the return statement and run the command again.

## VER-515

(warning) %s Discarding return value of function %s.

### Description

You receive this warning message when running the *read* or *elaborate* command if your SystemVerilog design contains a task-style call to a function where the function's return value is not used.

The warning is not issued if the return type of the function is void.

Feedback

### What Next

This is a warning message only. No action is required. If you intend to always ignore the return value of this function, change its return type to void. Otherwise, embedd this function call in an assignment statement or other expression that will demand its result value.

---

## VER-516

(error) %s the name %s after the end construct does not match the name %s of the construct.

### Description

You receive this error message when the name after the end construct (module, interface, block, function, or task) does not match the construct name.

The following is an example of mismatched names after endmodule.

```
module name1(input i, output o);
assign o = i;
endmodule :name2  //name2 is not the same as name1
```

The following shows another example of mismatched names for sequential block.

```
module name1(input i, output reg o);
always begin
  o = i;
end : name2  //the name of the sequential block is not specified.
endmodule : name1
```

### What Next

Correct the names so that they match and run the command again.

---

## VER-517

(error) %s A case statement is marked with both a unique or priority keyword, and a full_case or parallel_case directive.

### Description

You receive this error message from the *read* or *elaborate* commands when your SystemVerilog design contains a case, casex, or casez statement marked with the 'priority' or 'unique' keyword that is also marked with the '//synopsys parallel_case' or '//synopsys full_case' pragma.

In Verilog, pragmas were the only means of communicating information about a case statement's properties to the compiler. In SystemVerilog, the 'unique' and 'priority'

Feedback

keywords convey that information. The Presto HDL Compiler accepts either style, but does not accept a mixture of the two styles on the same case statement.

**What Next**

If knowledge of the design guarantees that :

```
1. At least one case condition will evaluate to true
BUT NOT:
  2. No more than one case condition will evaluate to true
```

then use the 'priority' keyword on the case.

If knowledge of the design guarantees that :

```
1. At least one case condition will evaluate to true
AND:
  2. No more than one case condition will evaluate to true
```

then use the 'unique' keyword on the case.

If knowledge of the design guarantees that :

```
1. No more than one case condition will evaluate to true
BUT NOT:
  2. At least one case condition will evaluate to true
AND:
```

then use the '//synopsys parallel_case' pragma for the case statement.

If neither of these conditions is known to be true, then use no keyword or pragma.

---

## VER-518

(error) %s Cannot recover from previous errors.

**Description**

This error message occurs when the errors reported so far have left the compiler in a state where further error reports would be inaccurate, misleading, or omitted. The *analyze* or *read* command stops even if some of the source text has not yet been processed. For example, if the $unit scope of a SystemVerilog compilation issues any errors, compilation of modules or interfaces with visibility into that $unit may not proceed.

**What Next**

Resolve the previously reported error message(s), and rerun the *analyze* or *read* command.

Feedback

## VER-519

(warning) %s Return value of function '%s' is not set.

### Description

This warning message occurs during a *read* or *elaborate* command, when your SystemVerilog design contains an automatic function with a non-void return value that does not set the return value inside the function body. The return value of the function is not specified by the language standard. Change the your code to clearly specify the result.

The warning is not issued if the return type of the function is *void*.

```
function automatic f;
   input a;
   reg r;
   r = 2 * a;
 endfunction

 always begin
  y = f (a);
 end
```

### What Next

If you intended to ignore the return value of the function you can disregard the warning message.

If the result is not what you intended, change the code to clearly specify the result.

## VER-520

(warning) %s Task enable in always_comb block.

### Description

This warning message occurs during a *read* or *analyze* command when your SystemVerilog design contains a task enable within an always_comb block. This is a possible simulation-synthesis mismatch, because the language standard does not require simulators to be sensitive to the contents of a task.

### What Next

Modify your code to use calls to void functions instead of task enables within always_comb blocks and then run the command again.

## VER-521

(error) %s Using nonexistent return value of void function '%s'.

Feedback

### Description

You receive this error message from the *read* or *analyze* commands when your SystemVerilog design uses a call to a void function as an expression instead of like a task enable.

```
function automatic void f ( a , output [1:0] b ) ;
 reg r;
    b = 2 * a;
 endfunction

 always begin
    y = f (a , b);
 end
```

### What Next

Modify the void function to one that returns a value or to pass back the result through an output port.

---

## VER-522

(error) %s The 'inout' port '%s' is not of net type.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters an inout port declared with a non-net type, such as 'struct', 'bit', 'reg' or 'logic'. According to IEEE Std 1800-2005, section 19.12.1, a variable data type is not permitted on either side of an inout port.

### What Next

Rewrite the SystemVerilog code to use a net type on this port or to use two ports instead of just one. (In simulation, a 'ref' port could also be used, but 'ref' ports are not synthesizable.)

---

## VER-523

(error) %s Static %s '%s' is not synthesizable in %s, expecting 'automatic' keyword.

### Description

This error message occurs when a function or task that is not automatic is encountered in $unit (formerly known as $root), in a package declaration, or in an interface declaration. The synthesizable SystemVerilog subset requires that each task and function in $unit, in a package declaration, or in an interface declaration be declared *automatic*.

Feedback

**What Next**

Add the *automatic* keyword after the *task* or *function* keyword.

---

## VER-524

(error) %s Multiple implicit port connection tokens in instantiation.

**Description**

This syntax error message occurs when the .* implicit port connection token is used more than once in a single module or interface instantiation:

xtend xtend(.* , .dout(dataout[7:0]), .*, din(alu_out[7]));

**What Next**

Remove all but one of the .* tokens from the instantiation. Run the *analyze* or *read* command again.

---

## VER-525

(error) %s Invalid interface access %s.

**Description**

This error message occurs when the Presto HDL Compiler finds an error when accessing the interface instance or the interface port.

For example:

```
I inst();   // I is an interface definition, with modport mp
            // assign a = inst.mp.b;
```

**What Next**

Correct the access to the interface and then run the compiler again.

---

## VER-526

(error) %s Invalid name %s in the modport %s of the interface %s.

Feedback

### Description

This error message occurs when the Presto HDL Compiler finds an invalid name in the modport definition. This error may be caused by one of the following:

- There is no valid symbol declared in the interface.
- The symbols declared are inconsistent with the usage in the modport declaration. In the following example, the function *foo* is used as a port and signal *s* is used as a function or task:

```
interface I();
function foo ... endfunction
logic s;
modport MP (input foo, import function s());
endinterface
```

- The name has been used in the modport declaration. In the following example, there are two ports named *s*:

```
interface I();
function foo ... endfunction
logic s;
modport MP (input s, input s, import foo());
endinterface
```

### What Next

Correct the name in the modport definition and then run the compiler again.

---

## VER-527

(error) %s The input port %s is not writable.

### Description

This error message occurs when the input port expanded from modport is not writable.

In the following example, *a* is an input port expanded from modport port *i* in module *M*. The assignment to *i.a* causes the error message.

```
interface I ();
logic a;
modport MP(input a);
endinterface

module M(I.MP i);
assign i.a = 1'b1;
endmodule
```

Feedback

**What Next**

Correct any errors in the code and run the command again.

---

## VER-528

(warning) %s Invalid symbol name '%s' in the pragma signal name list. It is being ignored.

**Description**

This warning message occurs because the Presto HDL Compiler found an invalid symbol name in the pragma signal name list. This problem may be caused by one of the following:

- There is no valid symbol declared in the module.
- The usage of the symbol in the pragma signal name list is not consistent with the symbol declaration in the module.
- The type of the symbol (such as constant or function name) is not allowed to appear in the pragma signal name list.

**What Next**

This is only a warning message. You can eliminate this warning by following the instructions below.

If you do not want the symbol to be ignored from the pragma signal name list, correct the symbol name in the pragma signal name list and then run the compiler again.

---

## VER-530

(warning) %s Treating %s '%s' as automatic in %s; possible simulation-synthesis mismatch.

**Description**

This warning message occurs when a function or task that is not declared *automatic* is encountered in $unit (formerly known as $root), in a package declaration, or in an interface declaration. The synthesizable SystemVerilog subset requires that each task and function in $unit, in a package declaration, or in an interface declaration be declared *automatic*.

**What Next**

Add the *automatic* keyword after the *task* or *function* keyword and run the command again.

Feedback

## VER-531

(information) %s Variable '%s' is being read, but is not initialized. The subprogram default value will be used.

### Description

You receive this message from the Presto HDL Compiler when your design contains a variable which is read, but has not been initialized yet. The subprogram default value will be used.

The subprogram default value can be 0's (as default) or tick-LEFT, which is controlled by the switch:

hdlin_subprogram_default_values

### What Next

Verify that you intended to use the subprogram default value as the initial value of the uninitialized variable.

## VER-532

(warning) %s If statement with %s directive but no else clause.

### Description

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a unique or priority if that has no has no else clause. For example:

```
unique if ( x == 0 )
    y = x;
```

According to the language standard, the unique or priotity keyword on an if with no else clause, is an assertion that the condition is always true. Hence, the example is equivalent to an assertion that x is always 0, followed by the assignment. It could be optimized to

```
y = 0;
```

### What Next

Verify that you intend to assert that the condition is always true. If so, consider using a formal assertion. If not, remove the unique or priority keyword.

## VER-533

(warning) %s Using default enum base size of 32.

Feedback

### Description

You receive this warning from the *read* or *analyze* commands when your SystemVerilog design contains an enum declaration without an explicit size declaration after the enum keyword. According to the language standard, the default size of an enum is 32. For example, in

```
typedef enum { RED, BLUE, GREEN, YELLOW } Color ;
  Color current, next ;
```

current and next will be 32 bits wide, not 2 bits wide, as in

```
typedef enum [1:0] { RED, BLUE, GREEN, YELLOW } Color ;
  Color current, next ;
```

### What Next

Modify your code to use an explict size declaration for the enum.

---

## VER-537

(error) %s Illegal %s direction for %s '%s' in modport.

### Description

This error message occurs when the Presto HDL Compiler finds a variable listed in a modport definition with the direction of *inout*, or a net listed with the direction of *ref*. These combinations are not possible for ordinary module ports, so they cannot be used to specify how to deliver the given interface content as part of an interface modport connection.

### What Next

Correct either the direction setting for this element of the modport list, or the variable versus net declaration of the interface content. Variables may pass as *ref*, *input*, or *output*. Nets may pass as *inout*, *input*, or *output*. Reanalyze the changed interface source.

---

## VER-538

(warning) %s Nonstandard %s direction for %s '%s' in modport.

### Description

This warning message occurs when the Presto HDL Compiler finds a variable listed in a modport definition with the direction of *inout*, or a net listed with the direction of *ref*. These combinations are illegal for ordinary module ports. The *hdlin_sv_allow_inout_modport_vars* switch setting has allowed Presto to form a wired connection to continuously transmit the value of this interface content.

Feedback

### What Next

This is only a warning message. No action is required.

However, to avoid this message you can correct either the direction setting for this element of the modport list, or the variable versus net declaration of the interface content. Variables may pass as *ref*, *input*, or *output*. Nets may pass as *inout*, *input*, or *output*. Reanalyze the changed interface source.

---

## VER-540

(warning) %s Redefining macro '%s' with value '%s' to '%s'.

### Description

A macro is being defined at least twice with different values in the RTL code. If this is not really intented by customer, it may produce unexpected syntesys results.

The macro redefinition may happend if it is defined several times in different files or when macros are defined in files included by other include files.

### What Next

If a redefinition of the macro was not intended, just rename the macro such that it does not collide with the other macro definition, or keep files using one set of macro definitions separate when reading in the designs, to avoid macro names clashes.

---

## VER-541

(warning) %s Parameters of macro '%s' have been redefined.

### Description

A macro is being defined at least twice with a different list of parameters in the RTL code. If this is not really intented by customer, it may produce unexpected synthesis results.

The macro redefinition may happen if it is defined several times in different files or when macros are defined in files included by other include files.

The redefinition checks for literal parameter definition. If in one file exists this definition:

`define SUM(x,y) x+y

and in another verilog file exists another definition of SUM:

`define SUM(a,b) a+b

and if both files are used while compiling the same unit scope, VER-541 warning message will be issued, even if the macros are semantically equal.

Feedback

When a macro is being redefined, usually the definition of macro will change too, so an additional VER-540 warning message may be issued.

**What Next**

If a redefinition of the macro was not intended, just rename the macro so that it does not collide with the other macro definition, or keep files using one set of macro definitions separate when reading in the designs, to avoid macro names clashes.

---

## VER-553

(error) %s Pack operation's result width is less than the total width of the source expressions.

**Description**

The Presto HDL Compiler issues this error message when the right-hand side of an assignment or the operand of a cast is a streaming operator ({<<{...}} or {>>{...}}) that is producing more bits than the left-hand side or the casting-type can utilize.

**What Next**

Increase the number of bits allocated in the target type, or shorten the data sizes of the source expressions.

---

## VER-554

(error) %s Unpack operation using streaming operator requires that width of source bit stream be greater than or equal to target.

**Description**

The Presto HDL Compiler issues this error message when the left-hand side of an assignment is a streaming operation that consumes more bits than the right-hand side can provide.

**What Next**

Correct any errors like this in your code.

---

## VER-555

(warning) %s Truncation discards bits.

**Description**

The Presto HDL Compiler issues this warning message when the left-hand side of an assignment discards some of the bits provided by the right-hand side.

Feedback

### What Next

Correct any errors like this in your code.

---

## VER-561

(error) %s Subscript expression of the enum member %s is not a positive literal constant.

### Description

You receive this error message when running the *read* or *elaborate* command if your SystemVerilog design contains an enumerated type declaration that uses [N] to produce a series of members in the type, but the N is not positive.

Only a positive literal constant is legal in that context.

For example, the following design fragment generates an error, because [0] is used to produces a series of members.

```
typedef enum { state[0] } states;
```

### What Next

Supply a positive literal value for expressions in enumerated type declarations.

---

## VER-563

(warning) %s Case statement marked unique0 has overlapping conditions.

### Description

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a *unique0* case statement with overlapping branches. This means that more than one condition can be true at the same time, which contradicts the definition of unique0 case.

For example, the following case is not unique0 because the third branch matches any value of c, including the values matched by the first two branches. Therefore, the case requires priority encoding for correct execution.

```
unique0 casex ( c )
    2'bx1: y = 2;
    2'b1x: y = 1;
    2'bxx: y = 3;
  endcase
```

The synthesis tool may make optimizations based on the *unique0* keyword so that the priority encoding logic is simplified. However, this may bring simulation/synthesis mismatch.

Feedback

If you are unsure whether or not a case is *unique0*, do not mark it *unique0*.

**What Next**

Check the case statement conditions. Make sure that the case labels are intended to overlap. Otherwise, either correct the conditions so that they do not overlap, or remove the *unique0* keyword.

---

## VER-565

(warning) %s If statement marked unique0 has overlapping conditions.

**Description**

You receive this warning message when running the *read* or the *elaborate* command if your SystemVerilog design contains a *unique0* if statement whose branches overlap. This means that more than one condition can be true at the same time, which contradicts the definition of a *unique0* statement.

For example, the following if statement is not *unique0* because the third branch overlaps with the first. Therefore, the if statement requires *priority* encoding for correct execution.

```
unique0 if ( c == 2'b01 )
    y = 2;
  else if ( c == 2'b10 )
    y = 1;
  else if ( c == 2'b11 || c == 2'b01 )
     y = 3;
```

The synthesis tool may make optimizations based on the *unique0* keyword so that the priority encoding logic is simplified. However, this may bring simulation/synthesis mismatch.

If you are unsure whether or not an if statement is *unique0*, do not mark it *unique0*.

**What Next**

Check the if statement conditions. Make sure that the case labels are intended to overlap. Otherwise, either correct the conditions so that they do not overlap, or remove the *unique0* keyword.

---

## VER-700

(error) %s The construct '%s' is not supported in synthesis.

**Description**

This error message occurs when the syntactic construct cited is not supported for synthesis.

Feedback

### What Next

Exclude non-synthesizable constructs by enclosing the code with the conditional compilation directives shown below.

```
module mt( a );
  `ifndef SYNTHESIS
    localparam realtime bus_stop=42;
  `endif
```

## VER-701

(error) %s Variable '%s' index not supported.

### Description

You receive this error from the *read -f verilog -netlist* command, which invokes the Verilog netlist reader, because your code contains constructs the Verilog netlist reader does not support. To read a limited set of constructs more efficiently, the Verilog netlist reader supports only those Verilog constructs that commonly occur in netlists.

The Verilog netlist reader does not support the use of variables within subscripts or array declarations.

### What Next

If your code contains any of these constructs, use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the "-netlist" option from the *read* command, or by using the *analyze* and *elaborate* commands.

## VER-702

(error) %s Unknown wire type '%s'.

### Description

This error message occurs error message is generated by the *read -f verilog -netlist* command, which invokes the Verilog netlist reader, because the code contains constructs the Verilog netlist reader does not support. To read a limited set of constructs more efficiently, the Verilog netlist reader supports only those Verilog constructs that commonly occur in netlists, in order to read a limited set of constructs more efficiently.

The Verilog netlist reader does not support the use of some Verilog variable declarations, such as the *reg* data type.

Feedback

**What Next**

If your code contains these constructs, use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the *-netlist* option of the *read* command, or by using the *analyze* and *elaborate* commands.

---

## VER-703

(error) %s Unknown constant value '%d'

**Description**

You receive this message because The Verilog netlist reader was unable to read the design; the reader could not determine a constant value for the variable named in the message.

**What Next**

Use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the "-netlist" option from the *read command*, or by using the *analyze* and *elaborate* commands.

---

## VER-704

(error) %s Constant width not matched '%d' vs '%d'.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-705

(error) %s Constant signal '%s' cannot be at the left side.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-706

(error) %s Verilog netlist reader encountered trouble to build the named port in this design.

Feedback

### Description

Verilog netlist reader has limited support for named port handling. The following examples demonstrate the typical cases netlister reader now has trouble handling.

```
module inouta (.a(i),.b(i));
        inout i;
    endmodule

    module bit_select ( .a(i), .b1(j[1]), .b2(j[0]) );
        input        i;
        output [1:0] j;
    endmodule
```

### What Next

Please use read command without the -netlist option.

---

## VER-707

(error) %s Variable index not supported.

### Description

This error message occurs when running the *read -f verilog -netlist* command, which invokes the Verilog netlist reader, because your code contains constructs the Verilog netlist reader does not support. To read a limited set of constructs more efficiently, the Verilog netlist reader supports only those Verilog constructs that commonly occur in netlists.

The Verilog netlist reader does not support the use of variables or arithmetic operations, within subscripts or array declarations.

### What Next

If your code contains any of these constructs, use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the *-netlist* option from the *read* command, or by using the *analyze* and *elaborate* commands.

---

## VER-708

(warning) %s The construct '%s' is not supported in synthesis; it is ignored.

### Description

This warning message issues when the cited construct cannot be synthesized, but might be ignorable. This can lead to behavior which differs from simulation.

Feedback

### What Next

Exclude non-synthesizable constructs by enclosing the code with the conditional compilation directives shown below.

```
module mt( a );
     logic static_init
  `ifndef SYNTHESIS
                       = 1'b0
  `endif
                              ;
     always ...
        if( !static_init ) ...
```

## VER-709

(warning) %s The interconnect net will be treated as a wire net in synthesis.

### Description

This warning message issues when a SystemVerilog interconnect net declaration is encountered, because it will be treated as a wire net declaration in synthesis.

There are fewer restrictions on the usage of wire nets than there on interconnect nets, so it's possible that some illegal usages of interconnect nets will be accepted in synthesis but correctly rejected in simulation.

### What Next

Exclude illegal usages of interconnect nets by also reading the design into a simulator. If there are no illegal usages, no further action is needed.

## VER-710

(error) %s The construct '%s' is not supported when %s = %s.

### Description

This error message occurs because the syntactic construct cited is not supported by the current configuration of the HDL Compiler or optimizer cited in the message.

### What Next

Adjust the global option named in the message. Note that not all option combinations are possible. After making your changes, run the command again.

## VER-720

(error) %s The construct '%s' is not supported in this language.

Feedback

**Description**

This error message occurs when the syntactic construct cited is not supported for the language specified by the *-format*, *-rtl*, or *-netlist* option of your *read* or *analyze* command.

Verilog (*-format verilog*) reports this error for syntax where SystemVerilog (*-format sverilog*) has extended the language beyond IEEE Std 1364.

This error may also be reported in rare situations where SystemVerilog does not implement syntax that is only available in older editions of Verilog.

The *-netlist* reader reports this error message about features that are not supported in gate-level netlists.

**What Next**

Adjust your use of the *-format* option or Tcl commands with the *read_* prefix to parse the intended source language.

Switching from *-netlist* to *-rtl* may not be a practical solution for a large design. Use the *-rtl* reader on a small sample of the cited syntax, write the equivalent gate-level output, and then recode your *-netlist* input in the pattern suggested by the *-rtl* compiler.

---

## VER-721

(error) %s The construct '%s' is not supported.

**Description**

This error message occurs when the syntactic construct cited is not supported in this compiler release.

**What Next**

Check whether or not you are running a current version of the synthesis tool.

If you are interested in more information about this feature, contact the Synopsys Support Center by using Enter A Call at http://solvnet.synopsys.com/EnterACall.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at http://solvnet.synopsys.com/ReleaseLibrary.

For information about creating, packaging, and sending a test case, go to http://www.synopsys.com/testcase.

---

## VER-722

(error) %s The relative placement directive '%s' has a syntax error.

Feedback

**Description**

This error message occurs when the relative placement directive has a syntax error.

For example, the orientation in may be *rp_orient* incorrect. The orientation should be N|W|S|E|FN|FW|FS|FE.

Another example is that the alignment default is not *sw* in *rp_align*.

**What Next**

Correct the relative placement syntax error.

---

## VER-730

(warning) %s The '%s' syntax is non-standard. %s

**Description**

This is a generic warning message which issues at every use of certain non-standard language features. The report includes a sentence to clarify what semantics are provided in lieu of the standard-prescribed error.

The setting of hdlin_vrlg_std at the time the (System)Verilog source is analyzed can influence which syntax gets this citation and what semantics are supplied.

**What Next**

Make sure you agree that the non-standard meaning is the intended behavior for this RTL. Check the setting of hdlin_vrlg_std if you believe that this construct is meant to invoke a standard definition. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

---

## VER-731

(warning) %s The '%s' syntax is non-standard. %s\n\tOnly the first use of this construct will be cited.

**Description**

This is a generic warning message which issues on the first use of oft-repeated, but non-standard, language features. The report includes a sentence to clarify what semantics are provided in lieu of the standard-prescribed error. Other uses of the construct will be handled similarly, but silently.

The setting of hdlin_vrlg_std at the time the (System)Verilog source is analyzed can influence which syntax gets this citation and what semantics are supplied.

Feedback

### What Next

Make sure you agree that the non-standard meaning is the intended behavior for this RTL. Check all uses of the non-standard construct. Check the setting of hdlin_vrlg_std if you believe that this construct is meant to invoke a standard definition. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

---

## VER-733

(warning) %s Forward references to '%s' are non-standard. %s

### Description

This message warns about violations of the SystemVerilog standard requirement that data variables be declared before use. Only the first reference to each name is cited. The references have been tolerated without this warning because the selection syntax you used could also be a legal form of hierarchical reference, but the explicit local declaration for this name became available before a hierarchical reference was located.

This is an unsound language extension, since forward references to variables cannot be resolved in all possible contexts. To aid the migration of legacy codes that may have relied upon forward reference, this message has warning level severity; it will rise to an error level severity in a future release of Presto SystemVerilog.

The setting of the *hdlin_sverilog_std* variable at the time the SystemVerilog source is analyzed can influence which syntax gets this citation and what semantics are supplied.

### What Next

Make sure you agree that the non-standard meaning is the intended behavior for this RTL. Check the setting of the *hdlin_sverilog_std* variable if you believe that this construct is meant to invoke a standard definition. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

---

## VER-734

(warning) %s Nonstandard package access '%s::'; this name has a more local definition.

### Description

This message warns about your use of a nonstandard language extension which might not be available in other SystemVerilog implementations. The SystemVerilog standard prescribes that the identifier left operand to the scope operator (::) can resolve to a local data object, function, block label, or a wildcard import candidate for such an object, even though doing so inevitably leads to an error for misuse of the scope extraction syntax. Your access to a package with the same name as this more local definition will not be supported on a minimally conforming language processor. Notwithstanding this language

Feedback

extension, the scope operator always resolves the name of a local type even if this leads to an error, despite the existence of a package of the same name.

**What Next**

No action is required. The scope operator found a package with the given name. To make this use conform to the IEEE standard, rename either the package or its local homograph.

**See Also**

- suppress_message

---

## VER-735

(information) %s Variables crossing hierarchy: %s%s%s.

**Description**

This information message occurs for a few RTL coding styles involving variables where simulation and synthesis use different approaches.

In simulation, an RTL variable is allocated storage at its point of declaration. References to simulation variables fetch the most recent value written into that storage, regardless of any process or hierarchical boundaries between various writers and readers.

In synthesis, storage is inferred whenever a process uses a variable as a way to feed its output back onto its input. These well-known conventions are not entirely incompatible, in fact it is typical for several processes to read the stored output of one other process, and for the RTL to express this using a variable.

More aggressive uses, for example with multiple processes writing, or with a single process using explicit delays to write at distinct simulation times, have no synthesizable counterparts. These will lead to multiple driver errors, or to race conditions that the tool may only warn you about by displaying "ignoring delays".

Presto informs you when a design hierarchy is added that separates two processes sharing a simulation variable. These situations include the following:

Explicit uses of *ref* port direction

In simulation, *ref* ports are used to connect simulation variables across the design hierarchy. When synthesized, *ref* ports connect wires and are continuously driven. This could cause nets to be multiply-driven or cause value sequences, controlled by simulation time delays, to resolve differently outside the module.

Feedback

Implicit connection of *ref* ports

Variables within an interface that are not given *input* or *output* direction by a modport declaration, will be connected via *ref* ports as described above.

In each case, there may be another RTL coding style that will present simulation with a more precise picture of what is being synthesized.

**What Next**

This is an information-only message. No action is required.

Implicit communication of variables can sometimes be avoided by adding a modport declaration that excludes the variable, and using it to modify the interface instance when it is passed as a port. Also, consider presenting the data on a signal wire instead. If your simulator does not permit a data type to be declared for a wire, use size'() casting to extinguish the type information as it is assigned to or read from a net.

**See Also**

- suppress_message

---

## VER-736

(warning) %s Task '%s' with non-empty body is mapped to '%s'; body will be ignored.

**Description**

This warning message occurs when you map a task to a module because the module (instead of the task body) determines the implementation of the task. The body of the task is ignored.

The following example contains a task for which this warning message is issued:

```
task so_msff_t(output so, input si);  // synopsys map_to_module r00foobar
  begin
     if(si === 1'b1) // task body will be ignored
       so <= si;
  end
  endtask
```

**What Next**

This only a warning message.

Make sure that you intended the body of the task to be ignored in favor of the module that the task is mapped to.

Feedback

## VER-737

(warning) %s No module instance name.

**Description**

The Presto HDL Compiler issues this warning message when a module instantiation without an instance name is detected during the *analyze* or *read* command.

According to the Verilog language standard, module instantiations must include an explicit name. For backward compatibility reasons, the Presto HDL Compiler issues a warning instead of an error on such usage and invents an instance name.

**What Next**

Add an explicit instance name so that the instantiation conforms with the language standard.

## VER-738

(error) %s No structure of instances name.

**Description**

The Presto HDL Compiler issues this error message when a structure of instances without a name is detected during the *analyze* or *read* command. This syntactic restriction is consistent with the syntactic restrictions the Verilog langauage standard imposes on arrays of instances.

**What Next**

Add an explicit name for the structure of instances.

## VER-739

(error) %s No array of instances name.

**Description**

The Presto HDL Compiler issues this error message when an array of instances without a name is detected during the *analyze* or *read* command. According to the Verilog language standard, every array of instances, even of gate instances, must have an explicit name specified.

**What Next**

Add an explicit name for the array of instances.

Feedback

## VER-746

(warning) %s The declaration of module '%s' is being ignored, because the module name is in hdlin_sv_blackbox_modules.

### Description

This warning message issues when the declaration of a module with its name in hdlin_sv_blackbox_modules is encountered. All text until the next endmodule token is skipped.

### What Next

If this module declaration should not be ignored, remove the module name from hdlin_sv_blackbox_modules.

## VER-747

(warning) %s The body of module '%s' is being discarded, because the module name is in hdlin_sv_interface_only_modules.

### Description

This warning message issues when the declaration of a module with its name in hdlin_sv_interface_only_modules is encountered. The body will be discarded, except for port declarations.

### What Next

If the body of this module declaration should not be ignored, remove the module name from hdlin_sv_interface_only_modules.

## VER-791

(warning) %s An end_keywords directive without a matching begin_keywords directive.

### Description

The Presto HDL Compiler issues this warning when excess end_keywords directives are encountered. For example,

```
`begin_keywords "1364-1995"
      module test (in, generate);
      input in;
      output generate;
      assign generate = in;
      endmodule
   `end_keywords
   `end_keywords
```

Feedback

### What Next

Determine whether there is a missing begin_keywords directive or too many end_keywords directives.

---

## VER-792

(warning) %s A begin_keywords directive without a matching end_keywords directive.

### Description

The Presto HDL Compiler issues this warning when insufficient end_keywords directives are encountered. For example,

```
`begin_keywords "1364-1995"
   `begin_keywords "1364-1995"
      module test (in, generate);
      input in;
      output generate;
      assign generate = in;
      endmodule
   `end_keywords
```

### What Next

Determine whether there are too many begin_keywords directives or not enough end_keywords directives to match them.

---

## VER-793

(error) %s Unknown begin_keywords directive version specifier '%s'.

### Description

The Presto HDL Compiler issues this error when the begin_keywords directives is used with an unknown version specifier. For example,

```
`begin_keywords "1364-1999"
      module test (in, generate);
      input in;
      output generate;
      assign generate = in;
      endmodule
   `end_keywords
```

### What Next

Determine if there is typo in the version specifier, which must be one of "1364-1995", "1364-2001", "1364-2001-noconfig", "1364-2005", or "1800-2005".

Feedback

## VER-794

(error) %s Missing or unknown version specifier in begin_keywords directive.

### Description

The Presto HDL Compiler issues this error when the begin_keywords directives is used alone, instead of with a version specifier, or when the double quotes in the version specifier are omitted. For example,

```
`begin_keywords
      module test (in, generate);
      input in;
      output generate;
      assign generate = in;
      endmodule
   `end_keywords
```

or

```
`begin_keywords 1364-1995
      module test (in, generate);
      input in;
      output generate;
      assign generate = in;
      endmodule
    `end_keywords
```

### What Next

Determine if there is a version specifier, which must be one of "1364-1995", "1364-2001", "1364-2001-noconfig", "1364-2005", or "1800-2005". If so, then check if the double quotes have been forgot.

## VER-795

(error) %s The begin_keywords directive is only supported in SystemVerilog format.

### Description

The Presto HDL Compiler issues this error when the begin_keywords directives is used with the Verilog format instead of with the SystemVerilog format.

### What Next

Read the design as SystemVerilog.

Feedback

## VER-796

(error) %s A begin_keywords directive within a design element.

**Description**

The Presto HDL Compiler issues this error when

**What Next**

Do something wonderful.

## VER-797

(error) %s An end_keywords directive within a design element.

**Description**

The Presto HDL Compiler issues this error when

**What Next**

Do something wonderful.

## VER-900

(error) %s The 'defparam' construct is not supported.

**Description**

Presto HDL Compiler does not support the use of defparam statements. The following is an example of a defparam statement.

```
module top;
    defparam b.parm = 0;
    bottom b ();
  endmodule

  module bottom;
    parameter parm = 1;
    . . .
  endmodule
```

**What Next**

Replace defparam statements with module instance parameter overrides as shown in the following example.

Feedback

```
module top;
    bottom #(.parm(0)) b ();
  endmodule
```

## VER-901

(error) %s The '`define' directive requires that commas separate formal arguments.

### Description

The '`define' directive allows you to parameterize macros. An example is:

```
`define ADD(A,B) ((A)+(B))
```

This error message is generated whenever two formal arguments to the macro are not separated by a comma.

```
`define ADD(A B) ((A)+(B))
             ^  The missing comma will result in an error message.
```

### What Next

Delete whitespace or add a comma to form the identifier(s) needed by the macro's definition.

## VER-902

(error) %s The '`define' directive requires a non-empty argument list if parentheses are present.

### Description

The following macro definition is rejected because no identifiers were found inside the parentheses.

`define MACRO() 10

### What Next

When a macro does not need arguments, omit the parentheses.

`define MACRO 10

## VER-903

(error) %s the `default_nettype directive cannot occur inside a module, interface, or package.

Feedback

### Description

This error message occurs because when using the `default_nettype directive, it must be placed outside the scope of a module declaration as shown in the following example.

```
`default_nettype wand

   module top;
   endmodule
```

The following example shows an invalid use of the `default_nettype directive.

```
module top;
    `default_nettype wand
   endmodule
```

### What Next

Remove any `default_nettype directives from within module bodies. Ensure that the desired default net type is in effect from a directive outside the module body.

---

## VER-904

(error) %s The `ifdef directive must have an identifier name after it.

### Description

This error message occurs when the token following an `ifdef directive is not an identifier name. A common mistake is to use a literal constant after the `ifdef.

The following is a example of the valid use of an `ifdef directive.

```
`ifdef SYNTHESIS
`endif
```

This is an example of an invalid use of the `ifdef directive, which generates this error message.

```
`ifdef 5
`endif
```

### What Next

Correct your design so that the `ifdef directive is used with a valid identifier, and then run the command again.

---

## VER-905

(error) %s The `else directive was found without a corresponding `ifdef directive.

Feedback

### Description

This error message occurs when an `else directive is found without a corresponding `ifdef directive. Two common causes of this error message are that the corresponding `ifdef either does not exist, or that the `ifdef is not followed by an identifier name.

The following is an example of an `else directive without a corresponding `ifdef directive.

```
`else
`endif

// the `ifdef is missing
```

This is an example of an `ifdef directive without the following identifier name.

```
`ifdef
`else
`endif

// the `ifdef exists, but no identifier name follows it
```

This is an example of the correct use of an `else directive.

```
`ifdef SYNTHESIS
// ...

`else
// ...

`endif
```

### What Next

Correct the design so that the `ifdef, `else, and `endif directives are matched, and then run the command again.

---

## VER-906

(error) %s The `endif directive was found without a corresponding `ifdef directive.

### Description

This error message occurs when the `endif directive is found without a corresponding `ifdef directive. Two common causes of this error message are that the corresponding `ifdef either does not exist, or that the `ifdef is not followed by an identifier name.

The following is an example of an `endif directive without a corresponding `ifdef directive.

```
`endif

// the `ifdef is missing
```

Feedback

This is an example of an `ifdef directive without the following identifier name.

```
`ifdef
`endif

// the `ifdef exists, but no identifier name follows it
```

This is an example of the correct use of an `endif directive.

```
`ifdef SYNTHESIS
// ...

`endif
```

**What Next**

Correct the design so that the `ifdef and `endif directives match, and then run the command again.

---

## VER-907

(error) %s The `timescale directive was used incorrectly.

**Description**

This error message occurs when the syntax of the `timescale directive is incorrect.

The correct syntax of the `timescale directive is shown below.

```
`timescale time_unit / time_precision
```

The following is example of the correct use of the `timescale directive.

```
`timescale 1 ns / 1 ps
```

The `timescale directive has no effect on synthesis.

**What Next**

Correct the directive to use a valid timescale. Consult the IEEE 1364 standard for valid values. After making your changes, run the command again.

---

## VER-908

(error) %s The `unconnected_drive directive requires pull1 or pull0 to be used.

**Description**

This error message occurs when either the `unconnected_drive directive is used without either pull1 or pull0.

Feedback

The following example shows the correct use of the `unconnected_drive directive.

```
`unconnected_drive pull1
```

This directive has no effect for synthesis.

**What Next**

Correct the `unconnected_drive directive to use either use pull0 or pull1 and then run the command again.

---

## VER-909

(error) %s The `default_nettype directive requires a valid wire type or 'none'.

**Description**

This error message occur when using the `default_nettype directive, without specifying a valid wire type or 'none'. The following list shows the valid wire types.

```
wire      tri         tri0
wand      triand      tri1
wor       trior       trireg
```

This example shows a valid use of the `default_nettype directive with the wand wire type.

```
`default_nettype wand
```

When the `default_nettype is set to 'none', all nets must be explicitly declared.

**What Next**

Correct the `default_nettype directive to use a valid wire type or 'none' and then run the command again.

---

## VER-910

(error) %s macro calls are nested too deeply.

**Description**

This error message occurs when there are too many nested macro calls. There is a limit to the amount of nesting that can occur in macro calls. The following is an example of a nested macro call.

```
`a( `b( `c( ... ) ) )
```

The Verilog standard sets the nesting limit to 50 levels, although the compiler may support more levels.

Feedback

### What Next

Recode your design to reduce the nesting of macro calls and then run the command again.

---

## VER-911

(error) %s The '`define' directive must have an identifier name after it.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it finds that the token following an `define directive is not an identifier name. A common mistake is to use a literal constant, which the following example shows:

```
`define 0 5
`endif
```

The following example shows a valid use of `define.

```
`define ZERO 0
`endif
```

### What Next

Correct any errors like this in your code.

---

## VER-912

(error) %s The macro specified with the '`define' directive has a bad parameter list.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters a `define directive that specifies a macro that in turn takes parameters, and the parameters are not a list of identifier names.

The following example generates this error message.

```
`define NOT(0) ~X
```

### What Next

Be sure that any macro you specify with a `define directive has a valid parameter list of identifier names.

---

## VER-913

(error) %s The macro '%s' has not been defined.

Feedback

### Description

This message occurs when an attempt is made to use a macro that has not been previously defined. An example of this error is:

```
module top (out);
        output out;

        assign out = `UNDEFINED_MACRO;
endmodule
```

### What Next

Either define the macro, correct the macro reference to refer to a defined macro, or remove the macro invocation. After making your changes, rerun the command.

---

## VER-914

(error) %s End-of-file found before `endif found.

### Description

This message occurs when an `ifdef or `ifndef compiler directive is not closed with a corresponding `endif compiler directive.

### What Next

Insert an `endif to close the `ifdef or `ifndef.

---

## VER-915

(error) %s Syntax error in system timing check at token '%s'.

### Description

Standard Verilog system timing checks can be grouped into those ($setup, $hold, $setuphold, $recovery, $removal, $recrem) that use a stability window and those ($skew, $timeskew, $fullskew, $period, $width, $nochange) that are for clock and control signals.

Although the syntax looks like system task enables, the Verilog standard makes clear that these timing checks are not actual system task enables.

This error is issued when an actual system task enable is encountered where a system timing check is expected.

### What Next

Modify the code to use standard system timing check syntax.

Feedback

## VER-916

(error) %s '%s' is a system function and not a system task.

### Description

You receive this error when a system function call is used as a statement instead of as an expression. Often this is an indication that the value of the system function call is being inadvertently thrown away.

```
module m ;
 always
   $random() ;
endmodule
```

### What Next

If you really do not wish to use the return value, you could assign it to a dummy variable that will not be used or wrap the system function call in a dummy if statement.

```
module m ;
 always
   if ($random()) ;
endmodule
```

## VER-917

(error) %s The 'inout' port '%s' is incompatibly declared as 'real'.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters an inout port declared a real type, which is invalid.

### What Next

Correct any errors like this in your code.

## VER-918

(error) %s The 'inout' port '%s' is incompatibly declared as 'reg'.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters an inout port declared a register type (reg), which is invalid.

Feedback

### What Next

Correct any errors like this in your code.

---

## VER-919

(error) %s The 'input' port '%s' is incompatibly declared as 'real'.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters an input port declared a real type, which is invalid.

### What Next

Correct any errors like this in your code.

---

## VER-920

(error) %s The 'input' port '%s' is incompatibly declared as 'reg'.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters an input port declared a register type (reg), which is invalid.

### What Next

Correct any errors like this in your code.

---

## VER-921

(warning) %s The macro '%s' you are attempting to undefine with the '`undef' directive is not defined.

### Description

When using the '`undef' directive to undefine a macro, it must be defined. For example, the following examples would result in error messages:

```
`define CAT
    `undef KAT

    `define MY_MACRO
    `undef MY_MACRO
    `undef MY_MACRO
```

Feedback

**What Next**

Examine the code to see if perhaps the name of the macro has been misspelled, the `undef occurs twice, or the macro never got defined.

---

## VER-923

(error) %s A valid identifier must follow the '`undef' directive.

**Description**

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it finds that the `undef directive lacks the required identifier.

The following example shows an instance of an invalid statement (0 is not a valid identifier):

```
`undef 0
```

**What Next**

Correct any instances of this type by replacing an invalid identifier with a valid one.

---

## VER-924

(error) %s Newline in argument list of `define %s.

**Description**

This error message occurs when the `define directive's argument list contains a new line. All parameters of a macro and its definition must occur on the same line.

**What Next**

Remove the newline, or if the newline is part of a formal argument's default text, use a backslash character (\\) immediately before the newline as an escape.

---

## VER-925

(error) %s Input files nested too deep '%s'.

**Description**

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it finds that input source files are nested too deeply, using the `include directive in Verilog.

When this happens, the message is generated.

Feedback

### What Next

Reduce the number of nested input files to a workable amount.

---

## VER-926

(error) %s The '`include' directive requires a filename enclosed in double quotes.

### Description

When using the `include directive to input another file, you must provide the filename enclosed in double quotation marks, as shown in the following example:

```
`include "my_include.h"
```

### What Next

Be sure to use double quotation marks when using the `include directive in this way.

---

## VER-927

(error) %s The number of parameters for the '%s' macro doesn't match its definition.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it finds that the number of parameters you pass to a macro does not match the number of parameters specified by the macro definition.

The following example shows such an error:

```
`define ADD(A,B) A+B

module top (IN, OUT);
        input IN;
        output OUT;

        assign OUT = `ADD(IN);
endmodule
```

### What Next

Correct any errors like this in your code.

---

## VER-929

(error) %s The input file %s specified by the '`include' directive cannot be recursive.

Feedback

### Description

This message occurs when the file specified by an '`include' directive contains an '`include' directive to the current file or to another file that has one or so on. The Verilog language standard expresses it as: "A file included in the source using the `include compiler directive may contain other `include compiler directives. The number of nesting levels for include files shall be finite."

### What Next

Remove one of more of the `include directives from the files, or wrap the contents of the included file in an `ifndef. For example,

```
`ifndef SEEN_HEADER_VH
  `define SEEN_HEADER_VH
     < the original contents of file >
  `endif
```

---

## VER-930

(error) %s System function %s has been defined.

### Description

This is a syntax error.

### What Next

Change the relevant code to conform to the IEEE Std 1364.

---

## VER-931

(error) %s System task %s has been defined.

### Description

This may be a syntax error.

### What Next

This message is no longer issued.

---

## VER-932

(error) %s '%s' is a system task and not a system function.

Feedback

### Description

This message is issued when a system task enable is used as an expression, that is, when it used as if were a system function call and had a return value. For example,

```
module m ( output reg o ) ;
         always o = $display("Hello, world") ;
      endmodule
```

### What Next

Modify code as appropriate.

---

## VER-933

(error) %s The '%s' system call should not have parentheses unless it has at least one parameter.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters invalid parentheses. In Verilog, when calling a system task or system function, if the task or function does not take parameters, you cannot have empty parentheses in the code.

The following example illustrates an invalid use of parentheses:

```
assign Q = $time();
```

Because $time takes 0 parameters, you must omit the parentheses, as shown here:

```
assign Q = $time;
```

### What Next

Correct any invalid instances like this in your code.

