# IC Compiler II Error Messages

This document describes the error messages supported by the IC Compiler II tool.

## 3DCODE

### 3DCODE-001

(error) %s.

**Description**

The input 3DCODE file(s) may contain syntax error.

**What Next**

Read the error message to identify and correct the syntax error in the input 3DCODE file(s).

### 3DCODE-002

(error) Python execute file (%s) error. Details are in the *.debug.log file.

**Description**

An error occurred while executing a Python command. Detailed information is available in the *.debug.log file.

**What Next**

Get the detailed information about the error and contact your AE for help.

### 3DCODE-003

(error) Syntax error: %s.

**Description**

The input 3DCODE file(s) contains syntax error. Please check the error message.

Feedback

**What Next**

Read the error message to identify and correct the syntax error in the input 3DCODE file(s).

---

## 3DCODE-004

(error) Data error: %s.

**Description**

The input 3DCODE file(s) contains incorrect data value. Please check with the error message.

**What Next**

Read the error message to identify and correct the data error in the input 3DCODE file(s).

---

## 3DCODE-005

(warning) Loop connection is found for block instance: %s in %s.

**Description**

There is loop connection in specified .3dBuilder file, thus z level of all the block instances will be set to zero.

**What Next**

Please check the source file to find the loop connection and remove it.

---

## 3DCODE-006

(error) Invalid library name '%s' specified in '%s' command option of read_3dcode.

**Description**

The library name specified is invalid because it contains spaces.

**What Next**

Ensure that there are no spaces in library name specified.

---

## 3DCODE-007

(error) %s.

Feedback

**Description**

The specified library name exists in directory. read_3dcode creates library path under ./refLibs/ directory. The specified library name from 3DCODE files already exists.

**What Next**

Please check the existing directory. Back up or delete it, then run read_3dcode again.

---

## 3DCODE-008

(error) The specified library path '%s' doesn't exist.

**Description**

The library name specified by -library contains path, but the path doesn't exist.

**What Next**

Ensure the library path exist.

---

## 3DCODE-009

(warning) BlockDesign '%s' has different bump thickness (%s and %s) under one region.

**Description**

Bumps belong to one region have different bump thickness.

**What Next**

Check the related bump thickness values are expected or not.

---

## 3DCODE-010

(warning) The bumps between block instance '%s' and '%s' are with inconsistent thickness %s and %s.

**Description**

A connection is detected by write_3dcode since their bump regions are overlapped.
But they have different bump thickness.write_3dcode chooses the top thickness as the connection thickness.

**What Next**

Check the related bump thickness values are expected or not.

Feedback

# 3DIC

## 3DIC-001

(error) Incorrect command %s option usage. %s.

**Description**

Incorrect command option usage.

**What Next**

See command man page for correct option usage.

## 3DIC-002

(Information) net %s already connects %s %s. net is ignored.

**Description**

Command *assign_3d_interchip_nets* will assign physical contact for logical net. This message tells user that certain net is already assigned so it is skipped in automatic optimal assignment.

**What Next**

User should double confirm whether the existed assignment status for this net is as expected. If not, please remove existed assignment of the net and run command again.

**See Also**

- assign_3d_interchip_nets

## 3DIC-003

(error) %s array %s already exists, please use another %s array name to create %s array.

**Description**

Errors are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

Feedback

## 3DIC-004

(error) The minCutSpacing value in tech file is %s, and specified TSV pitch (%s %s) violates minimal cut spacing rule.

**Description**

The spacing between two TSVs is less than minCutSpacing that defined in the tech file.

**What Next**

Check TSV array pitch value.

## 3DIC-005

(info) Current design %s is a 3DIC design.

**Description**

Current design type is 3DIC.

**What Next**

See command man page for correct command usage.

## 3DIC-006

(Error) Found multiple chip instances refer to same design %s. MIB is not supported.

**Description**

MIB is not supported in command assign_3d_interchip_nets.

**What Next**

Check the design again.

## 3DIC-007

(Error) -pins is only valid when source chip is hard macro.

**Description**

If -pin option is sepcified, then the source chip should be hard macro.

**What Next**

Please make sure that the source chip is hard macro before -pin is specified.

Feedback

## 3DIC-012

(Error) %s pair %s's matching type %s is different from %s's matching type %s.

**Description**

In 3DIC flow, matching type should be consistent on any physical path or logical path. Otherwise, inter-chip nets assignment will fail.

**What Next**

Set proper matching type on port or pins by set_matching_type or propagate_3d_matching_type.

## 3DIC-013

(Error) Logically connected bumps or drivers on net %s have different matching types.

**Description**

In 3DIC flow, matching type should be consistent on any physical path or logical path. Otherwise, inter-chip nets assignment will fail.

**What Next**

Set proper matching type on cells, terminals or pins by set_matching_type or propagate_3d_matching_type.

## 3DIC-014

(Error) The design_type of the die "%s" is not valid.

**Description**

In 3DIC design, the valid design_type of a die should be one of: module, macro, analysis, die, bridge, interposer, substrate.

**What Next**

Set proper design_type for the die.

## 3DIC-030

(warning) Z value must be an integer. Rounding value to %d.

**Description**

Z value stands for chip stack z value and must be an integer.

Feedback

**What Next**

Specify an integer to z value will be better.

---

## 3DIC-031

(error) No chip coordinates specified. Use -location {x y z}.

**Description**

3-D coordinate is used to describe the location of a chip in design.

**What Next**

Please input coordinate like -location {x y z}.

---

## 3DIC-032

(error) The specified scaling_factor value is not in range (0, 1].

**Description**

The scaling_factor value should be greater than 0 and no greater than 1.

**What Next**

Please specify a value greater than 0 and no greater than 1.

---

## 3DIC-033

(warning) Set attribute of chip %s, other chips will be ignored.

**Description**

This command set a chip each time.

**What Next**

Please input a chip name with -chip.

---

## 3DIC-034

(error) Z value must be no less than 0.

**Description**

Z value must be no less than 0.

Feedback

**What Next**

Use set_3d_chip_placement to set chip's z value.

---

## 3DIC-035

(warning) Block '%s' will not be saved. Library '%s' is in read mode.

**Description**

The specified block will not be saved because its library is open in read mode.

**What Next**

Open the specific library and block in edit mode and try again.

---

## 3DIC-036

(warning) Block '%s' will not be saved because it is in read mode.

**Description**

The specified block will not be saved because it is open in read mode.

**What Next**

Open the block in edit mode and try again.

---

## 3DIC-037

(error) Specified via def %s is not a TSV via def.

**Description**

The via def specified is not a TSV via def.

**What Next**

Specify TSV via def.

---

## 3DIC-038

(error) Specified %s is not a TSV.

**Description**

The specified option value is not a TSV.

Feedback

**What Next**

Specify TSV.

---

## 3DIC-039

(error) %s.

**Description**

Errors are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-040

(error) Command should run on top level and current design should be a legal 3DIC design.

**Description**

Current design is not a legal 3DIC design or command is not running on top level.

**What Next**

Please check the current design.

---

## 3DIC-041

(error) Less than two chips in the design.

**Description**

3DIC design should contains more than one chip.

**What Next**

Add more chips into the design.

---

## 3DIC-042

(error) The chip %s does not have a Z value.

**Description**

Chip should be assigned a Z value to describe the location in design.

Feedback

**What Next**

Assign a Z value to chip by command set_cell_location.

---

## 3DIC-043

(error) Chip %s is not editable.

**Description**

3DIC commands should be executed on editable chip.

**What Next**

Make sure the corresponding chip is editable.

---

## 3DIC-044

(error) Command should be run on top level and %s for chip %s should be set.

**Description**

%s should be set first for chip %s or this command is not running on top level.

**What Next**

Use set_3d_chip_placement to set chip's attribute.

---

## 3DIC-045

(warning) Specified pin %s is not connected to an existing net.

**Description**

Specified pin is not connected to an existing net.

**What Next**

Check command option value.

---

## 3DIC-046

(error) Specified TSV %s is not belong to current design.

**Description**

Errors are found during the processing of the command options.

Feedback

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-047

(warning) Specified pin %s is not I/O driver pin, bump pin or pin of standard cell.

**Description**

Specified pin is not I/O driver pin, bump pin or pin of standard cell.

**What Next**

Check command option value.

---

## 3DIC-048

(error) No specified matching type will be propagated.

**Description**

The specified matching types is not existed in source chip or these matching types contain no object.

**What Next**

Please check the design.

---

## 3DIC-049

(warning) No object has matching type %s, it will be ignored.

**Description**

No object in matching type %s, there is no way to propagate this matching type.

**What Next**

Add objects to matching type by using command add_to_matching_type.

---

## 3DIC-050

(warning) Matching type %s does not exist in any source chip and will be ignored.

**Description**

%s in -matching_type list does not exist in any source chip or the design.

Feedback

**What Next**

This matching type will be ignored.

---

## 3DIC-051

(error) No matching type in the '-matching_types {list}' exist in the source chip.

**Description**

There isn't any matching type with the name in '-matching_type {list}' existed in source chip.

**What Next**

Please check the option -matching_types.

---

## 3DIC-052

(Error) No valid matching type defined in design or chips specified by '-from'.

**Description**

No valid matching type defined in the design or chips specified by '-from'.

**What Next**

Please add matching types in source chip and do propagation.

---

## 3DIC-053

(error) Conflicting matching types %s and %s found on source chip %s. Related objects: %s.

**Description**

There are more than one matching type in a physical or logical connection on the source chip, it will cause error when propagate matching type from source chip to target chip.

**What Next**

Please check the design.

---

## 3DIC-054

(error) Matching types %s in target chip corresponding to the matching type %s in source chip during propagation. Related objects: %s.

Feedback

**Description**

This messages appears because one of scenario below happens: 1. There are more than one matching types in target chip corresponding to the same matching type in source chip; 2. The corresponding matching type in source chip and target chip has different matching type name.

**What Next**

Please check the design. Using -force may help to solve this conflict.

---

## 3DIC-055

(error) Objects do not have physical contact or logical connection with the other objects of the same matching type %s and were not propagated.

**Description**

Objects do not have physical contact or logical connection with the other objects of the same matching type and were not propagate.

**What Next**

Please check the design. Using -force may help to solve this situation.

---

## 3DIC-056

(warning) Conflicting matching types %s and %s found on source chip %s. Related objects: %s.

**Description**

There are more than one matching type in a physical or logical connection on the source chip, it will cause error when propagate matching type from source chip to target chip.

**What Next**

Please check the design.

---

## 3DIC-057

(warning) Matching types %s in target chip corresponding to the matching type %s in source chip during propagation. Related objects: %s.

**Description**

This messages appears because one of scenario below happens: 1. There are more than one matching types in target chip corresponding to the same matching type in source chip;

Feedback

2. The corresponding matching type in source chip and target chip has different matching type name.

**What Next**

Please check the design.

---

## 3DIC-058

(warning) Objects do not have physical contact or logical connection with the other objects of the same matching type %s and were not propagated.

**Description**

Objects do not have physical contact or logical connection with the other objects of the same matching type and were not propagate.

**What Next**

Please check the design.

---

## 3DIC-059

(warning) %s is specified, %s will be ignored.

**Description**

%s has high priority than %s.

**What Next**

Specify one of these two options.

---

## 3DIC-060

(error) The objects with same matching type name %s in source chip and target chip have no connections.

**Description**

The objects with same matching in two chips must have connection with each other.

**What Next**

Rename or remove matching type %s in target chip. Or use -force to solve this conflict.

Feedback

## 3DIC-061

(warning) The objects with same matching type name %s in source chip and target chip have no connections.

**Description**

The objects with same matching in two chips must have connection with each other.

**What Next**

Please check the design.

## 3DIC-062

(error) Specified pins are not connected to the same existing net.

**Description**

Specified pins connected to multiple nets.

**What Next**

Check command option value.

## 3DIC-063

(error) %s %s does not physically connect to the %s on the adjacent side of the vertical neighboring chip, the reason is '%s'.

**Description**

Found single bump or bond pad on the chip. These single bump and bond pad cannot be used to construct physical connections.

**What Next**

Adjust the location of chips or remove the single bump/bond pad or use create_3d_mirror_bumps to create bump pair/bond pad pair.

## 3DIC-064

(error) Non-aligned %s pair {%s, %s}, exceed tolerance of %s.

**Description**

%s %s and %s are physically contact but non-aligned, exceed tolerance of %s.

Feedback

**What Next**

Adjust bump or bond pad location or enlarge the alignment threshold of two bumps' center by set plan.3dic.bump_alignment_threshold.

---

## 3DIC-065

(error) %s {%s, %s} overlap with each other in a single chip.

**Description**

%s {%s, %s} overlap with each other in a single chip.

**What Next**

Adjust bump or bond pad location.

---

## 3DIC-066

(error) %s %s contacts to more than one %s {%s} of the neighboring die.

**Description**

%s %s contacts to more than one %s {%s} of the neighboring die.

**What Next**

Adjust bump location.

---

## 3DIC-067

(warning) No bump pair or bond pad pair on the adjacent sides between two vertical neighboring and overlap chips: {%s} and {%s}.

**Description**

No bump pair or bond pad pair between two vertical neighboring and overlap chips, then it cannot build any legal inter-chip connections between the two chips.

**What Next**

Check the design about below issues: 1. check the orientation of adjacent chips. 2. check there are valid bumps or bond pads on the adjacent sides between two vertical neighboring chips, the valid bumps must have metal shape on the off-die layer and its design type is flip_chip_pad. The valid bond pads also must have metal shape on the off-die layer and the attribute of 'is_bond_pad' is true.

Feedback

## 3DIC-068

(info) Specified pins are not connected to net, creating a default net %s to connect the pins.

**Description**

Specified pins are not connected to net, creating a default net to connect the pins.

**What Next**

Check command option value.

## 3DIC-069

(info) Creating a default net %s to connect the TSV.

**Description**

Creating a default net to connect the TSV.

**What Next**

Check command option value.

## 3DIC-070

(info) BPConstraint is created on TSV port %s and the destination pin is %s.

**Description**

BPConstraint is created on TSV and the destination pin.

**What Next**

Check BPConstraint.

## 3DIC-071

(error) No bump pair or bond pad pair for the top-level logical connection %s.

**Description**

Each logical connection should correspond to a bump pair or bond pad pair.

**What Next**

Make sure the top-level logic connection is correct.

Feedback

## 3DIC-072

(warning) %s %s and %s are contacted, but they have no net.

**Description**

If two bumps or bond pads are center-aligned, one bump-pin or bond pad should be connected to a top-level net, otherwise, the bump or bond pad in other side cannot be propagated with net connection. If two or one of these two bumps is dummy, the issue is legal and this violation will not be reported.

**What Next**

Make sure the top-level connection is correct.

## 3DIC-073

(error) Center-aligned %s pair {%s, %s} does not connect to the same net.

**Description**

If two bumps or bond pads are center-aligned, but the bump-pins' or bond pads' connected driver-pins are in different top-level nets, the logical net propagation will skip the scenario due to such critical error. Also, if one bump or bond pad is connected to top-level net while another has no top level net connection, the error message should also be reported. If one bump or bond pad is dummy, the other bump or bond pad is connected to top-level power net, this issue is legal and this violation will not be reported.

**What Next**

Make sure the top-level connection is correct.

## 3DIC-074

(info) TSV %s port %s is connected to net %s.

**Description**

Connect TSV port to net.

**What Next**

Complete assign tsv.

## 3DIC-075

(info) Pin %s is connected to net %s.

Feedback

**Description**

Connect pin to net.

**What Next**

Complete assign tsv.

---

## 3DIC-076

(error) The Z value of chips are not continuous.

**Description**

The Z value of chips are not continuous.

**What Next**

Modify the Z value of chips by command set_3d_chip_placement or set_cell_location.

---

## 3DIC-077

(error) All chips in the design have the same Z value.

**Description**

In 3D design, chips that are stacked should have different Z value.

**What Next**

Modify the Z value of chips by command set_3d_chip_placement or set_cell_location.

---

## 3DIC-078

(error) The Z value of the chips do not start from 0.

**Description**

In 3D design, chip with a Z value equals to 0 is seen as base chip, so it is required to have one chip with Z value equal to 0 in design.

**What Next**

Modify the Z value of chips by command set_3d_chip_placement or set_cell_location.

---

## 3DIC-079

(warning) %s.

Feedback

**Description**

Warnings are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-080

(error) The chips {%s, %s} with the same Z value are overlapping.

**Description**

In 3D design, the chips with the same Z value are in the same layer and should not overlapped.

**What Next**

Modify the attributes of chips by command set_3d_chip_placement or set_cell_location.

---

## 3DIC-081

(error) Vertical neighboring chips {%s, %s} are partially overlapped rather than the large one completely covers the small one.

**Description**

For two neighboring chips, if they overlapped on virtual top level, the larger chip should contain the other chip.

**What Next**

Modify the attributes of chips by command set_3d_chip_placement or set_cell_location.

---

## 3DIC-082

(info) BPConstraint is created on TSV port %s and the destination pin is TSV %s's pin %s.

**Description**

BPConstraint is created on TSV and TSV pin.

**What Next**

Check BPConstraint.

Feedback

## 3DIC-083

(error) Originally TSV %s connected to net %s, and can not be connected to net %s.

**Description**

Can not connect TSV to net.

**What Next**

Disconnect TSV original net and reconnect it.

## 3DIC-084

(error) Found distance %s between the TSV %s and the boundary of design %s on %s direction less than %s.

**Description**

You receive this message because the spacing between TSV and chip's boundary is less then tsvKeepoutSpacing that defined in the tech file.

**What Next**

Check and move TSV's location.

## 3DIC-085

(error) The TSV %s is not inside the boundary of design %s.

**Description**

You receive this message because some TSV are not in chip's boundary.

**What Next**

Check and move TSV's location.

## 3DIC-086

(error) found distance %s between the TSV %s and the TSV %s on %s direction less than %s.

**Description**

You receive this message because the spacing between two TSV is less than minCutSpacing that defined in the tech file.

Feedback

**What Next**

Check and move TSV's location.

---

## 3DIC-087

(error) The bump cluster %s in design %s has more than 1 connected nets.

**Description**

You receive this message because some bump cluster in the design has more than 1 connected nets.

**What Next**

Check the related bump cluster.

---

## 3DIC-088

(error) The physical contacts between %s and %s utilize clusters that are physically inconsistent.

**Description**

If one bump in a physical contact pair belongs to a cluster, the other bump in this physical contact pair should also belong to another cluster.

**What Next**

Check the design to find where the inconsistency comes from and fix this issue manually.

---

## 3DIC-089

(error) Chip %s with %s to package does not have Z = 0.

**Description**

Chip with net to package should has Z = 0.

**What Next**

Check the settings of chip or re-assign the related nets.

---

## 3DIC-090

(error) Net %s on the top level has %s pin(s).

Feedback

**Description**

Nets on top level should link two and only two pins.

**What Next**

Check the design.

---

## 3DIC-091

(error) Net %s on the top level between bottom-most die and package does not have a connected bump or bond pad.

**Description**

The net on top level between bottom-most die and package should have a connected bump.

**What Next**

Check the design about below issues: 1. check the orientation of adjacent chips. 2. check there are valid bumps or bond pads on the adjacent sides between two vertical neighboring chips, the valid bumps must have metal shape on the off-die layer and its design type is flip_chip_pad. The valid bond pads also must have metal shape on the off-die layer and the attribute of 'is_bond_pad' is true. If need to create bumps or bond pads between bottom-most die and package, use command create_bump_array or create_bond_pad_array to create.