---

## VER-934

(information) %s The imported name '%s' is %svisible to clients of this package.

### Description

This information message issues for every name imported into the most global scope of a package declaration. It indicates whether or not the prevailing SystemVerilog dialect makes this name visible to the package's clients.

Feedback

### What Next

Because early SV implementations differ on this aspect of the *import* statement, you may need to adjust the setting of *hdlin_sv_packages* to bring the set of exported names into agreement with other tools in the flow which use your package. The reported visibility is final; settings of hdlin_sv_packages at the time that clients refer to this package will have no effect on which of its names will be (in)visible.

### See Also

- VER-20

---

## VER-935

(error) %s Identifier name '%s' has not been declared.

### Description

This error is issued when the name of a variable is used before it has been declared.

### What Next

This error is no longer issued.

---

## VER-936

(warning) %s the undeclared symbol '%s' assumed to have the default net type, which is '%s'.

### Description

The Verilog standard says that if no explicit declaration is given for an identifier and the identifier is not in the scope of a '`default_nettype none' compiler directive, then it shall be assumed to be implicitly declared as a net of the default net type, which is 'wire' unless overridden with the `default_nettype compiler directive. Specifically, this is assumed for undeclared identifiers used in a port expression declaration, for undeclared identifiers used in the terminal list of a primitive instance or a module instance, and, in Verilog 2001, for undeclared identifiers that appear on the left-hand side of a continuous assignment statement.

### What Next

Check your design to make sure that you intended an implicit declaration for this symbol. If not, add an explicit declaration.

Feedback

## VER-937

(warning) %s Invalid argument for system function or task %s ignored.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-938

(warning) %s Missing expected argument for system function or task %s.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-939

(warning) %s The '%s' directive is not supported and will be ignored.

**Description**

This message is issued when a compiler directive is encountered that is not currently supported. The result is that the directive is just ignored. For example,

```
`delay_mode_unit
```

**What Next**

No action is necessary.

## VER-940

(error) %s Implicit wire declaration inside .%s port connection.

**Description**

The System Verilog standard says that a .port_identifier connection is semantically equivalent to the named port connection .port_identifier(port_identifier), with the exception that it creates an implicit wire declaration. This error message occurs because your code is attempting to create such a wire.

Feedback

### What Next

Modify your design, either by writing the full name of the port connection, or by declaring the wire before the instantiation.

---

## VER-941

(warning) %s Invalid escape sequence '\\%c' in call to '%s'.

### Description

When using '$display' (or similar) this message is issued when the format specifier contains an invalid escape sequence for printing special characters.

```
$display("Hello, \\zWorld.") ;
```

### What Next

Rewrite the format specifier to use a valid escape sequence.

---

## VER-942

(warning) %s Unescaped Verilog-2001 keyword '%s' used as identifier.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when you use one of the identifiers 'design', 'instance' or 'cell', which are reserved keywords in Verilog-2001, without escaping it. In future releases, this restriction will be enforced as a syntax error.

### What Next

Either modify the code, so that it doesn't use a keyword without escaping it, or disable Verilog 2001 features by setting hdlin_vrlg_std to 1995.

---

## VER-943

(error) %s Implicit net declaration for '%s' prohibited by '`default_nettype none' compiler directive.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when a net is implicitly declared within the scope of a '`default_nettype none' compiler directive.

Feedback

### What Next

Modify the code, so that either the net is explicitly declared or its implicit declaration is not in the scope of a '`default_nettype none' compiler directive.

---

## VER-944

(warning) %s A unnamed generate block with an LRM-defined name '%s' is detected, which is incompatible with Verilog standard 2001 or 1995.

### Description

This warning message is issued by the Presto HDL Compiler when running the *analyze* or *read* command and there is a unnamed generate block, which is not a scope in Verilog standard 2001 or 1995, but it is a scope in Verilog standard 2005 with an LRM-defined name attached.

For example:

```
17  generate
18    if (1) begin
19      sub u1 (a[1], b[1], clk, y[1]);
20    end
21  endgenerate
```

In Verilog standard 2005, the unnamed generate-if block at line 18 is a scope and will be assigned an LRM-defined name; for example 'genblk1'. The instance u1 within the generate block can be referred as 'genblk1.u1'; in Verilog standard 2001, the unnamed generate block is not a scope, and the u1 instance will be referred as 'u1'.

The Verilog standard 2005 is not backward compatible with Verilog standard 2001 or 1995. It is not recommended to read in designs with mixing Verilog standards.

### What Next

Make sure all of your designs are compiled under the same Verilog standard setting, for example 2005, and all the object names referred to in your scripts are consistent with the Verilog standard you are using.

It is considered best practice to attach a name to the unnamed generate block to prevent possible naming incompatibility issues caused by the different standard versions.

---

## VER-945

(warning) %s Potential simulation/synthesis mismatch on obsolete Verilog-2001 construct %s.

Feedback

### Description

This warning message occurs because you are using an obsolete construct that is now enforced as a SystemVerilog syntax error. Standalone generate blocks were allowed in the old Verilog-2001 standard (IEEE Std 1364-2001), but were later prohibited by the Verilog-2005 standard (IEEE Std 1364-2005). This prohibition was inherited by the SystemVerilog standards (IEEE Std 1800-2005 and IEEE Std 1800-2009).

For example:

```
17  generate
18    begin
19      sub u1 (a[1], b[1], clk, y[1]);
20    end
21  endgenerate
```

The standalone generate block on lines 18-20 was legal in Verilog-2001, but is illegal in Verilog-2005 and SystemVerilog.

### What Next

This is only a warning message. No action is required.

However, to avoid this message rewrite the code to remove the *begin* and *end* keywords.

---

## VER-946

(error) %s Syntax error on an obsolete Verilog 2001 construct %s.

### Description

This error message occurs when you use an obsolete Verilog 2001 construct standalone generate block. Standalone generate blocks were allowed in the old Verilog-2001 standard (IEEE Std 1364-2001), but were later prohibited by the Verilog-2005 standard (IEEE Std 1364-2005). This prohibition was inherited by the SystemVerilog standards (IEEE Std 1800-2005 and IEEE Std 1800-2009).

For example, an anonymous standalone block:

```
17  generate
18    begin
19      sub u1 (a[1], b[1], clk, y[1]);
20    end
21  endgenerate
```

For example, a named standalone block:

```
22  generate
23    begin:BLK
24      sub u1 (a[1], b[1], clk, y[1]);
```

Feedback

```
25    end
26  endgenerate
```

The standalone generate blocks on lines 18-20 and 23-25 were legal in Verilog-2001, but are illegal in Verilog-2005 and SystemVerilog.

For example, the following named generate block is legal, beacause it is part of a conditional generate construct:

```
27  generate
28    if (P==0) begin:BLK
29      sub u1 (a[1], b[1], clk, y[1]);
30    end
31  endgenerate
```

In the final example, it would have been legal to omit the generate block name, but in Verilog-2001 the instance could have been referred to from outside of the conditional generate, but in Verilog-2005 and SystemVerilog it could not. It is recommended to give names to all generate blocks.

**What Next**

Rewrite the code to remove the *begin* and *end* keywords.

---

## VER-951

(error) %s The destination of a procedural continuous assignment must not be an array reference, bit select, or part select.

**Description**

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters an invalid destination for a procedural continuous assignment. The destination must not be an array reference, bit select, or part select.

Eiher of the procedural continuous assignments in the following example causes this error.

```
module foo (A, B);
        output [1:0] A;
        input B;
        reg [1:0]A;
        reg C[1:0];

always
begin
        assign  A[1] = B;       // This is an error.
        assign  C[1] = B;       // This is an error.
end

endmodule
```

Feedback

### What Next

Correct any similar invalid instances in your code and then run the command again.

---

## VER-952

(error) %s Assigment to '%s' requires that it be a register.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters assignments that are not registers but should be.

In the following example, *a* and *c* should be registers.

```
always
begin
        a = b;
        c = d;
end
```

### What Next

Redefine the assignments as registers.

---

## VER-953

(error) %s Deassigning argument '%s' requires that '%s' be a register.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters a value for a deassignment that is not a register.

The code in the following example causes the error because *B* is not a register type:

```
module foo (A, B);
        input A;
        output B;

always
        deassign B;
endmodule
```

### What Next

Change the value of the deassignment to a register.

Feedback

## VER-954

(error) %s The register symbol '%s' has already been defined.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters a register defined twice in the code. It is illegal to define a register twice.

The code in the following example generates this error:

```
module foo;
        reg C;
        reg C;
endmodule
```

### What Next

Correct the code so that it defines a register once only.

## VER-955

(error) %s Assigning to output '%s' requires that it be a register.

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters assignments that should be registers.

In the following example, *a* and *c* should be registers:

```
always
begin
        assign a = b;
        assign c = d;
end
```

### What Next

Redefine the assignments as registers.

## VER-956

(error) %s The symbol '%s' is not defined.

Feedback

### Description

The Presto HDL Compiler issues this error message during execution of the *analyze* or *read* command when it encounters the use of a symbol or variable that has not been defined.

For example, the code in the following example generates the error:

```
module foo (A);
        input A;

always
        undefined = A;
endmodule
```

### What Next

Define the symbol or variable.

---

## VER-957

(error) %s Too many delay values supplied in the delay list.

### Description

When specifying the delay of gates, you cannot supply more delay values than the gate supports.

For example, the following code attempts to instantiate a buffer:

```
module foo (A, B);
        input A;
        output B;

        buf # (0, 1, 2, 3, 4, 5) (B,A);
endmodule
```

The buf gate uses only 2 delay values, so providing 6 delay values is an error.

### What Next

To correct the above example, the code should read as follows:

```
module foo (A, B);
        input A;
        output B;

        buf # (0, 1) (B,A);
endmodule
```

Feedback

## VER-958

(error) %s The triggered named event '%s' has not been declared.

### Description

This error is issued whenever the named event to be triggered on has not been declared. (NOTE: Event triggers are not supported by synthesis.)

For example,

```
module m;
     always
       begin
                -> nonexistent ;
       end
   endmodule
```

generates an error because the event 'nonexistent' has not been defined.

### What Next

Add an 'event' declaration to declare the named event, and wrap the event trigger with "`ifndef SYNTHESIS ... `endif" to avoid a VER-193 error.

For example,

```
module m;
     event nonexistent ;
     always
       begin
       `ifndef SYNTHESIS
                -> nonexistent ;
       `endif
       end
   endmodule
```

## VER-959

(error) %s The triggered event '%s' not declared as an event.

### Description

This error is issued when the event name to be triggered was declared as some type other than 'event'. (NOTE: Event triggers are not supported by synthesis.)

For example,

```
module foo;
     reg nonevent;
     always
        begin
```

Feedback

```
                -> nonevent ;
        end
      endmodule
```

generates an error because the name 'nonevent' has been declared as a 'reg' instead of an event.

**What Next**

Modify the declaration be an 'event' declaration, and wrap the event trigger with "`ifndef SYNTHESIS ... `endif" to avoid a VER-193 error.

For example,

```
module m;
     event nonevent ;
     always
       begin
       `ifndef SYNTHESIS
                -> nonevent ;
       `endif
       end
   endmodule
```

## VER-960

(error) %s Lack of register declaration requires combinational primitive.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

## VER-961

(error) %s Register declaration '%s' supported only for output.

**Description**

This is a syntax error.

**What Next**

Change the relevant code to conform to the IEEE Std 1364.

Feedback

## VER-962

(error) %s Existence of register declaration requires sequential primitive.

### Description

This is a syntax error.

### What Next

Change the relevant code to conform to the IEEE Std 1364.

## VER-963

(error) %s Illegal part select of memory '%s'.

### Description

In Verilog, it is illegal to index a slice of a memory using a part select. The following example illustrates a part select of a memory that results in this error message.

```
module foo;
     reg [10:0] mem [10:0];
     reg [10:0] temp [3:0];

     always
        temp[3:0] = mem[3:0];
   endmodule
```

### What Next

Rewrite this part of your design with a looping construct. Or, if available, read the file as SystemVerilog, in which it is legal to index a slice of a memory with a part select.

## VER-964

(error) %s Port '%s' incompatibly declared as scalar and vector.

### Description

You get this message when the width declarations for a port are inconsistent. For example,

```
module m(dataout);
    output dataout;
    reg [2:0] dataout;
    endmodule
```

Feedback

### What Next

Modify the declarations to be consistent with each other. Usually, but not necessarily, this entails adding vector range information to the scalar declaration.

---

## VER-965

(error) %s Premature end-of-file encountered in a '%s' block begun at line %d.

### Description

This message, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered a block of code that does not have its terminating token. For example, a *module* that has no *endmodule* or a comment that begins with '/*' but has no '*/' to terminate it.

### What Next

Review your code to locate such missing tokens and insert them.

---

## VER-966

(error) %s Procedural-continuous assignments are not supported by synthesis.

### Description

This message, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered a procedural-continuous assignment. Synthesis ignores such assignments.

The following example illustrates a procedural-continuous assignment, assign B = A, that synthesis ignores:

```
module foo (A, B);
        input A;
        output B;
        reg B;

always
        assign B = A;      //  this is a procedural-continuous
 assignment.

endmodule
```

### What Next

Because synthesis ignores procedural-continuous assignments, consider removing them if the code is intended for synthesis only.

Feedback

## VER-967

(error) %s The 'force' construct is not supported by synthesis.

### Description

This message, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered a force construct. Synthesis ignores such constructs.

The following example illustrates a force construct, force B, that synthesis ignores:

```
module foo (B);
        output B;
        reg B;

always
        force B = 1'b1;           // force is not supported

endmodule
```

### What Next

Because synthesis ignores force constructs, consider removing the force construct if the code is intended for synthesis only.

## VER-968

(error) %s The 'release' construct is not supported by synthesis.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered a release construct. Synthesis ignores such constructs.

The following example illustrates a release construct, release B, that synthesis ignores:

```
module foo (B);
   output B;
   reg B;

always
        release B;        // release is not supported

endmodule
```

### What Next

Because synthesis ignores release constructs, consider removing the release construct if the code is intended for synthesis only.

Feedback

## VER-969

(error) %s The 'deassign' construct is not supported by synthesis.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered a deassign construct. Synthesis ignores such constructs.

The following example illustrates a deassign construct, deassign B, that synthesis ignores:

```
module foo (B);
   output B;
   reg B;

always
   deassign B;          // deassign is not supported

endmodule
```

### What Next

Because synthesis ignores deassign constructs, consider removing the deassign construct if the code is intended for synthesis only.

## VER-970

(warning) %s The delay specification for gate instantiation is ignored.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered a delay information for gate instantiation. Synthesis ignores such a delay specification.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
   input A,B;
   output C;
   and #(1,2) (C,A,B);
endmodule
```

### What Next

Because synthesis ignores delay information on gate instantiation, consider removing the delay information if the code is intended for synthesis only.

Feedback

## VER-971

(warning) %s The delay specification for tri-state gate instantiation is ignored.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered delay information for a tri-state gate instantiation. Synthesis ignores such delay information.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
   input A,B;
   output C;
   bufif0 #(1,2) (C,A,B);
endmodule
```

### What Next

Because synthesis ignores delay information on tri-state gate instantiation, consider removing the delay information if the code is intended for synthesis only.

## VER-972

(warning) %s The delay specification for mos switch instantiation is ignored.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto HDL Compiler has encountered delay information for a mos switch instantiation. Synthesis ignores such delay information.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
   input A,B;
   output C;
   nmos #(1,2) (C,A,B);
endmodule
```

### What Next

Because synthesis ignores delay information for mos switch instantiation, consider removing the delay information if the code is intended for synthesis only.

## VER-973

(warning) %s The delay specification for cmos switch instantiation is ignored.

Feedback

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto compiler has encountered delay information for a cmos switch instantiation. Synthesis ignores such delay information.

The following examples illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C,D);
   input A,B,C;
   output D;
   cmos #(1,2) (D,A,B,C);
endmodule
```

### What Next

Because synthesis ignores delay information on a cmos switch instantiation, consider removing the delay information if the code is intended for synthesis only.

---

## VER-974

(warning) %s The delay specification for bi-directional switch instantiation is ignored.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the Presto compiler has found delay information for a bidirectional switch instantiation. Synthesis ignores such delay information.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
   input C;
   inout A,B;
   tranif0 #(1,2) (A,B,C);
endmodule
```

### What Next

Because synthesis ignores delay information on bidirectional switch instantiation, consider removing the delay information if the code is intended for synthesis only.

---

## VER-975

(warning) %s The delay specification for pull gate instantiation is ignored.

### Description

This warning, issued during execution of the *analyze* or *read* command, indicates that the compiler has found a delay specification for a pull gate instantiation.

Feedback

The following example illustrates a delay specification, #(1), that synthesis ignores:

```
module foo (A);
        output A;
        pullup #(1) (A);
endmodule
```

**What Next**

Because synthesis ignores delay specifications on pull gate instantiations, consider removing the delay specification if the code is intended for synthesis only.

---

## VER-976

(warning) %s The delay specification for net declaration is ignored.

**Description**

This warning, issued during execution of the *analyze* or *read* command, indicates that the compiler has found a delay specification in a net declaration.

The following example illustrates a delay specification, #(1), that synthesis ignores:

```
module foo;
        wire #(1) w;
endmodule
```

**What Next**

Be aware that synthesis ignores delay specifications on nets. If the code is intended for synthesis only, consider removing the delay specification.

---

## VER-977

(warning) %s The strength specification for a net declaration is ignored by synthesis.

**Description**

This warning, issued during execution of the *analyze* or *read* command, indicates that the compiler has found a strength specification in a net declaration.

**What Next**

Be aware that synthesis ignores strength specifications on nets. If the code is intended for synthesis purposes only, consider removing the strength specification.

---

## VER-978

(error) %s Ambiguous genvar ('%s') used in generate loop statement.

Feedback

### Description

You receive this error message because the two genvar assignments used in a generate loop specification must have the same genvar on the left hand sides. For example:

```
generate
     for (i=0; i<5; j=i+1)      // 2 different genvars "i" and "j" used
     ....
   endgenerate
```

### What Next

Change the generate loop so that the same genvar is used on the left side of both assignments, and then run the command again.

### See Also

- read_verilog

---

## VER-979

(error) %s Two nested generate loops using the same genvar '%s'.

### Description

You receive this error message because the same genvar is used as loop index by two nested generate loops. According to the language standard, using the same genvar by two nested generate loops is not allowed. The situation is demonstrated by the following example:

```
generate
  for (i=0; i<5; i=i+1) // genvar 'i' as index
    for (i=1; i<4; i=i+1) //ERROR: nested loop using the same genvar 'i'
 as index
  ....
endgenerate
```

### What Next

Rewrite one of the generate loops to use a different genvar as index.

### See Also

- read_verilog

---

## VER-980

(error) %s Illegal assignment to genvar '%s'.

Feedback

### Description

You receive this error message because the design contains an assignment to a genvar outside of a generate loop header. The value of genvars can only be defined by assignments inside generate loop headers. For example:

```
generate
     for (i=0; i<5; i=i+1) // only valid assignments to genvar 'i'
     ...
     i = 5;  // ERROR: invalid assignment to genvar 'i'
     ...
   endgenerate
```

### What Next

Rewrite the RTL description so that genvars are only assigned values inside the generate loop headers.

### See Also

- read_verilog

---

## VER-981

(error) %s Macro definition is recursive '%s'.

### Description

The Presto HDL Compiler issues this error message when a recursively defined macro is called while executing the *analyze* or *read* command.

Macros are defined using the define directive in Verilog.

### What Next

Redefine the macro to eliminate all self-references, including indirect self-references occurring in the definitions of other macros.

---

## VER-982

(error) %s The '`elsif' directive was found without a corresponding '`ifdef' directive.

### Description

You receive this error message when the `elsif directive is found with no corresponding `ifdef. The `ifdef might not exist, or the `ifdef might not be followed by an identifier name.

Feedback

The following is an example of a missing `ifdef:

```
`elsif SYNOPSIS_SYNTHESIS
`else
`endif

// the `ifdef is missing
```

The following shows an example of an `ifdef without an identifier name:

```
`ifdef
`elsif SYNOPSYS_SYNTHESIS
`else
`endif

// the `ifdef exists, but no identifier name follows it
```

### What Next

Correct the `elseif directive so it includes the `ifdef directive as shown in the example:

```
`ifdef SOMETHING_ELSE
// ...

`elsif SYNOPSYS_SYNTHESIS
// ...

`else
// ...

`endif
```

### See Also

- read_verilog

---

## VER-983

(error) %s The "`ifndef' directive must have an identifier name after it.

### Description

The tool issues this error message when the token following an `ifndef directive is not an identifier name. A common mistake is using a literal constant.

The following example shows an invalid identifier name, resulting in this error message.

```
`ifndef 5
`endif
```

Feedback

### What Next

Correct the identifier name after the `ifndef directive, as shown in the following example:

```
`ifndef SYNOPSYS_SYNTHESIS
`endif
```

### See Also

- read_verilog

---

## VER-984

(error) %s The '`elsif' directive must have an identifier name after it.

### Description

The tool issues this error message because the token following an `elsif directive is not an identifier name. A common mistake is using a literal constant.

The following example shows an invalid identifier name, resulting in this error message.

```
`elsif 5
```

### What Next

Correct the identifier name after the `elsif directive, as shown in the example of a valid `elsif:

```
`elsif SYNOPSYS_SYNTHESIS
```

### See Also

- read_verilog

---

## VER-985

(warning) %s The '`line' directive requires a %s.

### Description

You receive this warning message because the Verilog `line compiler directive cannot find the expected arguments.

The expected arguments are a nonnegative decimal number, a double-quoted string, and a level of 0, 1, or 2.

### What Next

No action is required on your part.

Feedback

## VER-986

(warning) %s Empty port in %s declaration.

### Description

You receive this warning message when the port list for a module, interface, primitive, or checker is empty, with no local name by which to form connections between its body and the instantiation site.

### Examples

The following legal Verilog statement indicates a module with four ports, the last of which is unconnected.

```
...
   module m( a,b,c,);   /* Legal, but perhaps not intended */
   ...
```

### What Next

This is a warning message only. No action is required on your part.

However, if the unconnected port is not your intention, remove a comma and then run the command again.

## VER-987

(warning) %s Port %s is implicitly typed

### Description

The port warned has been declared previously with a different type.

**Verilog**

```
module test ( ..., dataout);
output dataout;
reg [2:0] dataout;
```

Here dataout has been previously declared as one-bit, and later on declared as [2:0]. This may cause simulation, synthesis and formal verification mismatch due to the different interpretation in different tools as what's type of dataout.

### What Next

Change your Verilog source code to remove the inconsistent declaration for the port.

Feedback

## VER-988

(information) %s List () of one, unnamed, port is ignored.

### Description

This informational message issues when the port list of a module or interface declaration is entirely empty. The IEEE standards have always said this indicates one unconnected port, but legacy implementations all dissented; like them, we produce zero ports. The resulting module is the same as that produced when the empty parentheses are omitted. It will match an unresolved instantiation in which the parentheses are provided (as required!) and the list of port connections is similarly empty.

### Examples

The following Verilog statement declares a module with zero ports, not one.

```
module m( );   /* Ambiguous intention */
   ...
   endmodule
```

### What Next

This is an informational message only. No action is required on your part, unless the module has trouble linking to instances which supply one port.

If your intention is to produce one port which cannot be used within the module, use the syntax for a named port but omit the port_expression.

```
module m( .Port1() );   /* The explicit name matches the port's implicit
 name */
   ...
   endmodule
```

## VER-999

(error) %s Only simple identifiers are allowed in pragma signal list.

### Description

You receive this error message when the pragma signal list contains expression list or non-simple identifiers.

### Examples

The following verilog code won't work as identifier associated with pragam is not an simple identifier.

```
// synopsys sync_set_reset "reset[0]"

  reg y ;
```

Feedback

```
always @ (posedge clk)
begin : synchronous_reset
if (reset[0])
y = 1'b0;
else
y = d1;
end
```

**What Next**

Use a wire and replace non-simple identifier.

---

## VER-1000

(warning) The hdlin_enable_presto variable will be ignored in a future release.

**Description**

The HDL Compiler (Presto Verilog) tool was introduced as the default Verilog reader in the 2001.08 release. In a future release, you will no longer be able to disable it using the *hdlin_enable_presto* variable.

**What Next**

Remove the *hdlin_enable_presto* variable from your scripts.

---

## VER-1003

(warning) %s attribute of interface port %s is ignored.

**Description**

The port is interface and has atttribute_instance.

```
module test (output reg out,
           (*eco_dont_tap*) clientIF.fifoMod   cIF [2], ...);
         sub inst (out, ...);
       endmodule
```

Attribute "eco_dont_tap" will be ignored, because "clientIF" is interface.

---

## VER-1004

(warning) %s Net %s connected to instance %s is declared as reg data type but is not driven by an always block.

Feedback

### Description

The net connected to the instance is not driven by an always block but is declared as reg data type.

```
module test (output reg out, ...);
         sub inst (out, ...);
       endmodule
```

You should use sequential statements to assign values to nets with reg data type. Using continuous assignments for nets with reg type is illegal. When HDL Compiler finds no explicit driver from sequential statements and the net is connected to instances, the net is likely to be driven by an instance. In Verilog, a connection to an output port of an instance is a continuous assignment, so the tool issues a warning because it is illegal in Verilog to connect a net of reg type.

### What Next

Remove the inconsistent declaration of the net in the source code, or re-analyze the design as SystemVerilog because a continuous assignment to a variable is legal in SystemVerilog.

---

## VER-1005

(warning) %s Port %s of type input is being assigned.

### Description

The port of type input is being assigned.

**Verilog**

```
module test ( ..., datain);
input datain;
assign datain = ...;
```

The port of type input has been assigned. This may cause simulation, synthesis and formal verification mismatch due to the different interpretation in different tools as what's type of dataout.

### What Next

Change your Verilog source code to remove the inconsistent declaration for the port.

---

## VER-1006

(error) %s Entity of architecture '%s' cannot be found.

Feedback

**Description**

This error message occurs during an *analyze* or *read* command activity if the entity of an architecture cannot be found.

**What Next**

Ensure the desired entity exists and has been specified correctly. Check if there are any unsupported embedded configurations inside the architecture.

---

## VER-1007

(error) %s Only one event control allowed on always_ff block.

**Description**

You receive this error message because SystemVerilog does not support multiple event statements on an always_ff block.

**What Next**

Change the source code to remove the use of multiple events in the always_ff block.

---

## VER-1008

(error) %s Incompatible DW encrypted file %s, the encrypted file is version %s, only version lower than or equal to %s can be read by the current DC.

**Description**

This error message occurs when the tool detects that there is an incompatible version of an encrypted DW file.

**What Next**

You need another version of DC to read the file.

---

## VER-1009

(error) %s No delays are allowed on an always_ff, always_comb or always_latch block.

**Description**

You receive this error message because SystemVerilog does not support delays on an always_ff, always_comb or always_latch block.

Feedback

### What Next

Change the source code to remove the use of delays in the always_ff, always_comb or always_latch block.

---

## VER-1010

(error) %s Variable input port '%s' is being assigned.

### Description

This error message occurs when SystemVerilog adds variable input ports. In Verilog, there were two kinds of output ports, net output ports and variable output ports, but only one kind of input port, net input ports.

SystemVerilog added variable input ports. Unlike the net input ports of Verilog, it is not legal to assign to SystemVerilog variable input ports.

```
module test (input logic in1, in2, output out);
  assign in1 = in2;
  assign out = in1;
endmodule
```

### What Next

Change the direction of the variable port or remove the assignment to that port. It is not recommended to assign to a net input port, even though it is legal.

---

## VER-1011

(error) %s Tasks cannot contain event control statements.

### Description

You receive this error message because you have attempted to use an event control statement inside of a task. This is not supported by Presto.

### What Next

Rewrite the source code so that tasks don't contain events.

---

## VER-1012

(error) %s Nonblocking assignments to TASK local variable '%s';

### Description

Nonblocking assignments to static variables declared inside a TASK are not supported in synthesis.

Feedback

```
module ShiftR (Out, In);
output Out;
input In;
reg Out;
always@(In)
     tShift(Out, In );
task tShift(output Q, input D);
      Q <= D ;
endtask
endmodule
```

### What Next

To avoid receiving this error message, do not set the TASK local variable using a nonblocking assignment. You can change the variable as a global variable. The above example can be rewritten as follows:

```
module ShiftR (Out, In);
output Out;
input In;
reg Out;
always@(In)
     tShift(In);
task tShift(input D);
      Out <= D ;
endtask
endmodule
```

---

## VER-1013

(error) Format in VCS command file '%s' is not consistent with the format option '%s' in analyze command.

### Description

Format mentioned in the VCS command file is not consistent with the format argument of analyze command.

### What Next

Remove the format option from the analyze command.

---

## VER-1014

(error) %s Loop index variable '%s' of generate loop not a genvar.

Feedback

### Description

You receive this error message because the loop index variable of a generate loop has not been declared as a genvar. For example:

```
integer i; // integer variable as loop index of a generate loop

   generate
     for (i=0; i<5; i=i+1)
     ...
   endgenerate
```

### What Next

Declare the variable using 'genvar' keyword.

```
genvar i;

   generate
     for (i=0; i<5; i=i+1)
     ...
   endgenerate
```

or

```
generate
     for (genvar i=0; i<5; i=i+1)
     ...
   endgenerate
```

### See Also

- read_verilog

---

## VER-1015

(information) %s %s in encrypted file

### Description

You receive this message because the tool detected an issue in the protected region of the file. You need to contact the IP Vendor to understand and resolve the issue.

---

## VER-1016

(error) %s Error in reading protected envelope - %s %s

Feedback

### Description

You receive this message because the tool was unable to read a protected envelope in the input file. You need to correct any syntax issues in the envelope or contact the IP Vendor to resolve the issue.

---

## VER-1017

(error) %s Option %s is only supported for VHDL.

### Description

You receive this message because the option specified by you is only supported for VHDL. You must un-set the option and rerun the command.

---

## VER-1023

(warning) %s Break statement in multidimensional foreach iterator over '%s' is ambiguous, and terminates the foreach completely.

### Description

You receive this warning message because there are multiple foreach loop index variables and an ambiguous break statement associated with them. For example:

```
logic [3:0] array [0:1];
  logic [3:0] out;

  always_comb begin
   out = '0;
   foreach( array[j,k] ) begin     // j 0->1 then k 3->0
     if( array[j][k] == 1'b1 ) begin
       out[k] = 1;
       break;                    // terminate j or k ??
     end
   end
  end
```

Here the intent is probably to terminate only the inner "k" loop and then continue with the outermost "j" loop, but the actual expected behavior is to terminate the outermost "j" loop and jump out of the foreach.

### What Next

If the intent doesn't match the expected behavior, add a nested foreach with only a single loop variable. For example:

```
logic [3:0] array [0:1];
  logic [3:0] out;
```

Feedback

```
always_comb begin
  out = '0;
  foreach( array[j,] ) begin            // j 0->1
    foreach( array[,k] ) begin          // k 3->0
      if( array[j][k] == 1'b1 ) begin
        out[k] = 1;
        break;                          // terminate inner loop (k)
      end
    end
  end
end
```

## VER-1024

(warning) %s Overriding the same parameter, %s, multiple times.

### Description

You receive this warning message when a parameter is overridden more than once.

### Examples

The following module instantiation will warn on the parameter P being assigned multiple times

```
...
   module top;
     bot#(.P(1), .P(2)) U1(); /* Will be warned on P*/
   endmodule

   ...
```

### What Next

This is a warning message only. No action is required on your part.

However, if the resulting parameter assignment is not what is desired, remove the ambiguity to ensure the right value is being assigned.

## VER-1025

(error) %s Invalid argument within '{}': %s

### Description

Invalid argument given within {}. For example: analyze -format vhdl { -filelist flist.f}

-filelist is an invalid argument.

Feedback

**What Next**

Check if it is a supported argument for the command or misspelled commands

---

## VER-1026

(error) %s Value not specified for the argument in '{}': %s

**Description**

Invalid argument given within {}. For example: analyze -format vhdl {-f}

value not specified for the argument -f in {}.

**What Next**

In case of a name-value pair argument, specify value for the argument.

---

## VER-1051

(warning) %s Cannot redefine higher precedence macro '%s' with value '%s' to '%s'.

**Description**

A higher precedence macro is being redefined with a different value in the RTL code. It might produce unexpected synthesys results if not intended.

**What Next**

If the redefinition was not intended, just rename the macro such that it does not collide with the higher precedence definition. If intended, the define prioritization can be turned off by setting *hdlin_analyze_prioritize_command_line_defines* to *false*.

---

# VHD

---

## VHD-1

(error) %s The library '%s' is not mapped to a directory.

**Description**

This message indicates that you attempted to access a library which does not have a valid directory path associated with it.

Feedback

**What Next**

For information on mapping between design libraries and paths, refer to the *define_design_lib* command manual page. Mapping can also be done via the .synopsys_vss.setup file.

---

## VHD-3

(error) %s You have declared more than one architectures with the same name '%s'.

**Description**

You receive this error message if you have declared more than one architectures with the same name.

The last declared implementation of the architecture will overwrite its previous declared implementations.

**What Next**

Verify that each of the architecture has been assigned a different name.

---

## VHD-4

(warning) %s The architecture %s has already been analyzed. It is being replaced.

**Description**

You receive this warning message if an architecture with the same name has already been analyzed, which occurs if either of the following are true:

- The current analyzed file has already been analyzed.
- An architecture with the same name is declared in another file and has already been analyzed.

The implementation of the architecture is overwritten by the latest declared implementation.

**What Next**

This is only a warning message.

However, you can check the overwritten file. If the result is not what you intended, change the architecture name and then run the command again.

Feedback

## VHD-5

(warning) %s the architecture %s has already been analyzed by a compiler other than Presto HDL. It is being replaced.

**Description**

You receive this warning message if an architecture with the same name has already been analyzed by a compiler other than Presto HDL.

The implementation of the architecture is overwritten by the latest declared implementation.

**What Next**

This is a warning message only. No action is required on your part.

However, you can check the overwritten file. If the result is not what you intended, change the architecture name and then run the command again.

## VHD-6

(warning) %s The entity '%s' has multiple architectures defined. The last defined architecture '%s' will be used to build the design by default.

**Description**

You receive this warning message if there are multiple architectures associated with the same entity. Just one architecture will be chosen to build the design. In PRESTO-VHDL, the last defined architecture will be chosen by default.

**What Next**

Verify if the last defined architecture is what you want to use to build the design.

## VHD-7

(warning) %s Initial values for signals/variables are not supported for synthesis by default. They are ignored.

**Description**

You receive this warning message if the signals/variables have initial values when they are declared. Presto VHDL ignores the initial values and uses the subprogram default value instead. This may cause simulation mismatch.

Feedback

If variables are declared in a function, you can enable the variable initial value support by setting the following switch to true (the default is false):

```
hdlin_support_subprogram_var_init
```

**What Next**

This is only a warning message.

If the subprogram default value is the same as the declared initial value or is acceptable, no action is required.

Otherwise, you can do either of the following:

- Use the *hdlin_support_subprogram_var_init* switch to solve the problem.
- Instead of the initial value, use an explicit assignment to set the initial value.

---

## VHD-8

(information) %s Variable '%s' is being read, but is not initialized. The subprogram default value will be used.

**Description**

You receive this information message from the Presto HDL Compiler when your design contains a variable which is read, but is not yet initialized. The subprogram default value is used.

The subprogram default value can be 0s (as default) or ` (grave accent), which is controlled by the following switch:

```
hdlin_subprogram_default_values
```

**What Next**

This is only an information message. No action is required.

However, it is best practice to verify that you intended to use the subprogram default value as the initial value of the uninitialized variable.

---

## VHD-9

(error) %s Illegal character in entity, architecture, package, or configuration name.

Feedback

**Description**

You receive this error message when the name you specified for an entity, architecture, package, or configuration cannot be directly used to name a file in the host file system. This is usually due to some reserved characters, such as '/' or ':'. Names in the standard *definitions name space* exist as file system objects and must conform to host or network naming conventions in addition to VHDL lexical rules.

For example, \ab/cd\ is an invalid entity, architecture, package, or configuration name.

**What Next**

Change the entity, architecture, package, or configuration name in the relevant code to conform to the rules for file names in the host file system and run the command again.

---

## VHD-100

(error) %s Elements of aggregate or string literal are out of bound, overlap or do not cover all cases.

**Description**

This error occurs when the values specified for an aggregate do not cover all the possible elements or if more than one value is specified for the same element or if the values specified are for elements that are not part of this aggregate.

**What Next**

Modify your HDL description to ensure that there is one to one correspondence between elements of the aggregate and the values specified for it.

---

## VHD-101

(error) %s Invalid return value for function.

**Description**

The output of the subprogram doesn't exist or is not valid

**What Next**

Look at the subprogram body and see if all return paths exist and are valid

---

## VHD-102

(error) %s The value type of attribute %s is not %s.

Feedback

### Description

The attribute type mismatch.

### What Next

Check the attribute declaration and see if it conflicts with synopsys attribute declaration.

---

## VHD-103

(error) %s The type of formal generic subprogram %s does not match the type of the actual subprogram %s.

### Description

The types of the formal generic subprogram and the actual subprogram do not match.

### What Next

Check at the instantiation if the actual subprogram has the compatiable types as the generic subprogram specification.

---

## VHD-104

(error) %s Only simple names are supported for configuration port mapping.

### Description

You must use only simple names to map the ports of a configuration. In particular, a simple name for a port is the identifier that appears in the port declaration of a configuration, package, procedure, or function. HDL Compiler does not support other port naming styles for configuration port mapping, such as selected names, indexed names, slice names, and attribute names. For example, the following port mapping uses indexed names, which is not supported:

```
for all : my_AND
          use entity work.AND2 (rtl)
          port map (A => D_in(0), B => D_in(1), Z => Z);
        end for;
```

### What Next

You should create a wrapper to match the ports. For example:

```
entity mux21_wrapper is
  port(
    D_in : in  std_logic_vector (1 downto 0);
    S0   : in  std_logic;
    Z    : out std_logic
  );
```

Feedback

```
end mux21_wrapper;

architecture rtl of mux21_wrapper is
component mux21 is
    port(D0 : in  std_logic;
         D1 : in  std_logic;
         S0 : in  std_logic;
         Z  : out std_logic);
end component;
begin
    inst: mux21 port map (D0 => D_in(0), D1 => D_in(1), S0 => S0, Z =>
 Z);
end rtl;

In the configuration:

   for all : mux21_noarc
      use entity work.mux21_wrapper(rtl)
      port map ( D_in => D_in , S0=> S, Z => Z) ;
   end for;
```

## VHD-200

(error) Unexpected %s\n\t %s. Analysis Failed.

### Description

This message indicates an internal problem in the VHDL analysis for synthesis.

### What Next

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem. In the meantime, do not use the construct that caused the error.

# VHDL

## VHDL-1

(warning) Can't find types for all ports on design '%s'.\n \tIt will be written out with its ports bit-blasted.

### Description

This error is generated when vhdlout_single_bit is not set to BIT and if there are no bus information, then the design probably came from a format that doesn't put bus information on, and the user will expect the ports to be bit-blasted anyways.

Feedback

### What Next

Try to read in a different format of netlist which can represent buses. They can be EDIF,Verilog, VHDL, etc. Or change vhdlout_single_bit to BIT.

---

## VHDL-2

(warning) '%s' is both a %s and a %s.\n \tThe %s is being renamed to '%s'.

### Description

There was a name clash between these two objects. Please refer to the IEEE Standard VHDL Language Reference Manual (normally referred to as the VHDL LRM) for details on scoping rules for identifiers.

There is a limitation in the intelligence of VHDLout when issuing this warning. If there is a port with a name that clashes with a type-name, where the type is used as a sub-type of another type in a design being written out, and this sub-type is defined in STD.STANDARD (a predefined package that is part of the language definition), then this warning is issued even though no type declaration for the sub-type is written out. In other words this warning may be issued for a type name that is actually not written out. With the current version of the VHDL LRM, IEEE Std 1076-1987, this will only happen for the following example:

```
entity e is
  port ( bit: out bit_vector(1 downto 0));
end e;

architecture a of e is
begin
        ...
end a;
```

### What Next

You can change the port names so it will not be clashed with type-name.

---

## VHDL-3

(warning) Design '%s' has invalid vhdl types.\n \tIt will be written out with its ports bit-blasted.

### Description

This error is generated when vhdlout_single_bit is not set to BIT, and type information is not supported.

Feedback

**What Next**

Change the types to the supported types. one of the following: Bit,Array,Enumeration and Record

---

## VHDL-4

(error) Design '%s' is not linked. Use the link command on the design\n \tif you would like to write out vhdl for it.

**Description**

The design needs to be linked first in order for the VHDL writer to write out the design.

**What Next**

Run the link command in dc_shell.

---

## VHDL-5

(error) Could not process the types for the design.

---

## VHDL-6

(error) Could not process the types in the design. Try setting vhdlout_dont_write_types to TRUE.

---

## VHDL-7

(error) You must change 'vhdlout_bit_type' to a bit type that includes a\n \tthree-state value when writing out %s.

**Description**

*vhdlout_bit_type* determines what VHDL type to use when writing out ports, single-bit-wide ports, or ports that were buses in the original source but are written out bit-blasted.

This error can occur if, for instance, a generic three-state device is written out and *vhdlout_bit_type* is set to type "BIT," which does not contain a three-state value. Such a description cannnot simulate the high-impedance value, so VHDLout issues this error.

Note that VHDLout, apart from the type "BIT," does not recognize possible values of a type. So, if you use a type other than "BIT," but it does not contain a three-state value, this error will go undetected.

Feedback

### What Next

Set *vhdlout_bit_type* to a type that contains a three-state value. For example *std_logic*.

### Examples

This example will cause the error if read in and then written out with *vhdlout_bit_type* = *BIT*.

```
library IEEE;
use     IEEE.std_logic_1164.all;

entity TRI_VHDL is
  port ( cond : in boolean; a : in std_logic; r : out std_logic);
end TRI_VHDL;

architecture test of TRI_VHDL is
begin
  process ( cond, a) begin
    if( cond) then
      r <= a;
    else
      r <= 'Z';
    end if;
  end process;
end test;
```

### Examples

```
Error: You must change 'vhdlout_bit_type' to a bit type that includes a
        three-state value when writing out generic three-state devices.
 (VHDL-7)
```

---

## VHDL-8

(error) This pre-v2.0 db file contains inconsistent type information.\n

### Description

The current version of Design Compiler is not able to read the db generated before version 2.0.

### What Next

\tPlease re-read in the original VHDL file.

---

## VHDL-9

(error) You tried to write out two designs ('%s' and '%s') that contained\n \t\tdifferent types with the same name ('%s').\n

Feedback

**Description**

VHDL writer is not able to write out two designs (object) of the same names but of different types.

**What Next**

Please write out the designs separately.

---

## VHDL-10

(warning) The type '%s' in design '%s' was renamed to '%s'.

**Description**

This warning is generated when the type needs to be renamed because of the illegal VHDL character. It is generated internally for the returned types of subprograms.

**What Next**

Check the returned type defined for the subprograms; if it is an anonymous type, try to change it to be a real type.

---

## VHDL-11

(warning) The bits in port '%s' in design '%s' have inconsistent '%s' constraints.\n \tSome constraint information is being lost.

**Description**

This warning is generated when there is more than one constraint set for the same port. It takes the first constraint you set.

**What Next**

Make sure the constraints are setting once, or the first constraint is the one you want.

---

## VHDL-12

(warning) EQUAL and OPPOSITE attributes on multi-bit ports are being ignored.

**Description**

This warning is generated when EQUAL and OPPOSITE attributes exist on multi-bit ports.

**What Next**

Make sure the attributes are consistently set for multi-bit ports.

Feedback

## VHDL-13

(warning) The '%s' '%s' is not a legal vhdl identifier.\n \tIt has been renamed to '%s'.

**Description**

This warning is generated when the identifier contains illegal VHDL character.

**What Next**

Please refer to VHDL reference manual and change it to legal VHDL character if you do not it to be renamed.

## VHDL-14

(error) Record '%s' has duplicate field names '%s'

## VHDL-15

(error) The variable '%s' should be a list of lists with each\n \tsub-list having exactly three strings in it.

**Description**

The variable vhdlout_conversion_functions should contains list of list which contains exactly three strings in it. They are "from_type", "to_type" and "function_name".

**What Next**

Type "help vhdlout_conversion_functions" for more details.

## VHDL-16

(error) Unable to model inout ports '%s' and '%s', which are wired together.

**Description**

The *write -f vhdl* command is intended primarily for the creation of a simulation model of the contents of the *dc_shell* database. This error occurs if there is more than one bidirectional port (port mode "inout") in the same net. Note that a bidirectional port driving a bidirectional pin will not cause this error.

This connectivity cannot be correctly modeled for simulation in VHDL, because it would require one assign statement for port A driving port B and one for port B driving port A. This circular assignment does not work.

Feedback

### What Next

The preferred remedy is to change the HDL source so that it does not contain more than one bidirectional port per net.

The least preferred remedy is to use the *dc_shell disconnect_net* command to disconnect all but one of the bidirectional ports in the same net. Then re-write the design. If necessary, these ports can be reconnected manually in the resulting VHDL text file.

---

## VHDL-17

(error) Unable to write a conversion function for the inout %s port '%s'.

### Description

VHDLout encountered a bidirectional port when it was creating type conversion functions. Because information about the current direction of the signal is not available at any given time, it is not possible to create a working type conversion function for bidirectional signals. Hence, one does not know whether to convert for a source or a sink signal.

Beyond looking at the port's mode, VHDLout also analyzes the net to see if the port is used both as a sink and a source. If it is used only as a unidirectional signal, VHDLout treats it as such and creates a type conversion for it. Of course, this error does not occur in that case.

### What Next

Note that type conversion functions are created in two situations:

*vhdlout_single_bit* = *VECTOR* and *vhdlout_write_top_configuration* = *TRUE*.

To write a VHDL description for the design in this situation, change the setting of *vhdlout_single_bit* to "not equal VECTOR" or set *vhdlout_write_top_configuration* = *FALSE*.

*vhdlout_single_bit* = *USER* and *vhdlout_preserve_hierarchical_types* = *VECTOR* and

The suggested remedy for this situation is to set *vhdlout_preserve_hierarchical_types* = *USER*

To see the possible settings and their meanings, refer to the man page for the *vhdlout_single_bit* variable. With either of these two changes, no type conversions are created.

If the above setting does not work, then it could be this port connects to an component pin that is buffer.

Feedback

## VHDL-18

(warning) '%s' is not a legal simulator.\n \tVariable '%s' is being ignored.

**Description**

This warning is generated when vhdlout_target_simulator is set to an unknown simulater.

**What Next**

Reset vhdlout_traget_simulator to a valid simulator.

## VHDL-19

(warning) Target simulator '%s' is not supported when\n \t%s is set to "TRUE".

**Description**

The warning is generated when vhdlout_target_simulator is set to a "xp" or "xp100" simulator and vhdlout_equations is set to TRUE.

**What Next**

Change vhdlout_equations to FALSE or change vhdlout_target_simulator.

## VHDL-20

(warning) There are inout ports of type '%s' that are\n \tmultiply driven. The type '%s' must be a resolved type or\n \tthe vhdl will not simulate.

**Description**

VHDLout cannot determine whether the port is of a resolved type. This warning is issued whenever a multiply driven inout port is found.

**What Next**

Check that the type reported in the message is a resolved type. If it is, ignore this warning. If the type is not resolved, two remedies exist.

Modify the setting of *vhdlout_single_bit* or *vhdlout_preserve_hierarchical_types* as appropriate. Change the variable setting to "BIT" or "VECTOR." When necessary, VHDLout creates a resolved type. For more information on the use of these variables, see the appropriate man pages.

Alternately modify your VHDL source to use a resolved type for the inout ports, recreate the design, and write again. Note that the warning is issued only once for each type. In a hierarchical design, multiple entities with the same problem may exist.

Feedback

### Examples

Example of warning that is safe to ignore. "std_logic" is a resolved type.

```
library IEEE;
use     IEEE.std_logic_1164.all;

entity M_VHDL is
  port ( a, b : in std_logic; r : inout std_logic);
end M_VHDL;

architecture test of M_VHDL is
begin
  process ( a) begin
    r <= a;
  end process;

  process ( b) begin
    r <= b;
  end process;
end test;
```

Example where warning is correct. "BIT" is not a resolved type. This will cause problems in simulation.

```
entity M_VHDL is
  port ( a, b : in bit; r : inout bit);
end M_VHDL;

architecture test of M_VHDL is
begin
  process ( a) begin
    r <= a;
  end process;

  process ( b) begin
    r <= b;
  end process;
end test;
```

### Examples

```
Warning: There are inout ports of type 'std_logic' that are
        multiply driven. The type 'std_logic' must be a resolved type or
        the vhdl will not simulate. (VHDL-20)
```

---

## VHDL-21

(warning) STD.TEXTIO package used by design '%s' in file '%s' is not supported for synthesis.

Feedback

**Description**

STD.TEXTIO package is not supported for synthesis.

**What Next**

Remove the use of this package from the use clause

---

## VHDL-22

(error) Stop processing due to a corrupted db file (%s).

**Description**

Somehow the db file contains incomplete type information. Please find out which command caused this problem and report it to the Support Center or CAE.

**What Next**

Please regenerate the db file.

---

## VHDL-23

(error) Write command failed due to system error.

**Description**

It could be the file system is full.

---

## VHDL-24

(error) Can not write out the assignment statement for this inout port %s.

**Description**

This ocurrs probably due to the renaming on the inout port signals.

**What Next**

Check your design and the port assignment.

---

## VHDL-25

(error) Can not write out this design '%s' with memory operations in it using non-levelized writer.

**Description**

The design needs to be flatten before writting out.

Feedback

**What Next**

Please set vhdlout_levelize to TRUE.

---

## VHDL-225

(error) %s is not a formal port of component %s

## VHDL-226

(error) 'others' is not legal as a formal name in a port map statement %s

Feedback

## VHDL-227

(error) In a port map statement, formals that are not simple names \n \tor simple subelements are not supported %s

## VHDL-228

(warning) Initial values are not supported for variables %s

## VHDL-229

(error) '%s' must be a procedure %s

## VHDL-230

(error) Compilation aborted. Too many errors.

## VHDL-231

(error) Identifier %s is reserved for internal use. Please use a different\n \tname for this entity %s

## VHDL-232

(error) Cannot find entity %s

**Description**

The entity for the current architecture could not be found in the library.

**What Next**

Provide the entity for the architecture.

## VHDL-233

(warning) Port '%s' of component '%s' includes a default value, which is not supported for synthesis.

**Description**

Default values for ports of a component are not supported for synthesis. For example:

```
entity e is
  port (a: in bit;
```

Feedback

```
        z: out bit);
end;

architecture a of e is
  component c
    port (p: in bit;
          q: in bit := '1';
          x: out bit);
  end component;

begin
  u1: c port map (p => a, x => z);
end;
```

**What Next**

Remove the default value for the component port and add an equivalent association in the port map of the component instantiation. For example:

```
architecture a of e is
  component c
    port (p: in bit;
          q: in bit;
          x: out bit);
  end component;

  constant c1: bit := '1';
begin
  u1: c port map (p => a, q => c1, x => z);
end;
```

## VHDL-240

## VHDL-261

(error) Component name is not a simple name %s

## VHDL-262

(warning) Only simple configurations (specification of architecture for a top\n \tlevel entity) are supported. Nested block specifications and component\n \tconfigurations are ignored %s

## VHDL-263

(error) Expected simple name for architecture %s

## VHDL-264

(warning) Configuration specifications are not supported. They are ignored %s

## VHDL-265

(warning) The value '%s' of\n \t'vhdlout_preserve_hierarchical_types' is greater than\n \tthat of 'vhdlout_single_bit'.\n \t'vhdlout_preserve_hierarchical_types' is changed to be equal to\n \t'vhdlout_single_bit'.

**Description**

This error occurs when *vhdlout_preserve_hierarchical_types* is set to a higher value than *vhdlout_single_bit*.

The variables *vhdlout_single_bit* and *vhdlout_preserve_hierarchical_types* control how VHDLout handles types on ports and pins. See the manual pages on these variables for information on possible settings.

**What Next**

Change the value of *vhdlout_single_bit* and/or *vhdlout_preserve_hierarchical_types* and retry the *write* command.

Feedback

### Examples

Error: The value 'ENUM' of *vhdlout_preserve_hierarchical_types* is greater than that of *vhdlout_single_bit*. *vhdlout_preserve_hierarchical_types* is changed to be equal to *vhdlout_single_bit*.

---

## VHDL-266

(error) '%s' contains the invalid string '%s'.

### Description

This error occurs when *vhdlout_single_bit* or *vhdlout_preserve_hierarchical_types* is set to an invalid value.

The variables *vhdlout_single_bit* and *vhdlout_preserve_hierarchical_types* control how VHDLout handles types on ports and pins. See the manual pages on these variables for information on possible settings.

### What Next

Correct the setting of the variable and retry the *write* command.

### Examples

Error: 'vhdlout_preserve_hierarchical_types' contains the invalid string 'RNUM'.

---

## VHDL-267

(error) The current setting, '%s', of 'vhdlout_package_naming_style' does not produce a valid VHDL identifier.

### Description

VHDLout infers the name of the type-conversion package (if it is needed) from the variable *vhdlout_package_naming_style*. The setting of this variable must result in a legal VHDL identifier. See the manual page for *vhdlout_package_naming_style* for more details.

This error occurs when vhdlout_package_naming_style is set to a value that results in an illegal name for the type conversion package.

### What Next

Correct the setting of the variable and retry the *write* command.

### Examples

Error: The current setting, '%s', of *vhdlout_package_naming_style* does not produce a valid VHDL identifier.

Feedback

## VHDL-268

(error) '%s' is not valid for 'vhdlout_package_naming_style'.

### Description

VHDLout infers the name of the type-conversion package (if it is needed) from the variable *vhdlout_package_naming_style*. The setting of this variable must result in a legal VHDL identifier. See the manual page for *vhdlout_package_naming_style* for more details.

This error occurs when *vhdlout_package_naming_style* is set to a string that cannot be understood by VHDLout. The string (or substring) begins with a '%' followed by an unexpected character.

### What Next

Correct the setting of the variable and retry the *write* command.

### Examples

Error: '%' is not valid for *vhdlout_package_naming_style*.

## VHDL-269

(warning) The dc_script '%s' will be applied to all subsequent entities in this file.

### Description

This use of dc_scripts is discouraged because it does not have the same scope as *library* and *use* clauses.

### What Next

To apply a dc_script to a single design unit, the script must be declared in the declarative region of that design unit.

You can suppress this message by setting the *suppress_errors* variable.

## VHDL-270

(warning) Configurations are written out only when the\n \t'vhdlout_single_bit' mode is 'vector'.

### Description

Configurations between the test bench and your top-level design are written out only when the variable *vhdlout_single_bit* is set to type *vector*.

Feedback

The purpose of the configuration is to map between the original and new types. If *vhdlout_single_bit* is set to *user*, the original types are used, and a configuration is unnecessary. If *vhdlout_single_bit* is set to *bit*, the new ports do not map well to the original types. In this case, a configuration is impractical.

**What Next**

If you are using the original types (*vhdlout_single_bit* is set to *user*), you can ignore this message, or, to disable the writing of configurations, you can set *vhdlout_write_top_configuration* to "FALSE."

If you want to write out a configuration with your design, set *vhdlout_single_bit* to *vector*, and rewrite the design.

*NOTE:* Setting *vhdlout_single_bit* to *vector* does not affect the acceleration of your design.

---

## VHDL-271

(error) Design %s contains a type with name matching\n \tthe current setting of 'vhdlout_bit_type' (%s), that is more\n \tthan one bit wide. Cannot write a VHDL description including this design.

**Description**

The 'vhdlout_bit_type' must be a one-bit wide type for VHDLout to be able to produce a legal description.

**What Next**

Check your type definition and ensure it is one bit wide. If the type definition is an enumerated type with more than two possible values, it may be missing the ENUM_ENCODING attribute.

---

## VHDL-272

(warning) You must change 'vhdlout_bit_type' to a bit type that includes a three-state value when writing out three-state resolution functions. If left as is, this description may or may not simulate.

**Description**

Vhdlout found a possible clash between two connected objects. An object A, that may drive a three-state value. An object B, being driven by object A and that is of a type not including a three-state value.

For example: a signal of type 'bit' may drive a port in mode 'inout'. This is legal and works as long as that port is never driven by the outside world. This may also happen if the source description language was less rigorous on types than VHDL.

Feedback

Note that such a clash is cought by simulation during run-time.

**What Next**

The alternatives are:

A - locate the clash and correct the HDL description, re-analyze, re-synthesize and re-write vhdl. In the example above, one can either use a resolved type for the signal or change the port's mode to 'out'.

B - leave as is and simulate to find out if this was a true error.

---

## VHDL-273

(error) There is a latch in this un-compiled design. Unfortunately, this release cannot write VHDL for latches pre-compile.

**Description**

This will be fixed in a future release.

**What Next**

Work around, compile design before writing out VHDL.

---

## VHDL-274

(warning) Library cell %s has a pin of unsupported three-state driver type. It will be treated as a regular three-state driver type. The description may not simulate correctly.

**Description**

Driver type may be specified for three-state cell pins in Synopsys' Library format, which is used to describe technology libraries. This warning is issued when VHDLout is writing a behavioral description and don't recognize the driver type at hand. The resulting description may have problems simulating weak signal values properly.

Please inform Synopsys when this happens.

**What Next**

This warning is issued only when vhdlout_equations = TRUE. The warning can be avoided by setting the variable to FALSE in which case a structural description is written. For such a description, the driver type isn't relevant to VHDLout.

An alternate approach is to use the dont_use attribute on the library cell in question, prior to compiling the design. Please refer to man-page for the dc_shell command set_dont_use for details.

Feedback

## VHDL-275

(warning) Library cell %s have three-state pins of different driver types, VHDLout cannot handle more than one type on same cell. All pins on this cell will be treated as regular three-state driver type. The description may not simulate correctly.

### Description

Driver type may be specified for three-state cell pins in Synopsys' Library format, which is used to describe technology libraries. This warning is issued when VHDLout is writing a behavioral description and encounters different pin driver types on the same library cell. VHDLout is not capable of handling more than one driver type per cell.

The resulting description may have problems simulating weak signal values properly.

Please inform Synopsys when this happens.

### What Next

This warning is issued only when vhdlout_equations = TRUE. The warning can be avoided by setting the variable to FALSE in which case a structural description is written. For such a description, the driver type isn't relevant to VHDLout.

An alternate approach is to use the dont_use attribute on the library cell in question, prior to compiling the design. Please refer to man-page for the dc_shell command set_dont_use for details.

## VHDL-276

(warning) The acceleratable VHDL description that you requested could not be written, because your design, '%s', cannot be described using the XP-supported VHDL subset. The VHDL description is being written without setting the BACKPLANE attribute.

### Description

The XP accelerator accepts as input only a limited subset of VHDL constructs. A design that cannot be described using this subset is not acceleratable by the XP accelerator.

By setting the variable *vhdlout_target_simulator* to *XP*, you requested a VHDL output that is targeted at the XP accelerator. If *vhdlout_target_simulator* is set to *XP*, *write -f vhdl* attempts to describe the design using the XP-supported VHDL subset. If this is successful, then *write -f vhdl* adds the BACKPLANE attribute to the output VHDL file, indicating that the design is to be simulated using the XP Accelerator.

If, however, *vhdlout_target_simulator* is set to *XP* and the design cannot be described using the XP-supported VHDL subset, then *write -f vhdl* does not add the BACKPLANE attribute to the generated VHDL description, and issues this warning message.

Feedback

The XP-supported VHDL subset cannot describe type conversions or user-defined types. (For more information on allowed types, refer to the ZyCad XP manuals.) If you receive this warning message, your design might require type conversions and/or might contain user-defined types.

**What Next**

If your design contains user-defined types or requires type conversions, check the setting of the variable *vhdlout_single_bit* and, if it is set to USER, change it to VECTOR or BIT. Then re-execute *write -f vhdl*.

---

## VHDL-277

(error) The VHDL PROCESS on line %d must be labelled.

**Description**

The process statement contains an attributed object in its scope and, as a result, must be labelled.

**What Next**

Label the process statement.

---

## VHDL-278

(error) The port '%s' in design '%s' has unknown direction.

**Description**

The VHDL writer does not know the port direction, so it cannot write it out. This is probably caused by some modules that are missing when reading Verilog files.

**What Next**

Read in the complete design that has specified the port direction and try again.

---

## VHDL-279

(warning) STD.TEXTIO package is not supported for synthesis.

**Description**

STD.TEXTIO package is not supported for synthesis.

**What Next**

Remove the use of this package from the use clause

Feedback

## VHDL-280

(error) Only global constants are supported as the index constraint for aliasing.

### Description

Only global constants are supported as the index constraint for aliasing. Generics are also not supported in this position.

### What Next

Modify the alias declaration so that index constraint is a global constant.

## VHDL-281

(error) You cannot take an index or slice of a non-vector alias %s.

### Description

You received this message because you attempted to apply indexing or slicing to an alias that was not declared as a vector type.

Note that this error can occur even if the VHDL language permits indexing or slicing to be applied to the alias. For example, consider the following:

```
subtype T is bit_vector(0 to 2);
  alias b: T is a(1 to 3);
```

In the alias declaration, HDL Compiler does not recognize 'T' as a vector type. Thus, this error will occur if any attempt is made to apply slicing or indexing to 'b'; for example, "b(0)" or "b(0 to 1)".

### What Next

Modify the alias declaration so that the type of the alias is an array type; for example, std_logic_vector. The example shown above could be rewritten as follows:

```
alias b: bit_vector(0 to 2) is a(1 to 3);
```

## VHDL-283

(error) Aliased objects may only be a simple name, an index of a simple name, or a slice of a simple name.

Feedback

### Description

An attempt was made to declare an alias to a non-simple name. Aliases may be declared only for simple names, simple names with indexes, or simple names with slices. For example, the following aliases are acceptible:

```
alias a: bit is foo;
  alias a: bit is foo(0);
  alias a: bit_vector(0 to 1) is foo(2 to 3);
```

### What Next

Modify the alias declaration so that the aliased object is either a simple name, an index of a simple name, or a slice of a simple name.

---

## VHDL-284

(error) Arbitrary expression for bussed clock index is not supported.

### Description

Arbitrary expression for a bussed clock index is not supported. Only single variable index or integer expressions are supported.

### What Next

Use supported expressions for a bussed clock index.

---

## VHDL-285

(warning) "BAD CONNECTION - primary in/out port %s of %s is driven or read by an internal node. Using intermediate signal to generate a syntactically correct VHDL description. Consequently, this will violate the definition of structural VHDL description syntax."

### Description

VHDL syntax rule does not allow primary port of "in" mode be updated by an internal node, or a primary port of "out" mode be read by an internal node. VHDL writer is generating an intermediate signal of the form portName_port to handle this bad connection, so it can write out a syntatically correct VHDL file. The intermediate signal will be assigned a value in the body of the architecture, and this signal assignment will violate the rule for structural VHDL description.

### What Next

Fix this bad connection in your design.

Feedback

## VHDL-286

(warning) There is a data discrepancy between synopsys database and the output file.

**Description**

VHDL/verilog writer detects that the names of the netlist objects have changed to fit syntax and semantic requirement for VHDL/verilog. The change might cause a back-annotation problem in the flow. For example, if the VHDL/verilog output file is used to generate sdf or saif file. The netlist object names in the sdf or sail might not able to back-annotate to synopsys database.

**What Next**

Run the *change_names* command with the *-rule vhdl/verilog* and then rewrite the netlist.

**See Also**

- change_names

## VHDL-287

(error) "BAD CONNECTION - port %s of mode other than out is unconnected. Consequently, this will violate the definition of structural VHDL description syntax."

**Description**

VHDL syntax rule does not allow port of mode other than "out" be unconnected.

**What Next**

Run change_names to create a dummy net to connect the port.

## VHDL-288

(error) "BAD CONNECTION - bussed port %s is partially connected."

**Description**

VHDL syntax rule does not allow bussed port to be partially connected.

**What Next**

Run change_names to create a dummy net to connect each bit of the port.

## VHDL-289

(error) Bussed clock is not longer supported in VHDLC. Use Presto VHDL instead.

Feedback

**Description**

Bussed clock is no longer supported in VHDLC.

**What Next**

Please either recode the VHDL source code, or use Presto VHDL instead.

---

## VHDL-290

(warning) A dummy net '%s' is created to connect open pin '%s'.

**Description**

VHDL writer detects that a pin is not connected. The writer creates a dummy net connected to the pin to satisfy syntax requirement for VHDL. You may use variable vhdlout_unconnected_pin_prefix to control the prefix of the dummy nets. The dummy net appears in the output VHDL file only. It does not exist in the db file. To let db file contain dummy nets, change_names needs to be executed before VHDL writer.

**See Also**

- change_names

---

## VHDL-291

(warning) You are using an older version of the VHDL netlist reader/writer, which will be obsoleted in the X-2005.06 release.

**Description**

You are using an older version of the VHDL netlist reader/writer, which will be obsoleted in the X-2005.06 release. To use the current VHDL reader/writer, please make sure these variables are set as follows:

VHDL netlist reader: enable_2003.03_vhdl_reader true VHDL netlist writer: enable_2003.03_vhdl_writer true

---

## VHDL-292

(error) Verilog In Error, %d modules are possible top modules.

**Description**

Unsupport more then one top modules.

Feedback

**What Next**

Please check the design file, and make sure there is only one top module.

---

## VHDL-2001

(warning) Statements in an entity declaration are not supported for synthesis. They are ignored in entity %s %s

---

Feedback

## VHDL-2042

(warning) File declarations are not supported for synthesis. They are ignored %s

## VHDL-2043

(warning) Disconnection specifications are not supported for synthesis. They are ignored %s

## VHDL-2045

(warning) Guard conditions for blocks are not supported %s

## VHDL-2046

(warning) Declaration and use of generics and ports in a block header is not supported %s

## VHDL-2047

(error) The attribute '%s' defined on line %d is not\n \tcontained within an architecture. Attribute '%s' only\n \tapplies to processes, and it must be defined inside of the\n \tarchitecture that contains the process.

**Description**

Attributes that need to be applied to processes must occur inside of the architecture that contains them.

**What Next**

Move the attribute to inside of the architecture.

## VHDL-2048

(error) Could not find process '%s' inside of the architecture%s\n \tat line %d. The process is referred to by the attribute\n \t'%s' defined on line %d.

**Description**

The attribute '%s' is meant to apply to processes only, and the process defined could not be found.

**What Next**

Check the names of the processes and the definition of the attribute for errors.

Feedback

## VHDL-2049

(Warning) The attribute '%s' is only valid when applied to\n \tone of the following:\n \t\t%s. \n \tOn line %d, the attribute is applied to a(n) %s.\n \tThe attribute will be ignored.

### Description

The name attribute is only allowed to attribute certain classes.

### What Next

Check to make sure that the attribute is applied to the correct object.

## VHDL-2050

(warning) Timeout clause not supported for synthesis in wait statement %s

## VHDL-2060

(error) The translate_on/translate_off pragma has been incorrectly used here\n \tinside a construct %s.

### Description

Only use the translate_on and translate_off pragmas on complete constructs, not on parts of constructs. For example, do not use these pragmas to comment out one of more branches of a "case" statement or the "if" construct as shown in the following examples.

```
Example 1

-- pragma translate_off
if (Is_X(svec))  then
  assert (now < 20 ns)
    report "logic vector contains U, X, Z or W"
    severity error;
else
-- pragma translate_on
  if ( t > 20) then  -- synthesize this RTL
    . . .
-- pragma translate_off
end if;
-- pragma translate_on

Example 2

case (expr_1) is
  -- pragma translate_off
  when value_1 =>  -- incomplete case statement missing this branch
    . . .
```

Feedback

```
  -- pragma translate_on
  when value_2 =>
    . . .
  when . . .
    . . .
end case;
```

**What Next**

Modify the placement of translate_on and translate_off pragmas. When you use the translate_on and translate_off pragmas, use them around the entire "if"/"case" statement. When this isn't possible, then "translate_off" parts of a construct that aren't part of VHDL syntax. In the modified example below, the "if", "then" and "else" constructs are all "translated", the "else" clause is interpreted to synthesis as a "null".

```
Example 1

temp := (others => "X");
if (svec /= temp)  then
  if ( t > 20) then  -- synthesize this RTL
    . . .
else
-- pragma translate_off
  assert (now < 20 ns)
    report "logic vector contains U, X, Z or W"
    severity error;
-- pragma translate_on
end if;

Example 2

case (expr_1) is
  when value_1 =>
  -- pragma translate_off
    . . .
  -- pragma translate_on
  when value_2 =>
    . . .
  when . . .
    . . .
end case;
```

## VHDL-2090

## VHDL-2097

(warning) Signal assignment delays are not supported for synthesis. They are ignored %s

## VHDL-2098

(warning) 'Transport' construct is not supported for synthesis. It is ignored %s

## VHDL-2099

(warning) Assert and report statements are not supported for synthesis. They are ignored %s

**Description**

The VHDL "assert" and "report" statements have no meaning for synthesis. These statements are ignored by HDL Compiler.

Feedback

## VHDL-2100

(error) Allocators are not supported for synthesis %s

## VHDL-2103

(error) %s

**Description**

Slang functions cannot have a return data-type that is unconstrained. The return-type cannot be a record or multi-dimensional array.

The legal data types allowed are:

Scalar types: enumeration, integer, physical, floating-point Composite types: single dimensional array only Access Types File Types

Slang procedures and functions cannot have parameters whose data-type is a record or multi-dimensional array.

The legal data types allowed are:

Scalar types: enumeration, integer, physical, floating-point Composite types: single dimensional array only Access Types File Types

## VHDL-2104

(error) indexing of access-type line is not supported %s

## VHDL-2105

(error) The suffix all is not supported %s

## VHDL-2106

(error) generalized Wait statements are supported only in architectures that are attributed as TESTBENCH %s

## VHDL-2107

(error) generalized Wait statements are not supported in architectures whose TESTBENCH attribute is not set TRUE %s

Feedback

## VHDL-2108

(error) Wait statements are not supported in subprograms %s

## VHDL-2109

(error) Event and Stable attributes are not supported in subprograms %s

## VHDL-2110

(error) An expression of this kind is supported for synthesis, when only one variable is used. This expression has two variables %s and %s %s

## VHDL-2111

(error) Aggregate assignment by name is not supported for the field names of a record.

### Description

The fields of a record were assigned using named aggregate assignment, which is not supported for synthesis. The following is an example of this style of assignment:

```
type myrec_type is record
    vecpart : bit_vector(0 to 4);
    count   : integer range 0 to 4;
  end record;

  signal myrec : myrec_type;

    ...

  myrec <= (vecpart => input_vecpart, count => input_count);
```

In the above example, "vecpart" and "count" are fields of a record. For records, aggregate assignment using named notation is not supported.

### What Next

Assign each field of the record individually, or use positional notation. The following example shows both positional notation and assignment of each field individually.

```
type myrec_type is record
    vecpart : bit_vector(0 to 4);
    count   : integer range 0 to 4;
  end record;

  signal myrec_positional : myrec_type;
  signal myrec_eachfield  : myrec_type;
```

Feedback

```
  ...

myrec_eachfield.vecpart <= input_vecpart;
myrec_eachfield.count   <= input_count;

myrec_positional <= (input_vecpart, input_count);
```

## VHDL-2112

(error) %s

**Description**

File names in the file declaration should be constants, generics or constant string literals. Use of expression or argument of the subprogram parameter is not supported by Cyclone.

## VHDL-2120

(error) In a port map statement, formals that are not simple names or simple subelements are not supported for synthesis %s

## VHDL-2121

(error) Type conversion on formal associations is not supported for synthesis %s

## VHDL-2130

(error) Only simple configurations are supported for synthesis. This configuration declaration is not supported %s

## VHDL-2131

(error) Configurations are not supported for direct instantiation during synthesis %s.

**Description**

The following usage is not supported in VHDL Compiler.

```
LABEL:  configuration library_name.configuration_name
                generic map (...)
                port map (...);
```

Feedback

## VHDL-2132

(warning) Explicit architecture specification is not supported for direct instantiation during synthesis %s.

### Description

The following usage is not correct in VHDL Compiler.

```
LABEL:  library_name.entity_name(architecture_name)
                generic map (...)
                port map (...);
```

VHDL Compiler reads the architecture to be used from the .mra file. Therefore, only the most recently analyzed one is meaningful to synthesis.

### What Next

Remove the architecture specification from the statement and analyze the architecture you want to use first.

## VHDL-2140

(error) Multi-dimensional arrays are not supported for synthesis %s

## VHDL-2141

(error) Multiple waveform elements are not supported for synthesis %s

## VHDL-2142

(error) Attribute `RANGE or `REVERSE_RANGE can't have index with it %s.

### Description

Multiple-dimensional array is not supported for synthesis. So `RANGE(i) or `REVERSE_RANGE(i) is meaningless for synthesis.

## VHDL-2150

(error) This form of wait statement is not supported for synthesis %s

## VHDL-2151

(error) Attribute %s%s is not supported for synthesis %s

Feedback

## VHDL-2152

(error) Literal '%s' is not supported for synthesis %s

## VHDL-2153

(error) Physical types are not supported for synthesis %s

## VHDL-2154

(error) Cannot mix named and positional elements in same aggregate for synthesis %s

## VHDL-2155

(error) Deferred constants are not supported for synthesis %s

## VHDL-2156

(error) Floating point types are not supported for synthesis %s

**Description**

The VHDL predefined type "REAL" is an example of a floating point type.

**What Next**

Remove any floating point types from the VHDL source.

## VHDL-2157

(error) Type %s not found %s

**Description**

This error occurs if a type is used but not declared. It is likely to happen if the type declaration is enclosed in *translate_off* or *synthesis_off* comments.

**What Next**

Declare the type before you use it.

## VHDL-2158

(error) Record types (%s) are not supported in generic\n \tdeclarations for synthesis %s

Feedback

### Description

Record types are not support in generics, only in ports, signals variables, and constants.

### What Next

Use multiple smaller generics.

---

## VHDL-2159

(error) Empty string constants are not supported for synthesis %s.

### Description

A string with no characters or spaces is not supported by VHDL Compiler. For example, the following is not supported:

```
entity test is
  generic(str : string := "");  -- This is not supported
  port(data_in  : in std_logic;
       data2_in : in std_logic;
       data_out : out std_logic);
end test;

architecture one of test is
constant c1 : string := "";  -- This is not supported
begin
end test;
```

### What Next

Use a blank string (i.e. " ") instead of an empty string (i.e. ""). The above code should be modified to:

```
entity test is
  generic(str : string := " ");  -- Add a space.  This is allowed.
  port(data_in  : in std_logic;
       data2_in : in std_logic;
       data_out : out std_logic);
end test;

architecture one of test is
constant c1 : string := " ";  -- Add a space.  This is allowed.
begin
end test;
```

---

## VHDL-2160

(error) The 'event or 'stable attribute (%s) is supported only when the attribute is used in conformance with the style described in the Synopsys manual for the VHDL compiler.

Feedback

### Description

An example of the use of the *'event* attribute is:

```
if (clk'event and clk = '1') then ...

                or

        wait until clk'event and clk = '1';
```

An example for the use of the 'stable attribute is:

```
if (not clk'stable and clk = '1') then ...

                or

        wait until not clk'stable and clk = '1';
```

This error will occur in cases such as the following:

```
if(clock'event and clock = '1' and enable = '1') then ...

                or

        wait until clk'stable and clk = '1';
```

### What Next

Modify the statement containing the *'stable* or *'event* attribute so that it is in conformance with the suggested style.

---

## VHDL-2161

(warning) Synopsys attribute %s's value is not set to TRUE, the attribute is ignored %s

### Description

This is a Boolean attribute. To have any effect, it must be set to "TRUE."

### What Next

Check that the attribute specification assigns the value "TRUE." Case doesn't matter.

---

## VHDL-2162

(error) Usage of parameters or variables declared in parent subprogram is not supported %s

Feedback

### Description

VHDL Compiler doesn't allow parameters or variables declared in parent subprogram to be used in nested child subprograms. For Example, the following usage of "j" and "v" are prone to bad logic:

```
library ieee ;
use ieee.std_logic_1164.all ;

entity my_test is
port( d                 : in std_logic ;
       q                 : out std_logic
    );
end  my_test ;

architecture synthesize of my_test is
begin
    process(d)
        procedure outer_procedure(signal j : out std_logic) is
        variable v : std_logic;
            procedure inner_procedure is
            begin
                j <= v;
            end ;
        begin
            v := '1';
            inner_procedure(j);
        end ;
    begin
        outer_procedure(q);
    end process;
end  synthesize ;
```

### What Next

Change the usage of parameters or variables in your VHDL code.

---

## VHDL-2163

(error) The rising_edge or falling_edge function (%s) is supported only when used in conformance with the style described in the VHDL Compiler Reference Manual.

### Description

You receive this error message if you use the *rising_edge* or *falling_edge* function in a way that does not conform to the style described in the *VHDL Compiler Reference Manual*.

The following are examples of uses that would generate this error message.

```
if rising_edge( ck ) and enable = '1' then ...

                or
```

Feedback

```
        if falling_edge( ck ) and ck = '0' then ...
```

The following is an example of a supported use of the *rising_edge* function.

```
if rising_edge( ck ) then ...

                or

        wait until rising_edge( ck );
```

Similarly, the following is an example of a supported use of the *falling_edge* function.

```
if falling_edge( ck ) then ...

                or

        wait until falling_edge( ck );
```

**What Next**

Refer to the *VHDL Compiler Reference Manual* and modify the statement containing the *rising_edge* or *falling_edge* function so that it conforms to the suggested style. Then, re-execute the command.

---

## VHDL-2201

(error) An entity named '%s' already exists in this library. (It may be an internal Synopsys design). Please use a different name for your entity.

---

## VHDL-2202

(error) %s is the name of an internal Synopsys design. Please use a different name for your entity.

---

## VHDL-2203

(error) Cannot find entity %s %s

---

## VHDL-2204

(error) Could not find object %s %s. This error can occur if a\n \tpackage (%s) that exists in memory also exists in another library referred to\n \tin a Library statement. This error can also occur if the package uses\n \tsynthesis_off/synthesis_on directives around the object.

Feedback

### Description

This error occurs because the synthesis tool searches for packages in memory before it searches the libraries.

A package exists in memory if it has been analyzed in the current session of the tool. The error can also occur if two or more libraries have packages of the same name and if the packages are used in the same design.

If the object contains synopsys synthesis_off/on or translate_off/on directives around it, the object is not synthesized. As a result, the object cannot be found when it is referenced in the design. The problem can also occur if the directives are placed incorrectly around part of the object. For example, consider the following procedure declaration:

```
procedure my_proc (variable data_in: in std_logic;
                   variable clk: in std_logic;
                   variable data_out: out std_logic;
-- synopsys synthesis_off
                   variable delay: in time);
-- synopsys synthesis_on
```

In this case, the directives have not been inserted properly, so the procedure is not synthesized. To make the code usable for both synthesis and simulation, this procedure declaration should be:

```
procedure my_proc (variable data_in: in std_logic;
                   variable clk: in std_logic;
                   variable data_out: out std_logic
-- synopsys synthesis_off
                   ;
                   variable delay: in time
-- synopsys synthesis_on
                   );
```

### What Next

To get around this problem, if you have more than one package of the same name (even if they are in different libraries), rename one of the packages. If you do not have more than one package of the same name, analyze the package and the design that uses the package in separate sessions of *dc_shell* or *design_analyzer.*

If the problem has to do with the synthesis_off/on or translate_off/on directives, modify the code to use the directives appropriately. Please see the DESCRIPTION section above for additional information on this.

---

## VHDL-2205

(warning) Package '%s' defined more than once %s

Feedback

**Description**

This warning occurs if the same package is multiply declared in same HDL source file.

It also occurs if multiple HDL source files are read by the same *read* or *analyze* command *and* if the same package is defined in more than one of the files.

**What Next**

Be sure to read or analyze a package only once.

---

## VHDL-2206

(error) You have declared two architectures with the same name %s %s

**Description**

You are using two (or more) architectures with the same name, belonging to the same entity.

**What Next**

Rename the architecture(s) so that they have unique names.

---

## VHDL-2207

(error) You have declared a component inside a for generate loop.

**Description**

VHDL-compiler does not allow component declaration inside a for generate loop.

**What Next**

Move the component declaration outside the for loop.

---

## VHDL-2221

(error) Type %s is not defined %s

---

## VHDL-2230

(error) '%s' used more than once as the label for an instance.

**Description**

This error occurs if two or more instances in the same scope are labelled with the same name using the "label" pragma.

Feedback

**What Next**

Change the names of one instances to make them distinct. You can do this by changing the label pragma for each instance.

---

## VHDL-2231

(error) Undefined resource %s %s

---

## VHDL-2232

(error) Entity class must be 'type' for data_class attribute %s

---

## VHDL-2233

(error) Type %s has already been assigned a data class %s

---

## VHDL-2234

(error) Object %s not found %s

**Description**

An object was referenced but not declared. This can happen if a pragma *synthesis_off* hides the declaration.

**What Next**

Change the HDL description so that the declaration is visible for the HDL Compiler.

---

## VHDL-2235

(warning) Type %s not found %s

---

## VHDL-2236

(warning) Pragma "out_port_type" must have exactly two arguments %s

---

## VHDL-2237

(warning) The pragma '%s' on line %d is not a supported pragma\n \tIt will be ignored.

Feedback

**Description**

This error is given when the user has a comment of the form

-- pragma <pragma_name>

And the pragma_name is not one of the pragmas that is supported.

**What Next**

This is just a warning, so no action is required. However, the user may want to check the pragma_name to see if it has been mis-typed.

---

## VHDL-2241

(error) Cannot encode multiple types in same attribute specification %s

---

## VHDL-2242

(error) All encodings must be of equal length in enumeration %s

---

## VHDL-2243

(error) The value of Synopsys attribute %s is expected to be name of port, signal or variable %s

**Description**

The attribute value does not match the name of an object of the class of port, signal, or variable.

**What Next**

Change the attribute value.

---

## VHDL-2244

(error) Synopsys attribute %s's value is expected to be name of a process label %s

**Description**

The attribute value does not match name of a process label.

**What Next**

Change the attribute value.

Feedback

## VHDL-2245

(error) Label %s already has a Synopsys set_reset attribute %s

**Description**

The process label has more than one Synopsys *set_reset* attribute, which is illegal.

**What Next**

Change source code to put only one *set_reset* attribute on the process.

## VHDL-2246

(error) More than one Synopsys attribute master_process_is and/or slave_process_is specified for same process label %s

**Description**

A process label can have only one *master_process_is/slave_process_is* attribute.

**What Next**

Change source code to put only one attribute on the process.

## VHDL-2247

(error) Pragma translate_off inside an expression is not supported %s

**Description**

Inside an expression, the VHDL Analyzer cannot deal with pragma *translate_off* or *translate_on*.

**What Next**

In the case of an after-clause, like the example below, take out the pragmas. After-clauses are ignored for synthesis. A warning is issued in that case.

To suppress warnings, refer to the man page for the *suppress_errors* variable.

**Examples**

The following example will cause error VHDL-2247:

```
entity pragma is
        port ( iput : in bit; oput : out bit);
    end pragma;

    architecture test of pragma is
```

Feedback

```
    begin
        oput <= iput
        -- synopsys translate_off
        AFTER 7 ns
        -- synopsys translate_on
        ;

    end test;
```

## VHDL-2248

(error) Body of package %s seen before or without its declaration %s

### Description

The package declaration must be analyzed before the corresponding package body. There was probably a problem with the declaration part related to the synthesis subset, causing the analysis of the declaration to terminate. Since the analysis of the package declaration was terminated, the body cannot be analyzed.

### What Next

Correct the problem in the package declaration, and this error will go away.

### Examples

This example will cause error VHDL-2248:

```
package P is
          constant    C : bit; -- deferred constant, not supported by
 synthesis.
        end P;

        package body P is
          constant    C : bit := '0';
        end P;
```

## VHDL-2249

(warning) The attribute '%s' requires a list of more than one signal %s.

## VHDL-2250

(warning) Incorrect computation may result because range of the left hand side\n \tdoes not cover range of the right hand side for assignment %s.

Feedback

### Description

When the value of the right-hand side is outside the range of the left-hand side, a run-time error occurs in simulation. However, no logic is built by the VHDL Compiler to detect this kind of run-time error.

### What Next

Declare a proper range for the left-hand side. Or type-convert the right-hand side to ensure that the range of the left-hand side covers that of the right-hand side.

---

## VHDL-2251

(error) Enabling expression not permitted outside wait statements %s

### Description

This error occurs with statements of the form: if(clk'event and clock = '1' and enable = '1') then .. Such expressions are only permitted in: wait until clk'event and clock = '1' and enable = '1' ... at present

### What Next

Modify the if statement with the enabling condition to conform to suggested style.

---

## VHDL-2252

(information) Make sure there is an assertion statement in the design\n \tfor attribute '%s' %s.

### Description

Attribute 'one_hot' indicates at most one object in its group can have a *Logic1* value at any instance of time, all other objects must have a *Logic0* value. Attribute 'one_cold' indicates at most one object in its group can have a *Logic0* value at any instance of time, all other objects must have a *Logic1* value.

### What Next

For *"attribute one_hot of c1, c2, c3 : signal is "true"*, add a process in the design like the following exmaple.

```
-- synopsys synthesis_off
process (c1, c2, c3)
begin
  assert not ((c1='1' and c2='1') or
              (c1='1' and c3='1') or
              (c2='1' and c3='1'))
    report "One-hot violation"
```

Feedback

```
      severity Error;
end process
-- synopsys synthesis_on
```

For *"attribute one_cold of c1, c2, c3 : signal is "true"*, add a process in the design like the following exmaple.

```
-- synopsys synthesis_off
process (c1, c2, c3)
begin
  assert not ((c1='0' and c2='0') or
              (c1='0' and c3='0') or
              (c2='0' and c3='0'))
    report "One-cold violation"
      severity Error;
end process
-- synopsys synthesis_on
```

---

## VHDL-2253

(error) Unsupported type of value\n \t in attribute specification - %s.

### Description

Synthesis VHDL subset does not include this type of a value in a attribute specification. Value could be of concatenation type.

### What Next

Rewrite the attribute specification using the VHDL synthesis subset.

---

## VHDL-2254

(error) "Time" is an unsupported type - %s\n

### Description

Synthesis VHDL subset does not include the VHDL type TIME. Your HDL should not depend on simulation-specific delays for its proper behavior.

### What Next

You can prevent synthesis from using simulation-specific HDL by enclosing it within the synthesis_off / synthesis_on pragmas.

### Examples

The following is a sample usage of the TIME type used in a declaration:

GENERIC( DelayAmount : TIME );

Feedback

To prevent the TIME type from going through synthesis, change the above HDL to:

GENERIC( --synopsys synthesis_off DelayAmount : TIME --synopsys synthesis_on );

This will ensure the HDL is present for simulation, but is ignored during synthesis.

---

## VHDL-2255

(error) Generics of type string are not supported - %s\n

**Description**

Synthesis VHDL subset does not include generics of type string.

**What Next**

Rewrite the attribute specification using the VHDL synthesis subset.

---

## VHDL-2256

(error) Range of enum types is not supported %s.

**Description**

Ranges of enumerated types using the *TO* construct are not supported in VHDL Compiler. The following *CASE* statement using the *TO* construct is not supported.