---

## 3DIC-092

(Error) The chip '%s' and the chip '%s' have spacing violation(s). Minimum spacing required: %s, actual spacing: %s.

**Description**

In ICC 3DIC top level, user can set a "minimum spacing" rule for any two chips of same vertical level. The rule will be honored by 3D chip placement commands or check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the 3D chip placement in top level design. If not, re-set the rule to proper value.

Feedback

## 3DIC-093

(Error) Chip '%s' and chip '%s' have enclosure violation. minimum enclosure required:%s, real enclosure:%s.

**Description**

In ICC 3DIC top level, user could set a "minimum enclosure" rule for any two vertically adjacent chips. The rule will be honored by 3D chip placement commands or check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the 3D chip placement in top level design. If not, re-set the rule to proper value.

## 3DIC-094

(error) Net %s on top level does not connect the adjacent overlapped chip.

**Description**

You receive this message because the net %s is physically infeasible.

**What Next**

Check the design.

## 3DIC-095

(error) The TSV %s is overlapping with the TSV %s.

**Description**

You receive this message because two TSV are overlapping.

**What Next**

Check and move TSV's location.

## 3DIC-096

(warning) Cannot create TSV at coordinate %s.

**Description**

The TSV cannot be created in this position.

Feedback

**What Next**

Please check TSV array.

---

## 3DIC-099

(error) Pattern cell: %s is not valid for bump cluster pattern cell.

**Description**

Pattern cell specified must meet certain pre-requisites to be valid: (a) tool does not support hierarchical pattern cells; (b) tool needs at least one bump cell to connect bump_cluster net.

**What Next**

Fix pattern cell for error situation specified in message, or specify a different pattern cell.

---

## 3DIC-100

(Error) There is no corresponding bump on the mirroring face of source chip %s.

**Description**

In command *create_3d_mirror_bumps*, user should guarantee that there are one more bumps on the mirroring face of source chip, otherwise, the error message would be reported.

**What Next**

Check the situation in source chip to assure that there exists bump on the mirroring face.

---

## 3DIC-101

(Error) Cannot find library cell %s.

**Description**

The command *create_3d_mirror_bumps* should specify correct library cell.

**What Next**

Please specify the correct library cell.

---

## 3DIC-102

(Error) Bump %s in source chip %s is overlapped with bump %s in target chip %s.

Feedback

**Description**

Before running the command *create_3d_mirror_bumps*, the user should make sure that there is no overlapped bump between source chip and target chip .

**What Next**

Use *create_3d_mirror_bumps -force* or remove the overlapped bumps in target chip.

---

## 3DIC-103

(Info) Totally mirrored %d bumps, please use 'save_block' to retain the modification, otherwise, the data will be lost.

**Description**

Report the result *create_3d_mirror_bumps*.

**What Next**

Use *save_block* to save data.

---

## 3DIC-104

(Error) Chip %s is not in design view or outline view

**Description**

The command *create_3d_mirror_bumps* can only support the operation in design view or outline view chip, if the chip is in frame view, timing view or abstract view, the command does not support the scenarios.

**What Next**

Please specify the chip with correct view.

---

## 3DIC-105

(Error) Chip %s is not aligned with chip %s

**Description**

During the execution of command *create_3d_mirror_bumps*, the source chip and the target chip should be touched with together.

**What Next**

Make sure that the chip is intersected with the other chip.

Feedback

## 3DIC-106

(Warning) Bump %s is skipped because it is not within corresponding mirrored chip %s 's die-boundary.

**Description**

During the execution of command *create_3d_mirror_bumps*, the bump on source chip should be inside the boundary of target chip.

**What Next**

Make sure that the bump is inside the die boundary of target chip.

## 3DIC-107

(Error) The source chip %s and target chip %s 's differential z value is not 1.

**Description**

In command create_3d_mirror_bumps, the source chip and target chip 's differential z value should be 1.

**What Next**

Make sure the different z value of source chip and target chip is 1.

## 3DIC-108

(Info) Please use 'save_block -hierarchical' to retain the modification, otherwise, the data will be lost.

**Description**

The IC Compiler use save_block -hierarchical to retain the modification in multiple physical hierarchy.

**What Next**

N/A

## 3DIC-109

(Warning) Bond pad %s is skipped because it is not within corresponding mirrored chip %s 's die-boundary.

Feedback

**Description**

During the execution of command *create_3d_mirror_bumps*, the bond pad on source chip should be inside the boundary of target chip.

**What Next**

Make sure that the bond pad is inside the die boundary of target chip.

---

## 3DIC-110

(Error) No correct net in top level has been defined or specified.

**Description**

In command *propagate_3d_connections* and *disconnect_3d_bumps*, users can specify the corresponding nets in the command option, however, if there is no correct net in design, the error message will be reported.

**What Next**

Check the top-level netlists.

---

## 3DIC-111

(Error) Floating port without net connection.

**Description**

In command *propagate_3d_connections*, the port should be connected with the nets, otherwise, the nearby bump cannot be propagated.

**What Next**

Check the situation in block to make sure that the port is connected with nets.

---

## 3DIC-112

(Information) There are no nets in the current block.

**Description**

It is a critical information in 3DIC commands, which there are no nets in top-level.

**What Next**

Check the top-level netlists.

Feedback

## 3DIC-113

(Warning) Chip %s is not editable, thus the change inside chip cannot be saved.

**Description**

3DIC commands should be executed on editable chip. This warning message is reported due to several reasons, e.g., the reference block of the chip is read-only, the top design is read-only or the reference library cannot be edited.

**What Next**

Make sure the corresponding chip is editable.

## 3DIC-114

(Error) Chip %s is not design view or outline view.

**Description**

3DIC commands can be only executed on the chip with design view or outline view if this chip is not a hard macro.

**What Next**

Make sure the corresponding chip is design view or outline view.

## 3DIC-115

(Error) The net %s has two unaligned bumps %s and %s connected, this net is illegal.

**Description**

In command *propagate_3d_connections*, if a net has two bumps in different chips connected, the bump should be center-aligned to keep logical and physical consistency.

**What Next**

Make sure the two bumps on the same nets are logically and physically consistent.

## 3DIC-116

(Warning) Although the bump %s and the bump %s are contacted, they have no net to propagate, skipped.

Feedback

**Description**

In command *propagate_3d_connections*, if two bumps are center-aligned, one bump-pin should be connected to a top-level net, otherwise, the bump in other side cannot be propagated with net connection.

**What Next**

Make sure the top-level connection is correct.

---

## 3DIC-117

(Error) Although the bump %s and the bump %s are center-aligned but their associated logical ports %s and %s are connected to different nets %s and %s.

**Description**

In command *propagate_3d_connections*, if two bumps are center-aligned, but the bump-pins are connected to different ports with different nets, it will cause shorts.

**What Next**

Make sure the top-level connection is correct.

---

## 3DIC-118

(Warning) Although the bump %s and the bump %s are contacted, they have no net to propagate, skipped.

**Description**

In command *propagate_3d_connections*, if two bumps are center-aligned, but with no logical connection, it is a critical error.

**What Next**

Make sure the top-level connection is correct.

---

## 3DIC-119

(Error) Derive net on %s %s failed.

**Description**

In command *propagate_3d_connections* failed to propagate logical connections for some bumps or bond pads.

Feedback

**What Next**

N/A

---

## 3DIC-120

(Error) Remove net on bump %s failed.

**Description**

In command *disconnect_3d_bumps* failed to remove logical connections for some bump pins.

**What Next**

N/A

---

## 3DIC-121

(Info) Propagate %d nets.

**Description**

The command *propagate_3d_connections* result report.

**What Next**

N/A

---

## 3DIC-122

(Info) Totally %d bump pins are disconnected from nets.

**Description**

The command *disconnect_3d_bumps* result report.

**What Next**

N/A

---

## 3DIC-123

(Error) The aligned %s %s and %s have different matching type.

Feedback

**Description**

The command *assign_3d_interchip_nets* will choose aligned bump pair or bond pad pair which flip chip drivers can be assigned, the bump pair or bond pad pair should have same matching type, otherwise, the error message will be reported.

**What Next**

Change one bump's matching type.

---

## 3DIC-124

(Error) The connected driver pin %s and %s have different matching type.

**Description**

The command *assign_3d_interchip_nets* will choose two connected driver pins in different chip to assign to bumps, the driver pins should have same matching type, otherwise, the error message will be reported.

**What Next**

Change one driver pin's matching type.

---

## 3DIC-125

(Warning) Interchip net assignment between %s and drivers cannot be implemented because the number of %s pair is %d while driver pair number is %d.

**Description**

The command *assign_3d_interchip_nets* should guarantee that bump or bond pad number is not less than driver number in same matching type group. Also, both driver pair number and bump pair or bond pair number should be at least one.

**What Next**

N/A

---

## 3DIC-126

(Error) There is no bump on net %s.

**Description**

The command *propagate_3d_connections -nets -check_only* will check whether specified nets has bump pin for connection, if no bump pin is connected, the error message will be reported.

Feedback

**What Next**

Connect the net with at least one bump pin.

---

## 3DIC-127

(Error) The net %s has less than two driver pins.

**Description**

The command *propagate_3d_connections -nets* will check whether specified net must have at least two driver pins, if not, the error message will be reported.

**What Next**

N/A

---

## 3DIC-128

(Error) The net %s has one bump %s 's pin connected, the bump has not corresponding center-aligned bump for logical connection propagation.

**Description**

The command *propagate_3d_connections -nets* will check whether the bump on specified net has another center-aligned bump to be a pair.

**What Next**

Check the physical position of the bumps

---

## 3DIC-129

(Warning) The net %s has the bump-pin connected to the driver-pin, it will be skipped in inter-chip net assignment.

**Description**

The command *assign_3d_interchip_nets* will check whether the net has the bump pin connected on it, if there is bump pin on the net, this net will be skipped in the assignment afterwards.

**What Next**

Check the logical connection of the net

Feedback

## 3DIC-130

(Warning) The matching type '%s' group have no corresponding driver-pin pair for inter-chip net assignment.

**Description**

The command *assign_3d_interchip_nets* can do net assignment for different matching type, however, if there is no driver-pin pair, the warning message will be reported.

**What Next**

Make sure there is driver-pin in this matching type group.

## 3DIC-131

(Warning) The matching type '%s' group have no corresponding bump-pin pair for inter-chip net assignment.

**Description**

The command *assign_3d_interchip_nets* can do net assignment for different matching type, however, if there is no bump-pin pair, the warning message will be reported.

**What Next**

Make sure there is bump-pin in this matching type group.

## 3DIC-132

(Warning) Matching type %s does not exist in the child blocks of top design and will be ignored.

**Description**

%s in -matching_type list does not exist in the child blocks of top design.

**What Next**

This matching type will be ignored.

## 3DIC-133

(error) No matching type defined in child blocks of top design.

**Description**

No matching type defined in child blocks of top design.

Feedback

**What Next**

Please add matching types in child blocks as chips in the top design.

---

## 3DIC-134

(Error) There is no corresponding bond pad on the mirroring face of source chip %s.

**Description**

In command *create_3d_mirror_bumps*, user should guarantee that there are one more bond pads on the mirroring face of source chip, otherwise, the error message would be reported.

**What Next**

Check the situation in source chip to assure that there exists bond pad on the mirroring face.

---

## 3DIC-135

(Error) Bond pad %s in source chip %s is overlapped with bond pad %s in target chip %s.

**Description**

Before running the command *create_3d_mirror_bumps*, the user should make sure that there is no overlapped bond pad between source chip and target chip .

**What Next**

Use *create_3d_mirror_bumps -force* or remove the overlapped bond pads in target chip.

---

## 3DIC-136

(Info) Created %d bond pads on instance: %s, layer %s by mirroring from instance: %s, layer %s.

**Description**

Mirroring bond pads from source instance to target instance.

**What Next**

Assigning and checking 3DIC interchip nets.

---

## 3DIC-137

(warning) Layer %s is not bond pad layer.

Feedback

**Description**

Layer should be bond pad layer to create bond pads.

**What Next**

Specify bond pad layer which should be off-die layer.

---

## 3DIC-138

(Info) Created %d bumps and %d bump clusters on instance %s by mirroring from instance %s.

**Description**

Mirroring bumps and bump clusters from source instance to target instance.

**What Next**

Assigning and checking 3DIC interchip nets.

---

## 3DIC-139

(error) Collection specified for pattern cell contains %d entries, it must contain exactly one entry.

**Description**

User must specify a unique specification for pattern cell. If more than one entry matches given specification, user should update specification to match only the correct pattern cell for bump cluster creation.

**What Next**

Please check the name of pattern cell as well as list of reference libraries in design setup.

---

## 3DIC-140

(error) Cannot find pattern cell, or if a collection is specified, collection is empty.

**Description**

Tool cannot create bump_cluster because given pattern cell is not found in either design or reference library.

**What Next**

Please check the name of pattern cell as well as list of reference libraries in design setup.

Feedback

## 3DIC-141

(error) Pattern cell: %s is not valid for bump_cluster creation. Reason: %s

**Description**

Pattern cell specified for create_bump_cluster command must meet certain pre-requisites to be valid for bump_cluster creation. Some of the reasons, pattern cell could be invalid is: (a) pattern cell contains hierachy - tool doe snot support hierarchical pattern cells (b) pattern cell does not contain atleast one bump cell - tool needs atleast one bump cell to connect bump_cluster net.

**What Next**

Fix pattern cell for error situation specified in message, or specify a different pattern cell.

## 3DIC-142

(error) Bump cluster with name: %s is already existing in design.

**Description**

If user specifies name for a bump cluster, it must not conflict with another existing bump cluster.

**What Next**

Provide a new non-conflicting name for creating bump cluster

## 3DIC-143

(error) Bump cluster %s overlaps with existing %s. Aborting bump cluster creation.

**Description**

Tool does not create overlapping bump clusters (unless -force option is used). It should be noted that overlap is computed based on bounding box of each bump cluster.

**What Next**

If overlap is intentional and will not impact bump cluster functionality, user can use -force option. Otherwise, user must check -coordinates and orientation for all overlapping bump clusters.

## 3DIC-144

(warning) Bump cluster %s overlaps with existing %s. Continuing with bump cluster creation as -force option is used.

Feedback

**Description**

Tool does not create overlapping bump clusters unless -force option is used. Use of -force indicates taht overlap is intentional and will not impact bump cluster functionality. It should be noted that overlap is computed based on bounding box of each bump cluster.

**What Next**

User must ensure overlap is intentional and will not impact bump cluster functionality.

---

## 3DIC-145

(warning) Net: %s exists in design, bump cluster cells will connect to this net.

**Description**

If user-specified net is already existing in design, all bump_cluster cells will connect to this net. This may cause unexpected connectivity to other terminals on the net.

**What Next**

User should ensure that specified net is supposed to exist and any resulting connectivity to the bump cluster cells is expected

---

## 3DIC-146

(warning) Object: %s inside pattern cell: %s is unsupported design type: %s ; Ignoring for bump cluster creation.

**Description**

Bump cluster creation from given pattern cell only supports certain type of design objects as valid objects. It ignores specified design object even though presence of such object in pattern cell does not invalidate pattern cell.

**What Next**

Review warning messages to see if ignored design objects are relavent to bump cluster functionality

---

## 3DIC-147

(warning) No bump clusters matched specified input, returning empty string.

Feedback

**Description**

None of bump cluster names matched the input pattern name or specified -of_objects did not belong to any bump cluster. This condition is not considered error, and command returns empty string. However, user should check if no match was expected.

**What Next**

If user expected command to match one or more bump clusters, check input to the command, or name / content of all bump clusters in the design.

---

## 3DIC-148

(error) command cannot find any bump cluster for given name, or collection is empty.

**Description**

Command did not find any bump cluster with given name, if name was provided as text. Command performs standard wildcard expansion if necessary. If collection was provided, collection was empty.

**What Next**

Check the name or collection creation command for any spelling errors. You may use get_bump_cluster_name command to see list of all bump clusters.

---

## 3DIC-149

(warning) command did not match any object for obj_type: %s.

**Description**

Command did not find any object for given type in given bump cluster(s).

**What Next**

User may check pattern cell used for such bump cluster creation if given object exist in pattern cell. Other possibility is subsequent edit of bump_cluster contents. It should be noted that TSV instances are returned with -tsvs option, and not with either -bumps or -vias option.

---

## 3DIC-150

(error) Bump Cluster creation failed.

Feedback

**Description**

This message indicates that create_bump_cluster command failed due to one or more previously reported errors.

**What Next**

User should inspect all error (and warning) messages reported by create_bump_cluster command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-151

(error) %s.

**Description**

This message describes specific situations that may cause create or get commands related to bump_cluster to fail.

**What Next**

User should inspect all error (and warning) messages reported by create_bump_cluster command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-152

(warning) %s.

**Description**

This message describes specific situations that may cause bump cluster create or get commands to generate unexpected output.

**What Next**

User should inspect all messages reported by create_bump_cluster command. Also check the manpage of the command to correct any warnings related to option settings.

---

## 3DIC-153

(error) Z value is greater than %d.

**Description**

The specified z value can not exceed the given value. It must be equal to or greater than 0 and equal to or less than the given max value.

Feedback

**What Next**

Specify a new z value less than or equal to the given max value.

---

## 3DIC-154

(warning) The user specified scaling factor will be ignored since the value of %s has been defined in TLU+ file.

**Description**

User can specify the scaling factor only if it is not set in TLU+ file. If there is scaling factor in TLU+ file, the user specified scaling factor will be ignored.

**What Next**

Use the TLU+ file based scaling factor instead of specifying a new one.

---

## 3DIC-155

(error) There is no off-die layer on the die %s that physical contact the die %s.

**Description**

The source die and target die should have physical contact off-die layers. Generally, the off-die layer is the most top metal layer with mask_name as "metal#" and the most bottom metal layer with mask_name as "bmetal#". For example, if the back-side of a die faces to another die, then generally, this die should have back-side off-die layer with mask_name as "bmetal#", # here stands for a number. Furthermore, user can use "set_3d_multilevel_stacking" to set off-die layer of a die.

**What Next**

Please check the layer settings in the technology file, or use "set_3d_multilevel_stacking" to set off-die layer of a die.

---

## 3DIC-156

(Info) Created %d bump region patterns and %d bump regions with %d pseudo bumps on instance %s by mirroring from instance %s.

**Description**

Mirroring bump regions from source instance to target instance.

**What Next**

Commit pseudo bump regions to create real bumps or bond pads.

Feedback

## 3DIC-157

(Warning) bump region %s is skipped because it is not within corresponding mirrored chip %s 's die-boundary.

**Description**

During the execution of command *create_3d_mirror_bumps*, the bump region on source chip should be overlappled with the boundary of target chip.

**What Next**

Make sure that the bump region is overlapped with the die boundary of target chip.

## 3DIC-158

(Warning) Chip %s is not editable, thus the '%s' setting on chip cannot be saved.

**Description**

3DIC commands should be executed on editable chip. This warning message is reported due to the reference block of the chip is read-only.

**What Next**

Make sure the corresponding chip is editable.

## 3DIC-160

(error) Collection specified for -from option contains object of unsupported type: %s, object name: %s

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

## 3DIC-161

(error) Collection specified for -from option contains objects of multiple types; Prior type: %s, Conflicting type: %s at index: %d.

Feedback

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-162

(error) Collection specified for -to_object_ref option contains object of invalid type: %s; Allowed types are: TSV_ViaDef, BumpCell_Design, BondPad_Def or BondPad_Layer.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-163

(error) Total %d derived object will lie outside block boundary. First occurence is given below:

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-164

(error) Collection specified for -from option is empty. It must contain at least one object.