```
type STATE_TYPE is (STATE0, STATE1, STATE2, STATE3);
  signal STATE, NEXT_STATE : STATE_TYPE;

  process
  begin
    case STATE is
    when STATE0 =>
         DOUT <= '0';
    when STATE1 to STATE3  =>
         DOUT <= '1';
    end case;
  end process;
```

**What Next**

The workaround is to use the "|" construct which performs an *OR* operation.

```
type STATE_TYPE is (STATE0, STATE1, STATE2, STATE3);
  signal STATE, NEXT_STATE : STATE_TYPE;

  process
  begin
    case STATE is
    when STATE0 =>
```

Feedback

```
        DOUT <= '0';
    when STATE1 | STATE2 | STATE3 =>
        DOUT <= '1';
    end case;
  end process;
```

## VHDL-2257

(error) unsupported function call %s

### Description

Some remote functions can not be called.

### What Next

Move to a local package.

## VHDL-2260

(error) Bit-slice is not supported in generic for '%s',\n \t%s.

### Description

Bit slices in the generic map of a component instantiation are not supported. For example:

```
U1: GATE1  generic map ( INIT(0) => '0', INIT(1 to 7 ) => init_val)
           port map ( DINPUT(0) => d0, DINPUT(1) => d1, DOUTPUT =>
 dout );
```

### What Next

Concatenate the values assigned to slices in the generic map or port map. Assign this concatenation to an intermediate signal or variable, and use this signal or variable in the component instantiation. For example:

```
aggr1 <= ('0' & init_val);
U1: GATE1  generic map ( INIT => aggr1 )
           port map ( DINPUT(0) => d0, DINPUT(1) => d1, DOUTPUT =>
 dout );
```

## VHDL-2262

(error) Enumeration values may not be used as for or for-generate loop bounds

Feedback

**Description**

Enumeration values may not be used to define the bounds of a for or for-generate loop in Synopsys' synthesizable subset of VHDL. These bounds must be integer values that can be computed at compile time.

---

## VHDL-2263

(error) Number of enumeration encoding values does not match the number of enumeration values, line %d.

**Description**

The number of enumeration encoding values defined via the ENUM_ENCODING attribute must match the number of enumeration values for the type.

**What Next**

Modify the number of enumeration or enumeration attribute values.

---

## VHDL-2264

(error) Incorrect way to use '%s attribute .

**What Next**

event and 'stable attributes are allowed to be used only when inferring a clock edge . For example

(clock'event and clock = '1')

and

((not clock'stable) and clock = '1')

following are not allowed

((not clock'event and clock = '1')

and

(clock'stable and clock = '1')

---

## VHDL-2270

(error) The alias declaration%sis invalid because object %s is an alias. Aliases to existing aliases are not supported for synthesis .

Feedback

### Description

HDL Compiler supports aliases to signals, variables and constants only. HDL Compiler does not support aliases that refer to existing aliases.

### What Next

Either remove the alias to an alias and replace references to the first alias with references to the second, or replace the second alias with an alias to the original object. For example, given:

signal B : std_logic_vector(0 to 31); alias MSB : std_logic_vector(0 to 7) of B(24 to 31); alias MSN : std_logic_vector(0 to 3) of MSB(4 to 7);

...

MSN <= "0000";

You could remove the definition of MSN and replace its use with:

MSB(4 to 7) <= "0000";

Or, you could transform the declaration of MSN and leave its use intact:

alias MSN : std_logic_vector(o to 3) of B(28 to 31);

...

MSN <= "0000";

---

## VHDL-2271

(error) Cannot use predefined attributes with alias %s%s, as the alias's range is not locally static.

### Description

HDL Compiler does not support the use of predefined attributes (such as 'LEFT, 'HIGH, 'RANGE, and so on) with aliases when the alias range is not locally static.

### What Next

Replace the predefined attribute with the corresponding components of the alias's range. For example, given

procedure foo(B : inout std_logic_vector) is begin constant b_left : integer := B'length-1; alias b_alias : std_logic_vector(b_left downto 0) of B;

...

for I in b_alias'RANGE loop ... end loop;

Feedback

... end foo;

replace the loop with

for I in 0 to b_left loop ... end loop;

---

## VHDL-2280

(error) 'IMAGE is used outside of an attribute statement in a for-generate loop.

**Description**

HDL Compiler supports the 'IMAGE attribute only as part of an attribute specification of the following type:

attribute RELATIVE_LOCATION of <object> : label is <string_literal> & INTEGER'IMAGE(<indexvar>) & <string_literal>

Where <indexvar> is the index variable of a for-generate loop.

**What Next**

The following is an example of the situation in which 'IMAGE might be used.

G : FOR d IN 0 TO 7 GENERATE B : BLOCK ATTRIBUTE RELATIVE_LOCATION OF flop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0"; BEGIN flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); END BLOCK; END GENERATE G;

In this case, you're instantiating a set of eight DFFs that will be used to latch the value of an eight-bit bus. Note that 'IMAGE can be used only

```
+ Within a block within a for-generate loop.
+ As part of an attribute statement, where the attribute name is
  "RELATIVE_LOCATION" and the value is a concatination of three strings:
  a prefix, the 'IMAGE expression, and a suffix. In the previous example,
 "R"
  is the prefix and "C0" is the suffix. The prefix and suffix must be
  literals.
+ With the index variable for the for-generate loop.
```

Note that choices for the following are left to you:

```
+ The label for the for-generate loop and the block.
+ The number and contents of the instantiation statements within the
 block.
```

You can also specify more than one entity name in the attribute statement. For example, you can use

ATTRIBUTE RELATIVE_LOCATION OF flop,rflop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0";

Feedback

if you were instantiating two series of entities:

flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); rflop : dff PORT MAP (D => INP(d), Q=>R_OUTP(8-d), CK=>CLK);

You can also have more than one such attribute statement if you want to specify a different prefix or suffix.

---

## VHDL-2281

(error) The attribute RELATIVE_LOCATION does not have a value of the form <string_literal> & INTEGER'IMAGE(<indexvar>) & <string_literal>

**Description**

HDL Compiler supports the use of the RELATIVE_LOCATION attribute only with a very specific value. The attribute statement must be of the form:

attribute RELATIVE_LOCATION of <object> : label is <string_literal> & INTEGER'IMAGE(<indexvar>) & <string_literal>

Where <indexvar> is the index variable of a for-generate loop.

**What Next**

The following is an example of the situation in which you may use the attribute RELATIVE_LOCATION:

G : FOR d IN 0 TO 7 GENERATE B : BLOCK ATTRIBUTE RELATIVE_LOCATION OF flop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0"; BEGIN flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); END BLOCK; END GENERATE G;

In this case, we're instantiating a set of eight DFFs that will be used to latch the value of an eight-bit bus. Note that 'IMAGE can be used only: + Within a block within a for-generate loop. + As part of an attribute statement, where the attribute name is "RELATIVE_LOCATION" and the value is a concatination of three strings: a prefix, the 'IMAGE expression, and a suffix. In the above example, "R" is the prefix and "C0" is the suffix. The prefix and suffix must be literals. + With the index variable for the for-generate loop.

Note that choices for the following are left to you: + The label for the for-generate loop and the block. + The number and contents of the instantiation statements within the block.

You may also specify more than one entity name in the attribute statement. For example, you could use

ATTRIBUTE RELATIVE_LOCATION OF flop,rflop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0";

Feedback

if you were instantiating two series of entities:

flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); rflop : dff PORT MAP (D => INP(d), Q=>R_OUTP(8-d), CK=>CLK);

You may also have more than one such attribute statement, if you want to specify a different prefix and/or suffix.

---

## VHDL-2282

(error) The argument to 'IMAGE is not a for-generate loop index variable.

**Description**

HDL Compiler supports the 'IMAGE attribute only as part of an attribute specification of the following type:

attribute RELATIVE_LOCATION of <object> : label is <string_literal> & INTEGER'IMAGE(<indexvar>) & <string_literal>

Where <indexvar> is the index variable of a for-generate loop.

**What Next**

The following is an example of the situation in which 'IMAGE might be used.

G : FOR d IN 0 TO 7 GENERATE B : BLOCK ATTRIBUTE RELATIVE_LOCATION OF flop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0"; BEGIN flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); END BLOCK; END GENERATE G;

In this case, you're instantiating a set of eight DFFs that will be used to latch the value of an eight-bit bus. Note that 'IMAGE can be used only

```
+ Within a block within a for-generate loop.
+ As part of an attribute statement, where the attribute name is
  "RELATIVE_LOCATION" and the value is a concatination of three strings:
  a prefix, the 'IMAGE expression, and a suffix. In the previous example,
 "R"
  is the prefix and "C0" is the suffix. The prefix and suffix must be
  literals.
+ With the index variable for the for-generate loop.
```

Note that choices for the following are left to you:

```
+ The label for the for-generate loop and the block.
+ The number and contents of the instantiation statements within the
 block.
```

You can also specify more than one entity name in the attribute statement. For example, you can use

Feedback

ATTRIBUTE RELATIVE_LOCATION OF flop,rflop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0";

if you were instantiating two series of entities:

flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); rflop : dff PORT MAP (D => INP(d), Q=>R_OUTP(8-d), CK=>CLK);

You can also have more than one such attribute statement if you want to specify a different prefix or suffix.

---

## VHDL-2283

(error) Only the type INTEGER is supported for the prefix of the attribute 'IMAGE %s

**Description**

Presently 'IMAGE attribute has a limited support in HDL compiler. Only Integer may appear as a prefix to it

**What Next**

Please rewrite the use of 'image attribute so that it has integer as its prefix

---

## VHDL-2284

(error) Declarative regions of generate statements is not supported %s

**Description**

This version of VHDL Compiler doesn't support declarative regions of generate statements.

**What Next**

Use block statement inside the generate statement.

Example:

You replace the following VHDL codes

---------- build_blks: FOR i IN 1 TO 4 GENERATE

SIGNAL int_connect: unsigned(3 DOWNTO 0); BEGIN blk1: blk_in PORT MAP(a_in(i - 1), int_connect(i - 1)); blk2: blk_out PORT MAP(int_connect(i - 1), b_out(i - 1)); END GENERATE build_blks; ----------

by

Feedback

---------- build_blks: FOR i IN 1 TO 4 GENERATE

THE_BLOCK : block SIGNAL int_connect: unsigned(3 DOWNTO 0); BEGIN blk1: blk_in PORT MAP(a_in(i - 1), int_connect(i - 1)); blk2: blk_out PORT MAP(int_connect(i - 1), b_out(i - 1)); end block;

END GENERATE build_blks; ----------

## VHDL-2285

(warning) VHDL-93 generates different concatenation results from VHDL-87 %s.

### Description

You receive this message if *read* or *elaborate* detects that the concatenation result generated by VHDL-93 for your design differs from the result that would have been generated by VHDL-87. This message is to warn you to expect different results from those you might have become accustomed to with VHDL-87.

By default, currently VHDL Compiler uses VHDL-93 concatenation, which generates a different left bound and/or direction from VHDL-87. (For details of the concatenation definition, see the IEEE *VHDL-93 Language Reference Manual*.) You can override the default behavior by setting the *hdlin_vhdl93_concat* environment variable to *false*.

### What Next

If you receive this message, proceed as follows:

1. Read the *VHDL-93 Language Reference Manual* to understand the concatenation results generated by VHDL-93.
2. If this is acceptable for your design, you need take no further action.
3. If you want to revert to VHDL-87 behavior, set *hdlin_vhdl93_concat* to *false*.

# VL

## VL-001

(warning) lib-pin "%s" doesn't have required EM type via ladder candidates.

### Description

The lib-pin has attribute "is_em_via_ladder_required" set to true, and therefore it needs to have at least one EM type via ladder in its via ladder candidate list.

Feedback

**What Next**

Use set_via_ladder_candidate to add at least one EM type via ladder to the lib-pin's via ladder candidate list.

---

## VL-002

(Error) Via ladder candidate "%s" of lib-pin "%s" is undefined.

**Description**

The via ladder candidate defined on the lib-pin does not exist.

**What Next**

There are four options to resolve this.

- Use *create_via_rule* command to create the via ladder.
- Check technology file to see if the via ladder is properly defined.
- Check if the technology file is correctly read in.
- Use *report_via_ladder_candidates* command to check if the via ladder candidates are correctly defined on the lib-pin. If the via ladder candidates are incorrectly defined, please use reset_via_ladder_candidates and *set_via_ladder_candidate* commands to correct the settings.

---

## VL-003

(Warning) Illegal via rule "%s" - Pin layers on via ladder ("%s") and on "%s" ("%s") are different, tool will ignore this rule.

**Description**

Via rule is illegal due to layer is mismatch with pin.

**What Next**

Please check tech file or via rules.

---

## VL-004

(Warning) Illegal via rule "%s" - Terminal counts on via ladder ("%d") and on "%s" ("%d") are different, tool will ignore this rule.

**Description**

Via rule is illegal due to temninal counts are mismatch.

Feedback

**What Next**

Please check tech file or via rules.

---

## VL-005

(Warning) Illegal via rule "%s" - Top layer of via ladder ("%s") is over max layer ("%s") of the net, tool will ignore this rule.

**Description**

Via rule is illegal due to top layer is over max layer.

**What Next**

Please check tech file or via rules.

---

# VR

---

## VR-001

(information) Ignoring reference to '%s' in module '%s'\n \tbecause it has no connections.

**Description**

This message may occur during *read_verilog*. If all instances of a given reference name are unconnected within a module, the reference will be ignored and no instances of that reference will be created. Typically such instances are for filler cells or other physical objects that have no meaning in a logical netlist.

**What Next**

If you want to create instances in such cases, set the application variable *svr_keep_unconnected_cells* to "true".

---

## VR-002

(information) Renamed scalar %s '%s' to '%s' in design '%s'.

**Description**

While reading a Verilog file, two net or port names were found to be in conflict, requiring one of the objects to be renamed. This can occur for one of two reasons: an ambiguous bus naming style or escaped names.

Feedback

Given a bus_naming_style of "%s[%d]" and the following verilog port declarations:

```
output \\z[1] ;
output [1:0] z;
```

the bus reference z[1] conflicts with the scalar port z[1], declared with the first output statement. The scalar is renamed to something like z[1]1, unless there is already a port z[1]1, in which case z[1]2 is tried, and so on.

**What Next**

No action is required. This is an informational message.

---

## VR-004

(error) Invalid global reference '%s' - %s\n \tin module ending at line %d in %s

**Description**

You receive this message if we find an invalid global reference while reading a Verilog file. A global reference is a connection to a wire in another module. There are several restrictions on the use of global references. For a reference of the form *module.wire*, all of the following must be true:

- The module must exist in the file being read.
- The module must precede the module that is making the reference.
- The wire must exist in the module.
- The wire must be a logic constant.

Any deviation from these rules generates this error message.

**What Next**

There is no other support for global signals. If you cannot conform to the rules, you must remove these signals from your netlist.

---

## VR-005

(warning) Failed to find the specified top module '%s'.

**Description**

The user-specified top module was not declared in any Verilog file. The Verilog reader will attempt to determine the top module and set the current design.

**What Next**

Check the current design using the *current_design* command. If it is not correct, set the correct current design using the *current_design* command, or rerun read_verilog with the correct module passed through the *-top* option.

Feedback

## VR-006

(warning) Failed to determine the top module.

**Description**

The Verilog reader attempted to determine the top module based upon the module instantiations. However it was unable to find any possible top modules. The current design is not set.

**What Next**

Set the current design using the *current_design* command.

## VR-007

(error) Multiple possible top modules exist.

**Description**

The Verilog reader attempted to determine the top module based upon the module instantiations. However it found multiple modules that could be the top module, and was unable to determine the correct one. No design has been read.

**What Next**

Rerun the command and specify the top module with the *-top* option. You may use the *-verbose* option to display a list of possible top modules.

## VR-008

(warning) Module '%s' already exists (duplicate found at line %d in %s).

**Description**

The module is already defined in the design. The duplicate module definition is ignored. If reading multiple Verilog files into the same design, an earlier file may have already defined this module.

**What Next**

Rename or remove the duplicate.

## VR-009

(error) Unable to rename %s '%s'.

Feedback

**Description**

The object name conflicts with an existing object name. The Verilog reader attempted to find a new name for the object, but was unable to find a unique name. The object will be unnamed.

**What Next**

Check the input Verilog file.

---

## VR-010

(error) Duplicate declaration of port '%s'.

**Description**

The port has already been declared. Each port should be declared once and only once.

**What Next**

Check the ports in the input Verilog file.

---

## VR-011

(error) Design '%s' in library '%s' is currently opened; reading Verilog into an opened design is not allowed.

**Description**

The Verilog file cannot be read into a design that is currently opened in memory.

**What Next**

Close the currently opened design and then run *read_verilog* again.

---

## VR-012

(information) Reading Verilog into new design '%s' in library '%s'.

**Description**

A new design has been created by *read_verilog*. The Verilog file is read into the new design.

**What Next**

If your intention was to read the Verilog file into a new design, there is nothing further to do. However if this is not your intention, review the options that were used when calling *read_verilog*.

Feedback

## VR-013

(information) Reading Verilog into existing design '%s' in library '%s'; the existing design contents has been truncated.

**Description**

The Verilog file is read into the specified existing design. Incremental Verilog updates are not allowed. So *read_verilog* opens the design in truncate mode, discards the existing contents, and then reads the new Verilog file into the design.

**What Next**

When saving truncated designs, use the *save_block -as* option to avoid overwriting your existing design on disk.

## VR-014

(error) Unable to rename top module from '%s' to '%s'.

**Description**

The design and top module names must match. This command attempted to rename the top module to the same name as the design, but another module with that name already exists. As a result, this command failed and no design is read.

**What Next**

Run the command again and specify a different design name with the *-design* option.

## VR-015

(information) Multiple possible top modules exist.

**Description**

The Verilog reader attempted to determine the top module based upon the module instantiations. However it found multiple modules that could be the top module, and the first read module was chosen as the top module of the block.

**What Next**

Continue the reading flow and complete the block by linking it while selecting the correct top module, with the set_top_module command.

## VR-016

(error) Current block is already linked.

Feedback

### Description

The Verilog reader attempted to write to the current block, but the block is already linked. The current block must be unlinked to allow multiple read_verilog commands.

### What Next

Either create a new block or use the -design option to specify a new block. If the intended target was indeed the current block, ensure that it is not linked.

---

## VR-017

(warning) Net name '%s' is reserved and has been renamed to '%s' in module '%s'.

### Description

The Verilog file declares a signal net with the name "*Logic0*" or "*Logic1*". However net names "*Logic0*" and "*Logic1*" are reserved by Synopsys for the tie-low and tie-high constant nets. They cannot be used as names of signal nets in the netlist and have been renamed.

### What Next

No action is required. The Verilog file may have been incorrectly generated. If the Verilog file was generated by a Synopsys tool, try running the *change_names* command to fix the net name prior to writing the Verilog file.

---

## VR-018

(warning) Found redefinition of module '%s' (%s found at line %d in %s).

### Description

The module is already defined in the design. The duplicate module definition is ignored or the original overwritten. If reading multiple Verilog files into the same design, an earlier file may have already defined this module. Preference is given to a module definition if the source file was specified as a full pathfile name.

### What Next

Resolve the collision if necessary.

---

## VR-019

(error) Decryption Failed. %s

Feedback

**Description**

This message occurs when failing to read an encrypted verilog file, currently, *read_verilog* only can decrypt IEEE 1735 standard Verilog file.

**What Next**

Specify appropriate verilog file and then run *read_verilog* again.

---

## VR-020

(error) Module %s cannot be created because same name design cannot be found in current library and its reference libraries.

**Description**

*read_3d_verilog* requires physical blocks to be created firstly (except the top), then read in a 3D-Verilog file. All modules in Verilog file except the top module should have same name physial blocks existed in its reference libraries.

**What Next**

Please use option -design to specify the top design name. If the error still exists, please check whether modules in source Verilog file can match with designs in current library's reference libraries.

---

# VW

---

## VW-001

(warning) Writing verilog from unlinked design '%s'.

**Description**

The current design is not linked and could not be automatically linked. The generated Verilog file will contain only modules from within the current design. Modules from other designs and libraries will not be included. The modules will not be hierarchically ordered.

**What Next**

Link the current design and rerun write_verilog, if you want a complete or hierarchically ordered Verilog file.

---

## VW-002

(warning) Inapplicable option '%s' ignored.

Feedback

**Description**

The specified option is not applicable for unlinked designs. The current design is unlinked.

**What Next**

Link the current design and rerun write_verilog, if you want a hierarchically ordered Verilog file.

---

## VW-003

(warning) Non-unique module name '%s' (from library '%s' design '%s') renamed to '%s'.

**Description**

Multiple distinct modules exist with the specified name. Duplicate modules are renamed to a unique name.

**What Next**

The user must make sure that any external scripts are modified to match the now-unique Verilog file.

---

## VW-004

(error) A %s within the design %s does not have a valid name.

**Description**

The specified object within the design does not have a valid name. The object will be omitted from the Verilog output file.

**What Next**

The user should check the design and verify that it is valid.

---

## VW-005

(warning) Skipping module '%s' from design %s.%s ...

**Description**

The module cannot be written because it is from a non-design design view and would not create valid Verilog. The module is probably from an Abstract or an Outline design view. These design views are abstractions of the full designs. They do not contain the complete design information. Writing such a module would result in incomplete Verilog.

Feedback

### What Next

Switch to the design view for this design, then write your Verilog modules from that design.

### See Also

- read_verilog_outline

---

## VW-006

(error) Cannot write Verilog for design %s.%s.

### Description

The design cannot be written because it is from a non-design design view and would not create valid Verilog. The module is probably from an Abstract or an Outline design view. These design views are abstractions of the full designs. They do not contain the complete design information. Writing such a module would result in incomplete Verilog.

### What Next

Switch to the design view for this design, then write your Verilog modules from that design.

### See Also

- read_verilog_outline

---

## VW-007

(warning) Net name '%s' is omitted from the output file, because the net name does not match a connected port name. The net is implicitly renamed to match one of its connected ports.

### Description

The indicated net name is omitted from the output Verilog file, because the net name does not match a connected port name. The ports and pins of the net are connected together by a implicit net in the output file. This net is implicitly named to match one of its ports.

When this Verilog file is read back into the tool, the net will have the same name as one of its ports. Hence the original net name is lost.

To retain the original net name in the output Verilog file, assign statements must be written out. Set application option, file.verilog.write_pg_net_assigns, to true to output assign statements for renamed PG nets. Set application option, file.verilog.write_non_pg_net_assigns, to true to output assign statements for renamed non-PG nets.

Feedback

## VW-008

(error) Bus port '%s' of module '%s' is written out as a scalar port because it is in an invalid state. %s

### Description

The bus port is in an invalid state as indicated and cannot be written out using the Verilog bus format. It is written out as a scalar port.

A bus port is valid only if the port's owning bus name is a non-empty string and the port's name is the concatenation of the owning bus name, opening bus delimiter, bus index, and closing bus delimiter (e.g., bus[0]).

### What Next

Check the bus port and correct the data so it is in a valid state.

## VW-009

(error) The bus port '%s' of module '%s' has a port element with an irregular name '%s'; similar errors for each bus port might be reported only once. Run change_names before write_verilog.

### Description

The indicated bus port element name is irregular and cannot be written out using the Verilog bus format.

A bus port element name is acceptable only if its owning bus name is a non-empty string and the element name is the bus name followed by only one non-negative subscript.

The following examples show the unsupported bus port element names:

```
a[2][3]
  a.b
  a.b[2].c
  a[-1]
  a[b]
```

The following example shows the bus port element name that can be accepted:

```
a[4]
```

### What Next

Correct the issue, such as renaming the bus elements cited as being in an unsupported format. The *change_names -hierarchy -rule verilog* command will "flatten_port_bus" in most such cases. Then run the *write_verilog* command again.

Feedback

**See Also**

- change_names
- define_name_rules

---

## VW-010

(warning) Net name '%s' is renamed to '%s' in module '%s' in output file.

**Description**

The indicated net name is renamed to avoid name confliction in the module, because the net and same name port is not connected together in the module.

Otherwise, when this Verilog file read cannot read back into the tool, or the connection will be wrong.

**WHAT'S NEXT**

Check the net and same name port connection, and correct the name confliction in the module.

---

## VW-011

(error) object name '%s' contains space.

**Description**

Spaces are allowed in database object names, however the Verilog syntax does not support spaces in object names.

**WHAT'S NEXT**

Run change_names before write_verilog

---

## VW-012

(warning) Incorrect syntax '%s' specified for cell-rename entry. The entry will be ignored.

**Description**

The syntax for the cell-rename entry is not a valid one. Refer the man-page of write_verilog for the appropriate syntax.

---

## VW-013

(error) Failed to open the cell-rename map file '%s'.

Feedback

**Description**

The cell-rename map file could not be opened. Verify the file-permissions and retry.

---

## VW-014

(error) Invalid value for option -mask_shift_layers.

**Description**

There can not be duplicated layers in the specified value.

---

## VW-016

(error) Mask shifted cell '%s' does not have its corresponding mapping in the map file.

**Description**

There is not a corresponding mapping for the mask shifted cell in the map file.

**What Next**

Please add the corresponding mapping to the map file and then try again.

---

## VW-017

(error) Mask shift property mismatch on cell '%s'.

**Description**

There is mask shift property mismatch between different map files.

**What Next**

Please correct the mask shift property and then try again.

---

## VW-018

(error) Fail to remove the file '%s'.

**Description**

The verilog file is removed if failure occurs.

**What Next**

Please ignore the file.

Feedback

## VW-019

(error) The port '%s' of module '%s' has a duplicate name with other port or port bus. Run change_names before write_verilog.

**Description**

The Verilog syntax does not support two module ports with the same name.

**WHAT'S NEXT**

Run "change_names -rules verilog" before write_verilog.

## VW-020

(information) Output mask-shifted cell name according to rename files.

**Description**

This message occurs when -rename_cell is specified to write_verilog and the rename files are for mask-shifted cells.

**What Next**

No action required.

## VW-021

(error) Encrypt Verilog file failed.

**Description**

This message occurs when use -encrypt option and encrytion failed.

**What Next**

If encryption fails, please don't use -encrypt option temporary, and contact support for help.

## VW-022

(warning) Command will ignore analysis block %s.

**Description**

A message indicating that this command cannot be applied to an analysis block. An analysis block is for analysis purposes and isn't suitable for other usages.

Feedback

**What Next**

If you want to write out a shell netlist from the analysis design, use the -shell_only option.

---

## VW-023

(information) Writing from view '%s' as specified by the -switch_view_list option.

**Description**

An alternate view was found for the block as specified by the *-switch_view_list* option. This alternate view will be written to the generated Verilog, instead of the bound view.

---

## VW-024

(information) Writing from bound view '%s' instead of switching views as specified by the -switch_view_list option, because no alternate view exists.

**Description**

No alternate view was found for the block as specified by the *-switch_view_list* option. The bound view will be written to the generated Verilog.

---

## VW-025

(warning) Current design is analysis design, -key_file option will be ignored.

**Description**

RTLA analysis design doesn't support using user-specified keys to encrypt Verilog file.

---

## VW-026

(warning) Executing write_verilog with %s may change the NDM database.

**Description**

This is a warning message to indicate that write_verilog will not behave as a read_only command under the reported circumstances. Although the database contents will be restored to the pre-write_verilog state, the collections and the variables populated before write_verilog might be affected.

**What Next**

Use the reported message to change the settings according to the requirement.

Feedback

## VW-027

(error) The port bus '%s' of module '%s' is a malformed port bus.

**Description**

The reported port bus is a malformed port bus. Please check the design.

**WHAT'S NEXT**

Please use report_port_buses command to investigate and rectify the port bus reported.

## VW-028

(warning) The ports of the port bus '%s' of module '%s' are written out as scalar ports because the port bus is malformed.

**Description**

The reported port bus is a malformed port bus. Please check the design.

**WHAT'S NEXT**

Please use report_port_buses command to investigate and rectify the port bus reported.

## VW-029

(warning) In module '%s', the instance name '%s' is the same as the net name and this might cause issues.

**Description**

This warning is generated when the instance name has the same name as the port net name. In Verilog, both port and module have their own namespace, which include instance names and net names. Implicit nets are used for those nets that are connected to ports. This means that the port net uses the same name as its port. Because instance names and net names share the same space, they can not use the same names.

**WHAT'S NEXT**

Please use change_names command to correct before executing the write_verilog command.

## VW-108

(error) Port bus '%s' of module '%s' is invalid; its member '%s' is not a valid one-dimensional bus port. Similar errors may only report once for each port bus.

Feedback

**Description**

The indicated port bus is invalid, because its member name is invalid in Verilog; only one-dimensional array is supported.

**What Next**

Correct the issue and try write_verilog again.

# WINSEL

## WINSEL-001

(Warning) Invalid object class %s. Supported objects are : %s

**Description**

The specified object class does not exist.

**What Next**

Verify that the object class exists and the spelling is correct.

## WINSEL-002

*WINSEL-002* (ERROR) Bad syntax for rectangle: %s

**Description**

The syntax specified for the rectangle was not acceptable. Correct syntax is, a rectangle must be of the form

{ <lower_left_point> <upper_right_point> }

and the point is

{ <x_dist > <y_dist> }

Note that distances are fixed point numbers, like 17.25 or 13000.1 or 2500.

**What Next**

Please fix the syntax and try again.

## WINSEL-003

(error) Nothing matched for search constraints.

Feedback

**Description**

No objects satisfied the constraints you specified.

**What Next**

Check the command arguments you gave, and see if the constraints can be changed or relaxed to make a match.

# ZRT

## ZRT-001

(error) Could not save the design view.

**Description**

This error message indicates that the tool could not save the design view into the design library. Possible reasons for this are

- You do not have write permission.
- No disk space is available.

**What Next**

Verify that you have write permission and that there is sufficient disk space available.

## ZRT-002

(error) Cannot load the design.

**Description**

This error message indicates that the router could not read in all the required information from the design database. Possible reasons for this are

- There is an inconsistency issue in the design.
- There is a problem in the technology file.
- Certain information that is required for the router is missing.

**What Next**

Please check the design and the technology file.

Feedback

## ZRT-003

(warn) Cannot create the ECO route attachment file.

**Description**

This message indicates that the router could not create or update an attachment file that describes the nets that have been changed by the ECO routing command. Without this file, the signoff flow might be broken. Possible reasons for this are

- You do not have write permission.
- No disk space is available.

**What Next**

Verify that you have write permission and that there is sufficient disk space available.

## ZRT-004

(error) Number of routing layers has to be greater than 1.

**Description**

The design only has one routing layer and the router can only route design with two or more routing layers.

**What Next**

Please add more routing layer to the design.

## ZRT-005

(error) Unable to support design with more than %d routing layers.

**Description**

The router currently only supports maximum of 31 routing layers.

**What Next**

Please reduce the number of routing layers.

## ZRT-006

(warn) Both adjacent cut rule and enclosed cut rule are specified, supporting only enclosed cut rule.

Feedback

**Description**

Enclosed cut rule is a super set of adjacent cut rule which is an older rule the router supports for backward compatibility. So if both rules are specified, only enclosed cut rule is honored.

**What Next**

Please remove adjacent cut rule and use enclosed cut rule to specify adjacent cut rule.

---

## ZRT-007

(warn) Ignore fat rule on layer %s.

**Description**

The reason for receiving this warning could be one of the following:

- Fat threshold table is not in ascending order.
- Fat spacing table is not symmetric.

**What Next**

Please check the technology file and make sure the fat rule is specified correctly.

---

## ZRT-008

(warn) Ignore protrusion rule on layer %s.

**Description**

The reason for receiving this warning could be one of the following:

- Protrusion threshold table is not in ascending order.

**What Next**

Please check the technology file and make sure the protrusion rule is specified correctly.

---

## ZRT-009

(warn) Ignore %s rule on layer %s.

**Description**

This warning is issued because the spacing for this rule is not specified in increasing order.

Feedback

**What Next**

Please check the technology file and make sure the rule is defined correctly.

---

## ZRT-010

(warning) Cannot find a fat contact for layer '%s'.

**Description**

This error message indicates that the tool cannot find a suitable fat contact for the specified layer.

This error restricts the router's ability to resolve fat contact violations.

**What Next**

This error is most likely due to a missing fat contact definition in the technology file. Check the technology file and, if necessary, add a fat contact definition.

---

## ZRT-011

(warning) Found more than one fat contact for layer '%s'.

**Description**

This warning message indicates that the tool found more than one fat contact for the specified layer. This is most likely due to multiple fat contact definitions in the technology file.

When the technology file contains multiple fat contact definitions, the router arbitrarily uses one of the fat contacts to fix fat contact violations.

**What Next**

Check the technology file and remove the extra fat contact definitions.

---

## ZRT-012

(error) Found illegal fat contact '%s' for layer '%s'.

**Description**

This error message indicates that the tool found an illegal fat contact definition in the technology file.

This error restricts the router's ability to fix fat contact violations.

Feedback

**What Next**

Check the technology file and fix the fat contact definition.

---

## ZRT-013

(error) Found illegal extension fat contact '%s' for layer '%s'.

**Description**

This error message indicates that the tool found an illegal extension fat contact definition in the technology file.

This error restricts the router's ability to fix extension fat contact violations.

**What Next**

Check the technology file and fix the extension fat contact definition.

---

## ZRT-014

(warn) Ignore stub spacing definition on layer %s.

**Description**

The reason for this warning message is most likely because the stub spacing value is less or equal to 0

**What Next**

Please check the technology file and make sure the stub spacing is defined correctly.

---

## ZRT-015

(warn) Ignore contact %s.

**Description**

The reason for receiving this warning could be one of the following:

- Lower, upper, or cut layer of the contact is not a valid routing layer.
- The contact has the same lower and upper layer.

**What Next**

Please check the technology file and make sure the contact is defined correctly.

Feedback

## ZRT-016

(warn) Inconsistent %s design rule found between %s and %s.

**Description**

This warning message indicates that inconsistent design rule values are found. This is most likely due to the design rule being defined multiple times with the same two layers but with different values. Only the first definition read by the router is honored.

**What Next**

Please check the technology file and make sure the design rule is only defined once for the same two layers.

## ZRT-017

(warn) No diode ratio set for %s, turning off antenna rule mode %d.

**Description**

When an antenna rule of diode mode 5 or greater is defined, diode ratio also needs to be specified for every routing layer. In this case, one or more layers are found without diode ratio and so the antenna rule is ignored.

**What Next**

Please use technology file antenna definitions to specify diode ratio for every routing layer.

## ZRT-018

(warn) No scale factor set for %s, turning off antenna rule mode %d.

**Description**

When an antenna rule of diode mode 11 or 12 is defined, scale factor also needs to be specified for every routing layer. In this case, one or more layers are found without scale factor and so the antenna rule is ignored.

**What Next**

Please use define_antenna_layer_rule to specify scale factor for every routing layer.

## ZRT-019

(warn) Illegal min/max layer constraint on net %s.

Feedback

**Description**

This warning occurs when the min layer constraint is on a higher layer than the max layer constraint. This constraint is ignored for the net.

**What Next**

Please use set_net_routing_layer_constraints to redefine the min/max layer constraint or use remove_net_routing_layer_constraints to remove the constraint on the net.

---

## ZRT-020

(warn) Illegal cell min/max layer constraint.

**Description**

This warning occurs when the min layer constraint is on a higher layer than the max layer constraint. This cell constraint is ignored.

**What Next**

Please redefine or reset this cell layer constraint.

---

## ZRT-021

(info) A partial via ladder for user debugging has been detected. Please run refresh_via_ladders to remove these structures so that routing may proceed.

**Description**

This design contains partial via ladder for user debugging. All the Zroute commands are forbidden to run on this block, except for check_routes, insert_via_ladders, refresh_via_ladders, and other full routing commands with via ladder stage.

**What Next**

Please run refresh_via_ladders to remove these structures so that routing may proceed.

---

## ZRT-022

(warn) Cannot find a default contact code for layer %s.

**Description**

This warning message indicates that a default contact code was not found for the specified layer. This is most likely due to a missing default contact code definition in the technology file.

Feedback

**What Next**

Add a default contact code definition to the technology file. If the specified layer is a nonrouting layer, such as V0, you can ignore this message.

---

## ZRT-023

(warn) create_frame on %d macros were done with "treat blockage as thin".

**Description**

"Treat blockage as thin" flag was on during the create_frame process and thus blockages inside these macros will be treated as thin by the router.

**What Next**

If treating the blockages as thin is not the desired behavior, please re-run create_frame.

---

## ZRT-024

(error) %s has no corresponding % layer.

**Description**

The given layer does not have a corresponding wire/via layer. This limits the router's ability to move from one layer to another.

**What Next**

Please define the corresponding wire/via layer in the technology file.

---

## ZRT-025

(warn) Layer %s does not have a preferred direction, assigning to %s.

**Description**

This message indicates that the layer does not have a preferred direction assigned to it. If the adjacent layer has a preferred direction, the opposite direction is set for the layer. Otherwise, metal 1 is assigned to horizontal, metal 2 to vertical, and so forth.

**What Next**

Please use the set_attribute command to assign the preferred direction as follows:
set_attribute -name routing_direction -value vertical [get_layer M9]

Feedback

## ZRT-026

(warn) Layer %s default pitch %.3f may be too small to handle up/down via. Note, that minimum requirements are "wire/via-down %.3f" & "wire/via-up %.3f".

### Description

The pitch defined for the layer may be too small due to a larger "up via" and/or "down via" requirement. The router will use the larger spacing when placing those via.

### What Next

This is only a warning message.

## ZRT-027

(warn) Ignore %d top cell ports with no pins.

### Description

This warning message indicates that the design's top cell has logical ports which have no physical shapes attached to them. The router will ignore such ports.

### What Next

Please check the top cell and create physical shapes for those ports if needed.

## ZRT-028

(error) Failed to open child cell %s.%s.

### Description

This warning message indicates that the router was not able to open the child cell for read. This could be because the reference library where the child cell resides does not have read permission or is missing.

### What Next

Please make sure the reference library is linked and readable to the current design.

## ZRT-029

(error) Cell %s has inconsistent number of logical ports in the library and in the top cell.

Feedback

**Description**

This warning message indicates that the counts for the logical ports are different between the child library cell's record and the top cell's record. This could happen if the library cell got modified after the top cell was created.

**What Next**

Please check and update the design hierarchy.

---

## ZRT-030

(warn) Ignore pin (cell %s, pin %s) on layer %s.

**Description**

This warning message occurs because physical pin shape on non-routing layer was found. The router will ignore such pin.

By default, routing commands print only 10 messages of this type. If user wishes to have more messages of this type printed to log file, set_message_info command is to be used.

Example is: set_message_info -id {ZRT-030} -limit 300

**What Next**

Please check to see if the pin shape is on the correct layer.

---

## ZRT-031

(warn) Invalid routing layer '%s' on wire

**Description**

This warning message indicates that a wire from the database is on an invalid routing later. The wire will be ignored by the router.

**What Next**

Please check the database and fix the wire to be on valid routing layer.

---

## ZRT-032

(warn) Invalid routing layer '%s' on path

**Description**

This warning message indicates that a path from the database is on an invalid routing later. The path will be ignored by the router.

Feedback

**What Next**

Please check the database and fix the path to be on valid routing layer.

---

## ZRT-033

(warn) Invalid contact array of via def %s.

**Description**

This warning message indicates that an invalid contact array is in the database. The router was unable to find a master via corresponding to the specified via def from database.

**What Next**

Please check the database and specify the correct via def for the contact array.

---

## ZRT-034

(warn) Invalid contact with via def %s.

**Description**

This warning message indicates that an invalid contact is in the database. The router was unable to find a master via corresponding to the specified via def from database.

**What Next**

Please check the database and specify the correct via def for the contact.

---

## ZRT-035

(warn) Invalid routing layer '%s' on global route

**Description**

This warning message indicates that a global route from database in on an invalid routing layer. The router will ignore the global route.

**What Next**

Please check the database and fix the global route to be on valid routing layer.

---

## ZRT-036

(warn) Ignore polygon pin (cell %s, port %s) on layer %d.

Feedback

**Description**

This warning message occurs because polygon pin shape was found. The router currently does not handle polygon pin and thus this pin will be ignored.

**What Next**

Please modify the polygon into rectangles.

---

## ZRT-037

(warn) Ignore polygon via-region in cell %s.

**Description**

This warning message occurs because polygon via-region was found. The router currently does not handle polygon via-region and thus this via region will be ignored.

**What Next**

Please re-generate the frame view.

---

## ZRT-038

(warn) Cannot find via def %s for via-region in cell %s.

**Description**

This warning message indicates that via def cannot be found for the the via-region. This via-region will be ignored by the router.

**What Next**

Please use a correct via def for the via-region and re-generate the frame view.

---

## ZRT-039

(warn) Contact %s for via-region in cell %s cannot be rotated.

**Description**

This warning message indicates that non-rotatable contact was found for a rotated via-region. The via-region is ignored in this case.

**What Next**

Please re-generate the frame view.

Feedback

## ZRT-040

(warn) Cell %s's boundary has exceeded the limit.

**Description**

This warning message occurs because the cell boundary size is larger than maximum 32-bit integer value. The cell boundary has been adjusted to fit the limit.

**What Next**

Please re-size the cell boundary to be smaller.

## ZRT-041

(error) Cannot find port %s in cell %s.

**Description**

This warning message occurs when master port cannot be found during the instance port processing. This could happen if the library cell got modified after the top cell was created and the hierarchical information is out of date. This error may also be issued in antenna flows where this port information is not available in frame view. In such cases, antenna analysis may be incorrect.

**What Next**

Please check data and update the design hierarchy.

## ZRT-042

(warn) Contact %s's %s layer enclosure %s does not satisfy end of line enclosure design rule.

**Description**

The router depends on correct construction of contacts to avoid the end of line enclosure rule. In this case, the contact's metal enclosure does not satisfy the requirement and there may be end of line enclosure design rule violation at the end of routing stage.

**What Next**

Please modify the contact to satisfy the end of line enclosure requirement or remove the design rule from the technology file.

## ZRT-043

(warn) Found must join pins on port %s without any net.

Feedback

**Description**

Must join pins without net information were found. The router won't be able to connect them unless net is assigned to them.

**What Next**

Please create net for those pins.

---

## ZRT-044

(warn) Standard cell pin %s/%s has no valid via regions.

**Description**

Via regions are useful in avoiding DRCs in accessing pins and in accessing pins off the routing grid. It is defined with the matching via specified by the contact code number.

**What Next**

Please check for DRCs in accessing this pin, and check ZRT-038 for error in contact code number, and generate the via regions if necessary.

---

## ZRT-045

(warn) Via regions for port %s/%s may be blocked completely.

**Description**

Via regions are useful in avoiding DRCs in accessing pins and in accessing pins off the routing grid.

**What Next**

Please check for DRCs in accessing this pin and generate the via regions if necessary.

---

## ZRT-046

(warn) Conflicting voltage-areas for instance %s.

**Description**

This warning message indicates that the instance belongs to two conflicting voltage-areas. In the case of a conflict, the voltage-area of the smallest enclosing instance will take precedence. The reasons for this could be one of the following.

- The leaf-level instance has been assigned a voltage-area that conflicts with the enclosing hierarchical voltage-area.

Feedback

**What Next**

Please make sure that each instance belongs to only one voltage-area.

---

## ZRT-047

(error) Ignoring voltage-area %s because maximum number of voltage-areas allowed is %d.

**Description**

This error message indicates that the number of voltage-areas in this design exceeds the maximum allowed. The reasons for this could be one of the following.

- Too many voltage-areas are being used in this design.

**What Next**

Please make sure that the number of voltage-areas is within the limit.

---

## ZRT-048

(error) Failed to write block %s.

**Description**

The router issues this error when it cannot write the block to the design library.

**What Next**

Check the preceding error messages for the specific failure reasons.

---

## ZRT-049

(error) Failed to load block %s.

**Description**

The router issues this error when it cannot read the block from the design library.

**What Next**

Check the preceding error messages for the specific failure reasons.

---

## ZRT-050

(warn) Invalid rotated polygon in master cell '%s'

Feedback

**Description**

This warning message indicates that a rotated polygon in the master cell has invalid dimensions. This rotated polygon will be ignored by the router.

**What Next**

Please check the database and fix the rotated polygon dimensions.

---

## ZRT-051

(warn) Illegal Jog wire end of line rule (%s, %s).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

---

## ZRT-052

(warn) Illegal Jog wire end of line rule (%s, %s), (%d %d).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

---

## ZRT-053

(warn) Illegal Special end of line enclosure rule (%s, %s).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

Feedback

**What Next**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

---

## ZRT-054

(warn) Illegal Special end of line enclosure rule (%s, %s), (%d %d).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

---

## ZRT-055

(warn) Illegal T-shape end of line enclosure rule (%s, %s).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

---

## ZRT-056

(warn) Illegal T-shape end of line enclosure rule (%s, %s), (%d %d).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

Feedback

## ZRT-057

(warn) Illegal Jog wire off limits rule (%s, %s).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

## ZRT-058

(warn) Illegal Jog wire off limits rule (%s, %s), (%d %d).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

## ZRT-059

(warn) Illegal Fat wire off limits rule (%s, %s).

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

## ZRT-060

(warn) Illegal Fat wire off limits rule (%s, %s), (%d %d).

Feedback

**Description**

This warning message indicates that end of line rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

---

## ZRT-061

(warn) Port %s (cell %s) of net %s has no pin.

**Description**

This warning message indicates that the port has no physical shape attached to it. The router will ignore such port and the net will be left open at the end of the routing stage.

**What Next**

Please check the cell and create pin shape for the port.

---

## ZRT-062

(warn) Value %s is not one among the predefined values for option %s. Assigning the default value.

**Description**

This warning message indicates that the value specified for the string token option is not among the list of predefined values. This can happen if the set of predefined values change and an old value which no longer exists is read from a saved cell. In this case, the option is assigned the default value.

**What Next**

Please set the right value for the option, if the default value is not correct.

---

## ZRT-063

(warn) Cover cell '%s' contains a non PG port '%s'. Ignoring it.

**Description**

This warning message indicates that the cover cell contains a port which is connected to non PG net. This is not handled currently based on our methodology.

Feedback

**What Next**

Please make sure that the cover cell does not contain non PG port.

---

## ZRT-064

(error) Cell %s is not placed.

**Description**

Placement status of the cell indicates that it is not legally placed and will be ignored by the router.

**What Next**

Please make sure all the cells are placed before running the router.

---

## ZRT-065

(warn) Ignore net %s's connection to port %s (cell %s).

**Description**

This warning message indicates that the port will be ignored by the router, and the reason is most likely due to some data error with the cell.

**What Next**

Please check the port's cell and fix any problem associated with it.

---

## ZRT-066

(error) Net %s not found.

**Description**

Failed to find the net in the current design.

**What Next**

Check the spelling of the net name. Make sure net of that name exists.

---

## ZRT-067

(error) Net %s is not a power or ground net.

**Description**

The found net is not a power or ground net.

Feedback

**What Next**

Make sure the net is a power or a ground net.

---

## ZRT-068

(error) Could not find ground net.

**Description**

The tool could not find the ground net in the current block.

**What Next**

Add a ground net to the current block.

**See Also**

- connect_pg_net

---

## ZRT-069

(error) Too many ground nets, please specify one.

**Description**

This command found more than one ground net in the current design.

**What Next**

Specify a ground net as an argument to the command.

---

## ZRT-070

(error) Could not find any nets in the design that match the specification.

**Description**

The command expects the list of nets to be specified. Either the specification is incorrect, or there are no nets in the design that match the specification.

**What Next**

Please check to make sure that the syntax for specifying the nets is correct.

---

## ZRT-071

(warn) Skip physical_status locked shape(%s) on layer %s of net %s.

Feedback

**Description**

This warning message occurs because remove_routes find the physical status of the shape is locked.

**What Next**

Please unlock the shape and re-run remove_route if you want to remove it.

---

## ZRT-072

(error) Top cell not open.

**Description**

The top cell is not open.

**What Next**

Open the top cell to run the current command.

---

## ZRT-073

(error) The -from_file option specifies: %s but that file is not found .

**Description**

This warning message occurs because route_group cannot find a file by the name specified.

**What Next**

Please ensure that the file exits and has been generated correctly.

---

## ZRT-074

(error) The file: %s does not contain any valid net names.

**Description**

This warning message occurs because route_group cannot find any valid net names in the file specified by the -from_file option.

**What Next**

Please ensure that the file was generated correctly and contains some valid net names.

Feedback

## ZRT-075

(warn) The the file: %s specifies a net: %s which does not exist.

**Description**

This warning message occurs because the -from_file option for the route_group command has encountered a putative net name which does not specify a net.

**What Next**

Please ensure that the file was generated correctly and contains some valid net names.

## ZRT-076

(warn) Invalid contact array pitch (via master %s) (location %d %d).

**Description**

The contact array at the specified location has pitch smaller than the pitch required by the router. The router will continue, using the larger pitch. DRC's reported against the via arrays will be conservative.

**What Next**

Please check the database and verify that contact array pitch is even multiple of min grid.

## ZRT-077

(warn) %s has different horizontal and vertical net weight.

**Description**

The net has different horizontal weight and vertical weight specified. The router currently only supports one net criticality value per net, and the larger of the two values will be used. This message is only printed once for the first net found with the issue.

**What Next**

Please check the setup for the net and make sure it is correct.

## ZRT-078

(warn) Illegal enclosed via metal minLength rule (%s, %s).

Feedback

**Description**

This warning message indicates that enclosed via metal minLength rule is defined between inconsisten layers. It should be defined between a cut layer and the metal layer just above it.

**What Next**

Please check the technology file and make sure the enclosed via metal minLength rule is specified between a cut layer and metal layer.

---

## ZRT-079

(warn) Illegal enclosed via metal minLength rule (%s, %s), (%d %d).

**Description**

This warning message indicates that enclosed via metal minLength rule is defined between inconsisten layers. It should be defined between a cut layer and the metal layer just above it.

**What Next**

Please check the technology file and make sure the enclosed via metal minLength rule is specified between a cut layer and the metal layer jus above it.

---

## ZRT-080

(error) Layer %s has no routing tracks.

**Description**

The given layer does not have any routing tracks. This prevents the router from assigning wires and vias on the layer.

**What Next**

Please check if the routing tracks have been correctly defined on the layer. If the intent is to have the router automatically generate routing tracks then please make sure that the value of the router common option "-track_auto_fill" is set to true (the default value).

---

## ZRT-081

(warn) NDR width is smaller than default width (%s, %s).

Feedback

**Description**

This warning message indicates that the NDR width defined on one routing layer is smaller than the default width of the same layer.

**What Next**

Please check the NDR rule definition in tcl command to make sure that the NDR width is no less than the default width on each routing layer.

---

## ZRT-082

(warn) Turning off legal width checking on layer %s as the rule is not specified correctly.

**Description**

The number of legal widths specified cannot exceed 16. They must be in increasing order and must contain the default width on the layer.

**What Next**

Please check the technology file and make sure the legal width rules are correctly specified.

---

## ZRT-083

(warn) Contact %s's %s layer enclosure does not satisfy legal width requirement.

**Description**

The router depends on correct construction of contacts that satisfy the legal width rule. In this case, the contact's metal enclosure does not satisfy the legal width requirement and it may result in long routing run time.

**What Next**

Please modify the contact to satisfy the legal width requirement or remove the design rule from the technology file.

---

## ZRT-084

(warn) Turning off viaOnGrid rule checking on cut layer %s as the lower and the upper routing layers have the same preferred direction, and viaOnGrid rule is not well-defined.

Feedback

**Description**

If the upper and the lower routing layers of a cut layer have the same preferred direction, then the following conditions have to be satisfied in order to correctly check viaOnGrid rule on the cut layer.

- All routing tracks on both layers must be completely aligned.
- There must be a perpendicular direction layer, only one side of either below the lower layer or above the upper layer.

**What Next**

Please check the technology file and make sure the viaOnGrid rule and routing tracks on adjacent layers are correctly specified.

---

## ZRT-085

(error) Cannot run timing based detail route command with the timing driven option set to false.

**Description**

This error indicates that a timing based detail route command is being run without turning on the detail route timing driven option.

**What Next**

Please set the detail route timing driven option to true before running the command (set_app_options -global {route.detail.timing_driven true}).

---

## ZRT-086

(warn) Via ladder is not connected to all pin shapes on Cell %s Pin %s ( via rule %s ).

**Description**

The via-rule set to this pin is not having enough number of via cuts to connect all pin shapes.

**What Next**

Please check the via-rule setting flow or confirm the floating pin shape is fine.

---

## ZRT-087

(warn) The design contains a huge X-oriented obstruction.

Feedback

**Description**

This warning message indicates that the current design contains an unusually large X-oriented (45 or 135 degree) obstruction. Large X-oriented obstructions may cause inefficiency in the router and result in slow runtime.

**What Next**

Check the design to see if the large X-oriented obstruction is indeed intended. The user may need to break it into smaller ones if possible.

---

## ZRT-088

(error) NDR rule %s has illegal widths on layer %s.

**Description**

This error message indicates that either the wire width, shield width or the via width on the metal layer is illegal or larger than the signal route max width defined on that layer. Router will ignore this NDR rule on the associated nets in the design.

**What Next**

Please make sure that the NDR rule widths are legal and are less than or equal to the signal route max width defined in the tech file.

---

## ZRT-089

(warn) Value %s for layer %s is very big.

**Description**

This warning is issued because the value for a spacing is very big. Check if it is intentional.

**What Next**

If the large value was set by accident, correct it and rerun the routing command.

---

## ZRT-090

(warn) Master cell %s's place and route boundary does not contain all pin shapes.

**Description**

This warning message occurs when there is a pin shape does not overlap its master cell's place and route boundary.

Feedback

**What Next**

Please check master cell's place and route boundary.

---

## ZRT-091

(warn) Unsupported tech file value: %s: %s = %s. %s

**Description**

This warning message occurs when there is an unsupported tech file value.

**What Next**

Please check and correct the tech file.

---

## ZRT-092

(warning) Cell %s contains more than %d obstructions (%d). This can increase routing runtime; you might want to regenerate the frame view.

**Description**

A cell contains a large number of obstructions. This is atypical and might increase routing runtime.

**What Next**

If this is not expected, regenerate the frame view. To reduce the number of obstructions in the frame view, try using the *remove_non_pin_shapes* or *merge_metal_blockage* options.

**See Also**

- check_workspace
- create_frame
- lib.physical_model.remove_non_pin_shapes
- lib.physical_model.merge_metal_blockage

---

## ZRT-093

(error) Found global route in DR stage. %s

**Description**

This error message indicates that global route types are inputted in detail routing stage.

Feedback

**What Next**

Please check the database.

---

## ZRT-094

(error) Skipping a cell instance record from database as it has no name.

**Description**

There is a cell instance record in database with no name.

**What Next**

The database is corrupt. Please report this problem along with the commands run until this stage.

---

## ZRT-095

(warn) Ignore double pattern rule on layer %s.

**Description**

The reason for receiving this warning could be one of the following:

- The width threshold for an end is either not defined or is zero. • The side spacing is either not defined or is zero. • The corner spacing is either not defined or is zero.

**What Next**

Please check the technology file and make sure that all the double pattern rule values are specified correctly.

---

## ZRT-096

(error) Database contains global routing GCells that are too large.

**Description**

The database contains GCells that are too large. The number of track intersections in a GCell for any two adjacent perpendicular layers should not meet or exceed 1600. For example, if a square GCell contains 40 M2 tracks and 40 M3 tracks, this error will be triggered, since 40 x 40 >= 1600. The global routing data was likely not created with route_global.

**What Next**

Please run route_global before executing your flow.

Feedback

## ZRT-097

(warning) Pin %s in cell %s.frame does not contain the complete information required to honor x-shaped pins in routing. Please re-generate the frame view.

**Description**

The information required to process x-shapes in a pin is incomplete. The x-shapes may be ignored.

**What Next**

Please re-generate the frame view.

## ZRT-098

(warning) Contact code %s contains polygons and will be ignored by the router.

**Description**

The router does not support contact codes that have polygons. Such contact codes will be ignored by the router.

## ZRT-099

(error) Via ladder %s refers to an invalid cut name.

**Description**

A ViaRule specified in the tech file contains an invalid entry in cutNameTbl.

**What Next**

Please correct the tech file and try again.

## ZRT-100

(warning) Pin %s of net %s has no valid shapes to connect.

**Description**

This message indicates that pin has no shapes inside design boundary.

**What Next**

Please make sure that the pin has valid shapes to connect.

Feedback

## ZRT-101

(warning) Power net %s has no power preroutes, skip tie-off.

**Description**

Power net has no power preroutes. Tie-off will be turned off for this net.

**What Next**

Please add power preroutes.

## ZRT-102

(info) %d of the existing global routes are deleted.

**Description**

All existing global routes are deleted at the beginning of global routing stage, unless incremental option is set to true. In route group flow, global routes of nets not specified in the net group will be deleted even if incremental option is true.

**What Next**

No action necessary.

## ZRT-103

(info) Global Routing %s early.

**Description**

Global routing terminates early because either the congestion has been minimized or it does not seem like the congestion can be improved further.

**What Next**

No action necessary.

## ZRT-104

(warning) Routed net %s through blocked area.

**Description**

Global router routed the net through blocked area. Pin might be blocked or there is no routing solution.

Feedback

### What Next

Please check if the pins are blocked.

---

## ZRT-105

(warning) Macro pin (%s %s) does not have access edge.

### Description

The global router expects macro pins to have access edges to help the router to connect to the pins. The tool issues this warning when it finds a macro pin without an access edge. Possible causes are

- The pins are physically blocked.
- create_frame could not generate the access edges even though the pins are close to the edge of the macro.

This warning can significantly affect the runtime, memory, and QoR.

### What Next

Open the design view and verify that

- There is a clear path for the pin to exit the macro.
- It is possible for create_frame to generate the access edges.

  Try to rerun create_frame in the latest release to see if it generates more access edges.

### See Also

- check_routability

---

## ZRT-106

(warning) 'set_app_options route.global.comb_distance' option will be deprecated and replaced with 'set_app_options route.common.comb_distance' option.

### Description

The 'set_app_options route.global.comb_distance' option will be deprecated and replaced with 'set_app_options route.common.comb_distance' option.

### What Next

Please update scripts to use the new option.

Feedback

## ZRT-107

(warning) 'set_app_options route.global.clock_topology' option will be deprecated and replaced with 'set_app_options route.common.clock_topology' option.

**Description**

The 'set_app_options route.globalclock_topology' option will be deprecated and replaced with 'set_app_options route.commom.clock_topology' option.

**What Next**

Please update scripts to use the new option.

## ZRT-108

(warning) 'set_app_options route.global.comb_max_connections' option will be obsolete.

**Description**

The 'set_app_options route.global.comb_max_connections' option will be obsolete and not honored.

**What Next**

Please do not use the option in your scripts.

## ZRT-109

(error) Cannot map from non regular via %s.

**Description**

This error message indicates that the router does not support the via in the given via mapping.

## ZRT-110

(Warning) The global router sees the pin %s of net %s as blocked and might route the net through the blockages.

**Description**

The global router sees the pin as blocked in its modeling and might route the net through the blockages. The pin could be physically blocked due to blockages in the macro or a bad floorplan or due to conservative modeling of the global routing cell capacity. The pin could also be blocked due to incorrect min/max layer setting. If that's the case, the pin might be left unrouted.

Feedback

### What Next

View the pin in the GUI or run the *check_routability* command to see if the pin is physically blocked. If it is, fix the root cause and reroute the design. Also check if the pin layer is outside of min/max layer constraint setting.

### See Also

- check_routability

---

## ZRT-111

(error) The pin constraint on module %s pin %s is inconsistent with the constraint on module %s pin %s. Constraint will be ignored.

### Description

Two pin constraints are inconsistent. For example, a typical inconsistency would be when mod1 abuts to mod2 and abutting pins are placed at different locations or layers on the abutted edge. The program will discard the conflicting constraint and continue on.

### What Next

You should correct any inconsistent pin constraints; otherwise, you may get unexpected results.

---

## ZRT-112

(warning) Net %s could not be routed inside routing corridor %s.

### Description

The net could not be routed inside the specified routing corridor. This could be caused by the routing corridor not cover all pins or disconnected.

### What Next

Please run report_routing_corridors to see if the routing corridor is a legal one.

---

## ZRT-113

(warning) Net %s has unused floating user-enter shapes.

### Description

When the *connect_floating_shapes* option has a value of *false*, the net might have some unused user-enter shapes.

Feedback

**What Next**

If you want to connect the pins and all the user-enter shapes, use the *set_app_options* command to set the *route.common.connect_floating_shapes* common route option to *true* and rerun global routing.

---

## ZRT-114

(warning) The corridor setting of net %s will be ignored in incremental global routing.

**Description**

Corridors are used during initial global routing only. They should not be used during incremental global routing (*-reuse_existing_global_route true*) due to potential conflicts, such as when existing global routes are outside the corridor area. The global router ignores the corridor setting when the *-reuse_existing_global_route* option is enabled.

**What Next**

To prevent this message, remove the net routing corridor setting before running incremental global routing.

---

## ZRT-115

(Warning) The routing layer constraints of the %s net and the %s routing corridor conflict.

**Description**

The minimum or maximum routing layer setting of the routing corridor is not contained in the routing layer constraints of the net.

**What Next**

To prevent this message, adjust the minimum or maximum routing layer setting of the routing corridor or the net.

---

## ZRT-116

(Warning) The net %s is routed over blockages within the routing corridor %s.

**Description**

This warning occurs when the specified net is routed over blockages. The blockages can be macros, route guides, and so on.

**What Next**

To prevent this message, adjust the routing corridor to avoid blockages.

Feedback

## ZRT-117

(error) The location of the instance pin %s/%s is inconsistent with the location of the pin %s/%s on an abutted edge. The constraint is ignored.

**Description**

The tool issues this error when two block pin locations on an abutted edge are inconsistent. The tool discards the conflicting constraint and continues on.

**What Next**

You should correct any inconsistent pin placements; otherwise, you might get unexpected results.

## ZRT-118

(warning) 'set_app_options route.global.dpt_layer_utilization' option will be deprecated and replaced with 'set_app_options route.global.double_pattern_utilization_by_layer_name' option.

**Description**

The 'set_app_options route.global.dpt_layer_utilization' option will be deprecated and replaced with 'set_app_options route.global.double_pattern_utilization_by_layer_name' option.

**What Next**

Please update scripts to use the new option.

## ZRT-119

(warning) Setting double_pattern_utilization_by_layer_name %d on %s is invalid. Ignored.

**Description**

Setting double_pattern_utilization_by_layer_name on non-DPT layer is invalid and will be ignored.

**What Next**

Please check your tech file and scripts to make sure that you only set the DPT layer utilization on DPT layers.

## ZRT-120

(warn) Contact %s's %s layer enclosure does not satisfy legal dimension requirement.

Feedback

**Description**

The router depends on correct construction of contacts that satisfy the legal dimension rule. In this case, the contact's metal enclosure does not satisfy the legal dimension requirement and it may result in long routing run time.

**What Next**

Please modify the contact to satisfy the legal dimension requirement or remove the design rule from the technology file.

---

## ZRT-121

(warn) Not enough routing capacity for bus %s on side %d of module %s at the requested spacing of %d tracks between pins.

**Description**

There is not enough routing capacity for this bus on the selected edge with the requested pin spacing. This may be due to the size of the edge, or the number of other routes already directed through this edge. The router may have difficulty with this bus. The pin placer will attempt to place the bus on this side, but may not be able to maintain the requested spacing.

**What Next**

Set the "tracks between pins" to a smaller number. Another possible solution might be to guide the tool to place the bus on a longer or less congested edge.

---

## ZRT-122

(warn) There was an error processing physical bus %s.

**Description**

This physical bus may be empty or otherwise inconsistent.

**What Next**

Check the bus for consistency using "report_physical_bus". Use "remove_physcial_bus" to delete the bus if it is no longer needed.

---

## ZRT-123

(warn) Router ignores pin guide %s for intra module net %s.

Feedback

### Description

A pin guide was attached to the given net, but the net is entirely inside the module and therefore will not generate a pin on the module.

### What Next

Remove this net from the pin guide definition to eliminate this warning.

---

## ZRT-124

(warn) A pin guide for net %s is ignored as it implies a forbidden feedthrough on module %s.

### Description

A pin guide forces a feedthrough on the given module. However, feedthroughs are forbidden on this module, or on this net. Therefore this pin guide can not be implemented.

### What Next

Change the feedthrough settings to allow feedthroughs on this net or module. Altertavely, edit or delete the pin guide so that it does imply creation of this feedthrough.

---

## ZRT-125

(Warning) Router cannot access %s %s\n \ton net %s, forcing access.

### Description

The global router can NOT connect to this macro cell or IO pin using the pin access direction. This happens when the pin is totally blocked or when the pin is blocked in the assigned access direction. For instance, if a pin is located at the left edge of die area and has pin access direction from the left, the router will print this message. Or, in virtual flat routing mode, if a pin is located at edge of a block and has an access direction from outside the block, but needs to be connected to other pins inside the block, this message will be issued. In such cases, pin access direction cannot be honored and the router will connect to the pin without obeying the access direction.

### What Next

The pin may be blocked because it is on the edge of the die or block, because it is under an overlapping cell, or because it is blocked by some other obstruction. While exploration mode routing will still attempt to connect the pin, blocked macro pins are not expected and the floorplan should be adjusted to remove this condition.

Feedback

## ZRT-126

(Warning) Numerous standard cells have blocked pins. Assuming design is not legalized.

**Description**

The global router cannot access a number of standard cell pins because they are blocked, probably by overlapping standard cells. This is expected if the design has not been legalized.

**What Next**

If router is running in exploration mode and the placement is not legalized, such configurations are expected and you may ignore this message.

## ZRT-127

(Warning) The global router sees net %s having %d/%d blocked pins.

**Description**

The global router detects whether access to a pin is totally blocked. For example, during placement when the design is not legalized, a pin may be blocked by in-cell shapes and pin shapes of overlapping cells. Also, due to floorplan issues, sometimes a macro pin is completely embedded inside adjacent macros and cannot be accessed without going through routing blockages. The router will print a warning message for every net with blocked pins detected: how many pins are blocked among the total number of pins.

**What Next**

While the global router will still attempt to connect the pins, any floorplan issues causing blocked pins should be corrected to remove this condition.

## ZRT-128

(Warning) Total number of blocked macro pins according to global router modelling: %d. With blocked pins, global routing runtime can be higher.

**Description**

The global router detects whether access to a pin is totally blocked. For example, during placement when the design is not legalized, a pin may be blocked by in-cell shapes and pin shapes of overlapping cells. Also, due to floorplan issues, sometimes a macro pin is completely embedded inside adjacent macros and cannot be accessed without going through routing blockages. The router will print a warning message summarizing the total number of blocked macro pins in the design, if non-zero.

Feedback

### What Next

While the global router will still attempt to connect the pins, any floorplan issues causing blocked pins should be corrected to remove this condition.

---

## ZRT-129

(Warning) Total number of blocked standard cell pins according to global router modelling: %d. With blocked pins, global routing runtime can be higher.

### Description

The global router detects whether access to a pin is totally blocked. For example, during placement when the design is not legalized, a pin may be blocked by in-cell shapes and pin shapes of overlapping cells. Also, due to floorplan issues, sometimes a macro pin is completely embedded inside adjacent macros and cannot be accessed without going through routing blockages. The router will print a warning message summarizing the total number of blocked standard cell pins in the design, if non-zero.

### What Next

While the global router will still attempt to connect the pins, any floorplan issues causing blocked pins should be corrected to remove this condition.

---

## ZRT-130

(Warning) Port %s%s%s of net %s is blocked due to layer constraint settings. Routing will leave this net open.

### Description

The global router detects whether access to a port is totally blocked by layer constraint settings. For example, set the max_routing_layer to M7 in hard mode with number_of_vias_over_global_max_layer to 0, the M8 ports may be blocked by this layer constraint.

### What Next

Please check the layer constraint settings or set the net frozen if you intend to skip routing.

### See Also

- check_routability
- set_ignored_layers

Feedback

## ZRT-131

(Warning) Net %s is unroutable due to layer constraint settings. Routing will leave this net open.

### Description

The global router detects a net is totally unroutable due to layer constraint settings. For example, layer M3 is a frozen layer but a net has ports on M2 and M4, the net could be unroutable due to this layer constraint.

### What Next

Please check the layer constraint settings or set the net frozen if you intend to skip routing.

### See Also

- check_routability
- set_ignored_layers

## ZRT-132

(Error) Top port %s on net %s is at same location on the same layer as port %s on net %s inside multiple instantiated block (MIB) cells, shorted pins will be created

### Description

The global router detects top port terminal is inside a MIB instance while another top port terminal is at same location on other MIB instance, however, the top port direction is conflict (one is input and another one is output). Since the block pin will be placed at same location under the top level terminals, the pins will be shorted with each other on MIB reference block

### What Next

please check the top terminal location and layer.

## ZRT-133

(Warning) The net %s has port(s) outside the routing corridor %s.

### Description

This warning occurs when the specified net has port(s) outside the routing corridor.

### What Next

To prevent this message, please check if all the ports inside the routing corridor.

Feedback

**See Also**

- report_routing_corridors

---

## ZRT-134

(Error) Net %s is unroutable because pin %s/%s is not inside block %s. Routing will ignore this net.

**Description**

The global router detects that a net is unroutable because one or more of its pins is not in the intended block.

**What Next**

This condition can also be detected by report_placement -physical_hierarchy_violations, which should run clean before attempting virtual flat global routing. To fix the problem, either move the cell that is incorrectly placed, or edit the boundary of the block.

**See Also**

- report_placement

---

## ZRT-135

(Error) Failed to find reference block for instance %s

**Description**

This error message indicates that the router was not able to find the reference block for this cell. This may due to the linking error or reference design is missing. When router running in design planning hierarchinal routing mode, the routing results cannot be used to create feedthroughs or place_pins on the nets connected to this instance.

**What Next**

Please make sure the reference block is linked to the current design.

---

## ZRT-136

(Error) Coarse gCell capacity overflows. Global routing will proceed with this capacity bounded to maximum limit %u.

Feedback

**Description**

This Error message indicates that the capacity of this gCell overflows. This typically happens when the pitch size is too small comparing the minimum width and spacing requirement.

**What Next**

Please make sure the pitch size of design is within an appropriate range.

---

## ZRT-137

(Warning) If the placement is not legalized, the presence of blocked standard cell pins might be expected. If the placement is legalized, the number of blocked standard cell pins should be minimized by design entering routing to ensure routing quality. In addition, global routing reported blocked standard cell pins can be different from the set reported by check command because they use different mechanism.

**Description**

Warning message about the presence of standard cell blocked pins during placement. This is to clarify that blocked standard cell pins are expected in unlegalized designs.

**What Next**

While the global router will still attempt to connect the pins, any floorplan issues causing blocked pins should be corrected to remove this condition.

---

## ZRT-138

(info) %s layer %s will be routed with target utilization ratio of %d per cent.