**Description**

derive_3d_interface error message description is TBD

Feedback

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-165

(error) Collection specified for -to_object_ref option is empty. It must contain at least one object.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-166

(error) Collection specified for -to_object_ref reference cell/layer contains %d entries, it must contain exactly one entry.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-167

(error) Value specified for -coord_spec contains %d tokens, it must contain exactly 2 tokens.

**Description**

derive_3d_interface error message description is TBD

Feedback

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-168

(error) Value specified for -coord_spec contains invalid token(s). It must be one of c|bl|br|tl|tr.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-169

(error) Value specified for -connect must be one of true|false

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-170

(error) Command aborting due to input errors. No objects were created. Reason: %s

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

Feedback

## 3DIC-171

(error) Command must specify -bond_pad_width/-bond_pad_height if to_object_ref is BondPad type.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

## 3DIC-172

(error) Command must specify positive value for -bond_pad_width and -bond_pad_height.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

## 3DIC-173

(warning) Command will ignore specified -bond_pad_width/-bond_pad_height because to_object_ref is not of BondPad type.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

## 3DIC-174

(warning) Created Objects cannot use _index1_index2 naming because %s.

Feedback

**Description**

If the object name to be copied have naming style like <string>_<index1>_<index2>, derive_3d_interface will name the derived objects with <name_prefix>_<index1>_<index2>. Otherwise, the command will name the object with <name_prefix>_<string>. And a postfix _<number> will be added when there is a name conflict.

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-175

(warning) BlkInst: %s is connected to multiple nets: i) %s , and ii) %s ; First will be used for connecting derived object.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-176

(error) No bump needs any RV landing via.

**Description**

There is not a single bump needs any RV landing.

**What Next**

Please check your design and the pattern file. Only bumps on the front side of the die can have RV landings. All bumps in the exclusion section of the pattern file are excluded. In addition, only bumps on the top metal layer are chosen by default. You can try to specify viaDef of the RV landing in the pattern file.

---

## 3DIC-177

(error) The following line in pattern file %s: %s.

Feedback

**Description**

The description of the pattern file is not clear.

**What Next**

Please check your pattern file. All lines must follow the pattern file format.

---

## 3DIC-178

(error) %s.

**Description**

The bump via insertion fails.

**What Next**

Please change the pattern file based on the error information.

---

## 3DIC-179

(error) distance value missing in line %s.

**Description**

No distance value is found in this line of the pattern file.

**What Next**

Please change the pattern file based on the error information.

---

## 3DIC-180

(error) Bump cell that specified by '-ref_cell %s' has no terminal on the metal layer %s.

**Description**

To form contact bump pair, the mirrored bump that specified by '-ref_cell %s’ should have terminals on the metal layer %s.

**What Next**

Please specify another lib_cell for "-ref_cell" or specify another orientation for the target chip by usign cmd "set_cell_location".

Feedback

## 3DIC-181

(error) via %s cannot be on level %d since it requires more routing layers than that defined by the current technology.

**Description**

User pattern file requires more layers than what is defined.

**What Next**

Please check the technology of the design or change the pattern file.

## 3DIC-182

(warning) Command will ignore specified -bond_pad_width/-bond_pad_height because to_object_ref is BondPad_Def type.

**Description**

derive_3d_interface error message description is TBD

**What Next**

User should inspect all error and warning messages reported by derive_3d_interface command. Also check the manpage of the command to correct any errors related to option settings.

## 3DIC-190

(Error) No correct %s in the top level has been defined or specified.

**Description**

In command *derive_3d_connections*, users can specify the corresponding nets and ports in the top level in the command option, otherwise, the error message will be reported.

**What Next**

Check the top-level netlists.

## 3DIC-191

(Error) No valid die has been defined or specified.

Feedback

**Description**

In command *derive_3d_connections*, users should specify the correct dies in the command option, otherwise, the error message will be reported.

**What Next**

Check the dies in the current design.

---

## 3DIC-192

(Warning) %s is not in the top level, skip it.

**Description**

In command *derive_3d_connections*, users can specify the corresponding nets and ports in the top level in the command option, otherwise, the warning message will be reported.

**What Next**

Check the top-level netlists.

---

## 3DIC-193

(Warning) Pin %s is connected to the top net %s which doesn't connect to the port %s, skip it.

**Description**

If a pin is not connected to the port with the same name, then it should not be connected to any net in the top level.

**What Next**

Check the top-level netlists.

---

## 3DIC-194

(Warning) Net %s is connected to the top net %s, skip it.

**Description**

If a net in the die is not connected to the top net with the same name, then it should not be connected to any net in the top level.

**What Next**

Check the top-level netlists.

Feedback

## 3DIC-195

(Error) More than one library %s have block with name %s.

**Description**

More then one library have the block with the required name, it's hard for the command to decide in which library the block need to be updated.

**What Next**

Check the design.

## 3DIC-196

(Error) No library has block %s.

**Description**

No valid library or no specified library has the block with name as %s.

**What Next**

Check the design.

## 3DIC-197

(Error) Can't find the port(s) '%s' that specified by '%s' from the instances that specified by '%s'.

**Description**

The port specified by '-input' or '-output' option should exist on the specified instances.

**What Next**

Check the design.

## 3DIC-198

(Warning) Command '%s' is deprecated, please use the command '%s'.

**Description**

The old command is deprecated and replaced with another command with same functions.

**What Next**

NA.

Feedback

## 3DIC-200

(info) %s.

**Description**

3DIC Information message

**What Next**

Not applicable

## 3DIC-201

(error) 3DIC top-level chip placement is not correct. Use check_3d_design -chip_placement to identify and resolve all issues.

**Description**

If 3DIC top-level design has chip placement issues, these should be debug using check_3d_design -chip_placement command, and all reported errors must be fixed before proceeding.

**What Next**

Use check_3d_design -chip_placement to identify and resolve all issues.

## 3DIC-202

(warning) Via for bump %s cannot be placed in net bounding box due to user location constraints.

**Description**

User has provided location constraints for the via. The location constraint, if honored, results in the placement of via outside of the bounding box of the corresponding net.

**What Next**

Please check the user constraints and make sure it is correct. In addition, please check the via location. Change location constraints in the pattern file is needed.

## 3DIC-203

(warning) Via for bump %s has %s spacing violation due to user location constraints.

Feedback

**Description**

User has provided the exact location for the via. Although the tool places the via at the location, there is at least one design rule violation. The via may be too close to or overlap with bumps, vias, pre-routes, or blockages.

**What Next**

Please check the user constraints and make sure it is correct. Alternatively, user can change the design to fix the design rule violation.

---

## 3DIC-204

(error) because %s, the following line in pattern file cannot be processed: %s.

**Description**

The specified the line in pattern file contains incorrect information.

**What Next**

Please delete or correct the line.

---

## 3DIC-205

(warning) only single via will be inserted by default, stacked via spacing from pattern file is ignored.

**Description**

Since user does not specify any stacked via information nor stack level, the tool will insert single vias not stacked vias. Therefore, the stacked via spacing information in the pattern file is ignored.

**What Next**

If stacked vias are needed, please specify additional information in the pattern file. For example, user can use stack_level keyword.

---

## 3DIC-206

(warning) stacked via spacing larger than stack level %d is ignored.

**Description**

If stacked via spacing cannot be applied, it will be ignored. For instance, if stacked level is 1, you will have two levels of vias. If you specify the via spacing constraint for the third level or more, the information is ignored.

Feedback

**What Next**

Please correct any mistake in the pattern file related to via configuration.

---

## 3DIC-207

(warning) via_def in config section is choose for level %d.

**Description**

if both configuration section and drc section specify via_def for the same level, the via_def in configuration section is used.

**What Next**

Please fix the pattern file if needed.

---

## 3DIC-208

(error) stacked vias creation failure for net %s.

**Description**

Errors are found during the via placement.Although the top level via is placed successfully, one or many stacked via are not placed. Please check the result.

**What Next**

Examine all vias on the net. Perform manual editing of the design if needed.

---

## 3DIC-209

(warning) ignore %d top routing layers because via %s is on level %d.

**Description**

User pattern file specifies the via level. Based on this specification, some routing layers are ignored. Note that only bumps on the top layer according to the pattern file are considered. It is very likely that the pattern file is incorrect.

**What Next**

Please check the technology of the design or change the pattern file.

---

## 3DIC-210

(error) via cannot be inserted for bump %s.

Feedback

**Description**

The tool fails to find a legal location to place a via for a bump. There can be various reasons for this to occur. There might be routes or blockages that prevent the placement of a via. There might be bumps or other vias that prevent the placement of a via. The bounding box of the bump net might be too small.

**What Next**

Please check your design. User can provide the exact location for the via using the location constraint in pattern file.

---

## 3DIC-211

(warning) multiple stack level constraints are given and the largest value will be used

**Description**

There are multiple stack level constraints in the pattern file. The tool will use the largest value.

**What Next**

Change pattern file if needed.

---

## 3DIC-212

(warning) extra via_def beyond stack level in config section of the pattern file is ignored.

**Description**

There are more via_def given than the value defined by stack level.

**What Next**

Change pattern file if needed.

---

## 3DIC-213

(warning) via for net %s cannot be placed on pre-routes.

**Description**

User has selected "flat_net" mode for the via insertion. However, the tool cannot place the via on any RDL-layer pre-routes of the net. There can be several reason for this situation. There might not be any pre-routes in the design. The net might not be connected to any other pins except for bump pins on RDL layer. The tool will try to place the via close to a bump of the net instead.

Feedback

**What Next**

Please check the via created. If user wants to place the via on pre-routes, please add routes on RDL layers either manually or using a RDL router.

---

## 3DIC-214

(error) The following line does not describe a single %s cell: %s.

**Description**

The tool expects the name of a single bump cell or a single reference cell in the given portion of the pattern file.

**What Next**

Please correct the pattern file.

---

## 3DIC-215

(warning) some bump is not placed on min-grid.

**Description**

When bumps are not on min-grid, escaping vias cannot be placed next to bumps. The tool will use an enlarge boundary box of the corresponding bump to place the via.

**What Next**

Check the bump placement. If needed, adjust the relative position constraint of escaping vias.

---

## 3DIC-216

(warning) Pattern cell does not contain any cell of type: flip_chip_pad.

**Description**

Pattern cell specified for create_bump_cluster command may not be valid for bump_cluster creation because pattern cell does not contain at least one bump cell.

**What Next**

Fix pattern cell for warning situation specified in message, or specify a different pattern cell.

Feedback

## 3DIC-220

(error) bump pair {%s %s} have different matching types {%s %s}.

**Description**

There are more than one matching type in a physical contact pair, it will cause error when propagate matching type from source chip to target chip.

**What Next**

Please check the design. Using -force may help to solve this conflict.

## 3DIC-221

(warning) bump pair {%s %s} have different matching types {%s %s}.

**Description**

There are more than one matching type in a physical contact pair.

**What Next**

Please check the design.

## 3DIC-222

(error) Matching types {%s} in target chip %s corresponding to the matching types {%s} in source chip during propagation.

**Description**

This messages appears because one of scenario below happens: 1. There are more than one matching types in target chip corresponding to the same matching type in source chip; 2. The corresponding matching type in source chip and target chip has different matching type name.

**What Next**

Please check the design. Using -force may help to solve this conflict.

## 3DIC-223

(warning) Matching types {%s} in target chip %s corresponding to the matching types {%s} in source chip during propagation.

Feedback

**Description**

This messages appears because one of scenario below happens: 1. There are more than one matching types in target chip corresponding to the same matching type in source chip; 2. The corresponding matching type in source chip and target chip has different matching type name.

**What Next**

Please check the design.

---

## 3DIC-224

(error) routing on layer %s cannot go around bump escaping vias.

**Description**

Bump escaping vias are aligned to their corresponding routing. The routing of signal nets between the lower and upper layer of a via must go around the via if the via is close. In current 3D routing where tracks are evenly spaced, the track of the via cannot be the same as that of the net which needs to go around the via. Otherwise, there is no room for the net to go round.

**What Next**

Please set the stub_alignment_type option to staggered_before or staggered_after in the pattern file.

---

## 3DIC-225

(warning) exclusion section is ignored when bump_array_box is used in single_hbm style.

**Description**

If user uses the bump_array_box to define a 3D channel, the exclusion section in the pattern file is ignored. The option excluded_bump_in_box should be used to exclude any bumps inside the bump array boxes.

**What Next**

Use excluded_bump_in_box if needed. Remove the exclusion section from the pattern file.

---

## 3DIC-226

(warning) The reference_cell and bump constraints in the inclusion or exclusion section are ignored when single_hbm style is chosen.

Feedback

**Description**

When the single_bump style is chosen, the channel components cannot be described using the reference_cell and bump constraints in the inclusion or exclusion section. The channel can be defined using net constraints. It is recommended to use bump_array_box constraint in the exception section for 3D channel definition.

**What Next**

User bump_array_box for 3D channel definition. The following keywords are supported for hbm channel definition: net in inclusion section, float_bump, 2pin_through_net, bump_array_box, and excluded_bump_in_box in the exception section.

---

## 3DIC-227

(error) The middle_turn_offset is too large to fit in the middle section of the 3D channel.

**Description**

The value given is too large.

**What Next**

Reduce the value. If the value cannot be reduced, please try to route the middle section of the channel using a different pattern.

---

## 3DIC-228

(error) bump array does not match the pattern of an 3D channel: %s.

**Description**

An 3D channel usually contains two bump arrays, on the two ends of the channel, respectively. There are same number of bumps in either bump array. The bump count in a bump array is usually an even number. All bumps must be described in the pattern file although some bumps might not need routing. Moreover, bumps form an array of either inline or staggered pattern on either side of the channel.

**What Next**

Modify the pattern file to fully describe the 3D channel. User can use net or bump description.

---

## 3DIC-229

(error) 3D channel route planning cannot handle nets connected to three or more bumps.

Feedback

**Description**

During 3D channel routing, only two pin nets are routed.

**What Next**

Modify the netlist and/or pattern file so that the target design meet an 3D channel description.

---

## 3DIC-230

(error) Net specified by 2pin_through_net has incorrect connectivity or a net is partially selected.

**Description**

A through net must connect a single bump at the front side of the die and a single bump at the back side of the die. If a net has other connectivity, it cannot be a through net. Another reason that this message is issued is that a net is partially selected for the 3D channel. User must select the entire net to proceed.

**What Next**

Check all through nets. Modify the netlist and/or pattern file to correct the connectivity information.

---

## 3DIC-231

(warning) routing stubs snapped to the min-grid.

**Description**

Routing shapes must be placed on the min-grid. The stub locations specified by user using boundary_stub_corners is not on the mid-grid. The tool moves the stubs to the nearest mid-grid locations.

**What Next**

Check the routing result. If needed, change the pattern file.

---

## 3DIC-232

(error) via dimension is too wide for track alignment.

**Description**

In 3D routing, the pitch of wire tracks is the sum of wire width and wire spacing. The wire pitch must be large enough so that bump connection vias can be placed on a wire without

Feedback

introducing routing rule vioation between the via and neighoring wire track. Normally, via width or height should not be larger than twice of wire pitch minus wire width, for vertical or horizontal channels, respectively.

**What Next**

Choose a different via configuration to reduce via dimension or increase wire pitch.

---

## 3DIC-233

(error) bump %s cannot be excluded since it is connected to a two-bump net inside the 3D channel.

**Description**

All nets connected to two and only two bumps inside the 3D channel must be routed. Any bump connected to such nets cannot be excluded using float_bump.

**What Next**

Modify the netlist by removing the bump from its net or change the pattern file. The netlist and pattern file must be consistent.

---

## 3DIC-234

(error) middle section turn direction is ambiguous, please %s mid-track routing pitch.

**Description**

The middle section routing cannot be completed. Please adjust midtrack_spacing and/or midtrack_width.

**What Next**

Change midtrack_spacing and/or midtrack_width.

---

## 3DIC-235

(error) middle section routes cannot be created: %s.

**Description**

The middle section routing cannot be completed. Please check the dimension of the specified fraction. In particular, the length of the fraction must be no less than the width of its neighbor fraction, which is equal to the routing pitch times N-1, where N is the number of tracks, including tracks with no route. This error only occurs for Manhattan style middle section routing.

Feedback

**What Next**

Modify the middle section constraint midtrack_lengths to change the fraction lengths or change fraction routing pitch using midtrack_turn_spacing, midtrack_turn_width, midtrack_spacing, midtrack_width.

---

## 3DIC-236

(error) %s.

**Description**

In the current routing mode, the wire width must be less than the wire spacing in order to derive a DRC violation free routing result.

**What Next**

Modify the wire_spacing and/or wire_width in the pattern file.

---

## 3DIC-237

(error) fail to assign nets to routing stubs.

**Description**

The tool cannot assign all nets to routing tracks inside the 3D channel. It is likely that the channel routing capacity, which is determined by boundary_stub_range, is insufficient.

**What Next**

Increase the channel capacity by changing the values after boundary_stub_range in the pattern file.

---

## 3DIC-238

(error) the number of nets is %d, which is larger than the maximal track count %d.

**Description**

The 3D channel contains more nets than the routing capacity. It is impossible to route all nets.

**What Next**

Modify the pattern file or the netlist.

Feedback

## 3DIC-239

(error) Routing layer %s is invalid.

**Description**

The routing layer cannot be used. User may use the incorrect routing layer name.

**What Next**

Please check the routing layer names.

## 3DIC-240

(error) cannot derive valid shielding layers for middle section.

**Description**

Normally, the shielding layers should not be the same as layers used for signal routing. For an 3D channel, two layers are used for signal routing. The two layers below the corresponding signal routing layers are candidated for middle section shielding.

**What Next**

Please check the signal routing layers. The two layers cannot be adjacent.

## 3DIC-241

(error) cannot route all %d nets with space only enough for %d tracks.

**Description**

There is not enough space to route all nets in the bump array regions of an 3D channel.

**What Next**

There are multiple ways to increase the channel capacity. User can reduce routing width and/or spacing. User can reduce the size of bump access vias. If user uses boundary_stub_range in the pattern file, its parameters can be changed to increase the route area.

## 3DIC-242

(error) cannot route all nets within the specified range.

**Description**

There is not enough space to route all nets within the user specified range.

Feedback

**What Next**

Please increase the boundary_stub_range in the pattern file.

---

## 3DIC-243

(error) not enough routing stubs are available for net assignment: have %d but expect %d.

**Description**

There is not enough space to route all nets within the user specified range.

**What Next**

Please increase the boundary_stub_range in the pattern file. User can try without using boundary_stub_range in order to find out how wide the channel need to be.

---

## 3DIC-244

(error) fail to assign nets to boundary stubs on layer %s.

**Description**

There is not enough routing stubs for all nets on the specified layer.

**What Next**

Please increase the boundary_stub_range in the pattern file. User can try without using boundary_stub_range in order to find out how wide the channel need to be.

---

## 3DIC-245

(warning) bump access via dimension is equal to or larger than half of track pitch.

**Description**

Wider vias occupy more space. Therefore it is more difficult to route around them. In the extreme case, routing violations might not be completed avoided.

**What Next**

Please check the routing result to search for any routing violations.

---

## 3DIC-246

(error) bump access via dimension is too large.

Feedback

**Description**

Wider vias occupy more space. The tool cannot find a routable solution.

**What Next**

Please increase the space between adjacent tracks or use narrow vias.

---

## 3DIC-247

(error) failed to create stacked vias: %s.

**Description**

The tool is not able to create stacked vias for signal routing due to the given reason.

**What Next**

Please fix the specified issue.