**Description**

Information message about the target utilization ratio ZGR is going to use for a layer. Layers with double patterning rules will use a ratio of lower than 100 per cent unless specified by the user.

**What Next**

No action necessary.

---

## ZRT-139

(warning) custom width track(s) found while running route_global.

Feedback

### Description

Custom width track flow does not trigger in standalone global route; it only triggers with route auto or route group.

### What Next

Please delete custom width track(s) or re-run with either route_auto or route_group.

---

## ZRT-140

(error) Non-PG net %s has a %s shape with shape_use as shield_route. The shape's BBox is (%.3f, %.3f) (%.3f, %.3f). Changed the shape_use to detail_route.

### Description

A non-PG net's shape could not have shape_use attribute as shield_route. This illegal attribute might generate wrong data inside Zroute's infrastructure. It might corrupt Zroute's data and generate unexpected incorrect result of routing.

Zroute automatically changes the shape_use attribute from shield_route to detail_route and save it to database.

### What Next

User could run check_routability to get a report of shapes with illegal shape_use as shield_route.

---

## ZRT-141

(warn) The shield data checker detects: %s

### Description

An illegal or suspicious shield data is detected by the shield data checker. Please follow the description in the message. Not all issues detected by shield data checker is an error. Sometimes an issue is suspicious data rather than illegal data. The user has to be sure the data is correct before running any Zroute command.

### What Next

Please review and correct the issue specified in the description.

The user could run check_routability -check_shield true to get a report of shield data issues. The user could also use set_app_options -name route.common.check_shield -value true to enable shield data checker in all Zroute commands.

Feedback

## ZRT-142

(warn) PG net %s has a %s shape with shape_use detail_route and it is too long. Long part of the shape is located at (%.3f, %.3f) (%.3f, %.3f). The shape's BBox is (%.3f, %.3f) (%.3f, %.3f).

**Description**

In general, a PG wire with shape_use detail_route is a tie-off wire. However, a very long PG wire could be a part of PG mesh or rail. Please review and correct the shape_use of the shape reported. Please be noted, this check only detects suspicious ones, not all of them.

**What Next**

Review and correct the shape_use of the shape reported.

The user could run check_routability -check_shield true to get a report of shield data issues. The user could also use set_app_options -name route.common.check_shield -value true to enable shield data checker in all Zroute commands.

## ZRT-143

(warning) Secondary PG net %s has no power stripe, skip to route.

**Description**

Secondary PG net has no power stripe to connect.

**What Next**

Please add power stripe.

## ZRT-144

(warning) Option route.common.verbose_level is ON. This may increase the global router run time significantly.

**Description**

Option route.common.verbose_level may increase the router's run time significantly in commands where this warning is issued.

**What Next**

Disabling this option is recommended.

Feedback

## ZRT-145

(info) Shielding is up-to-date and re-shielding is not needed.

**Description**

Shielded nets are not modified during routing; therefore, there is no need to do re-shielding.

**What Next**

No action is required.

## ZRT-147

(warning) Failed to find reference port for pin %s

**Description**

This error message indicates that the router was not able to find the reference port for this pin. This maybe because cell instance is not linked correcty or the previously linked abstract view/design view/frame view is out-of-sync for this pin

**What Next**

Please check the flow to make sure that the linked views are in sync

## ZRT-148

(warning) Routing of %s could be slow

**Description**

Progress of this PG net seems to be slow. Possible reasons are:

1. Few or/and far away PG stripes to PG ports or shield shapes.
2. If it is a secondary PG net, maximum fanout limit could be too strict.
3. route.common.tie_off_mode is set to rail_only and rail for the net is not setup properly.

**What Next**

Please check PG structure setup for the net, or/and setting of number_of_secondary_pg_pin_connections or tie_off_mode.

## ZRT-149

(warn) macro cell %s is illegally placed inside block cell %s

Feedback

**Description**

This implies that there are macro cells that have been placed inside a block cell which doesn't contain those macro cells. Those cells will NOT being considered when calculate the channels during design planning global route

**What Next**

If this is NOT what you intend to do, please place the macro cells legally

---

## ZRT-150

(warn) top level port %s has no pin on net %s, feedthrough will not be created for this net

**Description**

Global route detects that some of the top level ports don't have pins or terminals. Router will skip those ports when routing connected nets and no feedthrough will be created on the connected nets

**What Next**

If this is NOT what you intend to do, please place the top level terminals first before running global route

---

## ZRT-151

(warning) clock comb/fishbone routing net %s has no mesh/stripe found, please create it or check layer constraint settings or check if mesh/stripe is blocked.

**Description**

comb/fishbone clock net has no mesh/stripe to connect.

**What Next**

please create clock mesh/stripe for the net or check layer constraint settings or check if mesh/stripe is blocked.

---

## ZRT-152

(Warning) Net %s has shape(s) %s that can't be connected due to layer constraint settings.

**Description**

The global router detects floating shapes that can't be routed to due to layer constraint settings. Global router will not connect to those route shapes.

Feedback

**What Next**

Please check the net's existing route shapes or/and layer constraint settings.

---

## ZRT-153

(warn) %s layer %s utilization ratio of %d might be too low.

**Description**

The utilization ratio specified by the user might be too conservative. Low utilization could lead to additional runtime spent on resolving congestion for the layer.

**What Next**

Check double_pattern_utilization_by_layer_name setting.

---

## ZRT-200

(error) Skipping track assignment because this design has no global routes.

**Description**

This message indicates that there are no global routes in this design, so the router cannot perform track assignment. This happens because either global routing is not correctly finished, or track assignment is already done.

**What Next**

First check whether track assignment was already completed. Then check whether global routing was completed before running track assignment.

---

## ZRT-201

(error) Skipping track assignment because this design has global route based via ladder.

**Description**

This message indicates that there are global route based via ladder in this design, so the router cannot perform track assignment. This happens because global routing was done with route.global.insert_gr_via_ladders set to true, and refresh_via_ladders hasn't been done.

**What Next**

Run refresh_via_ladders before track assignment.

Feedback

**See Also**

- route.global.insert_gr_via_ladders
- refresh_via_ladders

---

## ZRT-300

(warn) Antenna diodes cannot protect any pin.

**Description**

Under certain antenna calculation modes, diode cells do not offer any protection to violating pins.

**What Next**

Please check the antenna calculation mode. If diode cells are desired, set the antenna diode calculation mode appropriately.

---

## ZRT-301

(warn) Antenna diode insertion will be off.

**Description**

Antenna diode insertion is set on by the input options, but will be off in this run because diode insertion could not be initialized.

**What Next**

Please refer to the messages about problems in initializing diode insertion before this message. Fix those issues and rerun the routing command.

---

## ZRT-302

(warn) No antenna diodes found, or could not link them.

**Description**

Antenna diode insertion is set on by the input options, but no diode cells were found in the linked library.

**What Next**

Check the library to find diode cells.

Feedback

## ZRT-303

(warn) Failed to initialize legalizer for antenna diode insertion.

**Description**

Antenna diode insertion is set on by the input options, but the router could not initialize the legalizer for diode insertion.

**What Next**

Check the preceding messages from the legalizer for specific problems.

## ZRT-304

(info) Skip final DRC merging, too many DRCs.

**Description**

DRC merging reduces redundant DRCs by merging aligned and coincident DRCs. However, DRC merging is skipped if there are too many DRCs, as it might take too log.

**What Next**

No action necessary.

## ZRT-305

(info) Merged away %d aligned/redundant DRCs.

**Description**

DRCs can be merged if at least two opposing edges are aligned and they are of the same type, layer, and nets. For example, if two overlapping different-net-metal-spacing DRCs are between shapes of the same layer, from the same two nets, and have top and bottom edges aligned, then they will be merged to one DRC. Merging is done to give the user a more realistic number of DRCs, and to minimize the effect of the router's internal representation of the shapes on the DRC count.

**What Next**

No action necessary.

## ZRT-306

(info) Discarded %d drcs of internal-only type.

Feedback

**Description**

DRCs of internal-only type are not violations of technology rules and may be discarded.

**What Next**

No action necessary.

---

## ZRT-307

(info) Skip DR iteration %d for new DRC type to start.

**Description**

Some DRC analysis may be deferred until later global iterations. In that case, the router may skip iterations while the number of DRCs is zero, until all DRC analysis is on.

**What Next**

No action necessary.

---

## ZRT-308

(error) Design has global route wires. Please run track assignment before detailed route.

**Description**

Track assignment is required before detailed routing.

**What Next**

Run track assignment.

---

## ZRT-309

(warn) No antenna rules defined, Skip antenna analysis.

**Description**

Antenna rules must be defined in the library in order to do antenna analysis.

**What Next**

Define antenna rules in the library.

---

## ZRT-310

(error) Failed to store hierarchical antenna property.

Feedback

**Description**

The tool issues this message when an attempt to store hierarchical antenna property in top-level pins failed.

**What Next**

This is not expected behavior.

---

## ZRT-311

(warning) Skipping antenna analysis for net %s. The pin %s on cell %s does not have enough gate area information.

**Description**

One or more input pins of this net do not have the correct gate area values. So antenna analysis will not be done for this net.

Limit for number of ZRT-311 messages is set to 100 by default for readability of the log file. In order to print more or all the ZRT-311 messages, set this message limit to a very large number using set_message_info command.

**What Next**

Check and set correct gate area for all the input pins of the net on all the metal & cut layers. If gate area of some pins is not available, consider using app options route.detail.default_gate_size and route.detail.default_port_external_gate_size. Value set for these options will be used for pins without gate area information during antenna analysis.

---

## ZRT-312

(info) Detail Routing terminated early because DRCs were not converging: %s

**Description**

Detail Routing terminated early because DRCs were not converging.

**What Next**

No action necessary.

---

## ZRT-313

(warning) Ignoring the user defined partition as it is too big.

Feedback

**Description**

There is a limit on the size of the user defined partition as it can cause huge memory and run time overhead. As a rough guide, the area of the partition should be less than 600 pitches by 600 pitches on metal 1 (i.e., 600 tracks by 600 tracks).

**What Next**

Please use a smaller partition size.

---

## ZRT-314

(warning) Skipping diode insertion for port %s of cell instance %s as enough information is not available.

**Description**

The diode insertion values specified for this port are incorrect or a port and cell with that name does not exist.

**What Next**

Check the input specification for this port.

---

## ZRT-315

(info) Inserted/reused %d out of the specified %d diodes for port %s(cell %s).

**Description**

This message is for success rate of user-specified diode insertion for each port/cell. It is possible that diodes may not be inserted or reused for ports.

Diode insertion may fail for one of the following: - there are no legal locations in the region new diodes are attempted. or - there is no DRC clean solution to connect diode pin to the specified port. - specified diode(s) do not satisfy MV based constraints , or there is no voltage set on supply nets. ZRT-331 messages are issued for this condition.

**What Next**

If diodes are not inserted for a port, - Consider a modified diode distance, choice or number of diodes and rerun the command. - Check and reduce placement utilization in the area where diodes are to be inserted.

---

## ZRT-316

(warn) Zero equivalent gate area for net %s, port %s on layer %s for gate class %d and diode mode %d. The antenna analysis may not be correct.

Feedback

**Description**

For the case connected to diode, the equivalent gate area is a function of the diode ratio, diode protect and gate area. It is zero for this case. This may result in incorrect antenna analysis.

**What Next**

Check the antenna rules, gate area of the cells and the diodes in the design for non-zero diode protect.

---

## ZRT-317

(warn) Ignoring diode_preference setting as diode_insertion_mode is not set to new_and_spare.

**Description**

The diode_preference chooses preference between spare diode and new diodes. It is required that user allows new diodes and spare diodes for the diode preference to be effective. One of them is currently disabled with diode_insertion_mode.

**What Next**

Set the diode insertion mode to new_and_spare if diode preference should be honored.

---

## ZRT-318

(error) "%s" is not a supported route type.

**Description**

remove_shorts supports only the following route types:

user_enter, signal_route_detail, pg, clk, bus, shield_fixed, shield_dynamic

Other route types are not supported.

**What Next**

Specify only the supported route types.

---

## ZRT-319

(error) Only one region can be specified for short removal.

**Description**

Currently, only one region can be specified for remove_shorts to perform short removal.

Feedback

**What Next**

Specify only one region to perform short removal.

---

## ZRT-320

(error) Design still contains global route wires; cannot continue.

**Description**

remove_shorts can only be used after detail routing of the design. It cannot work when the design still contains global route wires.

**What Next**

Perform detail routing on the design before calling the remove_shorts command.

---

## ZRT-321

(info) Starting from the %s release, the default value of option %s of command %s will be %s.

**Description**

There is a change in default value.

**What Next**

No action necessary.

---

## ZRT-322

(warning) Ignoring diode mode 13 setting. Use diode mode 14 instead.

**Description**

Diode mode 13 is not supported as it is a subset of diode mode 14.

**What Next**

Modify antenna rule definition with diode mode 14 and re-run the routing commands.

---

## ZRT-323

(info) Filtered %d drcs of internal-only type.

Feedback

**Description**

DRCs of internal-only type are not violations of technology rules and are filtered for reporting purpose.

**What Next**

No action necessary.

---

## ZRT-324

(warn) remove_redundant_shapes cannot change net '%s' because it is open or has DRC violations.

**Description**

The tool issues this warning when remove_redundant_shapes is used to change open nets or nets with DRC violations.

**What Next**

Verify that the net is fully connected and free of DRC violations.

---

## ZRT-325

(warning) Skipping antenna analysis for net %s as it is open.

**Description**

Antenna analysis cannot be accurate when the net is open. So this net is skipped for antenna analysis.

**What Next**

Connect the net with incremental routing.

---

## ZRT-326

(error) partition bloating is too large to generate a valid metal sbin

**Description**

The metal bloat partion is huge, and the size of the sbin is larger than max int value

**What Next**

Please set "set_route_zrt_detail_options -continue_after_large_design_rule_value_error false", and run detail router to see the message.

Feedback

## ZRT-327

(Information) End Off Preferred Grid violations will be ignored since preferred grid extensions have been trimmed in this design.

**Description**

End Off Preferred Grid extensions on fixed shapes have been trimmed with the standalone command add_metal_extension_cut_metal -trim_end_off_preferred_grid_extension true.

**What Next**

Please add End Off Preferred Grid extensions on fixed shapes with add_metal_extension_cut_metal or route.detail.enable_end_off_preferred_grid_patching_on_fixed_shapes to allow for a complete DRC analysis.

## ZRT-328

(Warning) router fails to find preferred and bufferable voltage areas for net %s, global router will allow routing to go through none-default voltage areas and pin placement will allow pins on this net to be placed within none-default voltage areas

**Description**

Please check related supply net for the pins connnected to this net

## ZRT-329

(warning) Ignoring antenna mode %d as it is defined with diode mode %d.

**Description**

Floating metal based diode mode is to be defined with accumulative area type antenna modes only. They are antenna modes 3 or 6. If this diode mode is defined with any other antenna mode, that antenna mode based antenna rule will be ignored.

**What Next**

Please check and correct the antenna rule definitions.

## ZRT-330

(warn) Zero equivalent gate area for net %s, port %s on layer %s for gate class %d well type %d and diode mode %d. The antenna analysis may not be correct.

Feedback

**Description**

For the case connected to diode, the equivalent gate area is a function of the diode ratio, diode protect and gate area. It is zero for this case. This may result in incorrect antenna analysis.

**What Next**

Check the antenna rules, gate area of the cells and the diodes in the design for non-zero diode protection.

---

## ZRT-331

(warning) Skipping diode insertion for port %s of cell %s. There are no legal diodes available for the port that satisfy MV requirements, or there is no voltage set on supply nets.

**Description**

Diodes provided have the following issues: - they do not satisfy MV requirements for the specified port or - there is no voltage set on supply nets (please check OPT-006 messages). So diodes will not be used to fix antenna violations of the port.

**What Next**

Please check

1. antenna_diode_type library cell attribute of diodes 2. is_diode library pin attribute of diodes 3. The reference libraries have multiple diode cells with different voltage 4. set_voltage is to be set for each supply net

Selects the proper diode cell by using the following criteria: (a) If the load cell's supply voltage is lower than driver cell’s supply voltage, use a ground diode (b) If the load cell’s power supply is switchable and less always on than the driver cell‘s power supply, use a ground diode (c) If the load cell’s ground supply is switchable and less always on than the driver cell‘s ground supply, use a power diode (d) If there are conflicting conditions, do not insert a diode (e) For other cases, use any diode type (power, ground, or power-ground)

If there are more questions about this message, contact MV team for which requirements are not satisfied for the diode port.

---

## ZRT-332

(warning) Skipping antenna analysis for net %s. The pin %s on cell %s does not have enough nwell area information.

Feedback

**Description**

One or more pins of this net do not have the correct nwell area values. So antenna analysis will not be done for this net for diode mode 21.

Limit for number of ZRT-332 messages is set to 100 by default for readability of the log file. In order to print more or all the ZRT-332 messages, set this message limit to a very large number using set_message_info command.

**What Next**

Check and set correct nwell area for all the pins of the net on all the metal & cut layers.

---

## ZRT-333

(warning) Ignoring port protection diode for port %s as no diode with name %s found.

**Description**

Diode libcell name specified for port protection is not valid. Please correct the input and rerun routing command.

**What Next**

Check if libcell name specified is correct. Library name of the diode should not be specified in the input.

---

## ZRT-334

(warning) Ignoring port-protection diodes for port %s of net %s. This net has no no input ports.

**Description**

Net of the port(top-level pin) specified does not have any input ports. Port protection diodes are inserted only on nets with input ports.

**What Next**

Check and correct the port protection diode setting for the port.

---

## ZRT-335

(warning) Ignoring port-protection diodes for port %s of net %s. This net has no %s ports.

**Description**

Net of the port(top-level pin) specified does not have the needed other lib-cell ports to insert diodes. If port direction is input, diodes are inserted near the net's lib-cell pins with

Feedback

direction input. If port direction is output, diodes are inserted near the net's lib-cell pins with direction output.

**What Next**

Check and correct the port protection diode setting for the port.

---

## ZRT-336

(info) Deleted redundant diode %s that had pin connected to net %s.

**Description**

This diode does not help with any antenna violation for the connected net. So it is deleted.

**What Next**

Review the design if there are remaining antenna violations for the net.

---

## ZRT-337

(warning) Port protection diode %s does not connect within layer for top level port %s.

**Description**

Port protection diode cannot protect the port as it is not connected within the metal layer of the top level port.

**What Next**

Routing is to be modified so connection from the diode to top level port is within the layer of top level port. Set app option route.detail.shift_diode_locations_for_port_protection to TRUE and run detail route. With this app option setting, diode gets shifted and connected within layer of top level port.

---

## ZRT-338

(warning) Skipping antenna fixing for net %s due to large pin count of %d.

**Description**

The net has a large fanout. Antenna fixing is skipped to save runtime. Once the net is optimized later in the flow, antenna analysis and fixing will be done for the optimized net.

Power and ground nets are excluded for the high fanout check.

Feedback

**What Next**

If antenna fixing is needed for the high fanout-net nets, set app option route.detail.max_antenna_fixing_pin_count_threshold to -1 and rerun the routing commands.

---

## ZRT-339

(warn) Skipping diode insertion for port %s of cell %s based on user constraint allow_diode_insertion.

**Description**

User set constraint allow_diode_insertion to false on a top level port or lib-cell pin. If there are any antenna violations on this port, diode insertion will not be used for the fix. Instead layer hopping will be attempted.

**What Next**

Check if it is intended to skip didoe insertion for this port or lib-pin.

---

## ZRT-340

(warning) Skipping antenna analysis for pin %s of libCell %s.

**Description**

User specified lib cell pins to be skipped for antenna using app option route.detail.libcell_pin_names_to_skip_antenna. For all instances of the lib cell in top design, specified pin is skipped during antenna analysis and fixing by Zroute.

**What Next**

Check the setting of app option route.detail.libcell_pin_names_to_skip_antenna.

---

## ZRT-400

(error) Cannot open timing file '%s'.

**Description**

The reasons for this could be one of the following.

- The file does not exist.
- You do not have the required permissions to read it.

Feedback

**What Next**

Please make sure the timing file exists and that you have the required permissions to read it.

---

## ZRT-401

(error) Corrupted or incomplete timing file.

**Description**

The reasons for this could be one of the following.

- There was not enough disk space when the timing file was saved.
- The timing file was saved using a different executable from the one that is being used to read it.

**What Next**

Please re-run after making sure that there is enough disk space available.

---

## ZRT-402

(error) Cannot find the user specified timing file '%s'.

**Description**

The reasons for this could be one of the following.

- The file does not exist or the full path to the file was not specified.
- You do not have the required permissions to read it.

**What Next**

Please make sure the full path to the file is specified and that you have the required permissions to read it.

---

## ZRT-403

(warn) Hidden %s parameter %s of %s is obsolete in router.

**Description**

This debug/hidden parameter has been set or has a different value than the default value, but the parameter to option translator does not support translation of this parameter.

Feedback

**What Next**

If possible, please remove this parameter from the script or reset the value if it's coming from the cell parameter setting.

---

## ZRT-404

(warn) Unable to translate %s of %s because %s -%s does not support value %d.

**Description**

The parameter is set to a value that is not supported by the option and thus can not be translated.

**What Next**

Please do not use the unsupported value with the parameter.

---

## ZRT-405

(warn) Unable to translate %s -%s because %s of %s does not support mode %s.

**Description**

The option is set to an additional mode that is not supported by the parameter and thus can not be translated.

**What Next**

Please do not set the option to this mode if the translation of this option to parameter is required.

---

## ZRT-406

(warn) Unable to translate %s to %s because %s.

**Description**

The translator cannot perform the translation because there is no exact correspondence between the option and the parameter.

**What Next**

Please review the setting of the option or the parameter.

---

## ZRT-407

(error) Failed in separate process.

Feedback

**Description**

This error message indicates that the command failed in a separate process. The reasons for this could be one of the following:

- A crash occurred in the separate process flow.
- No disk space is available.

**What Next**

Verify that there is sufficient disk space available.

---

## ZRT-408

(error) Using -nets option with -antenna, -open_net, and -voltage_area set to false.

**Description**

This error message indicates that the command check_routes failed. The option "-nets" is specified with -antenna, -open_net, and -voltage_area options set to false.

**What Next**

1) Specify one or more of these three options in this Tcl command. or 2) Remove the "-nets" option and rerun the command.

---

## ZRT-409

(warn) %s parameter %s is not supported by router.

**Description**

The translator cannot perform the translation because the parameter is currently not supported by router.

**What Next**

Please review the setting of the parameter.

---

## ZRT-410

(info) %s parameter %s is obsolete in router.

**Description**

The translator cannot perform the translation because the parameter is obsolete in router. Most likely router is already handling the parameter automatically and there is no need for an user option, or the parameter is useless in router.

Feedback

## ZRT-411

(warn) %s parameter %s is supported only in the technology file.

**Description**

The tool issues this warning when you specify a routing option that is supported only in the technology file.

**What Next**

Define the design rule criteria in the technology file.

## ZRT-412

(warn) %s parameter %s cannot be translated exactly to corresponding router option.

**Description**

Router has a similar option, but the approach it takes is different and does not match the parameter with one to one correspondence.

**What Next**

Please set the option manually and refer to the application notes for more details.

## ZRT-413

(error) Invalid coordinates for area routing.

**Description**

The router cannot perform area routing because the specified coordinates are invalid.

**What Next**

Please use the correct format to specify the coordinates.

## ZRT-414

(error) Abnormal exit of child process

**Description**

Child process crashed.

**What Next**

This is not expected behavior.

Feedback

## ZRT-415

(warn) The number of threads for this run is reduced to %d.

**Description**

Based on the maximum number of threads set,an attempt is made to checkout the required number of license keys of each type.However all the required keys are not available.Based on available number of keys of each type,a reduced number of threads is calculated and used for this run.

**What Next**

Please check if license keys of each type are available for this run.

## ZRT-416

(warning) %d %s cell PG pins connected to net NULL and not PG.

**Description**

This warning message indicates that the filler cell removal command detects PG pins of some cells in the design connected to NULL net. Short violations between the PG pins connected to NULL net and PG pins connected to valid PG nets will be detected during the command, and filler cells with such violations will be removed.

**What Next**

Please run the connect_pg_net command to ensure valid PG connecttions to PG pins.

## ZRT-417

(warning) Deleted instance %s is not a standard filler cell

**Description**

This warning message indicates that the filler cell removal command detects a violation on a cell which name matches a given name pattern, but is not classified as a standard filler cell. Filler cells are standard cells without any connections to signal nets. Filler cells that were inserted with create_stdcell_fillers command have a prefix of "xofiller".

**What Next**

Please check the given name pattern if it is indeed intended for filler cell deletion. You may use a default name pattern if only filler cells with a prefix of "xofiller" were intended for deletion.

Feedback

## ZRT-418

(warning) Instance %s which is connected to signal nets is not deleted.

**Description**

This warning message indicates that the filler cell removal command detects a violation on a cell which name matches a given name pattern, but has connections to signal nets. Such cells can not be removed.

**What Next**

Please check the given name pattern if it is indeed intended for filler cell deletion.

## ZRT-419

(warning) Cell %s has internal violations

**Description**

This warning message indicates that the filler cell removal command detects a cell which has violation on objects inside the cell. Such violation is ignored for cell removal purpose.

**What Next**

Please check the filler library cell for violations.

## ZRT-420

(error) It is not recommended to use classic router commands after router commands.

**Description**

Routing was done with router on the current design. Now an attempt is made to run commands of classic router. This is not recommended because the DRC analysis and routing graph interpretations are different between the two routers.

**What Next**

Continue to run all the routing commands in router. If the intention to use the classic router for the flow, delete all the existing routes and start the flow with classic router.

## ZRT-421

(error) Cannot open file '%s' for '%s'.

Feedback

**Description**

The file cannot be opened.

**What Next**

Please make sure you have the required permissions on the directory.

---

## ZRT-422

(warn) %s option "%s" will be obsolete in %s release. %s.

**Description**

The option specified will be obsoleted in future release.

**What Next**

Please define the design rule in the technology file.

---

## ZRT-423

(warn) %s parameter %s is supported by router by command line option.

**Description**

The parameter is supported in router as command line option.

**What Next**

Please use command line option instead.

---

## ZRT-424

(warning) "-max_number_of_threads" option is deprecated

**Description**

The "-max_number_of_threads" option is being phased out, in favor of using the "-max_cores option" for the "set_host_options" command.

**What Next**

Please update scripts to use "set_host_options -max_cores" instead.

**See Also**

- set_host_options

Feedback

## ZRT-425

(warning) The "set_host_options -max_cores" option will be honored instead of the "set_app_options route.common.max_number_of_threads" option.

### Description

The tool issues this warning when you specify both the recommended *set_host_options -max_cores* command and the deprecated *set_app_options route.common.max_number_of_threads* command.

Because the *set_app_options route.common.max_number_of_threads* command is being phased out, the *set_host_options -max_cores* setting is used and the *set_app_options route.common.max_number_of_threads* setting is ignored.

### What Next

Update your scripts to use the *set_host_options -max_cores* command instead of the *set_app_options route.common.max_number_of_threads* command.

### See Also

- set_host_options

## ZRT-426

(error) This error message indicates that invalid route type is specified.

### Description

The valid values for the route type are fixed_route and nonfixed_route.

### What Next

Check the command syntax from the man page and use the correct value.

## ZRT-427

(warning) Net %s was modified, need to be reshielded.

### Description

The indicated shielded net was modified outside of router environment. It will be automatically unshielded by router. If option is set: set_app_options route.common.reshield_modified_nets reshield it will be automatically reshielded at the end of signal routing.

Feedback

### What Next

To leave shielding of modified nets intact, you should set: set_app_options route.common.reshield_modified_nets off To delete shielding of modified nets, you should set: set_app_options route.common.reshield_modified_nets unshield To reshield the modified nets, please set: set_app_options route.common.reshield_modified_nets reshield or run create_shield command.

---

## ZRT-428

(warning) Net %s is a reserved channel net, but feedthroughs are permitted on this net.

### Description

The net is designated to be routed in "reserved channels", but it is also permitted to create feedthroughs on blocks. Therefore the net may not be routed through the channels as expected. To guard against the possibility of very large log files, the number of these warnings is limited to fifty, so it is possible that not all problem nets are reported.

### What Next

If you want this net to be routed in channel areas as much as possible, you should set it to prohibit feedthroughs using the "set_individual_pin_constraints -nets <net_names>" command with the "-allow_feedthroughs false" argument.

---

## ZRT-429

(warning) One of avoid metal area (AMA) candidate set of lithography hotspot %s does not overlap with any changeable wire/via.

### Description

None of the avoid metal areas of the AMA candidate set overlap with any changeable wire or via. Since an AMA set will be valid for router only if at least one of its avoid metal areas overlaps with router changeable wire or via. This AMA candidate set will not have any effect in router and will not be output as an AMA set in the output file.

### What Next

You should check if the hotspot marker was generated correctly, since the AMA candidate set are generated based on the hotspot marker. For example, a bridge hotspot should have at least two polygons nearby, otherwise there is nothing to be "bridged". However, if one of the polygons is an unchangeable shape, like pin or obstacle shapes, while the other one is a changeable wire or via, then you can ignore this warning since router still have chance to use the other AMA set to fix the hotspot.

Feedback

## ZRT-430

(warning) All of avoid metal area (AMA) candidate set of lithography hotspot %s do not overlap with any changeable wire/via.

### Description

None of the avoid metal areas of all the AMA candidate sets overlaps with any changeable wire or via. An AMA set will be valid for router only if at least one of its avoid metal areas overlaps with router changeable wire or via. No AMA candidate set will be output for this hotspot in the output file. Thus router can not fix this hotspot by rip-up and reroute.

### What Next

You should check if the hotspot marker was generated correctly, since the AMA candidate set are generated based on the hotspot marker. You should also check if the settings in config_file_name are set to proper values, especially the DefaultSpacing field. A fake or false alarm hotspot marker often causes this warning.

## ZRT-431

(warning) Found conflict constraints between block %s and voltage area %s, voltage area constraints will be ignored.

### Description

This message is issued when you have a block boundary coincident with voltage area boundary and the feethrough constraints setting are conflict. When those constraints are conflict, block related pin constraints win and voltage area feedthrough constraints will be ignored.

### What Next

Please use report_block_pin_constraints and report_fp_voltage_area_constraints to check the constraint setting and examine the confliction.

## ZRT-432

(Warning) found conflict feedthrough constraint setting for voltage area and plangroup on net %s, voltage area based constraints will be ignored

### Description

This message is issued when you have feethrough constraints setting conflict from pin constraints and voltage area constraints on a net. When those constraints are conflict, plangroup related pin constraints win and voltage area feedthrough constraints will be ignored.

Feedback

### What Next

Please use report_fp_pin_constraints and report_fp_voltage_area_constraints to check the constraint setting and examine the confliction.

---

## ZRT-433

(Warning) Router cannot access %s %s\n \ton net %s, forcing access.

### Description

The global router can NOT connect to this pin using the pin access direction. This happens when the pin is totally blocked or when the pin is blocked in the assigned access direction. For instance, if a pin is located at the left edge of die area and has pin access direction from the left, the router will print this message. Or, in virtual flat routing mode, if a pin is located at edge of a block and has an access direction from outside the blcok, but needs to be connected to other pins inside the block, this message will be issued. In such cases, pin access direction cannot be honored and the router will connect to the pin without obeying the access direction.

### What Next

The pin may be blocked. If router is running in exploration mode and the placement is not legalized, such configurations are expected and you may ignore this message. Otherwise, please check to see if the pin is blocked and adjust the placement if necessary. If the pin is not blocked, please check if the pin can be connected using pin access direction.

---

## ZRT-434

(warning) reshield_rerouted_nets option is deprecated

### Description

The -reshield_rerouted_nets option is being phased out, in favor of using the 'set_app_options route.common.reshield_modified_nets'.

### What Next

Please update scripts to use 'set_app_options route.common.reshield_modified_nets' instead of using 'set_app_options route.detail.reshield_rerouted_nets'.

---

## ZRT-435

(warning) off_grid_routing_mode option is deprecated

Feedback

**Description**

The -off_grid_routing_mode option is being phased out, in favor of using layer onGrid parameter in technology file.

**What Next**

Please update scripts to remove 'set_app_options route.common.off_grid_routing_mode'. Instead, define onGrid parameter in the Layer section of technology file.

---

## ZRT-436

(error) Could not find plan group or soft macro for db Id %d.

**Description**

An object ID in the internal pdc constraint structure could not be located in the database. This is an internal error.

**What Next**

This is not expected behavior.

---

## ZRT-437

(warning) Could not find port named %s specified in the physical pin constraints.

**Description**

A port name specifed in the physical pin constraint file could not be matched in the current database. This constraint will be ignored.

**What Next**

Fix the port names in the physical pin constraint file, or delete this constraint.

---

## ZRT-438

(error) router is not allowed to run in XP mode.

**Description**

router is not licensed in XP mode.

**What Next**

Please check your license.

Feedback

## ZRT-439

(warning) Cannot route net %s (dbId %lu).

### Description

The global router has failed to route a net. This may happen when the router cannot find a legal routing solution for the net. Normally this is caused by inconsistent data or constraint settings. Here are potential reasons that can cause this message:

a). If feedthroughs are prohibited in a fully abutted designs, if a net cannot be routed without generating an illegal feedthrough this message will be issued.

b). This message may also due to a placement violation. For instance, if a cell that logically belongs to a block has been placed outside of its block or a top terminal is placed inside an unconnected block which has feedthrough disallowed for the net, this message will be issued because the router can not route to those pins/terminals.

c). In addition, if the net is clock net, by default, the router will not create feedthrough routing. User can control the clock net feedthrough routing by app option "plan.pins.exclude_clocks_from_feedthroughs" or use command "set_individual_pin_constraints".

d). There are fixed block pins which has wrong pin access direction.

e). The connected pins of nets are on different layers which are restricted due to the net's min/max layer connection settings (from app options route.common.global_min_layer_mode/route.common.global_max_layer_mode or command set_ignored_layers).

### What Next

Check to see if contraint settings are correct or if the placement has any violations. Try running report_placement -physical_hierarchy_violations. Or check if the net is clock net and feedthrough is disabled. Also check if there are fixed block pins with wrong access direction. Also check the routing app option settings (route.common.global_min_layer_mode/route.common.global_max_layer_mode) or layer settings from command set_ignored_layers.

### See Also

- route_global

## ZRT-440

(error) Illegal RDB file input or format.

Feedback

**Description**

RDB file is the input file to the RDB2RGF translator, which translate the route guidance from RDB format to RGF format that router takes. If the input file does not comply with the RDB format, the translator can not produce the correct RGF file and will abort the translation.

**What Next**

You should check if the format of the RDB file is correct. The possible error in the RDB file could be: empty or wrong (ther must be at least two different values for horizontal or vetical values) vertices of a hotspot; some necessary fields defined in the config file are missing, ..., etc. Please examine the RDB file and correct the incorrect place(s).

---

## ZRT-441

(warning) route design in floorplan mode, floorplan global routing results should NOT be used for track assignment or detail route

**Description**

Floorplan global routing is intended to be used in floorplan exploration and design planning, it is NOT supported to run track assignment or detail route on floorplan global route results

**What Next**

Please don't use floorplan global route results for track assignment or detail route

---

## ZRT-442

(error) exploration global routing results can not be used for track assignment or detail route, set -stop_after_global_route to true

**Description**

Exploration router global routing is mainly used for floorplan exploration and design planning, it is NOT supported to run track assignment or detail route on exploration global route results

**What Next**

Please use -stop_after_global_route true in exploration mode

Feedback

## ZRT-443

(error) It is not recommended to use the result from -exploration global routing. Please re-run global route.

**Description**

The -exploration mode global route is used for design planning purpose and the result should not be used for subsequent routing steps (track assignment, detail routing).

**What Next**

Please re-run global route without the -exploration option.

## ZRT-444

(info) Using %d threads for routing.

**Description**

This message reports the number of threads used in multi-threaded routing.

**What Next**

No action is required.

**See Also**

- set_host_options

## ZRT-445

(warning) timing driven mode is NOT supported in exploration routing mode, design will be routed without timing driven

**Description**

Exploration router global routing is mainly used for floorplan exploration and design planning, it is NOT supported to run global route in both timing driven and exploration mode

**What Next**

Please use either exploration or timing driven mode, but NOT both

Feedback

## ZRT-446

(warning) cross talk driven mode is NOT supported in exploration routing mode, design will be routed without cross talk driven

**Description**

Exploration router global routing is mainly used for floorplan exploration and design planning, it is NOT supported to run global route in both cross talk driven and exploration mode

**What Next**

Please use either exploration or cross talk driven mode, but NOT both

## ZRT-447

(warning) option -plan_group_aware_quality will be obsolete in 2010.12 release, please use -exploration option for route_global or route_group

**Description**

Option -plan_group_aware_quality will be obsolete in 2010.12 release, please use "-exploration true | false" to turn on/off exploration mode

**What Next**

Please switch to use -exploration option for route_global/route_group commands. For more information on -exploration option, please see the man page of route_global/route_group commands.

## ZRT-448

(warning) "place_fp_pins -block_level -effort high" does not support plan group aware routing. Setting "-plan_group_aware off".

**Description**

"place_fp_pins -block_level -effort high" uses the global router to determine blcok level pin positions. The router cannot observe plan group constraints and block level constraints concurrently.

**What Next**

Use the setting "set_app_options route.common.plan_group_aware off" when doing block level pin placement.

Feedback

## ZRT-449

(warning) Timing-driven mode is NOT supported in hierarchical design planning; design will be routed without timing-driven constraints.

### Description

Timing-driven routing is not supported in hierarchical design planning (pin placement) mode. Timing-driven routing constraints will be ignored.

### What Next

If you are performing global routing on a design that contains plan groups, you can resolve this warning by using the *set_app_options* command to set the *route.common.plan_group_aware* option to *off*.

## ZRT-450

(warning) Crosstalk-driven mode is NOT supported in hierarchical design planning; design will be routed without crosstalk constraints.

### Description

Crosstalk constraints are not supported in hierarchical design planning (pin placement) mode. Crosstalk constraints will be ignored.

### What Next

If you are performing global routing on a design that contains plan groups, you can resolve this warning by using the *set_app_options* command to set the *route.common.plan_group_aware* option to *off*.

## ZRT-451

(info) The application variable "max_parallel_computations" is too large. It will not override "set_host_options -max_cores".

### Description

The application variable "max_parallel_computations" is set to be larger than the option in "set_host_options -max_cores". Router will use "set_host_options -max_cores" option for routing.

"max_parallel_computations" should be set to a value between 0 and the "set_host_options -max_cores" option value in order to override the "set_host_options -max_cores" option. Otherwise, "set_host_options -max_cores" will continue to be used for multiple computations.

Feedback

### What Next

Reduce "max_parallel_computations" to a value no greater than the "set_host_options -max_cores" option value.

### See Also

- set_host_options

---

## ZRT-452

(info) The application variable "max_parallel_computations" overrides the "set_host_options -max_cores" option.

### Description

The application variable "max_parallel_computations" is set to override the option in "set_host_options -max_cores". Router will use "max_parallel_computations" value for multiple computations.

### What Next

No action is required.

### See Also

- set_host_options

---

## ZRT-453

(error) Value %s specified for option %s is not in correct format.

### Description

Setting for the option will be ignored due to incorrect format.

### What Next

Please see man page for correct specification.

---

## ZRT-454

(warn) Voltage area name %s specified for option -voltage_area_weight does not exist.

### Description

Weight setting for this voltage area will be ignored.

Feedback

**What Next**

Please check for correct voltage area name.

---

## ZRT-455

(error) Via ladder constraint %s is used on pin but is not defined in tech file.

**Description**

A via ladder ViaRule must be defined in the tech file before the constraint is set on a pin.

**What Next**

Create a corresponding ViaRule in the tech file or remove this constraint from the pin, then try again.

---

## ZRT-456

(error) %s. No ContactCode uses this cut.

**Description**

A via ladder has been specified to use this cut, but the tech file does not define a via that uses the cut. The via ladder is therefore invalid.

**What Next**

Modify the tech file so that any cut used in a via ladder is a cut that is used in at least one via, then try again.

---

## ZRT-457

(error) Too many via ladders listed in constraint for pin. No more than %d are allowed.

**Description**

The list of via ladder preferences for the pin contains too many entries.

**What Next**

Reduce the number of entries in the via ladder constraint and try again.

---

## ZRT-458

(error) %s. Cuts are required to be on increasing adjacent layers.

Feedback

**Description**

A via ladder has been specified with illegal non-adjacent cuts. Cuts in a via ladder must increase by 1 cut layer for each level of the via ladder.

**What Next**

Modify the tech file so that the via ladder uses adjacent layer-increasing cuts on each level and try again.

---

## ZRT-459

(error) Failed to read ViaRule %s. %s.

**Description**

A via ladder has been specified with incomplete or illegal settings. This can happen if a non-existent layer is given, or if the number of entries in each field do not match the specified table size.

**What Next**

Modify the tech file so that the ViaRule is legitimate, then try again.

---

## ZRT-460

(warn) Net %s has a pin guide AND a topological constraint. The toptological constraint takes precedence.

**Description**

In the case of multiple constraint types for one net, topological constraints take precedence over pin guides. You cannot mix constraint types on a single net.

**What Next**

Either delete the topological constraint, or delete the pin guide.

---

## ZRT-461

(error) The design contains plan group pin shapes, which are a floor planning feature. Track assignment and detailed routing are not supported for plan group pins.

**Description**

Plan group pin shapes are floorplanning objects and are not understood by track assignment and detailed routing. You have likely created them using "place_fp_pins" or

Feedback

"create_fp_pins". Normally, you should run "commit_fp_plan_groups" to convert your plan groups into soft macros with real physical pins before doing detailed route.

**What Next**

Run commit_fp_plan_groups before doing physical routing. It is also possible to rerun your command after turning off the plan_group_aware flag using "set_app_options -global {route.common.plan_group_aware off}".

---

## ZRT-462

(info) Coordinates are a guide for verification area, errors may be flagged outside of them.

**Description**

The rectangles specified by the -coordinates option in the check_routes command is only a guide for the area where the command performs the DRC check. The actual area checked by the command may exceed the specified rectangles. As a result, DRC errors maybe flagged outside the boundary of the specified rectangles.

**What Next**

No action is required.

**See Also**

- check_routes

---

## ZRT-463

(info) Certain net based DRC checks are not performed with area based DRC check.

**Description**

When the -coordinates option is specified in the check_routes command. The following net based DRCs are not checked:

1. Open net
2. Antenna
3. Tie to rail; Tie to rail directly 4. Secondary PG pin directly connection; Secondary PG pin maximum connections
4. Comb routing directly connection; Comb routing maximum connections; Comb routing daisy-chain distance

Feedback

### What Next

No action is required.

### See Also

- check_routes

---

## ZRT-464

(info) -coordinates option is specified with the command check_routes. -nets, -open_net, -report_all_open_nets, -voltage_area and -antenna options will be ignored.

### Description

When the -coordinates option is specified in the check_routes command. The net based DRCs are not checked. Net related options: -nets, -open_net, -report_all_open_nets, -voltage_area and -antenna are also ignored.

### What Next

No action is required.

---

## ZRT-465

(info) Complete DRC check is recommended after area based DRC checks are complete.

### Description

Area based DRC check does not check net based DRCs. To obtain a full DRC report, please run a complete DRC check (check_routes without -coordinate option).

### What Next

No action is required.

---

## ZRT-466

(error) -drc is turned off when -coordinates is specified.

### Description

Area based DRC check checks only DRC violations, so -drc should not be turned off when -coordinates is specified.

### What Next

Remove -drc false from the options when -coordinates is specified.

Feedback

## ZRT-467

(warn) A specified rectangular area extends outside the design boundary.

**Description**

Part of or the whole rectangle specified in the command is outside the boundary of the design.

**What Next**

Please check and see if there is any mistake in the input coordinates of the rectangle.

## ZRT-468

(error) Open the top cell to set this option.

**Description**

Some of the options require information from the design. Setting such options including this one require the top cell to be open.

**What Next**

Open the top cell and set this option.

## ZRT-469

(error) Cannot use comb routing topology with plan-group-aware routing. Using normal clock topology.

**Description**

The comb topology for routing clocks is not applicable to plan-group-aware routing. This error is not fatal; routing proceeds using normal topology for clocks.

**What Next**

To avoid this message, set the clock topology to normal before doing plan-group-aware routing.

## ZRT-470

(warning) Both exploration mode and effort are set. Exploration mode takes priority.

Feedback

**Description**

If you specify both exploration mode and effort for global routing, Router ignores the effort setting. This is just a warning; exploration routing proceeds as usual.

**What Next**

To avoid this message, do not set the global routing effort when using exploration mode.

---

## ZRT-471

(error) Invalid pin constraint specifies side %d on block %s that has only %d sides.

**Description**

This constraint is ignored because it specifies an invalid side number for the given module.

**What Next**

This is not a fatal error, but this constraint is dropped. Correct the side number (which should be 1 to n, where n is the number of sides in the block boundary) or delete the constraint. Note that sides are numbered clockwise from the lowest leftmost side.

---

## ZRT-472

(warning) The source-target pair on line %d of the feedthrough map file implies no feedthrough and overrides the previous feedthrough setting.

**Description**

If the feedthrough map input file has a source-target pair, such as "{Block A} {Block B}", it implies that the two must be connected directly, without feedthroughs. If there is a "{Feedthrough}" statement in the same net entry that permits feeds, that this directive is ignored.

**What Next**

This is just a warning. If you want to clean up the file, you can delete the "{Feedthrough}" statement.

---

## ZRT-473

(Warning) The virtual pin at (%.3f, %.3f) is outside of the %s boundary. It will be ignored.

**Description**

This warning occurs when the virtual pin location is outside of the corresponding plan group boundary.

Feedback

A virtual pin location must be on or inside the corresponding plan group boundary. If it is outside, it is ignored.

**What Next**

It is possible that the plan group boundaries were moved after the virtual pins were created. You should delete these virtual pins.

---

## ZRT-474

(Error) The '%s' value specified for the '%s' option is not of type %s.

**Description**

This error occurs when the value specified for an option has the incorrect type. The tool ignores this option setting.

**What Next**

See the command man page for information about the valid values for this option.

---

## ZRT-475

(Error) The '%s' value specified for the '%s' option is not in the range %s to %s.

**Description**

This error occurs when the value specified for an option is outside the acceptable range. The tool ignores this option setting.

**What Next**

See the command man page for information about the valid values for this option.

---

## ZRT-476

(Error) The '%s' value specified for the '%s' option is invalid.

**Description**

This error occurs when the value specified for an option is invalid. The tool ignores this option setting.

**What Next**

See the command man page for information about the valid values for this option.

Feedback

## ZRT-477

(Warning) Skip net: %s. Intended break point is too far away from legalized cell location. Current distance %d is more than %d.

**Description**

Intended break point is too far away from legalized cell location.

**What Next**

Please set a proper maximum distance in the split_net command option.

## ZRT-478

(Warning) Skipping net: %s. Breakpoint (%d, %d, %d) does not exist on layer %d.

**Description**

This warning message occurs when a breakpoint specified in the *-breakpoints* option of the *split_net* command does not exist on the specified layer.

**What Next**

Ensure that the layer specified in the breakpoint is valid for the specified coordinates.

## ZRT-479

(Warning) Skipping net: %d. Source net %d is invalid for the split_net command.

**Description**

This warning message occurs when the net specified in the *-from_nets* option of the *split_net* command is invalid.

**What Next**

Check the net specified in the *-from_nets* option in the *split_net* command.

## ZRT-480

(warn) Layer '%s' is not a frozen layer.

**Description**

This warning message occurs because the route.common.freeze_via_to_frozen_layer_by_layer_name option for the set_app_options command has encountered a metal layer which is not frozen.

Feedback

**What Next**

Please ensure that the layers specified in the list of the arguments are all frozen layers.

---

## ZRT-481

(warn) The similar option '%s' is specified earlier. The previous option is overwritten by the current option '%s'.