---

## 3DIC-248

(error) fail to assign tracks in bump array regions.

**Description**

The tool is not able to assign nets to routing tracks in the bump array regions. It is probably due to insuffcient tracks or tracks are not aligned to their corresponding bumps. Note that bump track locations are defined by boundary_stub_corners and are limited by boundary_stub_range.

**What Next**

Please increase the channel width defined by boundary_stub_range, or move the track ranges also defined by boundary_stub_range, or adjust bump-net assignment. User might also change the track locations by changing boundary_stub_corners and/or boundary_stub_range.

---

## 3DIC-249

(error) some new stub overlaps with bump-access vias.

**Description**

The tool is able to proceed. However, a routing stub overlaps with a bump-access via. The result is not routing rule clean.

Feedback

**What Next**

Please adjust pattern file paramenters to resolve overlap violations.

---

## 3DIC-250

(warning) Only %d routing layers are available.

**Description**

The tool is able to proceed. However, lack of routing layers might lead to bad routing and/or shielding result.

**What Next**

Please check the technology file and see whether any layer information is missing.

---

## 3DIC-251

(error) Cannot handle net %s with %d bumps.

**Description**

The tool can only route nets with two bumps.

**What Next**

Please check the netlist. If the netlist is correct, disconnect the bumps from the specified net and re-connect them after 3D routing.

---

## 3DIC-252

(error) bump %s and bump %s are not assigned to the same net.

**Description**

In an 3D design, there are two bump arrays at the two ends of the channel, respectively. Bumps in the two arrays are connected by 2-pin nets. For each pair of bumps connected by a net, they must be placed at the same relative locations inside the corresponding arrays.

**What Next**

Adjust the bump-to-net assignment or replace bumps.

---

## 3DIC-253

(error) fail to place access via for bump %s

Feedback

**Description**

Tool cannot find a feasible location to place a bump access via.

**What Next**

Reduce the via dimension described in the pattern file.

---

## 3DIC-254

(warning) bump %s ignored in low design hierarchy.

**Description**

Tool only processes top level bumps.

**What Next**

Please pop-up bumps in side any block.

---

## 3DIC-255

(error) %s are placed at different layers.

**Description**

all micro-bumps must be on the same metal layers. All C4 bumps must be on the same layer.

**What Next**

Check bumps or C4s in the design. Remove nets from the command line option if needed.

---

## 3DIC-256

(error) the chip specified by -to should be block with design view.

**Description**

The target chip should be block with design view.

**What Next**

Please check the design.

---

## 3DIC-257

(error) %s is destructible, it contacts with %s %s.

Feedback

**Description**

The object that contacts with destructible probe pad or probe pad cell should also be probe pad or probe pad cell and both have the same top level connection. The "destrutible" object is defined by the attribute "is_destrutible".

**What Next**

Please check the design.

---

## 3DIC-260

(error) The pg net %s doesn't connect to the package.

**Description**

The package supply power to the pg net in the design, the pg net should connect to the port on the package.

**What Next**

Please check the design.

---

## 3DIC-261

(error) The pg net %s is not continuous between package and %s.

**Description**

The package supply power to the pg net in the design and the pg net should always connect to the vertical adjacent dies. The the Z value of the dies that connect to the same PG net should be continuous.

**What Next**

Please check the design.

---

## 3DIC-262

(error) %s %s does not physically connect to the %s on the adjacent side of the vertical neighboring chip, the reason is '%s'.

**Description**

Found dangling dummy bump or bond pad on the chip.

Feedback

**What Next**

Adjust the location of chips or remove the dangling bump/bond pad or use create_3d_mirror_bumps to create bump pair/bond pad pair.

---

## 3DIC-263

(error) Non-aligned %s pair {%s, %s}, exceed tolerance of %s.

**Description**

%s %s and %s are physically contact but non-aligned, exceed tolerance of %s.

**What Next**

Adjust bump or bond pad location or enlarge the alignment threshold of two bumps' center by set plan.3dic.bump_alignment_threshold.

---

## 3DIC-264

(error) %s %s contacts to more than one %s {%s} of the neighboring die.

**Description**

%s %s contacts to more than one %s {%s} of the neighboring die.

**What Next**

Adjust bump location.

---

## 3DIC-265

(error) %s {%s, %s} overlap with each other in a single chip.

**Description**

%s {%s, %s} overlap with each other in a single chip.

**What Next**

Adjust bump or bond pad location.

---

## 3DIC-266

(warning) %s %s is not covered by the %s neighboring chip.

**Description**

Found dangling bump or bond pad is not covered by the vertical neighboring chip .

Feedback

**What Next**

Adjust the location of chips or remove the dangling bump or bond pad if needed.

---

## 3DIC-267

(warning) %s %s is not covered by the %s neighboring chip.

**Description**

Found dangling dummy bump or bond pad is not covered by the vertical neighboring chip .

**What Next**

Adjust the location of chips or remove the dangling dummy bump or bond pad if needed.

---

## 3DIC-268

(error) The dummy %s %s connect to no-dummy cell(s) %s in the same die.

**Description**

The dummy bump or bond pad connect to no-dummy cells in the same die which is not allowed.

**What Next**

Check the net connections of the dummy bump.

---

## 3DIC-269

(error) The dummy %s %s connect to more than one no-dummy cells which are in different dies.

**Description**

The dummy bump or bond pad connect to more than one no-dummy cells, this dummy bump or bond pad may be used for the net connections which is not allowed.

**What Next**

Check the net connections of the dummy bump.

---

## 3DIC-270

(error) The %s spacing between the chip {%s} and {%s} is %s which violate the constraint. The valid range is {%s, %s}.

Feedback

**Description**

In 3DIC design, user can set some spacing constraint for any two chips of same vertical level by setting app options: "plan.3dic.chip_vertical_spacing" or "plan.3dic.chip_horizontal_spacing", these constraints will be honored by check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the 3D chip placement in top level design. If not, re-set the constraint to proper value.

---

## 3DIC-271

(error) The %s misalignment between the chip {%s} and {%s} is %s which violate the constraint. The valid range is {%s, %s}.

**Description**

In 3DIC design, user can set some alignment constraint for any two chips of same vertical level by setting app options: "plan.3dic.chip_vertical_misalignment" or "plan.3dic.chip_horizontal_misalignment", these constraints will be honored by check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the 3D chip placement in top level design. If not, re-set the constraint to proper value.

---

## 3DIC-272

(error) The enclosure spacing between the chip {%s} and {%s} is %s which violate the constraint. The valid range is {%s, %s}.

**Description**

In 3DIC design, user can set enclosure constraint for two vertical neighboring chips by setting app option: "plan.3dic.chip_enclosure", this constraint will be honored by check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the 3D chip placement in top level design. If not, re-set the constraint to proper value.

Feedback

## 3DIC-273

(error) The %s %s %s is in the forbidden zone.

**Description**

In 3DIC design, user can set forbidden zone for connected or unconnected bump by setting app options: "plan.3dic.forbidden_spacing_of_unconnected_bump" or "plan.3dic.forbidden_spacing_of_connected_bump", this constraint will be honored by check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the bump placement in the chips. If not, re-set the constraint to proper value.

## 3DIC-274

(error) The %s %s %s is in the forbidden zone.

**Description**

In 3DIC design, user can set forbidden zone for connected or unconnected bump by setting app options: "plan.3dic.forbidden_spacing_of_unconnected_bump" or "plan.3dic.forbidden_spacing_of_connected_bump", this constraint will be honored by check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, correct the bump placement in the chips. If not, re-set the constraint to proper value.

## 3DIC-275

(error) The %s of bump cluster %s is larger than the constraint.

**Description**

In 3DIC design, user can set app option: "plan.3dic.max_bump_cluster_size" to make sure all bump clusters are within the specified {width height}, this constraint will be honored by check commands to report violations.

**What Next**

Double confirm the reported violation is as expected. If yes, re-generate the bump clusters. If not, re-set the constraint to proper value.

Feedback

## 3DIC-276

(error) Fail to create routing guidance file: %s.

**Description**

Cannot open the guidance file. It could happen when you do not have write permission in current working directory.

**What Next**

Please make sure that the guidance file can be created.

## 3DIC-277

(error) Fail to create routing guidance file for middle section routing.

**Description**

This error occurs when simple angled routing in the middle section fails due to insufficient routing resource.

**What Next**

Please check the design and adjust wire_spacing, wire_width, boundary_stub_gaps, or the number of routing layers in the pattern file.

## 3DIC-278

(error) Fail to create routing guidance file for vias to C4 bump connection.

**Description**

This error occurs due to improper C4 bump arrangement or wrong net-to-C4 assignment. For example, two C4 bumps are too close, or there are two or more nets assigned to the same C4 bump.

**What Next**

Please check and adjust the C4 bump arrangement.

## 3DIC-279

(error) Route planning failed for metal layer %s due to track bump alignment.

Feedback

**Description**

For two layer routing, tracks can be aligned in three different types (inline, staggered_before, staggered_after) specified by stub_alignment_type in the pattern file. This error occurs when the wire width and spacing cannot satisfy the specified alignment type.

**What Next**

Please adjust the settings related to wire width and spacing in the pattern file: wire_width, midtrack_turn_width, midtrack_width, wire_width_left_array, wire_width_lower_array, wire_width_right_array, wire_width_upper_array, boundary_stub_staggered_offset, wire_spacing, midtrack_spacing, midtrack_turn_spacing, boundary_stub_gaps, boundary_stub_gaps_high, boundary_stub_gaps_low, boundary_stub_gaps_middle.

---

## 3DIC-280

(error) Fail to place escaping vias to access bumps for lower routing layer.

**Description**

Fail to place escaping vias to access bumps in lower routing layer. This error may result from insufficient routing resource in bump array or multiple nets assigned to the same bump.

**What Next**

Please check if the routing channel is sufficient to route the number of target nets with given routing pitch, considering the space for escaping via placement or there are more than one net assigned to the same bump.

---

## 3DIC-281

(error) %s.

**Description**

Stubs are small routing segments to guide the detailed router to complete 3D routing. Boundary stubs are placed between bump array and middle section. The tool may fail to create stubs when the offset of stubs is too large or when the channel width is too small.

**What Next**

Please decrease boundary_stub_gaps. Adjust routing pitch using command option -wire_width or -wire_spacing. Alternatively, adjust wire_spacing or wire_width in pattern file.

Feedback

## 3DIC-282

(error) Error found when loading via_def and metal layers: %s.

**Description**

This error occurs when loading via_def and metal layers due to the specifed issue.

**What Next**

Please fix the specified issue.

## 3DIC-283

(error) Fail to route differential net pair.

**Description**

This error occurs when routing differential net pair failed because there is no enough space for differential net pair gap.

**What Next**

Please adjust differential_net_spacing in the pattern file.

## 3DIC-284

(error) Fail to place vias according to given location constraints.

**Description**

This error occurs because the given via locations are too close or the via location constraint data are not complete.

**What Next**

Please check and adjust the given via location constraints.

## 3DIC-285

(error) %s.

**Description**

This error occurs when the constraint value in the pattern file is invalid.

Feedback

**What Next**

Please check and correct the constraint value in the pattern file. See more explanation for pattern file constraints by using the command list_3d_routing_constraints.

---

## 3DIC-286

(error) Loading %s failed.

**Description**

This error occurs when loading the specified data from the tech file or the design failed.

**What Next**

Please check the tech file and the design.

---

## 3DIC-287

(error) Only 2-pin nets can be processed: %s.

**Description**

We expect to route the nets that connect bump-to-bump or bond-pad-to-bond-pad in 3D routing.

**What Next**

Please check if you have non-2-pin net.

---

## 3DIC-288

(error) Bump information error: %s.

**Description**

uBump layer should be on the top of C4 bump layer and PG net layer. A ubump should aligned inside the corresponding C4 bump. A C4 bump can contain at most one ubump. Floating bumps cannot have net connection. Missing lib-cell for bumps.

**What Next**

Please fix the specified issue. Check the layer configuration in the tech file. Adjust the positions of ubump and C4 bump. Remove nets on the floating bumps. Check the missing lib-cell for bumps in the cell library file.

Feedback

## 3DIC-289

(warning) Preroutes or vias exist in bump array regions.

**Description**

There exist preroutes or preplaced vias in bump array regions, which may reduce routability. Routing can still be successful. User needs to check whether these components are there due to mistakes.

**What Next**

Please remove unintended existing preroutes or vias in bump array regions.

## 3DIC-290

(error) Some bumps are not in pairs.

**Description**

In 3D routing, each 2-pin net should connect a pair of bumps. This error occurs when some bumps are not in pair for a net.

**What Next**

Please check and correct the bump-to-net assignment.

## 3DIC-291

(error) Total number of open nets = %d.

**Description**

This error message shows the number of open nets after auto 3D or die-to-die routing.

**What Next**

Please check the open nets in the design. Try to adjust wire_width, wire_spacing, or other constraints regarding wire spacing/width in the pattern file.

## 3DIC-292

(error) Non-uniform bumps detection error in narrow bump gap case.

**Description**

This error occurs when non-uniform bump dimension is found in the narrow bump gap case.

Feedback

**What Next**

Please increase bump gap in bump arrays.

---

## 3DIC-293

(error) %s.

**Description**

There exist two bumps that are supposed to be assigned to the same net but actually mismatched.

**What Next**

Please check and adjust the bump-to-net assignment. Make sure that a 2-pin net can only be assigned to exactly two bumps.

---

## 3DIC-294

(error) Narrow bump gaps are found in %s 3D bump array(s).

**Description**

In 3D routing, the gap between two bumps in the bump array(s) should keep a minimum distance for escaping routing. However, the bump gaps in %s 3D bump array are found to be too narrow.

**What Next**

Please check and increase the bump gaps in the 3D bump array(s).

---

## 3DIC-295

(error) Incorrect bump pairing specification.

**Description**

This error occurs when the bump pairing specification is incorrect.

**What Next**

NA.

---

## 3DIC-296

(error) Incorrect channel orientation.

Feedback

**Description**

This error occurs when the channel orientation is incorrect for the placement of bump arrays.

**What Next**

Please adjust channel_direction in the pattern file.

---

## 3DIC-297

(error) Incorrect routing layers specified: %s.

**Description**

The specified routing layer is incorrect or cannot be used.

**What Next**

Please specify valid routing layers in the tech file.

---

## 3DIC-298

(error) Incorrect stacked vias discovered.

**Description**

This error occurs when a bump is connected to multiple stacked vias or a stacked via is not connected to a correct bump.

**What Next**

Please check and correct the stacked vias connected to lower bumps.

---

## 3DIC-299

(error) Inclusion and exclusion sections cannot exist at the same time.

**Description**

When processing the RV pattern file for RV placement, the inclusion and exclusion sections exist at the same time.

**What Next**

Please check and adjust the inclusion and exclusion sections in the RV pattern file.

Feedback

## 3DIC-300

(warning) port duplication cannot be applied to power net %s.

**Description**

power nets specified by -nets or -ports are ignored by command.

**What Next**

No action is needed.

## 3DIC-301

(error) no valid net is specified for port duplication.

**Description**

User specified nets are all power nets which cannot be processed.

**What Next**

Please choose the correct nets or use no option.

## 3DIC-302

(warning) die %s is not hierarchical.

**Description**

If a die is a leaf cell, no new feedthrough can be created and no new port can be created on it.

**What Next**

Please change the design data if the die needs to be modified.

## 3DIC-303

(error) net %s cannot be processed since die %s is not hierarchical.

**Description**

Non-hierarchical dice cannot be changed. As a result, the specified net cannot be processed.

**What Next**

Please change the design data if the die needs to be modified.

Feedback

## 3DIC-304

(error) lower half of the %s bump array is not aligned to higher half.

**Description**

According to 3D design standard, the bumps at either end of an 3D channel must form a single array. The tool has detected misalignment of the bumps.

**What Next**

Please correct the mis-placed bumps.

## 3DIC-305

(error) lower half of the %s bump array has different number of rows in comparison to higher half.

**Description**

According to 3D design standard, the bumps at either end of an 3D channel must form a single array. The tool has detected misalignment of the bumps.

**What Next**

Please correct the mis-placed bumps.

## 3DIC-306

(error) bump pairing information does not match bump placement.

**Description**

Bump row and/or column index based on current bump placement does not match bump pairing information. It is likely that the bump are not placed correctly. It is also possible that bump pairing information is incorrect. Please examine the pairing information and make sure that all bumps in the pairs exist in the bump array.

**What Next**

Please correct the mis-placed bumps or modify the bump pairing information.

## 3DIC-307

(error) bump at {%d %d} already appears in a pair.

Feedback

**Description**

A bump can only appear in a single pair in bump_index_pair constraints at most.

**What Next**

Please correct the bump_index_pair constraints.

---

## 3DIC-308

(error) net %s is skipped since it is not on top level.

**Description**

Nets specified by -nets must be on top level.

**What Next**

Please change the net name.

---

## 3DIC-309

(warning) net %s is skipped since it belongs to the same flat net of net %s.

**Description**

The net is skipped because it belongs to the same flat net of another net which is already processed.

**What Next**

Please check the result netlist.

---

## 3DIC-310

(error) feedthrough port creation failed for net %s.

**Description**

The net needs some new feedthrough ports which cannot be created.

**What Next**

Please process the net manually.

---

## 3DIC-311

(warning) only %d tracks of routes can be placed on layer %s.

Feedback

**Description**

The C4 bump is not big enough to contain the number of tracks specified by the user. Only a small number of routes are added.

**What Next**

Please change the pattern file.

---

## 3DIC-312

(error) bump %s interferes with a via of net %s.

**Description**

Although a via is placed, there is a bump of other net too close. The min-spacing is violated.

**What Next**

Please adjust the pattern file or netlist to resolve the violation. For example, rdl_via_offset can be increased. User can specify a smaller spacing using rdl_route_spacing in the pattern file.

---

## 3DIC-313

(error) routing detour placed with routing rule violation.

**Description**

Routing cannot be completed because the routing detour around bump-accessing vias are too close to other routes.

**What Next**

Use detour_spacing in the pattern file to adjust the detour routing location. Check tech file to be sure its correctness.

---

## 3DIC-314

(error) stub range %s micron is not enough to hold %d net tracks on the %s side of the 3d channel.

**Description**

The stub range constraints define a narrow corridor which is not wide enough to route all nets of the 3D channel.

Feedback

**What Next**

Please check and modify the constraints in the pattern file. For example, user can increase the stub range of reduce the routing width and/or spacing.

---

## 3DIC-315

(error) No bumps are selected.

**Description**

The tool cannot find any bump to process.

**What Next**

Please check the command options.

---

## 3DIC-316

(error) layer information is missing for PG net %s.

**Description**

The tool cannot find layer information of the given PG net.

**What Next**

Please check the command options.

---

## 3DIC-317

(error) technology file is missing.

**Description**

The tool cannot find technology file, which is required to collect information such as layers.

**What Next**

Please check and fix the design.

---

## 3DIC-318

(error) %s.

**Description**

The tool find information that is unexpected and cannot be used.

Feedback

**What Next**

Please check and fix the command-line option values.

---

## 3DIC-319

(error) cannot reach pin layer %s of bump %s.

**Description**

The layer description is insufficient.

**What Next**

Please add more layers.

---

## 3DIC-320

(error) margin plus length is larger than the bump dimension for %s.

**Description**

The margin value and/or wire length is too large.

**What Next**

Please reduce margins and/or wire lengths.

---

## 3DIC-321

(error) grill span exceeds bump dimension for %s.

**Description**

The grill dimension is too large.

**What Next**

Please reduce wire width, wire spacing, margins, and/or number of routes.

---

## 3DIC-322

(error) cannot connect to pg net for bump %s.

**Description**

The grill cannot be connect to existing pg net.

Feedback

**What Next**

Please check whether the bump is placed under existing pg routes.

---

## 3DIC-323

(error) grill broken for bump %s.

**Description**

Either routes or vias cannot be added for a layer for the specified bump.

**What Next**

Please check the input parameters and modify.

---

## 3DIC-324

(warning) bump %s is connected to a different net, skipping.

**Description**

The bump is connected to a different net.

**What Next**

Please check the netlist.

---

## 3DIC-325

(error) There are multiple tech files {%s} in chip %s.

**Description**

Multiple tech files are used inside a single die, this is invalid. This should only be allowed on the top-level of the 3DIC flow. It should not be allowed at the die-level and below.

**What Next**

Check the tech file setting in the chip.

---

## 3DIC-326

(warning) Total %d %s {%s} were snapped to match the grid in target chip %s.

Feedback

**Description**

The bump cell/bond pad/bump cluster must placed to the grid correctly, if not, the tool will snap the location of target bump to grid. If the snapped behavior is not expected, please add "-no_snap" in command "create_3d_mirror_bumps" to prevent the snap.

**What Next**

NA.

---

## 3DIC-327

(error) The dummy %s %s contacts to the %s %s which is not dummy.

**Description**

The bump/bond_pad marked as is_dummy true must be in contact with any bump/bond_pad marked as is_dummy true.

**What Next**

Check the 'is_dummy' attribute of bumps or bond pads.

---

## 3DIC-328

(Warning) unable to set location of %d port(s) %s: %s.

**Description**

These ports cannot be set location because the is_pad attribute of related pin in bump cell is false.

**What Next**

please check the lib cell of connected bump.

---

## 3DIC-329

(Warning) the pin %s cannot be set the location to %s, the reason is '%s'.

**Description**

these pins cannot be set the location to the specified port because of the reason message describes.

**What Next**

please check the lib cell of connected bump.

Feedback

## 3DIC-330

(error) these bumps that are mirrored by %s %s and %s %s will be overlapped in the die %s.

**Description**

During the process of mirroring bumps, these new created bumps may be overlapped with each other, this behavior violates DRC rules and cannot be accepted. If this situation is expected by customer, please add the "-force" command option.

**What Next**

Please check the location of source bumps.

## 3DIC-331

(error) the layout for %s probe bumps {%s} is not vertices of a square with edges parallel to die edges which is violated the rule %s in the chip %s.

**Description**

NA.

**What Next**

Please adjust the location of probe bumps.

## 3DIC-332

(error) the number of %s probe bumps is %s which is %s than the constraint <%s>, the valid range is {%s %s} in the chip %s.

**Description**

The rule value of single probe bumps is "NUM_PROBE". The rule value of quad or group probe bumps is "NUM_QPROBE".

**What Next**

Please adjust the number of probe bumps.

## 3DIC-333

(error) the number of %s bumps that connect to %s is %s which is %s than the constraint <%s>, the valid range is {%s %s} in the chip %s.

Feedback

**Description**

The rule value of single probe bumps is "NUM_PROBE_POWER" or "NUM_GPROBE_POWER".

**What Next**

Please adjust the number of probe bumps.

---

## 3DIC-334

(error) the pitch between %s probe bumps {%s} and {%s} is %s which is %s than the constraint <%s>, the valid range is {%s %s} in the chip %s.

**Description**

The rule value of quad or group probe bumps is "PITCH_GPROBE_GPROBE".

**What Next**

Please adjust the location of probe bumps.

---

## 3DIC-335

(error) find the dangling %s probe bumps {%s} that violate the constraint <%s>, the valid range is {%s %s} in the chip %s.

**Description**

The pitch rule value of quad or group probe bumps is "PITCH_GPROBE_GPROBE". or the pitch rule value of quad or group probe bumps is "PITCH_GPROBE_BUMP".

**What Next**

Please adjust the location of probe bumps.

---

## 3DIC-336

(error) the %s pitch between %s probe bump %s and single probe bump %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s} in the chip %s.

**Description**

The pitch rule value is "PITCH_GPROBE_PROBE_ORTHOGONAL".

**What Next**

Please adjust the location of probe bumps.

Feedback

## 3DIC-337

(error) the pitch between %s probe bumps {%s} and single probe bump %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s} in the chip %s.

**Description**

The pitch rule value is "PITCH_GPROBE_BUMP";

**What Next**

Please adjust the location of probe bumps.

## 3DIC-338

(error) find the dangling single probe bump %s that violate the constraint <%s>, the valid range is {%s %s} in the chip %s.

**Description**

The pitch rule value of single probe bump is "PITCH_PROBE_BUMP_SQUARE". The pitch rule value of single probe bump is "PITCH_PROBE_DUMMYE". The pitch rule value of single probe bump is "PITCH_PROBE_BUMP".

**What Next**

Please adjust the location of probe bumps.

## 3DIC-339

(error) the pitch between single probe bump %s and %s in the true-dummy region is %s which is %s than the constraint <%s> setting, the valid range is {%s %s} in the chip %s.

**Description**

The rule value of single probe bump is "PITCH_PROBE_DUMMYREGION".

**What Next**

Please adjust the location of probe bumps.

## 3DIC-340

(error) the pitch between single probe bump %s and %s in the non-dummy region where the single probe bumps are in %s pattern is %s which is %s than the constraint <%s> setting, the valid range is {%s %s} in the chip %s.

Feedback

**Description**

The rule value of single probe bump is "PITCH_PROBE_SQUARE" or "PTICH_PROBE".

**What Next**

Please adjust the location of probe bumps.

---

## 3DIC-341

(error) the pitch between single probe bump %s and unprobed %s-dummy bump %s where the single probe bumps are in %s pattern is %s which is %s than the constraint < %s> setting, the valid range is {%s %s} in the chip %s.

**Description**

The rule value of single probe bump is "PITCH_PROBE_DUMMY" or "PITCH_PROBE_BUMP" or "PITCH_PROBE_BUMP_SQUARE".

**What Next**

Please adjust the location of probe bumps.

---

## 3DIC-343

(Information) No valid anchor pins are found, so these top nets between chip %s and chip %s will be skipped.

**Description**

Anchor pins are connected to the top nets in the die, these pins are used to determine the location of port and which bump pair should be used to assign the corresponding top nets.

**What Next**

Check the connectivity between neighboring chips.

---

## 3DIC-344

(Information) Collect %lu out of %lu nets between chip %s and %s for assignment.

**Description**

Collect top nets for net assignment between neighboring chips. These top nets that were already assigned to bumps or didn't connect to anchor pins are skippped.

**What Next**

NA.

Feedback

## 3DIC-345

(Information) %lu total nets are found between chip %s and chip %s. Bumps are fully assigned, no nets will be assigned.

**Description**

Nets between specified dies already have bumps assigned, no assignment is needed. Command will not re-assign existing assigned bumps and nets.

**What Next**

NA.

## 3DIC-346

(error) bump resource is not enough%s. Net count is %d while bump count is %d.

**Description**

The number of top nets that connect to anchor pins is larger than the number of bumps with the same matching type.

**What Next**

check the matching type setting of bumps.

## 3DIC-347

(warning) missing feedthrough port for top net %s in the chip %s.

**Description**

When propagate/assign top nets, the tool needs to punch new ports to construct the complete connections.

**What Next**

Use command propagate_3d_connections or assign_3d_interchip_nets to construct complete connections.

## 3DIC-348

(warning) port %s connect to %d terminals, exceed the limitation %d, skip to set location for this port.

Feedback

**Description**

If the port connects to too many terminals, the tool will skip to update the port location in order to reduce runtime. The default max number of terminals is 200.

**What Next**

Adjust the max number of terminals by app option 'plan.3dic.max_terminal_number_for_port_setting'.

---

## 3DIC-349

(Information) create new top net %s from top net %s.

**Description**

create the new top net by splitting the existed top net in order to connect the adjacent chip.

**What Next**

NA.

---

## 3DIC-350

(Information) No DFT issues found.

**Description**

This message tells you that the command found no DFT issues.

**What Next**

No further action in terms of DFT is required.

---

## 3DIC-351

(error) There are more than one type signal of type %s specified those signals are %s.

**Description**

There are more than one type signal of type specified in the message marked as specified TAP type.

**What Next**

Look at design and figure which one of the ports marked of specified type is a duplicate and remove it.

Feedback

## 3DIC-352

(error) Die %s is missing %d %s signals of types: %s

**Description**

The two ports mentioned in the error message are not correctly connected in the top level netlist.

**What Next**

Check the design for one of the two issues. The DFT marking on the specified port was incorrectly set. The logical connection to the specified port is not correct in the top level netlist.

## 3DIC-353

(error) Port %s of type %s is connected to %s of type %s should be connected to type %s.

**Description**

The ports mentioned in the error message is not connected a port of the correct type.

**What Next**

Check the design for one of the two issues. The DFT marking on the specified port was incorrectly set. The logical connection to the specified port is not correct in the top level netlist.

## 3DIC-354

(warning) %s, skipping.

**Description**

Tool cannot add enough via arrays for the specified bump.

**What Next**

Please check whether there are enough routes on the right layer near the bump.

## 3DIC-355

(warning) unexpected sub-channel dimension and/or count: %d sub-channels discovered.

Feedback

**Description**

Tool finds that the number of sub-channels is different from that in 3D standard. An 3D channel should have 37 sub-channels. Tool will route all sub-channels discovered.

**What Next**

Please check whether the bump arrays are correct.

---

## 3DIC-356

(warning) layer %s skipped since it is not below target layer %s.

**Description**

Tool skips a user-specified layer during create_vertical_connection run.

**What Next**

Please check whether the result is acceptable. Adjust target layer or layer list if needed.

---

## 3DIC-357

(warning) skipping non-bump cell %s.

**Description**

Tool skips a cell because it is not a bump.

**What Next**

Please check cell types.

---

## 3DIC-358

(warning) skipping cell %s since it is not on top level.

**Description**

Tool can only process cell on top level.

**What Next**

Please check physical hierarchy of cells.

---

## 3DIC-359

(error) cannot perform shielding since there is no PG net to use.

Feedback

**Description**

Tool cannot perform shielding for 3D channels because there is no PG net in the design or all PG nets do not have routes to tie to.

**What Next**

Please create either power or gound net. If users select a tie option, please route the PG net first so that the shielding tie can be made.

---

## 3DIC-360

(error) %s on net %s is not connected to correct TAP.

**Description**

The ports mentioned in the error message is missing a connection to a port of the correct type.

**What Next**

Add the marking that is missing on the specified net.

---

## 3DIC-361

(error) %s incorrectly connected to %s on net %s.

**Description**

The ports mentioned in the error message is not connected a port of the correct type.

**What Next**

Check the design for one of the two issues. First, make sure that the DFT marking on the specified port was set. Second, make sure that the logical connection to the specified port is correct in the top level netlist.

---

## 3DIC-362

(error) The direction of port %s is set to %s, it should be set to %s.

**Description**

The direction on the mentioned port is not set to the correct direction.

**What Next**

Correct the direction of the port in the netlist.

Feedback

## 3DIC-363

(warning) Ignoring Bump %s at location (%.4f,%.4f) due to overlap with another bump

**Description**

This message tell you that when the tool finds another bump in the same location as a previous bump that bump is ignored.

**What Next**

Modify your design so that bumps are not overlapping.

## 3DIC-364

(warning) Command should be run from the virtual 3DIC top. Bond pads will be ignored.

**Description**

This message tells you that you ran the command from the die instead of the virtual 3DIC top and that bond pads will be ignored.

**What Next**

Run the command form the virtual 3DIC top instead of the die.

## 3DIC-365

(Information) Auto-generating tolerance values as no tolerances were specified.

**Description**

This message tells you that the command is auto-generating tolerance values.

**What Next**

If the auto-generated tolerance is too small or large rerun the command specifing a better tolerance value.

## 3DIC-366

(Information) Using auto-generated tolerances values: x=%f, y=%f.

**Description**

This message tells you that values the command is using for auto-generated tolerance values.

Feedback

**What Next**

If the auto-generated tolerance is too small or large rerun the command specifing a better tolerance value.

---

## 3DIC-367

(Warning) The terminal %s on the %s side does not have 'is_bond_pad' attribute.

**Description**

The terminal %s on the %s side will not be seen as a valid bond_pad since it does not have 'is_bond_pad' attribute.

**What Next**

If this terminal should be a bond_pad, please use command "set_attribute" to set 'is_bond_pad' attribute as true.

---

## 3DIC-368

(Information) Value specified for -x_tolerence is too small, adjusting from %f to %f.

**Description**

This message tells you that the value you specified for -x_tolerance is too low and the tool has adjusted it larger value for you.

**What Next**

Check the value specified for -x_tolerance and make sure that it correct.

---

## 3DIC-369

(Information) Value specified for -y_tolerence is too small, adjusting from %f to %f.

**Description**

This message tells you that the value you specified for -y_tolerance is too low and the tool has adjusted it larger value for you.

**What Next**

Check the value specified for -y_tolerance and make sure that it correct.

Feedback

## 3DIC-370

(error) Object %s is not a port, leaf pin, hierarchical pin or net and therefore cannot be used with -3d_objects option.

**Description**

Only objects that are ports, leaf pins, hierarchical pins or nets can be specified with the -3d_objects option.

**What Next**

Remove the objects that do not meet the criteria from the -3d_objects option.

## 3DIC-371

(warning) Ignoring unconnected bump %s

**Description**

This message informs you that tool has found an signal bump that is not connected to a verilog port and omitted it from the fault lists because it is not connected to a net.

**What Next**

Connect the specified bump to a verilog port.

## 3DIC-372

(error) Bump-access via has DRC violations which cannot be fixed.

**Description**

This error occurs when bump-access via DRC violation is found due to insufficient room, and the violation cannot be removed.

**What Next**

Please set bump_via_shift_allowed or adjust rdl_via_spacing in the pattern file.

## 3DIC-373

(error) Incorrect stub-net layer assignment for switching routing layer in the middle section.

**Description**

A 2-pin net should access the bumps in two bump arrays from different layers. This error occurs when the layer assignment is incorrect.

Feedback

**What Next**

NA.

---

## 3DIC-374

(error) Cannot route nets on higher routing layer.

**Description**

This error occurs when routing nets on higher routing layer due to congestion.

**What Next**

Please adjust wire_spacing, wire_width, boundary_stub_gaps, for higher routing layer in the pattern file.

---

## 3DIC-375

(error) %s.

**Description**

This error occurs when middle section routing failed due to congestion.

**What Next**

Please adjust wire_spacing, wire_width, boundary_stub_gaps, or the number of routing layes in the pattern file.

---

## 3DIC-376

(error) No enough room to place bump-access vias inside C4 bump %s.

**Description**

This tool fails to place bump-access vias inside C4 bump due to not enough room in the bump array.

**What Next**

Please adjust the bump placement or adjust rdl_via_offset and rdl_via_spacing in the pattern file.

---

## 3DIC-377

(error) Cannot place stubs in the middle section for nets connected to C4 bumps from %s layer.

Feedback

**Description**

The tool fails to plan stubs in the middle section for nets connected to C4 bumps due to routing congestion.

**What Next**

Please adjust wire_spacing or wire_width in the pattern file.

---

## 3DIC-378

(error) Cannot place stacked vias for %s metal layer routing.

**Description**

This tool cannot create stacked vias from lower/higher metal layer to bumps. This error occurs when there exists bump overlap or via_def is not found.

**What Next**

Please fix the specified issue.

---

## 3DIC-379

(error) Cannot find complete bump pairs for all 2-pin nets.

**Description**

Each 2-pin net should be assigned to a bump pair. However, some 2-pin nets are not assigned to a bump pair. This error occurs when the bump numbers in bump arrays are enough for all 2-pin nets.

**What Next**

Please check if the number of bumps in each bump array is enough for all 2-pin nets.

---

## 3DIC-380

(error) C4 bump overlap is found for cell %s.

**Description**

This error occurs when there exists C4 bump overlap for some C4 bump cells.

**What Next**

Please check and remove the C4 bump overlap for the specified cell.

Feedback

## 3DIC-381

(error) Cannot sort odd number of bump columns.

**Description**

For 3D routing, the number of bump columns in a routing channel should be even.

**What Next**

Please check and correct the bump design for 3D routing.

## 3DIC-382

(error) Cannot use the same metal layer to route both upper and lower bump arrays.

**Description**

This tool cannot route both upper and lower bump arrays by using the same metal layer.

**What Next**

Please check and correct the specified metal layers in the option (-routing_layers) for upper and lower bump arrays in 2-layer routing mode.

## 3DIC-383

(error) Cannot create via in the middle section: net %s.

**Description**

Vias should be created in the middle section for switching layer. This errors occurs when via creation failed in the middle section due to routing congestion.

**What Next**

NA.

## 3DIC-384

(error) Cannot support %s.

**Description**

This tool currently cannot support the specified function.

**What Next**

Please fix the specified issue in the design, pattern file, or tech file.

Feedback

## 3DIC-385

(error) Error found in middle section: %s.

**Description**

This error occurs when the routing resource in the middle section is insufficient. It could be caused by large middle_turn_offset, midtrack_turn_spacing, midtrack_turn_width, or small midtrack_lengths.

**What Next**

Please adjust middle_turn_offset, midtrack_turn_spacing, midtrack_turn_width, or midtrack_lengths in the pattern file.

## 3DIC-386

(error) Fail to fix bump-to-net assignment, %s.

**Description**

This error occurs when creating the bump-to-net assignment failed and cannot be fixed due to the specifed issue.

**What Next**

Please check the bump and net design to fix the specified issue.

## 3DIC-387

(error) Error found in via_def: %s.

**Description**

This error occurs when an error is found in via_def. It could be missing via library for specific layers or bumps.

**What Next**

Please fix the specified issue in via_def.

## 3DIC-388

(error) Non-uniform bump dimension within a single bump array.

Feedback

**Description**

The dimension of bumps (width and height) in a single bump array should be the same. This tool cannot support bump array with non-unifrom bump dimension.

**What Next**

Please check and adjust bump dimensions in the design.

---

## 3DIC-389

(error) Netlist checking fails.

**Description**

This error occurs when the nets in two bump arrays are mismatched. Each 2-pin net should consist of two bumps in each bump array.

**What Next**

Please check the netlist and the bump-to-net assignment.

---

## 3DIC-390

(error) Error found during bump array analysis.

**Description**

This error occurs when the bump array analysis fails due to wrong bump placement. The tool detects unexpected bump array patterns.

**What Next**

Please correct the bump array accordingly.

---

## 3DIC-391

(warning) Cross-boundary net found: %s

**Description**

A net will be routed only if all bumps of the net are inside the specified boundary. The tool skips all cross-boundary nets in routing.

**What Next**

Please check whether the net needs to be routed or not. If the net needs to be routed, please adjust the command line option -channel_boundaries to include the net.

Feedback

## 3DIC-392

(warning) Congestion analysis fails: %s.

**Description**

The congestion analysis is to check if the wire width/spacing values can be used for nets to be routed through bump areas. If the wire width/spacing values are too large, the capacity in the bump area will be insufficient. Thus, routing will definitely fail.

**What Next**

Please adjust -wire_width or -wire_spacing in the command line. Alternatively, adjust wire_width or wire_spacing in the routing pattern file.

## 3DIC-393

(error) Net %s has a large bump/pin alignment offset %f (required <= %f).