**Description**

This warning message occurs because the route.common.freeze_via_to_frozen_layer and the route.common.freeze_via_to_frozen_layer_by_layer_name options for the *set_app_options* command are used sequentially to freeze vias. The option specified later will overwrite the previous one.

**What Next**

It is recommended to only use the option route.common.freeze_via_to_frozen_layer_by_layer_name.

---

## ZRT-482

(error) The options route.common.freeze_via_to_frozen_layer and route.common.freeze_via_to_frozen_layer_by_layer_name cannot be specified at the same time.

**Description**

This error message occurs because both the route.common.freeze_via_to_frozen_layer and the route.common.freeze_via_to_frozen_layer_by_layer_name options for the *set_app_options* command are used at the same time.

**What Next**

It is recommended to only use the option route.common.freeze_via_to_frozen_layer_by_layer_name.

---

## ZRT-483

(warning) The pin guide that contains point (%.3f %.3f) has a non-rectilinear edge and will be ignored.

**Description**

A pin guide shape must be rectilinear. If any edges are not vertical or horizontal, the pin guide will be ignored.

Feedback

**What Next**

Pin guide coordinates that are manually entered might not be rectilinear. Please check the pin guide shape.

---

## ZRT-484

(warning) Cannot route net %s (dbId %lu) with pin guides or pin blockages or individual pin constraint(s).

**Description**

The global router has failed to route a net with pin guides, or with pin blockages, or with individual pins/nets constraint(s).

**What Next**

Check to see that the pin guide/pin blockages/individual pins/nets constraints make sense in terms of the routing targets in this net or pins of this net.

---

## ZRT-485

(warn) cell %s is placed outside of partition or block cell %s

**Description**

This implies that the cell has been placed outside of partition or block cell boundary. The cell placement is violating hierarchical placement constraints and will NOT be considered in design planning pin placement and global route.

**What Next**

Fix placement errors for those cells

---

## ZRT-486

(warn) cell %s is NOT placed or placed illegally

**Description**

This implies that there are cells have NOT been placed in the design or placed illegally (for instance, cell is placed outside of top block boundary). Those cells will NOT be considered in design planning pin placement and global route. This could be the case if child level design has NOT been implemented yet if the cell is inside child block.

Feedback

**What Next**

If this is NOT what you intend to do, please place the cells inside the partition/block so that they will be consideredd in design planning global route and pin placement

---

## ZRT-487

(warn) Ignoring the bus ordering for the %s bus because the %s net has plan group pins.

**Description**

The tool issues this message when you have enabled the *-keep_buses_together* option of the *set_fp_pin_constraints* command, but one or more bits in the specified bus already have plan group pins. The router must obey the plan group pins, which might be incompatible with bus pin ordering, so it ignores the *-keep_buses_together* setting.

**What Next**

Either delete the plan group pins or disable the *-keep_buses_together* option.

---

## ZRT-488

(error) Plan group pin shape %s/%s is not on a routing layer.

**Description**

The tool issues this error when the layer of the specified plan group pin is not within the minimum and maximum routing layers specified by the *set_ignored_layers* command. The router cannot connect to the plan group pin shape under these conditions.

**What Next**

Either delete the plan group pin or reset the routing layers. To reset the routing layers, use the *set_ignored_layers* command. For example, to set the maximum routing layer as METAL8, run the following command: *set_ignored_layers -max_routing_layer METAL8*.

---

## ZRT-489

(error) Shield cannot be created because the '%s' shielding net is marked as frozen.

**Description**

The tool issues this error during shield creation when the shielding net is marked as frozen. When the shielding net is marked as frozen, the tool cannot make any changes to the net.

Feedback

**What Next**

Check the attributes of the shielding net.

---

## ZRT-490

(error) Shield cannot be created because the router cannot find the shielding net.

**Description**

Shield cannot be created because the router cannot find the shielding net.

**What Next**

Verify that the shielding net exists in the design database.

---

## ZRT-491

(warn) Shield cannot be created for the '%s' net because the router cannot retrieve the shielding options from the design database during incremental shielding.

**Description**

The tool issues this warning when the net has inconsistent shielding options.

**What Next**

Rerun the shielding flow for the specified net.

---

## ZRT-492

(warn) The -pg_via_tie_effort_level and -shield_via_tie_effort_level options are both set to low.

**Description**

The tool issues this warning when you set both the *-pg_via_tie_effort_level* and *-shield_via_tie_effort_level* options of the *create_shield* command to low. This could result in a low shielding ratio if there is no structured power and ground mesh.

**What Next**

Provide a structured power and ground mesh to which to connect the shielding wires.

---

## ZRT-493

(warn) Skip net '%s' for shielding since it is not a valid P/G net.

Feedback

**Description**

The tool issues this warning when there is invalid P/G net specified in *route.common.shielding_nets* of the *set_app_options* command.

**What Next**

Provide P/G net that has ring/rail/stripe structure.

---

## ZRT-494

(error) No valid P/G net specified in route.common.shielding_nets.

**Description**

The tool issues this error when there is no valid P/G net specified in *route.common.shielding_nets* of the *set_app_option* command.

**What Next**

Please specify at least one P/G net that has rail/ring/stripe structure.

---

## ZRT-495

(info) No-trimming shielding mode is activated. All shielding shapes with DRC violations will be kept. No further operations are recommended.

**Description**

In no-trimming shielding mode, all shielding shapes with DRC violations are kept. Therefore, no further operations are recommended.

---

## ZRT-496

(warning) Cannot route net %s (dbId %lu) with topological constraint.

**Description**

The router has failed to route a net that has a toplogical constraints. This may be due to unsatisfiable constraints. For example, if the constraint specifies a direct connection from block A to C, but there is no direct path from A to C without creating a feedthrough. In some cases, this failure could also occur if the topological constraint specifications greatly overload an edge segment, particularly in an abutted design.

**What Next**

Check the topological constraints for this net. Correct them if not valid.

Feedback

## ZRT-497

(warning) Cannot find flat net for supply net %s on voltage area %s.

**Description**

The router could not find a flat (global) net corresponding to the given supply net in the voltage area. The router will not be able to check for feedthrough compatibility between the driver and this supply net in this voltage area, and may therefore avoid the voltage area when not strictly necessary.

**What Next**

Check your specification of the power net connectivity.

## ZRT-498

(error) Feedthrough map file error on net %s. %s on side %d of block %s is obstructed by abutted block %s.

**Description**

The feedthrough map file specifies a location through which to connect two blocks, but that location is obstructed by a different, abutted block. The router will proceed, but will ignore this offset.

**What Next**

Fix the specification in the feedthrough map file.

## ZRT-499

(error) Layer '%s' does not exist in design.

**Description**

You receive this message because you used a layer that does not exist in design.

**What Next**

Check the layers from the design and use the right routing layer name.

## ZRT-500

(Warn) Incorrect special minimum area rule defined on layer %s.

Feedback

**Description**

The rectangle-based special minimum area rule is obsolete in router. You cannot define the *specialMinArea* attribute without the *minAreaEdgeThreshold* attribute.

**What Next**

Define one of the valid minimum area rules as described in the routing rules documentation.

---

## ZRT-501

(Warn) Invalid short metal rule defined on layer %s.

**Description**

The length, width, and spacing thresholds must be greater than zero; otherwise, the rule is ignored for that layer.

**What Next**

Define a valid short metal rule as described in the routing rules documentation.

---

## ZRT-502

(warn) No antenna rule assigned for net %s.

**Description**

When multiple antenna rules are defined and rules assigned to nets, a rule must be assigned to every net in the design. Otherwise that net will be skipped for antenna analysis and fixing.

**What Next**

Assign antenna rules for all the nets.

---

## ZRT-503

(warn) NDR %s rule '%s' is rounded up to the next %s multiple of the min grid rule on layer %s.

**Description**

The NDR width/spacing rule defined is not an even/integer multiple of the min grid rule. It is automatically rounded up to the next even/integer multiple of the min grid rule to avoid the conflict between the two rules.

Feedback

**What Next**

Please define the NDR width/spacing rule as an even/integer multiple of the min grid rule.

---

## ZRT-504

(error) Mismatch in soft rule effort level and soft rule spacing weights for rule: %s, layer: %s, efforts: %s, weights: %s.

**Description**

This error message indicates that the router found a mismatch between the number of soft rule effort levels and soft rule spacing weights specified.

**What Next**

Please ensure that the number of effort levels specified matches the number of soft spacing weights. High effort is always required for the hard weight rule, which may not have been specified by the user.

---

## ZRT-505

(warning) Skip net %s for pin guide %s on plan group %s (too few intersections).

**Description**

The pin guide specified for this net has NO or has only one intersection with a parent plan group and there is NO net connection (logical port) on this plan group. Since the net has no port on this plan group, the guide is considered a feedthrough guide for this plan group. A feedthrough guide must have at least 2 intersections with the plan group boundary.

**What Next**

Please ensure that the number of intersections between pin guide and plan group larger than 1

---

## ZRT-506

(warn) %s setting will be ignored.

**Description**

The setting is being ignored because constraints defined by define_voltage_area_routing_rule are found, and router does not honor the settings together.

Feedback

**What Next**

Please make sure only one type of constraint is set.

---

## ZRT-507

(warn) skipping path geometry with octagonal or round encap on net %s.

**Description**

Path geometry with an octagonal or round endcap is not supported and will be ignored.

**What Next**

Please use either a zero or half-width rectangular endcap.

---

## ZRT-508

(warn) skipping path geometry with octagonal or round encap.

**Description**

Path geometry with an octagonal or round endcap is not supported and will be ignored.

**What Next**

Please use either a zero or half-width rectangular endcap.

---

## ZRT-509

(error) Layer %s has odd default width defined in tech file.

**Description**

Odd default width for routing layer is strongly discouraged since it leads to routing wires to be off the manufacturing grid. The wires that are off-manufacturing-grid will not be reported as design rule violations.

**What Next**

Please specify even default width for each routing layer.

---

## ZRT-510

(error) Failed to get design.

**Description**

The design could not be opened.

Feedback

**What Next**

Open the design and run the command.

---

## ZRT-511

(Warning) Cell contains tie connections which are not connected to real PG.

**Description**

Cell contains some tie nets (tie_low or tie_high) which are not connected to real PG. These nets will not contain route information unless they are realized with PG rail. To connect to PG rail, users need to call "connect_pg_net" command.

An example for query such a net is get_nets -hierarchical -filter net_type=~tie_low

**What Next**

Run "connect_pg_net".

---

## ZRT-512

(warning) The '%s' via enclosure width is less than NDR width constraint of '%s' layer.

**Description**

You receive this message because the via enclosure width is less than NDR width constraint of the layer. Router may report "Less than NDR width" violation for these via enclosure.

**What Next**

Please increase NDR via enclosure to meet metal layer NDR width.

---

## ZRT-513

(warn) Ignoring interlayer via metal spacing check for the %s and %s layers.

**Description**

The tool issues this warning when entries in the minSpacingUpperEncCheck table are set to 0.

To enable the interlayer via metal spacing check, entries in minSpacingUpperEncCheck table must be set to 1.

**What Next**

Review the interlayer via metal spacing rule definition in the technology file.

Feedback

## ZRT-514

(warn) The error view specified with the -error_view option uses an invalid file extension (%s); using the file extension "err" instead.

### Description

The tool issues this warning when the error view specified with the *-error_view* option has an invalid file extension.

The *check_routability* command requires a file extension of "err" for the error view. If you specify a different file extension, the tool keeps the error view name, but replaces the file extension with "err".

Note that you can also specify the error view name without an extension; in this case, the tool adds the "err" extension, but does not issue a warning.

### What Next

To avoid this warning message, either use the "err" file extension or no file extension when you specify the error view name.

### See Also

- check_routability

## ZRT-515

(error) The error view specified with the -error_view option is invalid; using the default error view name instead.

### Description

The tool issues this error when the error view specified with the *-error_view* option is invalid. For example, the name consists only of the file extension and does not contain an error view name.

When this error occurs, the *check_routability* command ignores the specified error view name and uses the default error view name of *top_cell_name*.err instead.

### What Next

The *-error_view* option is not required. If you specify this option. ensure that you specify a valid name for the error view.

### See Also

- check_routability

Feedback

## ZRT-516

(info) Creating error view %s.err.

### Description

The results of the *check_routability* command are stored in the created error view and can be viewed by the GUI error browser.

### See Also

- check_routability

## ZRT-517

(warn) The %s.err error view already exists; the current results overwrite the existing error view.

### Description

The tool issues this warning when it writes to an existing error view. The contents of the existing error view are replaced with the results of the current run. All previous data stored in the error view is lost.

### What Next

If you need to keep the existing error view, such as when you want to compare the results of two *check_routability* runs, use the *-error_view* option to specify a new error view name.

### See Also

- check_routability

## ZRT-518

(warn) The value specified for the -blocked_range option is too large; the tool will use a value of 40.

### Description

To avoid performance issues, the maximum value allowed for the *-blocked_range* option is 40. When you specify a value larger than 40, the tool issues this warning and sets the value to 40.

### What Next

Specify a value less than 40 for the *-blocked_range* option.

Feedback

### See Also

- check_routability

---

## ZRT-519

(warn) The value specified for the -blocked_range_via_side option is too large; the tool will use a value of 40.

### Description

To avoid performance issues, the maximum value allowed for the *-blocked_range_via_side* option is 40. When you specify a value larger than 40, the tool issues this warning and sets the value to 40.

### What Next

Specify a value less than 40 for the *-blocked_range_via_side* option.

### See Also

- check_routability

---

## ZRT-520

(warn) The check_routability command uses a single CPU process; ignoring the set_host_options -max_cores setting of %d.

### Description

The tool issues this warning when run the *check_routability* command and have specified multiple cores with the *set_host_options -max_cores* command.

The *check_routability* command works only with a single CPU. Requests for multicore processing are ignored only for this command; it does not affect any other router commands.

Please be noted, The global route congestion map overflow check supports multi-thread. This warning is issued only for subsequent checks after global route congestion map overflow check.

### See Also

- check_routability

Feedback

## ZRT-521

(info) PG preroute in signal net %s.

**Description**

The signal net contains routing objects of PG route type.

**What Next**

No action necessary.

## ZRT-522

(warn) The value specified for the -standard_cell_search_range option is too large; the tool will use a value of 10.

**Description**

To avoid performance issues, the maximum value allowed for the *-standard_cell_search_range* option is 10. When you specify a value larger than 10, the tool issues this warning and sets the value to 10.

**What Next**

Specify a value less than 10 for the *-standard_cell_search_range* option.

**See Also**

- check_routability

## ZRT-523

(warn) The via cut and enclosure sizes for %s might cause the via surrounds to be off the minimum grid.

**Description**

The tool issues this warning when the via cut and enclosure sizes might cause the via surrounds to be off the minimum grid.

**What Next**

Check the the via cut and enclosure sizes in the technology file and correct if necessary.

Feedback

## ZRT-524

(warn) The via cut, minimum cut spacing, and enclosure sizes for %s might cause the via array surrounds to be off the minimum grid. Turn off min grid checking in check_routability.

**Description**

The tool issues this warning when the via cut, minimum cut spacing, and enclosure sizes might cause the via array surrounds to be off the minimum grid. Min grid checking in check_routability is turned off since there will be too many off minimum grid violations and runtime will be long if the via array surrounds off minimum grid issue is not fixed.

**What Next**

Check the via cut, minimum cut spacing, and enclosure sizes in the technology file and correct if necessary.

## ZRT-525

(warn) router does not support the rotated unfixed custom via %s and will ignore it.

**Description**

The tool issues this warning when it reads in an unfixed custom via while reading the vias from the database.

**What Next**

Double-check the usage of this via.

## ZRT-526

(warn) Invalid fat wire extension spacing rule on the %s layer.

**Description**

The tool issues this warning when both the forbidden space rule and the fat wire extension spacing rule are defined on the specified layer. When both rules are defined, the router ignores the fat wire extension spacing rule.

**What Next**

Remove the fat wire extension spacing rule from the technology file.

Feedback

## ZRT-527

(warn) The '%s' rule is specified with the create_routing_rule -spacing_weight_levels option. The effort level defined in the route.common.routing_rule_effort_level option is ignored.

### Description

The tool issues this warning when you specify the soft rule weights in the *create_routing_rule* command by using the *-spacing_weight_levels* option and also specify the effort level for the rule by using the *route.common.routing_rule_effort_level* option. In this case, the behavior can be ambiguous. If the *-spacing_weight_levels* option is used to specify the spacing weights, the entry in the *route.common.routing_rule_effort_level* option is ignored and the value from the *route.common.soft_rule_weight_to_effort_level_map* option is used.

### What Next

Remove the entry for the rule from the *route.common.routing_rule_effort_level* option.

### See Also

- create_routing_rule

## ZRT-528

(warn) %d ports are not checked because they include diagonal shapes %s.

### Description

The *check_routability* command has limited support for diagonal shapes. Diagonal shapes are checked only for minimum grid violations. Ports with diagonal shapes are not checked for accesibility. The warning message lists only the first 100 encountered ports with diagonal shapes.

### See Also

- check_routability

## ZRT-529

(warn) %d ports are not checked because they might be blocked by diagonal shapes %s.

### Description

The *check_routability* command has limited support for diagonal shapes. Diagonal shapes are checked only for minimum grid violations. Ports that might be blocked by diagonal

Feedback

shapes are not checked for accesibility. The warning message lists only the first 100 encountered ports that might be blocked by diagonal shapes.

**See Also**

- check_routability

---

## ZRT-530

(error) A technology file attribute (%s) on layer %s contains a larger value than expected (%f), which is above the limit of %f.

**Description**

This error message indicates that a larger than expected value has been found in the technology that might be due to a technology file coding error. In general, the design rule values should be smaller than the threshold limit specified in the error message (20 times the width of the global routing cell).

**What Next**

If this is a technology file coding error, you should reduce the value of the specified attribute to be less than the given threshold. If you want to perform routing using the current value, use the *set_app_options* command to set the *route.detail.continue_after_large_design_rule_value_error* option to *true*. This might result in excessive runtime and memory overhead.

---

## ZRT-531

(error) Skip splitting net %s, gap_length is not even multiple of min grid.

**Description**

The input of -gap_length is not even multiple of min grid. This will cause the wires after splitting to be off min grid.

**What Next**

Check the input of -gap_length and correct it to be even multiple of min grid.

---

## ZRT-532

(warn) Min layer of net %s cannot be updated to via ladder top layer of %s since the net has an existing max layer setting of %s.

Feedback

**Description**

This net contains via ladders that will imply a minimum routing layer for the net. See option route.common.via_ladder_top_layer_overrides_net_min_layer . The top layer across all via ladders on this net is higher than the maximum routing layer of this net. Therefore the minimum routing layer of this net cannot be updated.

**What Next**

Please check the maximum routing layer setting for this net and confirm it is compatible with the via ladder constraints for the pins of this net.

---

## ZRT-533

(warn) Ignore the onGrid rule defined on layer %s.

**Description**

The design has both "onGrid" and "onWireTrack" rule defined. We will ignore the "onGrid" value for all layers.

**What Next**

Clean up the onGrid rule in the tech file and try to use onWireTrack.

---

## ZRT-534

(warn) Illegal tech file: %s.

**Description**

The tool issues this error when the tech file specified a non-recoverable error.

**What Next**

Correct the error in the technology file listed in the message.

---

## ZRT-535

(error) Skip splitting net %s, breakpoint (%d, %d, %d) is not on min grid.

**Description**

The breakpoint is not on min grid. This will cause the wires after splitting to be off min grid.

**What Next**

Check the input of -breakpoints and correct it to be on min grid.

Feedback

## ZRT-536

(warn) There is no constraint to limit maximum number of secondary power and ground (PG) pins in a cluster.

**Description**

The option value of route.common.number_of_secondary_pg_pin_connections in set_app_options is 0. The routing/drc-check behavior for secondary PG pin will be exactly the same as signal pin.

**What Next**

Please set option value of route.common.number_of_secondary_pg_pin_connections in set_app_options

## ZRT-537

(warn) minSpacing in layer %s is not integer multiple of min grid in tech file.

**Description**

minSpacing is not integer multiple of min grid (gridResolution/lengthPrecision in tech file) for routing layer is strongly discouraged since it may lead to routing wires to be off the manufacturing grid.

**What Next**

Please specify minSpacing as integer multiple of min grid for each routing layer.

## ZRT-538

(error) An instance of cell %s contains too many pins or too many must-join terminals. The total for any cell cannot be greater than %d.

**Description**

The cell instance contains a large number of pins or the cell has ports with a large number of must-join terminals. The sum of all pins and must-join terminals cannot exceed the maximum value for any single cell.

**What Next**

Please check the cell to see if the number of pins exceeds the maximum supported number. If not, check if any of the terminals have a must_join_class setting that is non-zero. Then, either reduce the number of pins in the cell or set the must_join_class to 0 on some of the terminals. Or remove the instance. Then try again.

Feedback

## ZRT-539

(warn) Incorrect input data, %s.

**Description**

Found input data have error(s) as described.

By default, routing commands print only 10 messages of this type. If user wishes to have more messages of this type printed to log file, set_message_info command is to be used.

Example is: set_message_info -id {ZRT-539} -limit 300

**What Next**

Please check on the source that the data was from, and try again.

## ZRT-540

(warn) Illegal %s rule (%s, %s).

**Description**

This warning message indicates that the rule is specified between two inconsistent layers.

**What Next**

Please check the technology file and make sure the rule is specified between consistent layers.

## ZRT-541

(warn) The %s rule refers to an invalid cut name %s.

**Description**

A cut name specified in the tech file for the rule contains an invalid entry.

**What Next**

Please correct the tech file and try again.

## ZRT-542

(warn) Cell %s is marked as filler but has diode pin.

Feedback

**Description**

Diodes may be inserted or reused during routing. Filler cell location may be used for diodes too. Having the cell with both these settings causes difficulty for routing.

**What Next**

Do the necessary data clean up to avoid both markings and rerun the routing commands.

---

## ZRT-543

(warn) Shape {%d %d %d %d} on layer %s is not on min manufacturing grid. Snap it to {%d %d %d %d}. The shape belongs to Net: %s.

**Description**

Each edge of a shape should always be on the min manufacture grid. If this is not satisfied, DRC checking can't be accurate. This rule should apply to all the features on the layout.

**What Next**

If the off minGrid shape is a fixed shape from the libary, try to fix them manully. If the shape is a routable shape, it should be automaticlly fixed after running detailed route.

---

## ZRT-544

(warn) Ignore polygon shape : Cell %s, Layer %s, BBox [%d,%d..%d,%d].

**Description**

This warning message occurs because polygon shape was found. The router currently does not handle polygon shape and thus this shape will be ignored.

**What Next**

Please modify the polygon into rectangles.

---

## ZRT-545

(warn) A library cell %s contains too many pins or too many must-join terminals. The total for any cell instance cannot be greater than %d. Any attempt to instantiate this cell in a design will result in an error.

Feedback

**Description**

A cell in the library contains a large number of pins or the cell has ports with a large number of must-join terminals. The sum of all pins and must-join terminals cannot exceed the maximum value for any single cell.

These cells can exist in the library, but any attempt to instantiate such cells will result in an error.

**What Next**

No action is necessary if the cell is not instantiated in the design. A separate error will be issued if the cell is instantiated.

---

## ZRT-546

(warn) Unrecognized pattern type %s for maximum number of pattern route guide located at {{%.3f %.3f} {%.3f %.3f}} in cell %s.

**Description**

The maximum number of pattern route guide contains pattern type that cannot be recognized. Only the following pattern types are recognized: 1. NonPrefDirEdge

**What Next**

Please correct the pattern type in the route guide.

---

## ZRT-547

(warn) Skipping the maximum number of pattern route guide located at {{%.3f %.3f} {%.3f %.3f}} in cell %s because it is too big for pattern type %s.

**Description**

The maximum number of pattern route guide has the following size limit. Route guides width width or height exceeding this limit are ignored. 1. NonPrefDirEdge: 6 routing pitch of the layer it is defined on.

**What Next**

Please reduce the size of the route guide.

---

## ZRT-548

(warn) NDR rule %s has '%s' or '%s' defined with layer based tapering. Taper distance will be igored.

Feedback

**Description**

The NDR tapper has the control on "taper_distance" and "driver_taper_distance". When the layer based tappering is defined, i.e. 'taper_to_number_layer_over_pins/ taper_to_number_layer_under_pins', we automatically ignore the taper distance.

**What Next**

Don't define taper distance if using layer based tapering.

---

## ZRT-549

(warn) Ignore NDR width (%.2f) smaller than minimum width (%.2f) (%s, %s).

**Description**

The NDR width rule defined is less than the minimum width of the layer.

**What Next**

Please check the NDR rule definition in tcl command to make sure that the NDR width is no less than the minimum width on each routing layer.

---

## ZRT-550

(warn) Ignore a DRC with unknown/undefined layer(s), with DB layer numbers %d and %d.

**Description**

Ignore a DRC with unknown/undefined layer(s).

**What Next**

Please check the DRC marks' layers of the design.

---

## ZRT-551

(warn) Contact array %s-pitch (via master %s) (location %.3f %.3f) is not a even multiple of min grid. Router will use %.3f instead.

**Description**

The contact array at the specified location has pitch that is not an even multiple of min grid. Such a pitch value will result in lower/center/upper coordinate of the via to be off min grid. The router will continue using the larger pitch.

Feedback

**What Next**

Please check the database and verify that contact array pitch is even multiple of min grid.

---

## ZRT-552

(warn) Illegal via mask_constraint (%d) found in cell %s object %d.

**Description**

A via is found with mask_constraint value outside of the legal range. The legal values for mask_constraint are: 0, 1, 2, 3.

**What Next**

Please check the via mask_constraint assigned to the specified object.

---

## ZRT-553

(error) A net %s connects too many ports and out of the limit of router. The total net port cannot be greater than %d.

**Description**

The net connects a large number of ports The number of ports cannot exceed the maximum value for each net.

**What Next**

Please check the design to see if the number of ports of the net exceeds the maximum supported number.

---

## ZRT-554

(error) Cannot open design %s.%s for %s.

**Description**

You received this message when one of the following occurs: 1. the specified cell is locked or read-only and you tried to write to it, 2. you do not have permission to access the cell or the library where it resides, 3. the path (e.g. in stream out, a reference library path) or the cell name is incorrect, 4. too many files or reference libraries are open.

**What Next**

Check the path names, especially of reference libraries, and cell names to make sure they are correct, and also their file permissions. Check file descriptors using "ulimit -a"

Feedback

command. In Sun SparcOS5, the limit is 256. And increase the allowable number to its maximum value.

---

## ZRT-555

(error) Must specify at least one shape use.

**Description**

You receive this message because no shape use was specified in the command.

**What Next**

Correct the option.

---

## ZRT-556

(warn) Net pattern did not match any nets.

**Description**

The net pattern specified did not match with any nets.

**What Next**

Verify that the net pattern specified is correct.

---

## ZRT-557

(error) %s

**Description**

Basic input error checking.

**What Next**

Please recheck the command inputs and correct any errors reported in the log file.

---

## ZRT-558

(error) Found %d master cells that contain more than %d obstructions each. The total number of obstructions %d exceeds the maximum allowed value of %d. Please refer to ZRT-092 warnings in the log for additional detail. These obstructions will cause a very long routing runtime without any benefit. Please re-generate the frame view.

Feedback

**Description**

Multiple cells contain a very large number of obstructions. This is atypical.

**What Next**

Please re-generate the frame view.

---

## ZRT-559

(info) Routes in non-preferred voltage areas = %d

**Description**

Voltage areas are a soft constraint, and routing outside of preferred voltage areas is occasionally necessary and not indicative of an error.

For example, routes may cross through non-preferred voltage areas to avoid unacceptably long detours. Short routes may also enter a nearby non-preferred voltage area along the border. These behaviors are normal.

**What Next**

No action necessary.

---

## ZRT-560

(error) Cell %s is placed overlapping with other cells at {0 0}.

**Description**

This error message indicates that the cell has not been legally placed and it will be ignored by the router.

**What Next**

Please make sure all the cells are placed legally before running the router.

---

## ZRT-561

(error) Non default routing rule (%s) layer (%s) has width (%g) with no matching track

**Description**

The design has width constraint for tracks defined on the specified layer and non default routing rule with width not matching any track width.

This not routable, since the non default width nets have no legal routing location.

Feedback

**What Next**

Please check the track system is defined for the non default routing rule width.

---

## ZRT-562

(warn) Layer %s does not have a preferred routing direction.

**Description**

This message indicates that the layer does not have a preferred routing direction. Router cannot route without preferred routing direction.

**What Next**

Please use the set_attribute command to assign the preferred routing direction as follows: set_attribute -name routing_direction -value vertical [get_layer M9]

---

## ZRT-563

(warn) Non default routing rule exceeds 510 limitation.

**Description**

This message indicates that non-default routing rule number exceeds 510 limitation. Router may crash or has long runtime issue.

**What Next**

Please use remove_routing_rules command to reduce the non-default routing_rule number.

---

## ZRT-564

(info) Min layer of net %s was set to %s due to via ladders on the net and will be treated as a soft constraint.

**Description**

This net contains via ladders that will imply a minimum routing layer for the net. The top layer across all via ladders on this net is the new minimum routing layer for the net. This minimum routing layer will be treated as a soft constraint during all stages of routing.

**What Next**

If this minimum routing layer behavior is unexpected, please check the setting of app option route.common.via_ladder_top_layer_overrides_net_min_layer .

Feedback

## ZRT-565

(warning) Cell %s port %s contains more than %d pins (Number of pins: %d). This may increase routing runtime.

**Description**

A port contains a large number of pins. This is atypical and may increase routing runtime.

**What Next**

If this is not expected, please reduce the number of pins for the port.

## ZRT-566

(warn) Fixed contact array %s-pitch (via master %s) (location %.3f %.3f) is not a even multiple of min grid. Suggested value is %.3f.

**Description**

The contact array at the specified location has pitch that is not an even multiple of min grid. Such a pitch value will result in lower/center/upper coordinate of the via to be off min grid. This can cause the DRC checking not being accurate. The router can't change the fixed via array.

**What Next**

Please check the database and verify that contact array pitch is even multiple of min grid.

## ZRT-567

(error) No ECO changed area found.

**Description**

This error message indicates that the router could not get the ECO changed area for region-based DRC checking and removal on filler cells.

**What Next**

First check whether command read_eco_changes was already applied, then check whether ECO operations (e.g. place_eco_cells, legalize_placement, route_eco, create_stdcell_fillers, connect_pg_net) were already applied before running command remove_stdcell_fillers_with_violation.

Feedback

## ZRT-568

(error) Failed to read a via definition because there are more than %d via definitions defined in the design.

**Description**

The design has more via definitions defined than Zroute can support.

**What Next**

Check the design to determine if the large number of via definitions was created due to a problem in the flow.

## ZRT-569

(error) A shape at metal layer %s location {%f %f %f %f} is missing mask_constraint in DB or has other DB related problem

**Description**

Metal shape don't have a mask_constraint or other DB related mask_constraint problem happens

**What Next**

Please check the mask_constraint of the shape at location specified

## ZRT-570

(Warning) Cannot run timing driven route command when setup timing information is not available.

**Description**

This warning message indicates that a timing-driven routing command is being run on a design that does not have any timing constraints or extraction setup. When the tool issues this message, it does not perform detail routing.

**What Next**

To perform timing-driven routing, set the timing constraints or extraction setup before running the routing command.

Feedback

To disable timing-driven routing, set the following application options to *false* before running the routing command:

- *route.detail.timing_driven*
- *route.global.timing_driven*
- *route.track.timing_driven*

**See Also**

- route_auto
- route_detail
- route_eco

---

## ZRT-571

(error) In rule %s, via enclosure of %s has illegal widths on layer %s.

**Description**

This error message indicates that NDR via enclosure on the metal layer is illegal or larger than the signal route max width defined on that layer. If such via is the only candidate defined for the NDR rule, it may cause inefficiency in the router and result in slow runtime. Router will use the default vias instead.

**What Next**

Please make sure that the NDR via enclosure is legal and is less than or equal to the signal route max width defined in the tech file.

---

## ZRT-572

(warn) Pin %s of cell %s has more than %d access edges.

**Description**

The global router expects macro pins to have access edges to help the router to connect to the pins. This may affect the runtime, memory, and QoR significantly. There are some pins with unreasonably large number of access edges. Zroute will skip reading many of these access edges.

**What Next**

Check if it is possible for the frame creation to generate fewer number of access edges. Try to re-generate the frame view in latest release to see if reasonable number of access edges are generated.

Feedback

## ZRT-573

(warn) Design has custom via def %s with %d cuts.

**Description**

The design has custom via def with more than thousand cuts. Instances of such a via def in the design can impact runtime of Zroute. Correct the data by creating those vias as via arrays in NDM.

**What Next**

Check the design and create those via defs as of via array type.

## ZRT-574

(Information) Freeing timing information from routing.

**Description**

This information indicates that timing update has happened after route_global or route_track command and all timing information used in route_global or route_track command is freed. To be consistent with route_auto ICC2 use the same timing information for route_global, route_track and route_detail steps when timing driven is on. But if the user calls update_timing explicitly between route_global/route_track/route_detail, the existing timing information will be freed and the next route_command will use up-to-date timing information.

## ZRT-575

(error) Unfixed X shape wires at (%.4g, %.4g) on layer %s will be treated as fixed by router.

**Description**

ZRoute does not support unfixed X shape wires. Any unfixed X shape wires will be treated as fixed by router.

**What Next**

Please mark the X shape wires as fixed.

## ZRT-576

(error) via cut routing blockage {%.3f %.3f} {%.3f %.3f} in layer %s is treated as real via.

Feedback

### Description

This via cut blockage is treated as real via because these six attribuites are all false:
1. icc_route_guide 2. icc_system_layer_blockage 3. is_design_rule_blockage 4. is_boundary_blockage 5. is_external_boundary_blockage 6. is_zero_spacing

And the size of via cut blockage doesn't fit any legal cut size (cutWidthTbl, cutHeightTbl, minWidth) in the layer specified by technology file.

Thus it is incorrect real metal via cut.

In general, the 1. to 5. are special attributes generated from tool flow. The user could set 6. as true to represent a routing blockage, or as false to represent a real metal.

The router applies DRC rule checking on them and the performance could be degraded. These via cut blockages might also generate unreasonable DRCs, which might lead to unexpected router behavior.

### What Next

Please review the via cut blockage attributes and the technology file.

---

## ZRT-577

(error) There should be at least one horizontal routing layer and at least one vertical routing layer.

### Description

This error message indicates that all the routing layers have the same preferred direction. This is illegal input to the router. Zroute will print an error message and quit.

### What Next

Please check the input and make sure that there is at least one horizontal routing layer and at least one vertical routing layer.

---

## ZRT-578

(warn) Ignore bad shield association attached to shield wire at (%.3f, %.3f, %.3f, %.3f) metalLay: %s

### Description

The shield association of the shield wire is wrong. Either the shielded net of the shield association is PG net or the shielded net of the shield association does not exist.

Feedback

**What Next**

Please use remove_shield_association command to remove the shield association.

---

## ZRT-579

(warn) Ignore bad shield association attached to shield via at (%.3f, %.3f) cutLay: %s

**Description**

The shield association of the shield via is wrong. Either the shielded net of the shield association is PG net or the shielded net of the shield association does not exist.

**What Next**

Please use remove_shield_association command to remove the shield association.

---

## ZRT-580

(error) There is no shielding target to connect

**Description**

There is no PG stripe and PG ring in the design. Besides, both -ignore_shielding_net_pins and -ignore_shielding_net_rails of create_shields are set as true. Therefore, There is no shielding target to connect.

**What Next**

Check the usage of -ignore_shielding_net_pins and -ignore_shielding_net_rails

---

## ZRT-581

(error) A track must have mask_constraint of mask1 or mask2. Unexpected track mask_constraint is found on layer %d.

**Description**

A track should be with a mask_constraint of either mask1 or mask2.

**What Next**

Please check the track mask_constraint on the layer reported.

---

## ZRT-582

(Warning) Starting from %s release, the '%s' command will no longer support the '%s' option

Feedback

**Description**

This command option will no longer be available in a future release.

**What Next**

Consult the man page of the command for suggestions regarding other commands or options to accomplish the same effect. Consult the release notes.

---

## ZRT-583

(Warning) Starting with the %s release, the %s command will no longer support the %s option. Use the %s option instead.

**Description**

This command option will no longer be available in a future release. Please use the recommended alternative instead.

**What Next**

See the release notes or command man page for suggestions regarding other commands or options to accomplish the same effect.

---

## ZRT-584

(warning) %s.frame does not exist.

**Description**

This message indicates that Zroute cannot find frame cell for a design in physical library.

**What Next**

If not having frame view for this design is intended, ignore this warning. If frame view is expected for this design, please check the designs in the library and man page of LNK-055 for more details.

---

## ZRT-585

(info) Skipping internal port %s of %s.%s as it is not physical.

**Description**

Zroute skips pins of ports with port_direction internal and port_is_physical false for routing and DRC checks.

Feedback

**What Next**

If these pins are intended to be routed, check the data preparation.

---

## ZRT-586

(Warning) No existing global route is available for reuse in incremental global routing.

**Description**

Option *-reuse_existing_global_route true* is set for global router. However, no existing global route can be found. As a result, no global route is reused in incremental global routing.

**What Next**

To prevent this message, create global route before running global router with option *-reuse_existing_global_route true*, or run global router with the default option (*-reuse_existing_global_route false*).

---

## ZRT-587

(warn) NDR rule (%s) wide track requirement conflicts with tapering.

**Description**

The NDR rule has a conflict between wide track requirement and tapering.

**What Next**

Disable tapering for the NDR rule.

---

## ZRT-588

(error) The design is not legalized. Skip blocked port checkings.

**Description**

If the placement is not legalized and standard cells are overlapped, the presence of blocked port are expected and routing quality will be very bad. check_routability skips checking blocked port because those checkings are meaningless and time consuming when design is not legalized.

**What Next**

Please do legalize_placement before doing check_routability.

Feedback

## ZRT-589

Error: Net fails consistency check. Skip net graph extraction. (%s)

**Description**

The net fails consistency check before RT graph extraction. The net will be skipped for graph extraction.

**What Next**

Turn on interactive routing verbose to find out why the net fails the consistency check and fix it.

## ZRT-590

Fail to set in-cell mask (%s)

**Description**

Fail to set in-cell mask. This will result in some objects in an instance cell missing DPT colors.

**What Next**

Stop at the error code to see why it is failed.

## ZRT-591

(error) Found clock net %s has topology issue

**Description**

Expect clock net topology to be a tree.

**What Next**

Double check on the net's route, debug and fix the topology if necessary.

## ZRT-592

(warn) Skip shielded net '%s' since it is an RDL net created in 45 degree.

**Description**

The tool issues this warning when there is a invalid shielded net.

Feedback

**What Next**

Please make sure shielding only supports RDL nets which are created in 90 degree for all layers. Please refer to *flip_chip.route.layer_routing_angles*

---

## ZRT-593

(Information) The design has %ld vias.

**Description**

The design has a very large number of vias. Please review if this is intended or a problem with data preparation.

**What Next**

Check the design and correct the data if necessary.

---

## ZRT-594

(warn) Found must join pins on port %s of instance %s without any net.

**Description**

Must join pins without net information were found. The router won't be able to connect them unless net is assigned to them.

**What Next**

Please create net for those pins.

---

## ZRT-595

Design has at least one Macro with no-color shapes when DPT color-based flow is enabled and/or with via-color rule.

**Description**

Design has at least one Macro with no-color shapes when DPT color-based flow is enabled and/or with via-color rule.

**What Next**

Check message reported during router dbIn in the log to see which macro cell has incorrect shape color and fix the coloring problem.

Feedback

## ZRT-596

(warn) Incorrect syntax found in layer %s table %s.

**Description**

Error was encountered parsing the table entry in the tech file. The router may not interpret the rule as the user intends.

**What Next**

Please double check the tech file entry.

## ZRT-597

(warn) Incorrect syntax found in layers %s,%s table %s.

**Description**

Error was encountered parsing the table entry in the tech file. The router may not interpret the rule as the user intends.

**What Next**

Please double check the tech file entry.

## ZRT-598

(info) Min layer of net %s was overridden from %s to %s due to via ladders on the net. The original min layer mode was %s and the new min layer mode will be soft.

**Description**

This net contains via ladders that will imply a minimum routing layer for the net. The top layer across all via ladders on this net is the new minimum routing layer for the net. Please note this minimum routing layer will be treated as a soft constraint during all stages of routing. It may be a relaxation of the original minimum routing layer mode.

**What Next**

If this minimum routing layer behavior is unexpected, please check the setting of app option route.common.via_ladder_top_layer_overrides_net_min_layer .

## ZRT-599

(warn) Spare cell %s is placed overlapping with %d other spare cells at {%.3f %.3f}.

Feedback

**Description**

This warning message indicates that there are over 100 other spare cells overlapping with this spare cell and these spare cells will be ignored by the router.

**What Next**

Please make sure all the spare cells are placed legally before running the router.

---

## ZRT-600

Ignore unsupported NDM mask %s

**Description**

Reading an unsupported NDM mask which will be ignored in router. This indicates some objects from DB may have unsupported colors.

**What Next**

Stop at the error code to see the detail of the NDM mask.

---

## ZRT-601

(warn) Eco route ignores -open_net_driven and -nets options when route.detail.enable_end_off_preferred_grid_patching_on_fixed_shapes is set to true or end extension for via enclosure rule is defined.

**Description**

When route.detail.enable_end_off_preferred_grid_patching_on_fixed_shapes is set to true or end extension for via enclosure rule is defined, fixed shape patches in the entire design need to be deleted and redone. So the options to restrict the eco like -open_net_driven and -nets do not make sense. Instead we run regular eco route as if those options were not specified.

**What Next**

Update script to run regular eco route when route.detail.enable_end_off_preferred_grid_patching_on_fixed_shapes is set to true or end extension for via enclosure rule is defined.

---

## ZRT-602

(warn) Ignore via array %s longer than the chip.

Feedback

### Description

The via array from DB is longer than the top design boundary. Router ignores the via array.

### What Next

Review the via array and correct its definition.

---

## ZRT-603

(warning) Net %s has locked shields, it's not recommended in reshield mode.

### Description

The indicated shielding net has physical_status locked shield shapes. It's not recommended in reshield mode. Any locked shield in reshield mode might cause degradation of run-time, shielding rates, or introducing new opens in shields.

### What Next

It is recommended to set physical_status of shield shapes to be minor_change (fixed shield) or unrestricted (dynamic shield) in reshield mode. Reshield mode is controlled by route.common.reshield_modified_nets option.

### See Also

- set_attribute
- report_app_options
- set_app_options
- route.common.reshield_modified_nets

---

## ZRT-604

(info) Shielded%s%d%% side-wall of (%s)

### Description

Reports the shielding rates of a net. Any shielding rates below 1% is rounded to 1%.

### What Next

While the total rates of all nets are high, it's OK when the user sees low shielding rates of a few nets. To increate the shielding rates, please review shield related rules, settings, or reserve more space for shields.

Feedback

## ZRT-605

(Error) Ignoring unfixed via matrix on layer %s at (%d, %d).

**Description**

Zroute does not support unfixed via matrix objects. Please correct the input.

**What Next**

Mark the via matrix objects as fixed and rerun the routing command.

## ZRT-606

(Warning) Layer %s does not have a preferred direction track.

**Description**

There is no preferred direction track defined for the layer.

**What Next**

Set the correct preferred direction for the layer or correct the direction for the track.

## ZRT-607

(info) Skipping global routing as it has already been run in the global_route_opt stage of clock_opt.

**Description**

Message indicates that the tool detected a situation where global routing is already done previously in the global_route_opt stage of clock_opt. Therefore, global routing will be skipped. This is applicable to route_global and route_auto commands. Application option route.global.force_rerun_after_global_route_opt can be used to override this behavior.

**What Next**

No action necessary.

## ZRT-608

(info) Forcing rerun of global router after global_route_opt due to app option route.global.force_rerun_after_global_route_opt being set.

Feedback

**Description**

Message indicates that the tool detected route.global.force_rerun_after_global_route_opt as set. In this case, global router will be forced to rerun after global_route_opt.

**What Next**

No action necessary.

---

## ZRT-609

(error) Failed in cell reader (%s)

**Description**

Failed in reading cell in router DbIn.

**What Next**

Stop at the error code to see why it is failed.

---

## ZRT-610

(error) Failed to start IMRD manager due to %s

**Description**

Failed to start IMRD manager due to a router dbIn error.

**What Next**

Stop at the error code to see why it is failed.

---

## ZRT-611

(Warn) Found %s

**Description**

Found a number of unplaced cells. (Some of the unplaced cells are printed using ZRT-064.)

**What Next**

Please make sure all the cells are placed before running the router.

Feedback

## ZRT-612

(warn) PG structure in the region (%.4f %.4f)_(%.4f %.4f) on layer %s might cause router to fail to route long wires on same layer.

**Description**

Message indicates that the PG structue might cause router to fail to route long straight wires without changing layers.

**What Next**

No action necessary unless the user thinks it is not allowed on the particular layer.

## ZRT-613

(info) RC layer preference is turned %s for this design.

**Description**

RC layer preference is turned off if the design does not have enough variation in RC value among the reasonable routing layers. A layer is reasonable if it is within min and max routing layers, and its pitch is within six times the average pitch of the lower five metal routing layers.

**What Next**

No action necessary.

## ZRT-614

(warn) The global router sees multiple (%d) terminals for the port %s on net %s, cannot perform feedthrough creation on this net.

**Description**

Message indicates that more than one terminals exist for the reported port. Due to abutment, it forces more than one feedthrough creations to connected with the port, which is an unsupported behavior by pin creation. Thereby, the feedthrough creation is canceled. Feedthrough creation for other connections of the net may also be affected.

**What Next**

Verify that the port have a single terminal.

## ZRT-615

(warn) %d tracks on layer %s will cause high memory consumption.

Feedback

**Description**

Message indicates that the number of tracks on the given layer is unusually high which will cause high memory consumption.

**What Next**

Verify if tracks are defined correctly and check if size of design is reasonable for routing command.

---

## ZRT-616

(warn) Average track distance %f is much smaller than pitch %f on layer %s.

**Description**

Message indicates that the the average track distance deviates considerably from the pitch on the given layer. This might point to unintentional or erroneous track definitions.

**What Next**

Verify if tracks are defined correctly.

---

## ZRT-617

(warn) The global router sees signal net %s connecting with %u power or ground %s.

**Description**

Message indicates that the top level signal net is connected with power or ground pins on stand cells or macro cells inside of child blocks. The global router will skip routing to most of these power and ground pins in hierarchical global routing to avoid potential runtime issues.

**What Next**

Verify the tie off results of this signal net.

---

## ZRT-618

(warn) %d redundant duplicated PG %s at {%.3f %.3f} {%.3f %.3f} in layer %s.

**Description**

Redundant duplicated PG shapes are overlapped at the same location, which might degrade the DRC results and performance.

Feedback

### What Next

Please review whether the redundant duplicated PG shapes should be removed or not.

---

## ZRT-619

(info) Via ladder engine would be activated for pattern must join connection in certain commands. Please refer to man-page for the command list.

### Description

This design contains pattern must join pins, which is required to be connected by pattern must join connection shapes. Pattern must join connection has similar structure to via ladder, and is also constructed by via ladder engine. It would be processed during via ladder related commands, and full routing commands. Here is the command list: insert_via_ladders, verify_via_ladders, refresh_via_ladders, route_group, route_auto, route_eco, route_opt. To separate route_auto into several commands, please run through: insert_via_ladders, route_global, route_track, route_detail.

### What Next

If this pattern must join connection is unexpected, please check the attribute of pin, pattern_must_join.

---

## ZRT-620

(warning) Core area is (partially) outside boundary area.

### Description

This message indicates that the core area is not completely inside the block boundary. This may create problems for routing.

### What Next

This likely means that the block core area is not set up correctly. It can be fixed by using initialize_floorplan on the block.

### See Also

- initialize_floorplan
- check_physical_constraints

Feedback

## ZRT-621

(warn) The library real metal blockage at (%.4f %.4f)-(%.4f %.4f) on layer %s is touching or overlapping a library pin.

**Description**

A real metal routing blockage touching or overlapping a library pin might cause routing time degradation and DRC non-convergence issues.

This blockage is treated as a piece of real metal because these six attribuites are all false: 1. icc_route_guide 2. icc_system_layer_blockage 3. is_design_rule_blockage 4. is_boundary_blockage 5. is_external_boundary_blockage 6. is_zero_spacing

Thus it is treated as a piece of real metal.

In general, the 1. to 5. are special attributes generated from tool flow. The user could set 6. as true to represent a routing blockage, or as false to represent a real metal.

The coordinates reported here are relative to the library block inside, not the top design block.

**What Next**

Please review the library routing blockage attributes and the flow of library generation. When a library routing blockage is not representing a piece of real metal, it should have the attribute "is_zero_spacing" to be true.

## ZRT-622

(warn) X-oriented shapes are not supported, %s.

**Description**

This warning message indicates that the current design contains X-oriented (non-manhattan direction) shapes.

**What Next**

X-oriented shapes should be pre-processed.