**Description**

For die-to-die routing, the bump/pin alignment offset of a net should be less than a threshold value. A large bump/pin alginment offset would cause routing failure. User can specify the threshold value by setting the app option 3dic.route.die2die_net_alignment_max_offset.

**What Next**

Please check and adjust the bump-net assignment to decrease the bump/pin alignment offset.

## 3DIC-394

(error) Net %s crosses subchannel %d and subchannel %d.

**Description**

In 3D routing, two bumps of a net should be in the same subchannel. A cross-subchannel net is invalid and will cause routing failure.

**What Next**

Please check and correct the bump-net design.

## 3DIC-395

(warning) %d is an invalid maximum number of die-to-die routing iterations.

Feedback

**Description**

User specifies an invalid value for the maximum number of die-to-die routing iterations, so the tool is using one iteration instead. The maximum number of die-to-die routing iterations should be a positive integer. User can modify the value by the app-option 3dic.route.die2die_max_routing_iterations.

**What Next**

Please check and correct the value of the app-option 3dic.route.die2die_max_routing_iterations.

---

## 3DIC-396

(warning) The net ordering in sub-channel %u is not sequential. The nonsequential nets in the sub-channel are:%s.

**Description**

The net assignments of both bump arrays are inconsistent in an 3D sub-channel. That is, the net ordering is not squential and twisted on the bump arrays, which causes net crossing in the sub-channel. In an 3D sub-channel, inconsistent bump-net assignments (or net crossing) may cause routing quality degradation. However, some local net crossing may not significantly impact routing quality. Therefore, if the tool successfully completes the routing, please just ignore this warning.

**What Next**

Please adjust the net assignments of both bump arrays to remove net crossing in the sub-channel.

---

## 3DIC-397

(warning) The bump signal assignment is not sequential for bump %s (net: %s) and bump %s (net: %s) in subchannel %u.

**Description**

The net assignments of bumps are inconsistent on the bump arrays. That is, the net ordering is not squential and twisted on the bump arrays, which causes net crossing in a subchannel or some nets even cross subchannels. In an 3D subchannel, inconsistent bump-net assignments (or net crossing) may cause routing quality degradation. Please check the bump net assignments to avoid route planning issue or a suboptimal routing quality. However, some local net crossing may not significantly impact routing quality. Therefore, if the tool successfully completes the routing, please just ignore this warning. User can also add excluded nets into exclusion section of pattern file so that the tool will

Feedback

ignore the nets in bump order check. Besides, the information of wire length variation can also help to check if there is a bump order issue.

**What Next**

Please adjust the net assignments of both bump arrays to remove net crossing in the subchannel.

---

## 3DIC-398

(warning) Bump cells are placed with multiple %s pitches on %s.

**Description**

The X/Y pitches of bumps are inconsistent on left (lower) or right (upper) bump arrays. This mighit cause route planning issue or a suboptimal routing quality. However, if it is intended by users, please just ignore this warning.

**What Next**

Please check the bump pitch if it is intended.

---

## 3DIC-399

(warning) The bump arrays use multiple reference cells.

**Description**

The reference cells of bumps are inconsistent in the 3D channel. If this is intended by users, please just ignore this warning.

**What Next**

Please check the bump arrays and reference cells if they are as expected.

---

## 3DIC-400

(Information) Simulation concluded successfully with no errors, and log: %s.

**Description**

This message tells you that simulation concluded successfully with no errors.

**What Next**

Check the log file for details of the simulation.

Feedback

## 3DIC-401

(Information) Running external tool %s using path %s

**Description**

This message tells you that what version of the external tool is being used.

**What Next**

Check to make sure that the correct version is being used.

## 3DIC-402

(Information) Differential pair setting only specified on transmitter: %s but not on receiver: %s even though they share net %s.

**Description**

The message tells you that differential pair setting was only applied on the transmitter.

**What Next**

Preferably, fix the specification of differential pair so that is correct. If this is not fixed the command will still run correctly.

## 3DIC-403

(Information) Differential pair setting only specified on receiver: %s but not on transmitter: %s even though they share net %s.

**Description**

The message tells you that differential pair setting was only applied on the receiver.

**What Next**

Preferably, fix the specification of differential pair so that is correct. If this is not fixed the command will still run correctly.

## 3DIC-404

(Information) Found executable %s for %s.

**Description**

This message tells you that the given executable was found in the specified location.

Feedback

**What Next**

Check the path to make sure it is the correct version.

---

## 3DIC-405

(Warning) Object %s was specified as part of a differential pair but not specified as either a transmitter or receiver.

**Description**

The message tells you that the object specified was not specified as either a transmitter or receiver.

**What Next**

Check and make sure that specified object name is correct, if it is correct make sure it is listed in either the -receivers or -transmitters option.

---

## 3DIC-408

(Information) Extraction concluded successfully with no errors, log %s.

**Description**

This message tells you that extraction concluded successfully with no errors.

**What Next**

Check the log file for details of the extraction.

---

## 3DIC-409

(Error) Extraction was not successful, log %s.

**Description**

This message tells you that extraction had errors and did not conclude successfully.

**What Next**

Check the log file for details of the errors in the extraction.

---

## 3DIC-410

(Error) Unable to find the executable for %s.

Feedback

**Description**

This message tells you that the specified executable was not found.

**What Next**

Setup the path for the specified executable.

---

## 3DIC-411

(error) %s.

**Description**

The tool encountered the error specified.

**What Next**

Please check and fix the command-line options specified to the command.

---

## 3DIC-412

(error) Incorrect command %s option usage. %s.

**Description**

Incorrect command option usage.

**What Next**

See command man page for correct option usage.

---

## 3DIC-413

(Error) Simulation was not successful, log: %s

**Description**

This message tells you that simulation had errors and did not conclude successfully.

**What Next**

Check the log file for details of the errors in the simulation.

---

## 3DIC-414

(Error) Reading Directory is not supported. File %s is a directory.

Feedback

**Description**

The input file is a directory.

**What Next**

Change the input that specifies a file instead of directory.

---

## 3DIC-415

(Error) Different differential pair setting on port %s and %s even though they share net %s.

**Description**

The message tells you that specified ports have a different differential pair settings even though both ports share a net.

**What Next**

Fix the specification of differential pair so that is correct.

---

## 3DIC-416

(Error) Unable to get licence for external tool %s.

**Description**

The message tells you that command was unable to get licence for external tool specified.

**What Next**

Check your licensing settings, including environmental setting to make sure they are correct.

---

## 3DIC-417

(Error) File %s is not supported as a model file.

**Description**

The message tells you that specified file is not a supported model file.

**What Next**

First, check the file and make sure it is correct file and file type. The correct file types end with .s2p and .s4p. If it is the correct type, make sure that the file is not corrupted.

Feedback

## 3DIC-418

(warning) differential net routing cannot be implemented.

**Description**

The differential nets specified by the user cannot be routed in the required routing style. Thus, they are treated as normal nets.

**What Next**

Differential net routing is only supported for 2-layer 3D routing. There must be and only be two pairs of differential signals. In addition, bumps of a pair of differential nets cannot be selected arbitrarily. They need to be close to each other. Moreover, the two pairs of nets must be in different bump regions so that they can routed on different layers with the same routing foot-print. Please check the routing result and adjust bump-to-net assignment if needed.

## 3DIC-419

(error) current max_net_count_per_layer (%d) is not large enough to complete 3D routing: needs to be at least %d.

**Description**

The maximal net count per layer constraint in the pattern file is not sufficient to complete the 3D routing.

**What Next**

User can either increase max_net_count_per_layer or add more routing layers.

## 3DIC-420

(error) Cannot derive layer assignment for nets.

**Description**

The tool is not able to derive layer assignment for the 3D netlist.

**What Next**

User can either increase max_net_count_per_layer or change the bump-to-net assignment. It is recommended that the bumps of a single net should be at the same relative locations of the two corresponding bump arrays.

If user uses keyword target_net_count_for_layer, it is important to check whether the values are consistent with the bump-to-net assignment. Specifically, the tool requires all

Feedback

bumps of the same column to be assigned to the same layer. The column orientation is perpendicular to the channel orientation. In addition, the columns of bumps assigned to a layer must be consecutive. Please check whether the values of target_net_count_for_layer are possible to achieve or not.

---

## 3DIC-421

(error) Stubs at the %s bump array boundary must have a consistent pitch when bump-access vias are abutted to micro-bumps.

**Description**

When bump-access vias are abutted to micro-bumps, the stubs at either bump array boundaries must have the same widths and pitch, except for differential signal nets, which can have different spacing.

**What Next**

Please change boundary_stub_gaps_high and/or boundary_stub_gaps_low if bump-to-via abutment is required. Otherwise, please consider choosing non-abutted routing mode.

---

## 3DIC-422

(warning) differential nets cannot be routed in the overlapping pattern since inline stub pattern is not selected.

**Description**

The differential nets specified by the user cannot be routed in the required routing style because inline stub pattern is not selected.

**What Next**

Please select inline for stub_alignment_type.

---

## 3DIC-423

(error) bump %s does not abut its bump-access via.

**Description**

The tool fails to place a bump and its via with perfect abutment.

**What Next**

Please adjust stub locations and/or spacings to fix the abutment error.

Feedback

## 3DIC-424

(warning) max_net_count_per_layer in pattern file is igored for single or dual layer 3D routing.

**Description**

User has chosen either single layer or dual layer 3D routing. The constraint max_net_count_per_layer is not supported. It is supported only for routing with 3 or more layers. It is also supported for 2-layer routing with hard_spacing in the pattern file.

**What Next**

Please fix any error in the pattern file.

## 3DIC-425

(warning) modified middle subchannel routing skipped.

**Description**

The 3D subchannel identifical find inconsistency between middle subchannels on the two sides of the 3D channel. The routing of middle channels is skipped.

**What Next**

Please route the middle channel separately or use "keep_inconsistent_mid_subchannel"

## 3DIC-426

(warning) Expanding routing region beyond bump array area.

**Description**

The bump array area contains vias and/or pre-routes which prevent routing from going through. The tool has to create detours beyond bump array area. As a result, DRC violations might occur.

**What Next**

Check the routing result. Remove pre-existing vias and/or preroutes if needed before running 3D routing.

## 3DIC-427

(error) Tool fails to route due to existing blockages.

Feedback

**Description**

There are vias and/or pre-routes in the bump array area, which prevent routing from going through. As the result, there is no enough space for all the routing tracks.

**What Next**

Check the routing result. Remove pre-existing vias and/or preroutes before running 3D routing.

---

## 3DIC-430

(Error) The value of the app option %s is required for thermal model construction.

**Description**

The value of this app option is required but it has no default value.

**What Next**

Set the corresponding app option value.

---

## 3DIC-431

(Error) The height of the dies %s is not set in the app option %s.

**Description**

The height of the dies is not specified in the app option.

**What Next**

Provide the height of the dies in the app option in unit of um, where die is of libraryName:designName format.

---

## 3DIC-432

(Error) The height of the dies %s from the app option %s needs to be greater than 0.

**Description**

This occurs when the specified height value of the dies is not positive.

**What Next**

Specify a positive value for the height of the dies in unit of um.

Feedback

## 3DIC-433

(Error) No power map file specified for any of the cell instances.

**Description**

This occurs when no power map file is specified for cell instances.

**What Next**

Specify power map for at least one cell instance.

## 3DIC-434

(Error) Could not find the power %s for the cell instance %s from the app option %s.

**Description**

This occurs when the power for the corresponding cell instance is not found in the given path.

**What Next**

Correct the path of power for the given cell instance in the corresponding app option.

## 3DIC-435

(Error) Failed to find the interposer of %s.

**Description**

The design does not have interposer.

**What Next**

Check the design.

## 3DIC-436

(Error) The cell %s with 0 z_offset has no C4 bump.

**Description**

This occurs when the cell with 0 z_offset does not have C4 bump.

**What Next**

Check the design.

Feedback

## 3DIC-437

(Error) The die %s has no micro-bumps.

**Description**

The die has no micro-bumps.

**What Next**

Check the design.

## 3DIC-438

(Error) Cannot find the must-keys %s of the app option %s.

**Description**

Cannot continue because some required attributes are missing from the given prototype.

**What Next**

Set the missing attributes in the given prototype, where the formats of some attributes are as follows: size: {LL_X, LL_Y, UR_X, UR_Y} # Origin is at its center-center layers: {Layer Name, Thickness, Type, Metal Composition Percentage}, where Type has possible values: 0 is Signal, 1 is Dielectric, and 2 is Power molding: {MOLD Name, LL_X, LL_Y, UR_X, UR_Y, Thickness} solderball: {X Pitch, Columns, Y Pitch, Rows}

## 3DIC-439

(Warning) Failed to evaluate the command %s.

**Description**

This warning message occurs when executing a command.

**What Next**

None.

## 3DIC-440

(Error) Error when running %s, check the log file '%s' for details.

**Description**

This error message occurs when executing the executable.

Feedback

**What Next**

Check the log file for errors/warnings for hints.

---

## 3DIC-441

(Error) Error when running %s.

**Description**

This error message occurs when executing the executable.

**What Next**

None.

---

## 3DIC-442

(Information) %s executed successfully.

**Description**

The executable executed successfully.

**What Next**

None.

---

## 3DIC-443

(Information) Starting to analyze thermal...

**Description**

Starting to analyze thermal with the given design and settings.

**What Next**

Started the thermal analysis.

---

## 3DIC-444

(Information) Extracting TSV, C4 bumps, and micro-bumps...

**Description**

Extracting TSV, C4 bumps, and micro-bumps from the design.

Feedback

**What Next**

The TSV, C4 bumps, and micro-bumps are extracted from the design.

---

## 3DIC-445

(Information) Finished the extraction of TSV, C4 bumps, and micro-bumps.

**Description**

The TSV, C4 bumps, and micro-bumps are all extracted successfully.

**What Next**

Generating the thermal script after finishing the extraction of TSV, C4 bumps, and micro-bumps.

---

## 3DIC-446

(Information) Generating the thermal script...

**Description**

Generating the thermal script for thermal analysis.

**What Next**

Generated the thermal script.

---

## 3DIC-447

(Information) Generated the thermal script successfully.

**Description**

Generated the thermal script for successfully.

**What Next**

Starting thermal analysis.

---

## 3DIC-448

(Information) Updating thermal database...

**Description**

Completed thermal analysis. Starting to update the thermal result in thermal database.

Feedback

**What Next**

The thermal result is generated in thermal database.

---

## 3DIC-449

(Information) Deleting old thermal database %s.

**Description**

Try to delete existing thermal database and create a new one.

**What Next**

Check if you can delete the old thermal database.

---

## 3DIC-450

(Error) Failed to remove old thermal database files.

**Description**

Cannot delete the old thermal result files in the thermal database. You may not have permission to access the files or the some of files are opened by other processes.

**What Next**

Check the permission and the opened files of the directory and try again.

---

## 3DIC-451

(Information) Created the thermal database %s.

**Description**

Created the thermal database for thermal result.

**What Next**

Make sure the thermal database can be populated with the thermal result files.

---

## 3DIC-452

(Information) Updated the thermal database successfully. The thermal result is %s.

**Description**

Show the thermal result after updating the thermal database.

Feedback

**What Next**

The thermal result can be opened by 'open_thermal_result' or automatically loaded by 'analyze_3d_thermal'.

---

## 3DIC-453

(Information) Finished thermal analysis successfully.

**Description**

Finished thermal analysis successfully.

**What Next**

None.

---

## 3DIC-454

(Information) Starting data preparation for thermal analysis...

**Description**

Generating the thermal script and input data for the analysis.

**What Next**

Generated the thermal script and input data.

---

## 3DIC-455

(Information) Finished the data preparation for thermal analysis.

**Description**

Generated the thermal script and input data for the analysis.

**What Next**

None.

---

## 3DIC-456

(Error) The cell instance %s has non-zero z_offset with no supporting cell instance below it.

**Description**

The cell instance has non-zero z_offset, but has no supporting cell instance below.

Feedback

**What Next**

Check if the supporting cell instances are available in the design.

---

## 3DIC-457

(Warning) %s is an invalid value for %s, so %s is used instead.

**Description**

The value is not set properly.

**What Next**

Modify the value if necessary.

---

## 3DIC-458

(Error) %s is an invalid value for %s.

**Description**

This occurs when the value is not valid.

**What Next**

Correct the value.

---

## 3DIC-459

(Information) The analysis is powered by Ansys RedHawk-SC Electrothermal, and the required version is 2023R2.3.

**Description**

The analysis is powered by Ansys RedHawk-SC Electrothermal, and the required version is 2023R2.3. There could be some unexpected issues if unmatched version is used.

**What Next**

None

---

## 3DIC-460

(info) StarRC channel extraction clock net settings cleared.

**Description**

This option tells you that StarRC channel extraction clock net settings have cleared.

Feedback

**What Next**

Make sure this was intended.

---

## 3DIC-461

(info) StarRC channel extraction inductance settings cleared.

**Description**

This option tells you that StarRC channel extraction inductance settings have cleared.

**What Next**

Make sure this was intended.

---

## 3DIC-462

(Error) The instance %s can not be found.

**Description**

The instance can not be found in the block.

**What Next**

Check whether the instance is in the block or not.

---

## 3DIC-463

(Error) The point %s is outside of %s's boundary bbox.

**Description**

The point is outside of the boundary bbox.

**What Next**

Choose a point inside the boundary bbox.

---

## 3DIC-464

(Error) No %s Profile file result.

**Description**

The Profile file result was not generated.

Feedback

**What Next**

Check if there is something wrong at previous step.

---

## 3DIC-465

(Error) Unable to find %s's thermal file %s of static thermal analysis.

**Description**

Unable to find the thermal file of static thermal analysis.

**What Next**

Check whether the thermal file exists or not.

---

## 3DIC-466

(Error) The Profile %s already exists.

**Description**

The Profile already exists in memory.

**What Next**

Specify a unique name.

---

## 3DIC-467

(Error) The Profile %s does not exist.

**Description**

The Profile does not exist in memory.

**What Next**

Check whether the Profile exists in memory or disk or not. You can also create a Power Profile by *create_power_profile or create_rail_power_profile. Run thermal analysis to obtain Thermal Profile or Probe Profile.*

---

## 3DIC-468

(Error) The format of the value %s of %s is invalid for the %s data type.

Feedback

**Description**

The value is invalid; we can not convert it to the certain data type. The data types include string, double, ndmBBox, and ndmCoord.

**What Next**

Check the format of the input value.

---

## 3DIC-469

(Error) The value of -kind option does not match the file extension.

**Description**

The value of -kind option does not match the file extension. We only support "spr" and "mhs" currently.

**What Next**

Use "spr" and "mhs" as the file extension instead.

---

## 3DIC-470

(error) mirror bump %s will cause miss alignment with bumps in chip %s.

**Description**

When 3DIC structure has MIB(Multiply Instantiated Blocks), create mirror bumps from one block to one MIB block, this operation will cause miss alignment between bumps in another MIB chip.

**What Next**

Check MIB die location and source bump location.

---

## 3DIC-471

(warning) mirror bump %s cannot find corresponding bump in chip %s.

**Description**

When 3DIC structure has MIB(Multiply Instantiated Blocks), create mirror bumps from one block to one MIB block, this operation will cause dangling bump in another MIB chip.

**What Next**

Check MIB die location and source bump location.

Feedback

## 3DIC-472

(error) propagate nets {%s} will change the golden netlist.

**Description**

When 3DIC structure has MIB(Multiply Instantiated Blocks), propagate nets will change the golden netlist.

**What Next**

Check nets connection.

## 3DIC-473

(error) assign nets {%s} will change the golden netlist.

**Description**

When 3DIC structure has MIB(Multiply Instantiated Blocks), assign nets will change the golden netlist.

**What Next**

Check nets connection.

## 3DIC-474

(warning) found short violation in 3D routing result.

**Description**

Tool detects overlapping violation between pre-routes and 3D routes. Normally, 3D routing is performed before power routing and other signal routing. Therefore, there should not be pre-routes in the 3D channel. If there are such pre-routes, customer should use pattern file to make tool avoid them.

**What Next**

Remove or modify preroutes to resolve overlapping violations. Alternatively, user can change the pattern file to re-generate 3D routing result.

## 3DIC-475

(warning) pre-existing route shape %s overlaps with 3D routes.

Feedback

**Description**

Tool detects a route shape which overlaps 3D routes.

**What Next**

Remove or modify the route. Alternatively, user can change the pattern file to re-generate 3D routing result to avoid the route shape.

---

## 3DIC-476

(warning) pre-existing via %s overlaps with 3D routes.

**Description**

Tool detects a via which overlaps 3D routes.

**What Next**

Remove or modify the via. Alternatively, user can change the pattern file to re-generate 3D routing result to avoid the via.

---

## 3DIC-477

(warning) net %s is skipped during routing.

**Description**

Tool skips the specified net since the net does not cross the 3D channel.

**What Next**

Route the net after auto-3D routing.

---

## 3DIC-478

(error) middle track offset does not fit the %s switch offset: minimal adjusting distance is %s.

**Description**

The middle track offset must be increased or the upper edge switch offset must be decreased by the given amount if the violation is on the upper side so that the middle section can be routed. The middle track offset must be decreased or the lower edge switch offset must be decreased by the given amount if the violation is on the lower side so that the middle section can be routed.

Feedback

**What Next**

Please adjust the mid_routing_switch_direction_gaps.

---

## 3DIC-479

(error) The middle channel is too narrow for single-waterfall routing pattern.

**Description**

The offset of bump arrays is large. As a result, it is impossible to route the middle channel section using the single-waterfall routing pattern.

**What Next**

Set mid_routing_switch_direction to true or adjust bump array locations to reduce offset.

---

## 3DIC-480

(error) Pattern dimensions are illegal, please check the pattern setting.

**Description**

In pattern's setting, 'dx' and 'dy' must be not negative, other dimensions must be not zero or negative.

**What Next**

NA.

---

## 3DIC-481

(error) When create objects by lib cell in '-lib_cell_selection' option, these objects will overlap in %s direction.

**Description**

The near objects that created by lib cell will overlap because the distance between the near objects is less than pattern's pitch.

**What Next**

check the '-lib_cell_selection' option or '-pattern' setting.

---

## 3DIC-482

(error) The command cannot support multiple dies scenario.

Feedback

**Description**

The command cannot support multiple dies scenario.

**What Next**

check '-core', '-design_boundary', '-voltage_area', '-block' or '-boundary' option setting.

---

## 3DIC-483

(error) Cannot find any region to create objects.

**Description**

From command options, it's impossible to get any region to create objects.

**What Next**

check '-core', '-design_boundary', '-voltage_area', '-block' or '-boundary' option setting.

---

## 3DIC-484

(error) Assign net failed, the hier of object %s is not same as the hier of net %s.

**Description**

The net cannot be assigned to the object that create by the command.

**What Next**

check '-net_assignment' option setting.

---

## 3DIC-485

(error) The region %s that plan to create objects is overlapped because of Multipy Instance Blocks.

**Description**

Overlapped region will cause incorrect objects placement.

**What Next**

check '-boundary' option setting.

---

## 3DIC-486

(warning) The boundary of the existing region '%s' overlaps with the boundary of the newly created region boundary {%s}.

Feedback

**Description**

The overlapped region boundary may lead to the failure to create a new region.

**What Next**

NA

---

## 3DIC-487

(warning) Net assignment is not supported in 3DIC top Level.

**Description**

In top level, net assignment is not supported, '-net_assignment' option will be ignored.

**What Next**

NA

---

## 3DIC-488

(warning) Region '%s' is existed, %d associated objects were removed, and the region will be reset.

**Description**

When users run 'create_3d_region_objects' or 'copy_3d_region_objects', and the target region is existed , the region will be reset after running these commands.

**What Next**

NA

---

## 3DIC-489

(warning) Pattern '%s' is existed, and the pattern will be reset.

**Description**

When users run 'create_3d_object_pattern', and the pattern is existed , the pattern will be reset after running the command.

**What Next**

NA

Feedback

## 3DIC-490

(error) All objects cannot be created and placed correctly in the #%u ring with boundary {%s}.

**Description**

When users use ring pattern to create new region and objects, the specified ring cannot create and place new objects correctly.

**What Next**

NA

## 3DIC-491

(warning) Link and link_location cannot be copyed from region '%s' to new region.

**Description**

NA.

**What Next**

See command 'create_3d_region_objects'

## 3DIC-492

(error) '-aligned_top_level' option only supports the scenario when command runs in top level and sets '-boundary' option.

**Description**

The command can support to keep new objects aligned only when set '-boundary' option in top level.

**What Next**

NA.

## 3DIC-493

(error) When command sets '-boundary' option on the top level, the '-target_die' option must be specified at the same time.

**Description**

NA.

Feedback

**What Next**

NA.

---

## 3DIC-494

(error) The region '%s' is %s set back side , it's conflict with the layer set by bond pad reference '%s'.

**Description**

When the region is set to back side, the layer set by bond pad reference must be in the back side. When the region is not set to back side, the layer set by bond pad reference also must be not in the back side.

**What Next**

Check the setting of bond pad layer.

---

## 3DIC-495

(error) The name of bond pad reference '%s' cannot be the same as the name of any lib cell or bond pad def.

**Description**

The bond pad reference name must be unique, it cannot have the same name with any lib cell or bond pad def.

**What Next**

Set a unique bond pad reference name.

---

## 3DIC-496

(warning) Bond pad reference '%s' is existed, and the bond pad reference will be reset.

**Description**

When users run 'create_bond_pad_reference', and the reference is existed, the reference will be reset after running the command.

**What Next**

NA.

Feedback

## 3DIC-497

(error) Cannot find any valid region to commit objects.

**Description**

From command options, it's impossible to get any valid region to commit objects. No valid or specified regions are existed in current block.

**What Next**

Check if none of regions in "region_names" option is existed in top level; Check if there are no regions in current block when "region_names" option is not specified.

## 3DIC-498

(warning) The associated edit group with region '%s' is existed, %d associated objects were removed, the region will be re-committed.

**Description**

If the region has been committed, the existed committed objects will be removed and the new objects will be re-committed.

**What Next**

NA.

## 3DIC-499

(warning) There is no %s in the die %s.

**Description**

There is no %s in the die %s.

**What Next**

Create the bumps in the die.

## 3DIC-500

(warning) There is no valid <%s> for current 3dic design.

**Description**

There is no valid <%s> setting can match current 3dic design. For <FP_PATTERN>, it means the floorplan of current design doesn't match any pattern; For <SOC_TYPE>, it

Feedback

means the height/width/length/diagonal of 'SOC' can't statisfy all of the settings in any <SOC_TYPE> section.

**What Next**

Adjust the floorplan by 'set_cell_location' or adjust the boundary of the die by 'set_block_boundary'.

---

## 3DIC-501

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The spacing between the bump and its parent die violate the constraint.

**What Next**

Adjust the bump's location.

---

## 3DIC-502

(error) The %s of %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The shape of bump violates the constraint.

**What Next**

Check the bumps in the design.

---

## 3DIC-503

(error) Find dangling %s %s that violate the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The bump is too far away with other bumps that it will be seen as a dangling bump.

**What Next**

Adjust the bump's location.

Feedback

## 3DIC-504

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The relative location of two bumps violates the constraint.

**What Next**

Adjust the bump's location.

## 3DIC-505

(error) The bump(s) reside in the %s corner triangular zone of %s violate the constraint <%s> setting, the wedge length is {%s}.

**Description**

The constraint specifies a triangular zone at the corner of a wafer-level fanout box where the specify rank (corner-most) bump (electrically unconnected) must reside.

**What Next**

Adjust the bump's location.

## 3DIC-506

(error) %s abutt or overlap with %s which violate the constraint <%s> setting.

**Description**

The bumps are abutted or overlpped.

**What Next**

Adjust the bump's location.

## 3DIC-507

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.%s

**Description**

The relative location or area_ratio between two dies violates the constraint.

Feedback

**What Next**

Adjust the boundary or location of the die.

---

## 3DIC-508

(error) The %s of %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.%s

**Description**

The shape of die violates the constraint.

**What Next**

Adjust the boundary of the die.

---

## 3DIC-509

(error) %s.

**Description**

Errors are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-510

(warning) %s.

**Description**

Errors are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

---

## 3DIC-511

(warning) The bump %s of net %s is ignored for port creation as it is not within the user specified bounding box.

Feedback

**Description**

The bump is ignored as it is not fully contained within the user specified bounding box.

**What Next**

Please check your bounding box.

---

## 3DIC-512

(warning) The bump %s of reference net %s is ignored for port creation as it is not within the user specified bounding box.

**Description**

The bump is ignored as it is not fully contained within the user specified bounding box.

**What Next**

Please check your bounding box.

---

## 3DIC-513

(error) The reference net %s has zero bumps inside the user defined bounding box.

**Description**

The bump is ignored as it is not fully contained within the user specified bounding box.

**What Next**

Please check your bounding box.

---

## 3DIC-514

(warning) %s.

**Description**

The port name defined for the net does not correspond to a bump and cannot be used for simulate_signal_integrity.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

Feedback

## 3DIC-515

(warning) Object of type %s is not supported in extract_channel_parasitics right now. Objects of this type will not be written to the EDB.

**Description**

The aforementioned object is not supported and will not be written to the EDB.

**What Next**

Please check the object type.

## 3DIC-516

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The area_ratio of toal area of bumps in specific region between area of specific region violates the constraint.

**What Next**

Adjust the location of the bumps.

## 3DIC-517

(error) Find dangling bump %s that violate the constraint <%s> & <%s> setting, the valid <%s> is {%s %s} and the valid <%s> is {%s %s}.

**Description**

The bump is too far away with other bumps that it will be seen as a dangling bump.

**What Next**

Adjust the bump's location.

## 3DIC-518

(warning) Detected incomplete net %s

**Description**

Detected an incomplete net on a 3DIC design. This might be caused by bump mis-alignment or bad net assignment on pins.

Feedback

A top-level inter-die net is incomplete if any one of its logical ports is unreachable from another.

**What Next**

Please refer to the error browser for more information.

---

## 3DIC-519

(warning) Detected short violations for nets %s on bumps %s.

**Description**

Detected a die to die short violation on bumps. This might be caused by bump mis-alignment or bad net assignment on pins.

**What Next**

Please refer to the error browser for more information.

---

## 3DIC-520

(warning) Detected short violations for nets %s at pin %s.

**Description**

Detected a short violation caused by bad net assignment at pins.

---

## 3DIC-521

(warning) Ignore invalid cell %s which is not a bump or TSV cell or the reference cell is not in the "-include_ref_cells" list.

**Description**

Only 3DIC related objects, including bumps, TSVs, special included reference cells and routes are the copying target of this command, other objects are ignored and not copied.

**What Next**

Please check the input.

---

## 3DIC-522

(warning) Invalid block net input for '%s' option.

Feedback

**Description**

The input net is not a valid net.

**What Next**

Please check if the input net is valid.

---

## 3DIC-523

(warning) Net conflict found between '%s' and '%s' when doing net tracing.

**Description**

Net conflict is found when trying to propagate the net from one shape to other touched objects.

**What Next**

Please check the conflict and correct the net assignment or remove the objects.

---

## 3DIC-524

(warning) Copied object %s is outside of design boundary.

**Description**

One of the copied objects is outside of design boundary.

**What Next**

Please check the -to or -delta input option to correct the copy destination.

---

## 3DIC-525

(Info) Objects already exist in destination bounding box.

**Description**

There are already objects in the destination bounding box. This situation might be expected for copying objects to connect exsiting objects. But it can also be an error due to wrong destination given.

**What Next**

Please check if the copy result is expected.

Feedback

## 3DIC-526

(warning) No valid objects to copy.

**Description**

Only 3DIC related objects, including bumps, TSVs, and routes are the copying target of this command, other objects are ignored and not copied.

**What Next**

Please check the input.

## 3DIC-527

(warning) control_channel_bus_width ignore since control channel cannot be identified.

**Description**

The control channel is the middle subchannel. Since there are even number of subchannels, no control channel can be identified. The control_channel_bus_width constraint is ignored.

**What Next**

Please check the design.

## 3DIC-528

(error) channel length needs to be increased by %s.

**Description**

The channel length is too short. 3D routing cannot be completed.

**What Next**

Please increase the channel length or reduce routing pitch.

## 3DIC-529

(warning) Ignore invalid object %s which is not a cell or shape.

**Description**

Only 3DIC related objects, including bumps, TSVs, and routes are the copying target of this command, other objects are ignored and not copied.

Feedback

**What Next**

Please check the input.

---

## 3DIC-531

(error) When commit objects by adjacent design/bond_pad_reference '%s' and '%s', these objects will overlap because the adjacent distance between these two designs is less than the '%s' of pattern '%s'.

**Description**

The adjacent objects that created by design collection will overlap because the distance between the adjacent objects is less than pattern's pitch.

SH WHAT NEXT If this phenomenon is which you expect, please add the '-force' option in command "commit_pseudo_bumps". check the '-bumps', '-probe_bumps' or '-dummy_bumps' option setting.

---

## 3DIC-532

(error) Total %s pseudo bumps {%s} are not within its '%s' in chip '%s'.

**Description**

Pseudo bump must be within its region. Pseudo bump must be within its die boundary.

SH WHAT NEXT Adjust the boundary setting of bump region.

---

## 3DIC-533

(error) Total %s pseudo bump pairs {%s} overlap in chip '%s'.

**Description**

Two pseudo bumps does not overlap.

SH WHAT NEXT Adjust the pitch or stagger pitch setting of bump region pattern.

---

## 3DIC-534

(error) Pseudo bump '%s' is dummy and it still assigns net '%s' in chip '%s'.

**Description**

Dummy bump cannot be assigned to a net.

SH WHAT NEXT Check the net attribute setting of pseudo bump.

Feedback

## 3DIC-535

(warning) connector spacing is reduced in current subchannel.

**Description**

The route spacing in the connector region is reduced.

**What Next**

Please increase channel length.

## 3DIC-536

(error) cannot apply default 2-layer routing due to bump-net assignments.

**Description**

In the default 2-layer routing mode, the bump array is divided evenly. Half of the bumps are routed using a single layer. It requires that no net can span across the two halves of bump arrays. If there is one or more nets whose bumps are in different halves of bump arrays, the routing cannot be performed.

**What Next**

Consider routing the channel in a single layer with subchannel_layer_list in the pattern file. Or check the bump to net assignment and perform modification. User can also use create_interposer_routeplan to route the channel separately, with non-default bump array boxes defined by bump_array_box in the pattern file.

## 3DIC-537

(warning) Bump lib cell %s has more than 1 port.

**Description**

Bumps should only have a single port. The tool detects a bump lib cell with more than 1 port.

**What Next**

Please check the bump lib cell.

## 3DIC-538

(Error) The configuration file is not specified for the app option %s.

Feedback

**Description**

The occurs when the .gds file is specified for 3dic.thermal.pkg_file and/or 3dic.thermal.pcb_file, and the corresponding configuration file is not set.

**What Next**

Set the corresponding configuration file in the app option.

---

## 3DIC-539

(Error) Could not find the file %s from the app option %s because the file does not exist.

**Description**

This occurs when the file is not found in the given path.

**What Next**

Provide correct filepath in the corresponding app option.

---

## 3DIC-540

(Error) tracks are too close to abutted vias.

**Description**

Although the tool places bump access vias, these vias are too close to tracks and routing cannot be completed without DRCs.

**What Next**

Please check constraints. Use smaller spacing values with keyword rdl_route_spacing

---

## 3DIC-541

(error) %s is outside of the boundary of die %s which violates the constraint <%s>.

**Description**

The bump is not fully inside the die boundary.

**What Next**

Please adjust the bump location.

---

## 3DIC-542

(error) %s overlaps with %s which violate the constraint <%s> setting.

Feedback

**Description**

The tag cell overlaps with bump.

**What Next**

Adjust the tag cell or bump's location.

---

## 3DIC-543

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The relative location of tag cell and bump violates the constraint.

**What Next**

Adjust the bump or tag cell's location.

---

## 3DIC-544

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The relative location of bump and tag cell violates the constraint.

**What Next**

Adjust the location of bump or tag cell.

---

## 3DIC-545

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The spacing between the tag cell and its parent die violate the constraint.

**What Next**

Adjust the tag cell's location.

Feedback

## 3DIC-546

(error) %s is outside of the boundary of die %s which violates the constraint <%s>.

**Description**

The tag cell is not fully inside the die boundary.

**What Next**

Please adjust the tag cell's location.

## 3DIC-547

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The area_ratio of toal area of tag cells in specific region between area of specific region violates the constraint.

**What Next**

Adjust the location of some tag cells or remove/add some tag cells.

## 3DIC-548

(warning) failed to set preferred_pin for port %s.

**Description**

The command "commit_pseudo_bumps" cannot set preferred pins for the assigned port from corresponding pseudo bump.

**What Next**

Please check the specified lib cell and port.

## 3DIC-549

(warning) The bump region '%s' is at the top level and it cannot be committed.

**Description**

The command "commit_pseudo_bumps" cannot support the bump region at the top level to be commited. Please create bump region in dies.

Feedback

**What Next**

Use command "create_bump_region" in dies.

---

## 3DIC-550

(warning) The off-die tsv layer is not frontSide port layer or backSide port layer, the layer will be ignored.

**Description**

The first five characters of frontSide port layer's mask name must be 'metal'; The first six characters of backSide port layer's mask name must be 'bmetal'; The specified off-die layer must be frontSide port layer or backSide port layer, or the off-die layer will be ignored. The command will use the current frontSide port layer and backSide port layer to report informatton of feedThrough TSV.

**What Next**

NA.

---

## 3DIC-551

(warning) These 'is_dummy' and 'is_probe_pad' attributes of pseudo bump '%s' are true at the same time, the pseudo bump cannot be commited.

**Description**

NA.

**What Next**

NA.

---

## 3DIC-552

(warning) apply user spacing of layer %s even it is smaller than that in the tech-file, which is %s microns.

**Description**

The min-spacing specified by user is smaller than that in the tech-file.

**What Next**

Please verify the tech-file and/or user spacing for the specified layer.

Feedback

## 3DIC-553

(error) cannot find '%s' lib cell specified in plan.3dic.pattern_marker_lib_cell_names. PRS checking will be skipped.

**Description**

Both two lib cells specified in app option plan.3dic.pattern_marker_lib_cell_names must be existed.

**What Next**

check if the reported lib cell is existed.

## 3DIC-554

(warning) source bump cell '%s' has no pin.

**Description**

The source bump has no pin, and attribute "is_dummy" is not set true.

**What Next**

NA.

## 3DIC-555

(error) the probe bumps cluster {%s} is invalid in chip %s.

**Description**

Probe bump cluster must be exactly 2x2 bumps, all 4 identical bumps shape, size, layer, perfect equal square spacing, all 4 connected to the same net.

**What Next**

NA.

## 3DIC-556

(error) the distance between quad probe bumps {%s} and {%s} is less than min distance %s in chip %s.