## ZRT-623

(warn) Option value "%s" of app option "%s" will be obsolete in "%s" release.

**Description**

The option value specified will be obsoleted in future release. Please refer to man page of that option for complete details.

Feedback

**What Next**

Please specify valid option value for this option as currently specified value would be obsolete.

---

## ZRT-624

(warn) Option %s is set to %s, reset %s to %s with this setting.

**Description**

Conflicting app options are detected. Reset internally. Please refer to man page of that option for complete details.

**What Next**

Please check if any option is set unexpectedly.

---

## ZRT-625

(warn) Master cell %s has duplicated redundant library pin shapes at {%.3f %.3f} {%.3f %.3f} on layer %s.

**Description**

Duplicated redundant library pin shapes are found at the give location. The coordinates are relative to the library inside. These incorrect data will impact the router performance and DRC convergence.

**What Next**

Please remove the redundant pin shapes. Please also review the tool flow, they might be generated from incorrect library preparation flow.

---

## ZRT-626

(warning) High fanout net %s can affect runtime for antenna fixing.

**Description**

The design has high fanout nets and antenna fixing is turned on. Runtime of antenna check and fixing is affected by high fanout nets.

**What Next**

Please check the design and address the high fanout net issue. If antenna check is not needed for these nets, consider setting app option route.detail.max_antenna_pin_count.

Feedback

Option "route.detail.max_antenna_pin_count" specifies the maximum number of pins on a net on which antenna checking is performed.

---

## ZRT-627

(warning) Skipping route_group command as global_route_opt has been run.

**Description**

Message indicates that the tool detected a situation where global_route_opt has already been run. Therefore, route_group command will be skipped. Application option route.global.force_rerun_after_global_route_opt can be used to override this behavior.

**What Next**

No action necessary.

---

## ZRT-628

(info) Forcing rerun of route_group command after global_route_opt due to application option route.global.force_rerun_after_global_route_opt being set.

**Description**

Message indicates that the tool detected application option route.global.force_rerun_after_global_route_opt as setafter global_route_opt. In this case, route_group command will be forced to rerun. This will erase global routing data and therefore user must ensure rerunning global routing by setting route.global.force_rerun_after_global_route_opt to true.

**What Next**

No action necessary.

---

## ZRT-629

(Warning) Shape at (%.4g %.4g) on layer %s in frozen net %s (type %s) has no color.

**Description**

Found a shape on a frozen (usually locked) net has no dpt color on a dptColor enabled layer when router reads in the design.

**What Next**

Please look for the shape at the specified location to study why it has no color and fix the problem. Please note all shapes on a dptColor enabled layer in a frozen (usually locked)

Feedback

net should be assigned a color properly. Router does not change shape color in frozen nets.

---

## ZRT-630

(warn) Abutted feedthrough pin may be created on cell %s to connect with top level port %s that has different related supply nets.

**Description**

Hierarchical global router detects that the routing needs to create abutted feedthrough to connect with the top level port. However, the abutted child block and the top level port have different related supply nets.

**What Next**

Please review the floorplan and power domain configuration.

---

## ZRT-631

(warn) Net %s may create feedthroughs in unbufferable voltage area.

**Description**

Hierarchical global router detects that the net may need to route through unbufferable voltage area in order to be fully routed. It could be due to the floorplan issue which a voltage area for the given net is completely isolated by unbufferable voltage areas, or the applied routing constraints do not allow connectivity through bufferable voltage areas for the given net.

**What Next**

Please review floorplan and constraints to allow net connectivity within the bufferable voltage areas.

---

## ZRT-632

(warn) Option route.detail.force_end_on_preferred_grid is set to true due to techfile missing %s on layer %s.

**Description**

Forcing end on preferred grid since techfile is out-dated. Please refer to man page of that option for complete details.

**What Next**

Please check if the techfile is up-to-date.

Feedback

## ZRT-633

(Error) Zroute commands do not support designs with 40-bit NDM object Ids.

**Description**

If NDM has 40-bit object Ids, Zroute commands can't support it.

**What Next**

Please check your design for 40 bit objects. Modify the design to use 32-bit NDM objects to run Zroute commands.

## ZRT-634

(warn) Skipping non-manhattan pin cut shape at location {%f %f} on layer %s in master cell %s.

**Description**

Zroute does not support non-manhattan pin cut shapes.

**What Next**

Please check the database and fix the not supported shape.

## ZRT-635

(warn) Metal extensions generated with option route.detail.force_end_on_preferred_grid set to true are found in the design.

**Description**

Metal extensions forcing on preferred grid are found in this design. It could lead to longer wirelength and less optimized result with option route.detail.force_end_on_preferred_grid set to false.

**What Next**

Check if these out-of-date metal extensions are desirable.

## ZRT-636

(warn) Ignore %s due to %s.

Feedback

**Description**

Incorrect or conflicting options are detected. Reset internally. Please refer to man page of that option for complete details.

**What Next**

Please check if any option is set unexpectedly.

---

## ZRT-637

(warn) Lib-pin '%s' does not have required 'pattern_must_join' attribute. There are multiple pin shapes on metal layer '%s'.

**Description**

If the top layer terminals of a lib-pin are with multiple pin shapes, then the 'pattern_must_join' attribute should be set as true on this lib-pin.

**What Next**

If you want to connect all multiple pin shapes of the lib-pin, please update the 'pattern_must_join' attribute on lib-pin or set 'must_join_group' attribute on terminals.

---

## ZRT-638

(warn) Instance cell pin '%s' does not have required high performance or electromigration via ladder. Current via ladder list: %s.

**Description**

The instance cell pin's lib-pin has attribute 'is_em_via_ladder_required' set to true, and therefore it needs to have at least one high performance or electromigration via ladder in its via ladder list.

**What Next**

Please try one of below methods to fix the problem. 1. change current via ladder type by setting 'for_high_performance' or 'for_electro_migration' attribute. 2. add at least one high performance or electromigration via ladder to the instance cell pin's via ladder list 3. reset the 'is_em_via_ladder_required' attribute on its lib-pin.

---

## ZRT-639

(warn) The %s application option is set to %s; suggested value for the via ladder flow is %s.

Feedback

**Description**

For better via ladder insertion result, please use suggested app-option value

**What Next**

Please reset the app-option value.

---

## ZRT-640

(error) Cell %s is placed overlapping with %d other cells at {%.3f %.3f}.

**Description**

This warning message indicates that there are over 1000 other cells overlapping with this cell.

**What Next**

Please make sure all the cells are placed legally before running the router and run check_legality before running check_routability.

---

## ZRT-641

(warn) Current design technology file is inconsistent with the technology file used to create frame views of reference library %s. Update via regions for the reference frame views (in memory only) with current design technology file.

**Description**

Current design technology file is inconsistent with the technology file used to create frame views of the reference library. The tool will re-generate via regions by current technology file, but only in memory. The original via regions saved in the reference frame views, including the auto generated via regions by frame creation process or the user created via regions, will not be overwritten in the reference library. But the tool will use the new in memory via regions for later process.

**What Next**

Please confirm that current design technology file is correct.

---

## ZRT-642

(warn) %s.

Feedback

**Description**

The router detected unreasonable routing track settings. Please review routing track settings and the layer pitches in technology file.

There are three types of warning: 1. The step of a set of track is less than the pitch of layer defined in technology file. 2. The set of track is defined in a non-routing layer. 3. The quantity of tracks in a rectilinear chip area is unreasonably high. The reasonable quantity of tracks is less than or equal to the width or height of area divided by the pitch of layer. Please also check for redundant routing tracks in this area.

Incorrect routing track settings could degrade router performance and unexpected router behavior.

**What Next**

Please correct any incorrect track settings and layer pitch values.

---

## ZRT-643

(warn) Ignoring pin access route guide at (%.4f %.4f) (%.4f %.4f) with missing macro information.

**Description**

DRC checks for pin access route guides in Zroute require information about associated macros. If this information is not available for a route guides of this type, they will be ignored for "Metal over pin access route guide" DRC check.

**What Next**

Create the pin access route guides using command "derive_pin_access_route_guides" to have them associated with macro instances in the design.

---

## ZRT-644

(warn) Cannot find contact code that realizes sufficient line-end trimming at location {%.4f %.4f} on layer %s, skipping contact code exchange for %s.

**Description**

The message indicates that for the via at given location no contact code can be found that realizes sufficient line-end trimming, according to spacing value defined in trim_shapes command. The contact code is not exchanged and the original line-end spacing is maintained.

Feedback

**What Next**

Verify if tech file contains all contact codes necessary for trimming line-ends according to spacing values defined in trim_shapes command.

---

## ZRT-645

(warn) Invalid attribute of pattern_must_join/via_ladder object %s.

**Description**

The "shape_use" attribute of pattern_must_join/via_ladder object is invalid.

**What Next**

Please remove the invalid object or update the "shape_use" attribute of object. The valid value is "user_route".

---

## ZRT-646

(warning) %s

**Description**

Specified command will be deprecated. Please follow the instruction to update your script accordingly.

**What Next**

Please update scripts to remove the command specified, and migrate to new one if any.

---

## ZRT-647

(Warning) Current dominant scenario %s for timing driven route %s is different from dominant scenario for the previous timing driven route which is %s.

**Description**

The message tells dominant scenario which drives timing driven route changed from the previous timing driven route. Timing driven route behavior will be different from the previous timing driven route. Especially, in RDE flow, if the dominant scenario for RDE capturing is different from initial route stage, it will impact the correlation.

**What Next**

Use route.common.focus_scenario to control dominant scenario for timing driven route

Feedback

## ZRT-648

(warning) %s

**Description**

A situation may need case-by-case analysis to ensure the correctness.

**What Next**

A warning that needs user's attention.

## ZRT-649

(error) Invalid cut layer %s specified for route.common.redundant_via_include_weight_group_by_layer_name or route.common.redundant_via_exclude_weight_group_by_layer_name.

**Description**

A string supplied to redundant_via_include_weight_group_by_layer_name or redundant_via_exclude_weight_group_by_layer_name does not name a valid cut layer.

**What Next**

Please review the layer names supplied to these options.

## ZRT-650

(error) Invalid weight group %d specified for route.common.redundant_via_include_weight_group_by_layer_name or route.common.redundant_via_exclude_weight_group_by_layer_name.

**Description**

A weight group supplied to redundant_via_include_weight_group_by_layer_name or redundant_via_exclude_weight_group_by_layer_name is invalid or out of range.

**What Next**

Please review the weight groups supplied to these options.

## ZRT-651

(warn) Ignore rule %s on layer %s.

Feedback

**Description**

This warning message occurs because unexpected value is set for the specified rule. Ignore it.

**What Next**

Please check to see if the rule is correctly defined on this layer.

---

## ZRT-652

Error: rtPsvMngr::splitGrh is called on non-splittable shape. (%s)

**Description**

rtPsvMngr::splitGrh is called on non-splittable shape which may cause unexpected result.

**What Next**

Make sure to call rtPsvMngr::isSplitable to check if a shape is valid before calling rtPsvMngr::splitGrh.

---

## ZRT-653

(Error) An obstrcution in cell has no valid color. (%s)

**Description**

An obstrcution in cell has no valid color.

**What Next**

If the cell is a macro, user should have assigned all obstructions in the macro cell before routing. Please fix the input issue and re-run the tool. If it is not a macro, please pass a test case to router team to look into why the color is missed.

---

## ZRT-654

(info) Ignoring patch clean-up in iteration %d due to option route.detail.min_number_iterations_after_last_patch_clean_up_iteration.

**Description**

Patch clean-up is skipped in some iterations due to conflict to route.detail.min_number_iterations_after_last_patch_clean_up_iteration.

Feedback

**What Next**

Please review settings for route.detail.patch_clean_up_iteration_frequency, route.detail.patch_clean_up_max_number_iterations, route.detail.patch_clean_up_iterations and route.detail.min_number_iterations_after_last_patch_clean_up_iteration.

---

## ZRT-655

(error) In rule %s, var via %s is an special via that we don't support.

**Description**

This error message indicates that the NDR via is an special via.

**What Next**

Please specify the NDR via using non special ones.

---

## ZRT-656

(warn) Ignoring via at (%.3f %.3f) with missing via definition.

**Description**

Vias without a via definition in NDM will be ignored by Zroute.

**What Next**

Please check and correct the input vias with missing via definition.

---

## ZRT-657

(Warning) Rule %s has unexpected setting on lay %s.

**Description**

This warning message indicates that the rule has unexpected setting on layer for the specified rule.

**What Next**

Please check the technology file and make sure the rule is correct.

---

## ZRT-658

(Warning) Top level routing blockage on layer %s at (%.3f %.3f) (%.3f %.3f) is not marked as zero spacing. This may impact runtime of routing.

Feedback

**Description**

This warning message indicates that there are routing blockages at top level that are not marked as zero spacing. This can impact the DRC convergence and runtime of detail route.

**What Next**

Please check the input and set the blockages as zero spacing.

---

## ZRT-659

(Information) Ignoring %s at (%.3f %.3f) as it is marked as %s.

**Description**

Vias with this marking are ignored by routing commands.

**What Next**

This message is for the user to be aware of the ignored vias when reviewing the design.

---

## ZRT-660

(error) Failed to read via definition because there are too many of them in the design.

**Description**

The design has more via definitions defined than Zroute can support.

**What Next**

Check the design to determine whether this large number of via definitions was created due to a problem in the flow.

---

## ZRT-661

(Warning) An invalid global route shape is found. %s.

**Description**

When a shape, via or G-Link has these attributes: 1. Shape_use is global_route. 2. Owner net is none.

It is considered as an invalid global route shape. It could negatively impact the router's performance and quality of result.

Such global route shapes are deleted if the routing command being run involves creating or modifying the routes.

Feedback

**What Next**

Please review the reason invalid global route shapes get created before the routing command.

---

## ZRT-662

(warn) Eco route ignores -open_net_driven option when -nets option is defined.

**Description**

When -nets option is used, the -open_net_driven option will be ignored.

**What Next**

Update script to remove -open_net_driven option when -nets option is used.

---

## ZRT-663

(warn) router does not support the rotated unfixed custom via with def %s at (%.3f %.3f) and will ignore it.

**Description**

The tool issues this warning when it reads in an unfixed custom via while reading the vias from the database.

**What Next**

Double-check the usage of this via.

---

## ZRT-664

(error) Found global route in frozen nets in the input to track assignment. %s

**Description**

This error message indicates that there are some global routes in frozen nets in the input to track assignment. As frozen nets are skipped by track assinment, these global routes will not be assigned correctly and cause detail router error.

**What Next**

Please check the database and fix the issue of global routes in frozen net.

Feedback

## ZRT-665

(Warning) The input to track assignment has out-of-chip-boundary shape or graph node. %s

### Description

This error message indicates that there are some out-of-chip-boundary shapes or graph nodes in the input to track assignment. This may result in out-of-chip-boundary shapes in the output of track assignment.

### What Next

Please fix the issue in the input to track assignment.

## ZRT-666

(warn) Change the value of %s because the current setting is not compatible for the given technology node.

### Description

The warning message indicates that the value of app options is not compatibile for the given technology node so tool helps to correct the value.

### What Next

Even tool helps to correct the value, Users may need to check their script and setting.

## ZRT-667

(warn) The value of %s is different from what mega switch wants. It might degrade the result in the given technology node.

### Description

The warning message indicates that the value of app options is different from what mega switch wants. Tool still use the current value but it might degrade the result

### What Next

Users may need to check their script or setting to see if the value of this app options is what they want.

## ZRT-668

(error) This design has %d gCells with overflow >= %d. Please open global route congestion map to review it.

Feedback

**Description**

This error message indicates that there are some high overflow gCells in global route congestion map. In general, high overflow gCell areas might be unable to get a good routing result. In some worst cases, detail route stage hang might happen due to severe overflow.

**What Next**

Please open global route congestion map in GUI to review this design.

Please be noted, this check runs a fast global route to get a coarse result. When the user needs an accurate congestion map, please run report_congestion command.

---

## ZRT-669

(warn) Instant secondary PG pin %s at (%.3f %.3f) is in the instant cell's primary PG net %s. The primary PG pin is %s.

**Description**

Should not use zroute to route primary PG net.

**What Next**

Please use power tools to route PG pins to the primary PG net.

---

## ZRT-670

(warn) Number of Chunks (num = %d) is less than number of Workers (num = %d). Some workers will be pending.

**Description**

The number of chunks is less than the number of workers in this case. some workers will be pending.

**What Next**

Please review if we could start less number of workers to avoid idle workers.

---

## ZRT-671

(warn) Cluster at {%.3f %.3f} {%.3f %.3f} on layer %s exceeds max cluster limit.

**Description**

The cluster size exceeds the sav_on_grid_max_cluster_size for SAV rule. It could result in incorrect DRC checking and bad routing convergence.

Feedback

**What Next**

Please increase the sav_on_grid_max_cluster_size limit.

---

## ZRT-672

(warn) Automatically switch the option value of "%s" to true in "%s" mode of option "%s". \n.

**Description**

The option clip_rule_patch_mode is enabled by default and works under the option value of treat_preferred_grid_on_clip_rule_layer_as_clip_grid as true. If users set the option value of treat_preferred_grid_on_clip_rule_layer_as_clip_grid as false, it will automatically modified to true.

**What Next**

Please set the option value of treat_preferred_grid_on_clip_rule_layer_as_clip_grid as true if users do not want to see this warning message.

---

## ZRT-673

(warn) (rtapi) (@GOE) cannot find the MifsNet for the ndmBlkNet %s of driver term %s

**Description**

Error found in rtapi module. Optimization passes a net to router to route while router sees it is an invalid net.

**What Next**

Please recheck if the net have physical pins.

---

## ZRT-674

(warn) Cannot find any MifsNet to route in routeNetGrp!

**Description**

Error found in rtapi module. Optimization passes nets to router to route while router does not see any physical nets.

**What Next**

Please recheck if the net have physical pins. There may not be QoR impact as they are not routable nets.

Feedback

## ZRT-675

(warn) Cannot find MifsNet for the ndmBlkNet (%s) passed into routeNetGrp!

**Description**

Error found in rtapi module. Optimization passes the net to router to route while router does not consider it as a physical net.

**What Next**

Please recheck if the net have physical pins. There may not be QoR impact as it is not a routable net.

## ZRT-676

(warn) (rtapi) (@GOE): GIMRD via-ladder info corrupted

**Description**

Warning found in rtapi module. Please fix the described error.

**What Next**

Correct the described error.

## ZRT-677

(warn) (rtapi) (@GOE): With GR via-ladders enabled, net has a DR via-ladder: %s

**Description**

Warning found in rtapi module. Please fix the described error.

**What Next**

Correct the described error.

## ZRT-680

(error) voltage precision is not defined.

**Description**

The voltage precision is not defined in the tech file. This can cause incorrect voltage spacing violations.

Feedback

**What Next**

Please define unitVoltageName and voltagePrecision in the tech file.

---

## ZRT-681

(error) The via %s is set as default via but did not specify upperLayerMaskConstraint or lowerLayerMaskConstraint, please check the tech file to correct specified via definition

**Description**

The default via must specify upperLayerMaskConstraint or lowerLayerMaskConstraint

**What Next**

Please check the tech file to correct specified via definition

---

## ZRT-682

(warn) Fall back to non-distributed routing for better runtime.

**Description**

Due to the sparse distribution of input DRCs, disable distributed routing to get better runtime.

**What Next**

Please check if the design is good for distributed routing.

---

## ZRT-683

(warning) A net %s connects more than %d ports (Number of ports: %d). This may increase routing runtime.

**Description**

A net contains a large number of ports. This is atypical and may increase routing runtime.

**What Next**

If this is not expected, please reduce the number of pins for the port.

---

## ZRT-684

(Error) Incorrect %s routing guide is detected in this design. %s.

Feedback

**Description**

Please check the problematic routing guides and correct issues to proceed.

**What Next**

Correct the routing guide and rerun routing.

---

## ZRT-685

(Warn) Incorrect setting %s is detected in app option %s. %s.

**Description**

Please check the problematic setting and correct it.

**What Next**

Correct the app option setting and rerun.

---

## ZRT-686

(warning) Routing of PG net %s could be slow due to strict fanout constraints and/or non-optimal topology

**Description**

The routing of this PG net may take lots of time. Reasons are:

1. Maximum fanout limit could be too strict. More than 10 separate components need to be generated.
2. The ports which are over 10 cells row height away from a preroute account for more than 50 percent of the total unrouted ports.

.SH WHAT NEXT Please check PG structure setup for the net, or/and setting of number_of_secondary_pg_pin_connections.

---

## ZRT-687

(warn) Insufficient upper routing layers to connect pattern_must_join pin '%s/%s' on layer '%s'. Ignoring pattern_must_join.

**Description**

A pin on an upper layer is set as pattern_must_join. A pattern must join connection requires at least one metal layer above the pin. The required number of layers do not exist, so the router is ignoring the pattern_must_join attribute.

Feedback

**What Next**

Remove the pattern_must_join attribute on the library pin.

---

## ZRT-688

(warn) Skipping antenna fixing for net %s.

**Description**

User set some nets to be skipped for antenna fixing using app option route.detail.skip_antenna_fixing_for_nets. Those nets are reported in this message.

**What Next**

Check if it is intended to skip antenna fixing for the net.

---

## ZRT-689

(warning) The value of app option "route.common.concurrent_redundant_via_mode" is not compatible for the given technology node. This may increase routing runtime and reduce routability.

**Description**

The "route.common.concurrent_redundant_via_mode" option is not recommended to set for the given technology node. This may increase routing runtime and reduce routability.

**What Next**

Correct the app option setting and rerun.

---

## ZRT-690

(error) Zroute does not support more than %d metal layers in 3DIC Compiler.

**Description**

In 3DIC shell, there is a limit of number of routing layers that Zroute commands support.

**What Next**

Please modify number of metal layers for routing in the design or contact Synopsys support.

Feedback

## ZRT-691

(warn) Distance of neighboring grids of congestion map is too large between %s %d and %d (%d gcells)

**Description**

A large distance between neighboring grids may cause slowness and error in routing.

**What Next**

Check the setup of the congestion map to ensure reasonable distance between neighboring grids.

## ZRT-692

(warning) A net %s connects more than %d ports (Number of ports: %d), and the value of app option %s is %s. This may increase routing runtime.

**Description**

A net contains a large number of ports, and the app option setting is not recommended to set for this kind of net. This may increase routing runtime.

**What Next**

If this is not expected, please reduce the number of ports for the net or correct the app option setting.

## ZRT-693

(Information) Make adjustment on tech file : %s.

**Description**

This information indicates that the setting of endToEndForbiddenSpaceRangeMin/ endToEndForbiddenSpaceRangeMax and lengthPrecision/gridResolutionin tech file are inconsistent. Tools will do the conversion automatically on endToEndForbiddenSpaceRangeMin/endToEndForbiddenSpaceRangeMax.

## ZRT-694

(Information) Non preferred direction routing is disabled by option on layer %s.

**Description**

Non preferred direction routing is disabled by application option route.common.disable_non_preferred_direction_routing_by_layer_name.

Feedback

## ZRT-695

(warning) secondary PG net %s has cluster size of %.1f around location (%.4f %.4f), and the value of app option %s is %.1f. This may increase routing runtime.

**Description**

A net has a way large cluster than expected. This makes detailed routing difficut to fix secondary PG violations and it would increase routing runtime.

**What Next**

Please check net PG structure to see if it is setup properly. You can also save global routing and track assignment results to see if the problem aleady appears at these stages.

## ZRT-696

(error) router does not support the rotated unfixed custom via with def %s at (%.3f %.3f) and will ignore it.

**Description**

The tool issues this error when it reads in an unfixed custom via while reading the vias from the database.

**What Next**

Check the usage of this via.

## ZRT-697

(warning) secondary PG net %s has cluster size of %d around location (%.4f %.4f), and the value of app option %s is %d. This may increase routing runtime.

**Description**

A net has a way large cluster than expected. This makes detailed routing difficut to fix secondary PG violations and it would increase routing runtime.

**What Next**

Please check net PG structure to see if it is setup properly. You can also save global routing and track assignment results to see if the problem aleady appears at these stages.

## ZRT-698

(warning) Routing of PG net %s could be slow due to power PG structure coverage over ports.

Feedback

**Description**

The routing of this PG net may take lots of time. Reasons are:

1. The bounding box of PG structure only covers less than 50% percent of bounding box of ports.

.SH WHAT NEXT Please check PG structure setup for the net, or/and setting of number_of_secondary_pg_pin_connections.

---

## ZRT-699

(error) Definition of ViaRule %s will exceed the maximum allowed number of definitions. No more than %d are allowed.

**Description**

The number of via ladder definitions exceeds the total number supported. Too many ViaRule via ladders defined in the tech file or using create_via_rule.

**What Next**

Reduce the number of via ladder definitions.

---

## ZRT-700

(warning) %s layer %s has no enough gcell capacity for promoted nets.

**Description**

Too many promoted nets with layer constraints and no enough capacity for routing.

**What Next**

Reduce the number of promoted nets.

---

## ZRT-701

(Error) Potential memory overflow. Detail: %s

**Description**

Tool finds a situation that may cause memory overflow. More detail is printed.

**What Next**

Tool finds a situation that may cause memory overflow. Please check if the chip floor plan size is reasonable. If the chip size has problem, please fix the issue. Otherwise, please pass a test case to router team.

Feedback

## ZRT-702

(warn) Skipping the rectangle_only route guide located at {{%.3f %.3f} {%.3f %.3f}} because it doesn't cover the design boundary in the layer's preferred direction.

**Description**

The rectangle_only route guide need to cover the design boundary in the layer's preferred direction. If not, we will skip this route guide.

**What Next**

Please adjust the size of the route guide.

## ZRT-703

(info) Option route.detail.force_end_on_preferred_grid will be ignored since none of the layers have preferred grid.

**Description**

Ignore option route.detail.force_end_on_preferred_grid since there are no preferred grids in this design.

## ZRT-704

(warn) The value of %s is different from default value or mega switch value. Please make sure the value is expected.

**Description**

The warning message indicates that the user value if different from default value or mega switch value. Please make sure the value is expected as this kind of app option can easily impact the result.

**What Next**

Users may need to check their script or setting to see if the value of this app options is what they want.

## ZRT-705

(Error) Tech file error: Layer %s. %s

**Description**

Error found in the tech file design rule definition. The rule will be skipped.

Feedback

**What Next**

Correct the tech file error.

---

## ZRT-706

(Information) When applicable layer based tapering will taper up to %.2f in distance from the pin.

**Description**

Distance control for layer based tapering is turned on.

---

## ZRT-707

(Information) When applicable Min-max layer allow_pin_connection mode will allow paths of length %.2f outside the layer range.

**Description**

Distance threshold for min-max layer allow pin conn mode.

---

## ZRT-708

(warn) net %s has opens.

**Description**

The warning message indicates that the net is open in the end of global route.

**What Next**

Users may need to check whether and why the net is open and to solve open net issue.

---

## ZRT-709

(info) Detail Router is running in early mode.

**Description**

In early mode, Detail Router will reduce rip-up and rerouting in some locations to reduce runtime. This may have an impact on the DRC counts.

**What Next**

See app option route.detail.mode for different modes

Feedback

## ZRT-710

(Error) Closed routing DB due to an exceptional situation. (%s)

**Description**

Routing data-base needs to be shut down due to an unexpected situation to prevent crash. User should look for root cause and fix it.

**What Next**

Please look for the script or flow issues and discuss with the flow owner to fix it.

## ZRT-711

(info) The value of the app option "%s" is ignored. New value "%s" will be used for DR early mode.

**Description**

In early mode, Detail Router will trun some settings on by default.

**What Next**

See the reported app option for detailed information.

## ZRT-712

(info) Using early mode ZGR.

**Description**

This message reports that early mode ZGR is activated.

**What Next**

No action is required.

**See Also**

- set_host_options

## ZRT-713

(warn) Unable to launch distributed routing as the library is opened in readonly mode.

Feedback

### Description

The distributed routing requires the library to be opened in non-readonly mode. It will fall back to non-distributed routing.

### What Next

Open the library in non-readonly mode.

---

## ZRT-714

(warn) Recovered from an unexpected state. More information may be provided in following lines.

### Description

When a segmentation fault or a floating-point exception is encountered in Zroute detail route or via ladder stage, if the crash can be managed and skipped, the tool can complete the rest jobs and continue. ZRT-714 informs the user a crash is managed and skipped. The stack trace is printed if available. The tool terminates with ZRT-715 when the amount of ZRT-714 in a command exceeds a configurable threshold. If a crash cannot be managed and skipped, the tool terminates.

### What Next

When a ZRT-714 is issued in detail route or via ladder, the user can continue the work. The DRC closure may not be optimal due to skipped jobs. The DRC report may be inaccurate due to skipped jobs. The NDM database remains valid after a ZRT-714 recovery. It is recommended to run check_routes after a ZRT-714. When check_routes has ZRT-714, the DRC report is inaccurate due to skipped jobs. It is recommended to report a ZRT-714 with logs and data.

---

## ZRT-715

(error) The occurrence count of unexpected state recovery hits the maximum.

### Description

The tool terminates with ZRT-715 when the amount of ZRT-714 in a Zroute command exceeds the threshold. With default threshold value, many ZRT-714 may indicate problems in input data or persistent bugs in the router. The maximal recovery threshold is controlled by app_option route.common.unexpected_state_recovery_threshold

### What Next

Please review the input data and logs. The user could change the value of app_option route.common.unexpected_state_recovery_threshold. It is recommended to report ZRT-714 with logs and data.

Feedback

## ZRT-716

(Error) (rtapi) %s

**Description**

Error found in rtapi module. Please fix the described error.

**What Next**

Correct the described error.

## ZRT-717

(warn) Instance pin %s has a via ladder constraint but also has a physical custom via ladder attached. Current via ladder constraint list: %s. The custom via ladder may be removed by refresh_via_ladders and related operations.

**Description**

Custom via ladders are usually not expected on pins that have a conventional via ladder constraint.

**What Next**

Please confirm that the via ladder constraints are expected on the pin, and be aware that the router may remove the custom via ladder. If the custom via ladder is not described by a ViaRule in the constraint, the custom via ladder will be removed.

## ZRT-718

(Information) When applicable Min-max layer allow_pin_connection mode will allow paths of length %.2f outside the layer range on clock nets.

**Description**

Distance threshold for min-max layer allow pin conn mode on clock nets.

## ZRT-719

(warn) Could not find corresponding default via contactCode on %s layer enclosure of cut layer to match the track width constraint %.7g on layer %s.

**Description**

Routing layer has track width constraint less than default width. Router needs to update this track width as default width. But the corresponding track width via contactCode is

Feedback

missing or is not a default contactCode, which will cause router to use the wrong via during routing.

**What Next**

Please update the tech file to add or set the via contactCode that match the track width constraint as default contactCode.

---

## ZRT-720

(Warning) Port %s at {{%.3f,%.3f} {%.3f,%.3f}} is out of boundary. Cannot be routed.

**Description**

The port is out of boundary.

By default, routing commands print only 10 messages of this type. If user wishes to have more messages of this type printed to log file, set_message_info command is to be used.

Example is: set_message_info -id {ZRT-720} -limit 300

**What Next**

Please check the design.

---

## ZRT-721

(warn) An invalid shape is ignored because %s

**Description**

An invalid shape is ignored as described reason.

**What Next**

Please review and correct the shape.

---

## ZRT-722

(info) Applying settings based on technology node %s.

**Description**

The reminder of the technology node user had specified.

Feedback

## ZRT-723

(warning) Invalid or missing min cut spacing value for contactCode (%s). New value %g is used instead.

### Description

The min cut spacing value of the contactCode is invalid or missing. Router will use the min spacing value of the corresponding cut layer to replace it. Default value 0 will be used if the min spacing value is invalid too.

### What Next

Please check the contactCode value in the tech file and correct it if needed.

## ZRT-724

(warn) Skipping antenna analysis for net %s.

### Description

User set some nets to be skipped for antenna analysis using app option route.detail.skip_antenna_analysis_for_nets. Those nets are reported in this message.

### What Next

Check if it is intended to skip antenna analysis for the net.

## ZRT-725

(warn) Pin shape (cell %s, pin %s) is not on a routing layer %s.

### Description

The tool issues this error when the layer of the specified pin is not within the minimum and maximum routing layers. Please check the setting of *set_ignored_layers* command or the routing layer setting for this net. The router cannot connect to the pin shape under these conditions.

### What Next

Please check the setting of *set_ignored_layers* command or the routing layer setting for this net.

### See Also

- set_ignored_layers

Feedback

## ZRT-726

(warning) PG net %s has rail in the region (%.4f %.4f) (%.4f %.4f) on layer %s that crosses even number of tracks.

**Description**

PG rail with DPT mask crosses even number of tracks. It might reduce the routing resource.

**What Next**

Re-build the track or shift the rail.

## ZRT-727

(warning) the routing tracks on DPT layer %s are without any mask information.

**Description**

When the option route.common.color_based_dpt_flow is truned on, it is necessary to specify mask information for the routing tracks on DPT layer.

**What Next**

Please check your tech file and scripts to make sure that you set the mask information for the tracks on DPT layers.

## ZRT-728

(warning) Layer %s has no routing tracks.

**Description**

The given layer does not have any routing tracks. This prevents the router from assigning wires and vias on the layer.

**What Next**

Please check if the routing tracks have been correctly defined on the layer.

## ZRT-729

(warning) Track at {%.3f %.3f} {%.3f %.3f} on layer %s is out of boundary.

**Description**

The track is out of boundary. It may impact the routing result.

Feedback

**What Next**

Please check if the routing tracks have been correctly defined on the layer.

---

## ZRT-730

(warning) The value of stackViaPairLayerCount on layer %s is invalid.

**Description**

The value of stackViaPairLayerCount is not valid (is 0 or larger than the max number of stack levels of that via layer) Zroute ignores this rule to prevent unexpected behavior.

**What Next**

Please check if the value of stackViaPairLayerCount is correctly defined on the via layer.

---

## ZRT-731

(error) Reset %s on layer %s since the option route.detail.force_end_on_preferred_grid is set to true.

**Description**

Reset natural end on preferred grid center rule since force end on prferred grid is enabled.

**What Next**

Please check if the techfile is up-to-date.

---

## ZRT-732

(warning) The pg_pin_weight was lowered for %d pins of the secondary PG nets. These pins are unroutable with the original pg_pin_weight values due to missing enough tap-points. Use check_routes to highlight their locations.

**Description**

The pg_pin_weight was lowered for pins of the secondary PG nets. These pins are unroutable with the original pg_pin_weight values due to missing enough tap-points. Use check_routes to highlight their locations.

**What Next**

Please check if the pg_pin_weight of pins is up-to-date or if tap-points is enough.

Feedback

## ZRT-733

(warning) checkMetalEndThreshold is ignored for cut Metal layer %s since the endToEndSpaceMaxWidthThreshold of metal layer %s is not specified.

**Description**

When the checkMetalEndThreshold of the cutMetal layer is specified as 1, the endToEndSpaceMaxWidthThreshold of the corresponding metal layer must also be specified.

**What Next**

Please check and correct the techfile.

## ZRT-734

(warning) The option "route.detail.limit_m0_routing_pin_extension_for_1cpp_cell_gap" is defined but metal layer %s does not have preferred grid.

**Description**

When the option "route.detail.limit_m0_routing_pin_extension_for_1cpp_cell_gap" is defined, the preferred grid on metal layer must also be specified.

**What Next**

Please check and correct the option or specify the preferred grid on metal layer.

## ZRT-735

(warn) Option %s is set to %s while %s is not set to %s.

**Description**

Conflicting app options are detected. Please refer to man page of that option for complete details.

**What Next**

Please check if any option is set unexpectedly.

## ZRT-736

(error) Cannot run this command for multiple die.

Feedback

**Description**

The design is multiple die design that contains base die and interposer die and all zroute commands should stop for this kind of design.

**What Next**

Please modify the design or contact Synopsys support.

---

## ZRT-737

(warn) %s command line option "%s" has no effect since route.auto_via_ladder.apply_app_options_to_insert_via_ladders_command is true (default).

**Description**

The specified command line option will be obsoleted in a future release. Please use the route.auto_via_ladder.* app option with the same name.

**What Next**

Please migrate scripts to use route.auto_via_ladder.* app options for all insert_via_ladders and verify_via_ladders settings.

If the command line options must be used, please set "route.auto_via_ladder.apply_app_options_to_insert_via_ladders_command false." However, this temporary support will disappear in a future release.

---

## ZRT-738

(warn) route.auto_via_ladder.apply_app_options_to_insert_via_ladders_command will become obsolete in %s and will be treated as true by default.

**Description**

route.auto_via_ladder.apply_app_options_to_insert_via_ladders_command is now true by default and does not need to be explicitly set. Users are encouraged to migrate all scripts to use route.auto_via_ladder.* app options, and avoid use of any redundant insert_via_ladders or verify_via_ladders command line options.

Legacy command line controls can still be used by setting "route.auto_via_ladder.apply_app_options_to_insert_via_ladders_command false" but support will be made obsolete in a future release.

**What Next**

Please migrate scripts to use route.auto_via_ladder.* app options for all insert_via_ladders and verify_via_ladders settings.

Feedback

If the command line options must be used, please set "route.auto_via_ladder.apply_app_options_to_insert_via_ladders_command false." However, this temporary support will disappear in a future release.

---

## ZRT-739

(warning) Cell %s port %s contains more than %d pin shapes (Number of pin shapes: %d). This may increase routing runtime.

**Description**

A port contains a large number of pin shapes. This is atypical and may increase routing runtime.

**What Next**

If this is not expected, please reduce the number of pin shapes for the port.

---

## ZRT-740

(warning) %s is unplaced. This may impact routing result.

**Description**

A port is unplaced. This is atypical and may impact routing result.

**What Next**

If this is not expected, please fix the issue.

---

## ZRT-741

(warn) Reset %s on layer %s since there is no preferred grid defined.

**Description**

Reset natural end on preferred grid center rule since there is no preferred grid defined.

**What Next**

Please check if the techfile is up-to-date.

---

## ZRT-742

(warning) %s track is not on center of pin %s. This may impact via_ladder insertion. Please enable app-option route.auto_via_ladder.generate_center_track_on_off_grid_pattern_must_join_pin_shapes.

Feedback

**Description**

This track is not on center of pin. This is atypical and may impact via_ladder insertion.

**What Next**

If this is expected, please enable app-option route.auto_via_ladder.generate_center_track_on_off_grid_pattern_must_join_pin_shapes.

---

## ZRT-743

(error) Track at {%.3f %.3f} {%.3f %.3f} on layer %s without preferred grid is found. Please make sure track is set up properly.

**Description**

This layer has enablePrefGrid but corresponding track does not have consistent preferred grid setting.

**What Next**

Please check tracks are created correctly.

---

## ZRT-744

(Error) Invalid LEE blockage metal layer found. Please make sure the -exclude_layers of create_line_end_extension_blockages command is set up properly.

**Description**

Error out due to invalid LEE blockage metal layer specified.

**What Next**

Please check if the -exclude_layers of create_line_end_extension_blockages command is set up correctly.

---

## ZRT-745

(Error) Remove cut metals failed since %s.

**Description**

Command remove_cut_metals failed. The cut metals cannot be deleted or the design has no cut metal.

**What Next**

Please check the cut metals in the design accroding to the reported message.

Feedback

## ZRT-746

(error) Incorrect table size for syntax %s on layer %s.

**Description**

Set the correct table size for the specified syntax on that layer.

**What Next**

Please check if the table size of the specified syntax is correct.

## ZRT-747

(warning) Cell %s contains more than %d “forbidden_preferred_grid_extension” routing guides (%d). This can increase routing runtime; you might want to regenerate the frame view. The internal engine will ignore more than threshold route guides.

**Description**

A cell contains a large number of “forbidden_preferred_grid_extension” routing guides. This is atypical and might increase routing runtime.

**What Next**

If this is not expected, regenerate the frame view.

**See Also**

- check_workspace
- create_frame

## ZRT-748

(warn) Incorrect value or syntax missed for %s as %s has been defined on layer %s.

**Description**

Set the correct value of the syntax or add the required syntax on that layer.

**What Next**

Please check if the value of specified syntax is correct or any required syntax missed.

## ZRT-749

(error) Invalid syntax value %s found in %s on layer %s.

Feedback

**Description**

Set the valid value for the specified syntax on that layer.

**What Next**

Please check if the value of the specified syntax is correct.

---

## ZRT-750

(warning) Net %s has a min_layer and max_layer that are identical (%s).

**Description**

A net has a min layer and max layer that are identical and may be overly restrictive.

**What Next**

Relax either the min_layer or the max_layer to avoid DRC convergence issues.

---

## ZRT-751

(warning) App option "route.common.prefer_via_cuts_of_default_vias_as_ndr_vias" is set to TRUE, but cannot found user defined ndr via of rule (%s) that has cut size matching the default vias on layer %s.

**Description**

If app option "route.common.prefer_via_cuts_of_default_vias_as_ndr_vias" is set, user defined vias not matching the cut size of default vias will be filterd out. This warning indicates that there is no such valid user defined via, and all user defined vias will still be used.

**What Next**

Please check the routing rule and define the valid vias.

---

## ZRT-752

(error) %s %s of top level net %s is out of specified routing bounding box.

**Description**

This error message indicates that the specified routing bounding box should contain top level terminal or cell instance pin of top level net.

**What Next**

Please specify appropriate routing bounding box.

Feedback

## ZRT-753

(warning) Post-route command "%s" is disabled since ZRoute is running in early mode.

**Description**

Post-route commands/operations are disabled in ZRoute early flow to prevent long runtime on early designs. The early fow was set by "set_qor_strategy -mode early_design".

**What Next**

Please update the early flow script to exclude post-route commands.

## ZRT-754

(error) %s, options %s and %s cannot be used together.

**Description**

User specified options are mutually exclusive.

**What Next**

Please change the options.

## ZRT-755

(warn) The value of %s is different from mega switch value. Reset it to %s on %s to accomodate both user setting and mega switch.

**Description**

Conflicting options are detected. Reset internally.

**What Next**

Please check if any option is set unexpectedly.

## ZRT-756

(info) Dirty region identified at {{%.4f %.4f} {%.4f %.4f}} due to %s violation explosion.

**Description**

A region with extremely high violation number is detected which could cause hang in detailed routing or DRC checking.

Feedback

**What Next**

Please review the region of interest and see if any unexpected input in there.

---

## ZRT-757

(warning) When running the Early GR flow the removal of global routes shapes is prevented.

**Description**

The functionality of commands which are removing global route shapes is restricted in the Early GR flow.

---

## ZRT-758

(warning) In rule %s, var %s set to 0 on layer %s.

**Description**

This warning message indicates that the taper distance and/or the driver taper distance set to 0.

**What Next**

Please specify the NDR taper (driver) distance using non zero ones.

---

## ZRT-759

(warning) Convert via cut routing blockage {%.3f %.3f} {%.3f %.3f} on layer %s to zero spacing based on EDC records.

**Description**

The via cut blockage was identified as invalid blockage (ZRT-576) in check_routability and recorded in early data check (EDC). The blockage will be converted to zero spacing during routing in EDC repair mode.

**What Next**

See ZRT-576, report_early_data_checks

---

## ZRT-760

(warning) Remove shape {%.3f %.3f} {%.3f %.3f} on layer %s based on EDC records because of no net information.

Feedback

**Description**

The shape is without any net information and is recorded in early data check (EDC). The shape will be removed during routing in EDC repair mode.

**What Next**

See report_early_data_checks

---

## ZRT-761

(warning) pin is off track in the region (%.4f %.4f) (%.4f %.4f) on layer %s.

**Description**

This pin is off track.

---

## ZRT-762

(warning) Please run the command "check_routability" before running Zroute commands.

**Description**

When the design or setting is changed, please run the command "check_routability" before running Zroute commands. The command can detect incorrect desin and setting. Please fix unexpected error to get better result of router.

**What Next**

Run the command "check_routability" before running Zroute commands.

---

## ZRT-763

(warning) Cell %s is placed overlapping with other cells at {{%.3f %.3f} {%.3f %.3f}}.

**Description**

This warning message indicates that there are other cells overlapping with this cell. This is a roughly check for overlapped cell. For detailed information, please run "check_legality".

**What Next**

Please make sure all the cells are placed legally before running the router and run check_legality before running check_routability.

---

## ZRT-764

(warning) PG net %s has opens.

Feedback

**Description**

This warning message indicates the open PG nets. This is a roughly check. For detailed information, please run "check_lvs".

**What Next**

Please make sure all PG nets are connected and run check_lvs to fix the error.

---

## ZRT-765

(warning) Net %s skips pin-to-pin routing because the distance of the psv pair is larger than %d gcells (psv pair %d: from node %d to node %d, distance = %d).

**Description**

The open of the given is too large for incremental routing.

---

## ZRT-766

(warning) Net %s skips pin-to-pin routing because the distance of the psv pair is larger than %d gcells.

**Description**

The open of the given is too large for incremental routing.

---

## ZRT-767

(warning) Net %s rips up all edges because the distance of the psv pair is larger than %d gcells.

**Description**

The open of the given is too large for incremental routing.

---

## ZRT-768

(warning) All NDM blockages in cell %s are skipped based on EDC record.

**Description**

There are too many routing blockages detected in this cell in check_routability and recorded in early data check (EDC). These routing blockages will be skipped in EDC repair mode.

Feedback

**What Next**

See report_early_data_checks

---

## ZRT-769

(warning) All “forbidden_preferred_grid_extension” routing guides in cell %s are skipped based on EDC record.

**Description**

There are too many “forbidden_preferred_grid_extension” routing guides detected in this cell in check_routability (ZRT-747) and recorded in early data check (EDC). These routing guides will be skipped in EDC repair mode.

**What Next**

See ZRT-747, report_early_data_checks

---

## ZRT-770

(warning) All NDM existing duplicate shapes in block %s are removed based on EDC records by running the command "check_duplicates -remove".

**Description**

Redundant duplicated PG shapes are identified in check_routability and recorded in early data check (EDC). The shapes will be removed in EDC repair mode.

**What Next**

See ZRT-618, report_early_data_checks

---

## ZRT-771

(warn) %s is high fanout net, going to set it to locked.

**Description**

This warning occurs when there is high fanout net, and it is going to be set to locked.

**What Next**

See report_early_data_checks

---

## ZRT-772

(warn) %s is the net connecting to blocked ports, going to set it to locked.

Feedback

**Description**

This warning occurs when there is a blocked port, and the net connecting to blocked ports is going to be set to locked.

**What Next**

See report_early_data_checks

---

## ZRT-773

(info) Detected forbidden_preroute_access_layers attribute on net %s with {%s}.

**Description**

Net's forbidden_preroute_access_layers is defined.

**What Next**

Please double check the purpose of forbidden_preroute_access_layers, or make sure the net's stripes are all DRC clean.

---

## ZRT-774

(warning) Incorrect via ladder %s with via ladder rule %s set on pin %s.

**Description**

Found via ladder rules set on pins have error(s) as described.

**What Next**

Please check via ladder rules which are set on pins and make sure that each rule is set correctly, and try again.

---

## ZRT-775

(warn) PG structure in the region (%.4f %.4f) (%.4f %.4f) on layer %s might cause router to fail to drop default vias.

**Description**

The reported PG structure might cause router to fail to drop default vias on the transition layer.

**What Next**

Check the reported PG structure.

Feedback

## ZRT-776

(warning) When running the Early GR flow the option -rerun_global_router automatically maps to option -recompute_map.

**Description**

Rerunning the global router is restricted in the Early GR flow. Only recomputation of the congestion map is allowed based on the existing global route shapes.

## ZRT-777

(Information) %s based on technology file setting.

**Description**

The technology file has the setting "enableExplicitCutMetalGeneration = 1".
But the app options "route.common.enable_explicit_cut_metal_generation" or "route.common.enable_cut_metal_merge_abut" is set to false. Will use the technology file setting instead.

**What Next**

Check the technology section in the tech file and the option settings

## ZRT-778

(info) Eco change area percentage: %.2f \%

**Description**

Percentage of change area in route_eco

**What Next**

Check the changed area

## ZRT-779

(warning) PMJ/VL pin %s (%s layer) has preroute via overlapped.

**Description**

When a PMJ/VL pin has preroute via in the same layer overlapped, check_routability -via_ladder will report it as a warning.

Feedback

## ZRT-780

(warning) The attribute route_connection of pin %s is set to skip.

**Description**

When the attribute route_connection of the pin is set to skip, check_routability -check_pins will report it as a warning.

## ZRT-781

(warning) Port%s%s %s might be blocked.

**Description**

When the port might be blocked, check_routability will report it as a warning.

## ZRT-782

(warn) The option "route.detail.enable_via_in_non_preferred_region_check" is set, but the tech file syntax "contactDefaultPreferredRegionMode" is not set to 1. The option setting will be ignored.

**Description**

Option value has conflict with tech file syntax.

**What Next**

Please check if the option is set unexpectedly or update the tech file.

## ZRT-783

(warning) Blockage data overflowed. The router will ignore all blockage data and continue with incomplete input.

**Description**

The router identified a bad input pattern where too many blockage data are being loaded. The router will ignore all blockage data in order to continue. The routing behavior might not be desired.

**What Next**

Clear bad input problem and rerun routing.

Feedback

## ZRT-784

(Warning) Ignore viaShiftDistance setting on contact %s for oneSideAlignedVia rule.

**Description**

The router will ignore the viaShiftDistance if the layer of via enclosure has oneSideAlignedVia rule.

**What Next**

Check techfile about viaShiftDistance and oneSideAlignedVia.

## ZRT-785

(info) Via ladders found in areas with DRCs = %d

**Description**

Via ladder verification will count DRCs in the vicinity of any via ladder if the app option route.auto_via_ladder.report_via_ladder_in_area_with_drc_threshold is set to a non-negative value. This message reports the number of via ladders in areas with a DRC count that exceeds that threshold.

**What Next**

No action necessary.

## ZRT-786

(Warning) pin %s width is larger than techfile's maxWidth on layer %s.

**Description**

The incorrect pin width causes the maxWidth violation, and DRC will never converge.

**What Next**

Please check the pin width to meet the constraint of techfile's maxWidth.

## ZRT-787

(Warning) Skip fixing fixed shapes DRCs not involving nets specified in route_group command.

Feedback

### Description

The warning message occurs when -fix_general_fixed_shapes_drcs_involving_routed_nets_only command option specified in route_group command. This indicates that the router will not fix those fixed shapes DRCs which do not involve nets in -nets command option. User who uses this command option has the responsibility to take care of the miscorrelation issue as a result.

### What Next

Users need to be aware of where those DRCs which will have to be resolved in later stages involving DR.

---

## ZRT-788

(warning) Option '%s' is ignored when running the Early GR flow.

### Description

The specified option has no effect in the Early GR flow and its intention is ignored.