Feedback

**Description**

The min distance between two quad probe bumps is set by app option "plan.3dic.min_probe_bumps_quad_spacing" or "plan.3dic.qprobe_min_pitch". If the two app options are specified, the command will use the max value to check the violations.

**What Next**

NA.

---

## 3DIC-557

(error) bump %s in outermost edge must be dummy or assign to VSS/VDD net in chip %s.

**Description**

The outermost bump along the edge must be dummy or the bump assigned to VSS/VDD net.

**What Next**

NA.

---

## 3DIC-558

(error) there is no unique bump pattern in chip %s.

**Description**

One bump pattern in chip corner must be unique.

**What Next**

NA.

---

## 3DIC-559

(error) the distance of the intradie bump %s in orientation %s is less than min distance %s in chip %s.

**Description**

The min distance of intradie bump is set by app option "plan.3dic.min_bump_zone_street_keepout_margin".

**What Next**

NA.

Feedback

## 3DIC-560

(error) there are no two opposite corners which have PRS cells with specified margins in chip %s, the reason is '%s'.

**Description**

Two opposite corners which have PRS cells in each chip. These PRS cells must satisfy conditions as below: 1.The die contains exactly two unique PRS markers specified by the user. 2.The two cells must be placed such that two edges are flush with the EDM (within a tolerance - specify by app options,default is zero) 3.The two cells must be placed in opposite corners.

**What Next**

check the number of PRS Cells or location.

## 3DIC-561

(error) the %s length of %s's plate hole is less than %s from rv rule in %s chip.

**Description**

The rv rules are set by app options, these rules limit the width/height length of via's plate hole.

**What Next**

check the width/height of via's plate hole.

## 3DIC-562

(error) the spacing distance between %s and %s is less than %s from rv rule in %s chip.

**Description**

The rv rules are set by app options, these rules limit the distance between two objects.

**What Next**

check the spacing distance between two objects.

## 3DIC-563

(warning) the dimension of the die is out of industry standard.

Feedback

**Description**

This sanity check ensure the dimension is within industry standard.

**What Next**

Either check the dimension or apply "estimate_3d_thermal -force" with caution in simulation result.

---

## 3DIC-564

(Warning) The size of %s is out of industry standard.

**Description**

This sanity check by command *estimate_3d_thermal* ensure the dimension is within industry standard.

**What Next**

Either check the dimension or apply *estimate_3d_thermal –force* to proceed simulation with caution.

---

## 3DIC-565

(error) File format error in block power file '%s'.

**Description**

Please check your file and correct the part that does not match the format.

Block power file format is as follows:

```
region_currents = [
    {
        'name':'A',
        'coord':RealRect(0.000000,0.000000,12000.000000,12000.000000),
        'method':'Method',
        'current':{Net('VDD'):1. 0e-3,Net('VSS'):1.5e-03}
    }
]
```

where the 'coord' and 'current' input are the necessary information. Please keep the format of having each information and the brackets in a single line.

**What Next**

Correct the file input.

Feedback

## 3DIC-566

(error) In option '%s', '%s' is not a valid die instance name.

**Description**

Please provide a valid die instance name for the -block_power_files, -exculde_regions, -via_def or -lib_cell option. The die instance name should be one of the 'get_cells' result collection of the top die.

**What Next**

Correct the option input.

## 3DIC-567

(error) In file '%s', '%s' is not a valid %s input. %s.

**Description**

Please check your file and correct the part that does not match the format.

Block power file format is as follows:

```
region_currents = [
    {
        'name':'A',
        'coord':RealRect(0.000000,0.000000,12000.000000,12000.000000),
        'method':'Method',
        'current':{Net('VDD'):1. 0e-3,Net('VSS'):1.5e-03}
    }
]
```

where the 'coord' and 'current' input are the necessary information.

**What Next**

Correct the file format.

## 3DIC-568

(error) In block power files associated with die inst '%s', there are overlapped regions which is not supported. Overlapped regions: %s and %s.

**Description**

Currently, multiple current regions in one die is supported when the regions are disjoint. Overlapped region are not supported.

Feedback

**What Next**

Please correct your input.

---

## 3DIC-569

(error) Wrong input for option '-block_power_files'. Correct format {{die_instance_name1 file_name1} {die_instance_name2 file_name2} ...}.

**Description**

The input format for '-block_power_files' option is {{die_instance_name1 file_name1} {die_instance_name2 file_name2} ...}.

**What Next**

Please correct your input.

---

## 3DIC-570

(warning) In option '-block_power_files', die '%s' and '%s' refer to the same reference design. Input '%s' is ignored.

**Description**

For multiply instantiated module (MIM) or block (MIB), the block power data should be the same. Ignore the second input to avoid conflict.

**What Next**

Check the result and correct the option input if needed.

---

## 3DIC-571

(warning) Net %s specified from '-pg_nets' option %s. Skip it.

**Description**

The net input from '-pg_nets' option either does not exist in the target creation die or is not a PG nets. The net is skipped during PG TSV creation.

**What Next**

Please check the option input.

---

## 3DIC-572

(info) No PG nets are specified by option -pg_nets. Use all PG nets as target nets.

Feedback

**Description**

When the option -pg_nets is not specified or all the nets specified by -pg_nets options are invalid, then all PG nets of the target creation die which has power density information is used to create PG TSVs.

**What Next**

Check the result.

---

## 3DIC-573

(warning) There are already %d TSVs on die '%s' which are not taken into calculation. New created TSV might have DRC violations with them.

**Description**

This command does not support incremental TSV creation. The existing TSVs are not taken into density calculation, thus the final TSV number might not meet the required power density needs. Moreover, newly created TSV might have DRC violation with the pre-exist ones.

**What Next**

Please check the result and if the result is not correct, remove all TSVs and rerun the command.

---

## 3DIC-574

(warning) the committed editgroup '%s' cannot be assigned to the port '%s'.

**Description**

When the corresponding pseudo bump was assigned to one port, but the committed editgroup cannot support to be assigned to any port.

**What Next**

NA.

---

## 3DIC-575

(warning) there are more than one ports: %s on the net '%s' which assigned on pseudo bump '%s'.

Feedback

**Description**

Multiple ports are connected to the assigned net, the tool cannot decide which port can be used to create terminal.

**What Next**

Check the net attribute setting of pseudo bump.

---

## 3DIC-576

(warning) the pseudo bump '%s' was set net '%s' and port '%s' at the same time and it will be committed to a bond pad, the corresponding assigned net will be ignored.

**Description**

The committed bond pad will be assigned to the port which connected to the specified net. If the assigned port is also specified, the assigned port will be conficted. During this scenario, the specified net will be ignored.

**What Next**

NA.

---

## 3DIC-577

(error) the bump cell pin '%s' cannot be setted preferred pin to port '%s'.

**Description**

The bump cell pin which can be setted to preferred pin to one port must satisfy below conditions: 1. The pin in bump cell must be IO Pad. 2. The specified port cannot have any regular shapes.

**What Next**

NA.

---

## 3DIC-578

(error) the net which connected to the port '%s' is '%s', it's not same with the net '%s' which assigned to pseudo bump '%s'. it will cause unexpected behavior that one net will be removed.

**Description**

Two nets connect to one bump cell, it will caused one net will be removed. If this scenario is expected, please add '-force' option.

Feedback

**What Next**

NA.

---

## 3DIC-579

(warning) there are more than one ports: %s on the net '%s' which assigned on pseudo bump '%s' in chip '%s'.

**Description**

NA.

**What Next**

Check the net attribute setting of pseudo bump.

---

## 3DIC-580

(error) connet bond pad '%s' to net '%s' failed, target net '%s' is dangling, it is not connected to a valid port. Cannot create bond pad terminal without an associated port.

**Description**

If committed bond pad needs to connected to the specified net, the specified net must connect to a valid port.

**What Next**

NA.

---

## 3DIC-581

(error) committed %s '%s' from pseudo bump '%s' using design/bond pad reference '%s' in bump region '%s' cannot be assigned to port '%s'.

**Description**

Please check 1. If the specified port has any regular shapes. 2. If the attribute 'is_pad' of the pin in the lib cell is false.

**What Next**

Please add '-force' option in command.

Feedback

## 3DIC-582

(error) committed %s '%s' from pseudo %s '%s' using %s '%s' in bump region '%s' cannot be connected to net '%s'.

**Description**

If the committed object type is 'bump cell', please check if there is any valid pin from specified design. If the committed object type if 'bond pad' , please check if there is any valid port connected to the speccified net.

**What Next**

NA.

## 3DIC-583

(warning) Need %d TSV to support the current setting for this region, and the region is too small to create these TSV without DRC violation. Skip the creation for this region.

**Description**

The distance between TSVs need to be larger than minimum spacing and pitch defined in technology file. According to the input current value from the block_power_files and tsv_conversion_factor, the number of TSV needed to support the current setting is too many to keep enough distance between each other. In order to avoid long runtime for creating TSV with DRC violations, the TSV creation for this region is skipped.

**What Next**

Check the input and correct it.

## 3DIC-584

(error) In option '-exclude_regions', '%s' is not a valid bbox list.

**Description**

Please provide a valid bbox list with the associate die instance name. The input format of '-exclude_regions' option is {{die_inst_name1 {{{box1_llx box1_lly} {box1_urx box1_ury}} {{box2_llx box2_lly} {box2_urx box2_ury}}}} {die_inst_name2 {{{box3_llx box3_lly} {box3_urx box3_ury}}}}}. If the bbox list comes from other tcl command, such as [get_attribute [get_cells $myCell] bbox], please use double quote instead of the most outer curly brackets. Example: "{die_inst_name1 {[get_attribute [get_cells $myCell] bbox]}} {die_inst_name2 {[get_attribute [get_cells $myCell2] bbox]}}"

Feedback

**What Next**

Correct the option input.

---

## 3DIC-585

(error) In option '%s', the input is not a valid list of %s.

**Description**

Correct format for -via_def is {{die_instance_name1 via_def_name1} {die_instance_name2 via_def_name2} ...}. Correct format for -lib_cell is {{die_instance_name1 tsv_cell_name1} {die_instance_name2 tsv_cell_name2} ...}.

**What Next**

Correct the option input.

---

## 3DIC-586

(warning) Die %s has "face-down" orientation FN with no adjacent die at a higher stacking level. TSV creation is skipped.

**Description**

A die which has "face-down" orientation and no adjacent die at a higher stacking level does not need TSV, since there is no adjacent die or package to connect.

**What Next**

Check your design.

---

## 3DIC-587

(warning) Die %s has no TSV layer defined in technology file. TSV creation is skipped.

**Description**

The die has no TSV layer (mask name is tsv). Cannot create TSV for this die.

**What Next**

Check your design.

Feedback

## 3DIC-588

(warning) Need %d TSV to support the current setting for net %s in this region, and the PG stripes are too short to create these TSV without DRC violation. Skip the creation for the net in this region.

**Description**

The distance between TSVs need to be larger than minimum spacing and pitch defined in technology file. According to the input current value from the block_power_files and tsv_conversion_factor, the number of TSV needed to support the current setting for the net is too many to keep enough distance between each other along the PG stripe. In order to avoid long runtime for creating TSV with DRC violations, the TSV creation for this net in this region is skipped.

**What Next**

Create more PG stripes for the net in the region or correct the settings.

## 3DIC-589

(error) the deisgn type of cell '%s' is not flip_chip_pad but it's on the off-die layer in '%s' die.

**Description**

The design type of cell must be flip_chip_pad when it's on the off-die layer.

**What Next**

Please contact foundry or bump cell library provider.

## 3DIC-590

(error) the bump '%s' is not on the off-die layer in '%s' die.

**Description**

The bump must be on the off-die layer.

**What Next**

Please contact foundry or bump cell library provider.

## 3DIC-591

(warning) there is no bumps on the %s layer in '%s' die.

Feedback

**Description**

NA.

**What Next**

NA.

---

## 3DIC-592

(error) the pin '%s' is not %s but %s in '%s' die.

**Description**

The bond pad must be on off-die layer and set bond pad attribute.

**What Next**

NA.

---

## 3DIC-593

(error) tsv cell '%s' has no shape on 'tsv' layer in '%s' die.

**Description**

Tsv cell must have one or more shapes on 'tsv' layer.

**What Next**

Please contact foundry or tsv cell library provider.

---

## 3DIC-594

(error) tsv cell '%s' has no shape on %s layer in '%s' die.

**Description**

Tsv cell must have one or more shapes on front layer whose mask_name is 'metal*' and back layer whose mask_name is 'bmetal*'.

**What Next**

Please contact foundry or tsv cell library provider.

---

## 3DIC-595

(error) the frame view of lib cell '%s' is missing.

Feedback

**Description**

The frame view of lib cell will be used during 3DIC Designing Planning flwo, it's missing will cause unexpected error.

**What Next**

Please contact foundry or tsv cell library provider.

---

## 3DIC-596

(error) the lib cell of 'flip_chip_pad' type '%s' is not on the off-die layer.

**Description**

Lib cell of 'flip_chip_pad' type must be on the off-die layer.

**What Next**

Please contact foundry or tsv cell library provider.

---

## 3DIC-597

(error) the lib cell of 'tsv' type '%s' has no shape on layers '%s'.

**Description**

Lib cell of 'tsv' type must have one or more shapes on 'tsv', 'metal*' and 'bmetal*' layers at the same time.

**What Next**

Please contact foundry or tsv cell library provider.

---

## 3DIC-598

(error) the layer setting of bump cell '%s' is different with its parent block in '%s' die.

**Description**

The layer setting of bump cell is different with its parent block, because the order of layer setting is different or some layers setting is missing.

**What Next**

Please contact foundry or tsv cell library provider.

Feedback

## 3DIC-599

(error) the attribtue 'is_pad' of pin '%s' in the lib cell %s is false, it will cause the port assignment failure.

**Description**

The pin can be set to the preferred_pin of the port, the attribte 'is_pad' of the pin must be true.

**What Next**

Please contact foundry or bump cell library provider.

## 3DIC-600

(error) the pitch of single probe bumps %s in the non-dummy region is less than value %s where the single probe bumps are in %s pattern in chip '%s'.

**Description**

The rule value of single probe bump in square pattern is set by app option 'plan.3dic.sprobe_min_pitch_square'; The rule value of single probe bump in other pattern is set by app option 'plan.3dic.sprobe_min_pitch_other';

**What Next**

Please adjust the placement of bumps.

## 3DIC-601

(error) the pitch of single probe bumps %s in the true-dummy region is less than value %s in chip '%s'.

**Description**

The rule value of single probe bump in other pattern is set by app option 'plan.3dic.sprobe_min_pitch_true_dummy_region'.

**What Next**

NA.

## 3DIC-602

(error) dummy region area.

Feedback

**Description**

The rule value of single probe bump in other pattern is set by app option 'plan.3dic.sprobe_dummy_region_area'.

**What Next**

NA.

---

## 3DIC-603

(error) the pitch between single probe bump '%s' and unprobed %s-dummy bump '%s' is less than value %s where the single probe bumps are in %s pattern in chip '%s'.

**Description**

The rule value of the pitch between single probe bump and unprobed non-dummy bump in square pattern is set by app option 'plan.3dic.sprobe_min_pitch_non_dummy_ubump_square'; The rule value of the pitch between single probe bump and unprobed non-dummy bump in other pattern is set by app option 'plan.3dic.sprobe_min_pitch_non_dummy_ubump_other'; The rule value of the pitch between single probe bump and unprobed true-dummy bump is set by app option 'plan.3dic.sprobe_min_pitch_true_dummy_ubump';

**What Next**

Please adjust the placement of bumps.

---

## 3DIC-604

(error) the layout for quad probe bump '%s' is not vertices of a square with edges parallel to die edges in chip '%s'.

**Description**

NA.

**What Next**

Please adjust the placement of bumps.

---

## 3DIC-605

(error) the pitch between quad bump '%s' and bump '%s' is less than value %s in chip '%s'.

**Description**

The rule value is set by app option 'plan.3dic.qprobe_pitch_ubump';

Feedback

**What Next**

Please adjust the placement of bumps.

---

## 3DIC-606

(error) the pitch between quad bumps %s and %s is less than value %s in chip '%s'.

**Description**

The bump quad must be square. The rule value of is set by app option 'plan.3dic.qprobe_min_pitch'.

**What Next**

Please adjust the placement of bumps.

---

## 3DIC-607

(error) the pitch between quad probe bump '%s' and single probe bump '%s' is less than value %s at %s direction in chip '%s'.

**Description**

The rule value is set by app option 'plan.3dic.qprobe_min_orthogonal_pitch_sprobe';

**What Next**

Please adjust the placement of bumps.

---

## 3DIC-608

(error) the number of probe bumps is %s, it's more than value %s in chip '%s'.

**Description**

The rule value is set by app option 'plan.3dic.probe_num_max';

**What Next**

Please adjust the number of probe bumps.

---

## 3DIC-609

(error) the number of probe bumps that connect to %s is %s, it's less than value %s in chip '%s'.

Feedback

**Description**

The rule value is set by app option 'plan.3dic.probe_num_min_discrete_power_ground';

**What Next**

Please adjust the number of probe bumps.

---

## 3DIC-610

(error) the number of quad probe bumps is %s, it's less than value %s in chip '%s'.

**Description**

The quad probe bump is the probe bump with square pattern. The rule value is set by app option 'plan.3dic.qprobe_num_min'.

**What Next**

Please adjust the number of quad probe bumps.

---

## 3DIC-611

(warning) No PG stripes of net %s found in this region. Skip the creation of %d TSVs for this net.

**Description**

With the '-pg_align_layer' option, the TSVs are created on the PG stripes of the nets. If there are no PG stripes in the region, the TSV creation for this net is skipped.

**What Next**

Create more PG stripes for the net in the region.

---

## 3DIC-612

(warning) Cannot find layer '%s' in tech file of die '%s'

**Description**

The layer name specified in '-pg_align_layer' option cannot be found in the technology file of the associated die.

**What Next**

Correct the layer name or the die name in the '-pg_align_layer' option.

Feedback

## 3DIC-613

(info) Found current information of net '%s' in upper die '%s'. Add TSV to supply the current for upper die.

**Description**

If net is found in upper die by connectivity tracing or name matching and the current information is defined in associated block power file, then enough TSVs are created to support the current for upper die.

## 3DIC-614

(info) No current information of net '%s' found in upper die '%s'. Create TSV to supply current for this die only.

**Description**

If no corresponding net is found in upper die by connectivity tracing or name matching, or there is no current information defined in associated block power file, then TSVs are created only to support the current for the creation target die.

## 3DIC-615

(warning) Cannot snap TSV from (%.3f %.3f) to the nearest TSV grid (%3.f %3.f).

**Description**

If there are already another TSV on the nearst TSV gird, then snaping the TSV to the TSV grid causes violation. Skip the snapping in such case.

**What Next**

Undo the creation anf try to create TSV again with smaller TSV pitch.

## 3DIC-616

(error) %s.

**Description**

Some via might overlap with preroutes.

**What Next**

Please perform DRC checking and fix any errors.

Feedback

## 3DIC-617

(error) bump %s has insufficient RDL routing.

**Description**

RDL routing connected to the given bump does not meet the min-area rule.

**What Next**

Please check the routing and modify it using GUI if needed.

## 3DIC-618

(error) %s %.3f is smaller than %s %.3f.

**Description**

The -delta value cannot be smaller than the TSV pitch defined in techfile. Otherwise, there will be spacing violation between created TSV. The -offset value cannot be smaller than the TSV width/height. Otherwise, the created TSV will overlap with the creation boundary.

**What Next**

Correct the command input.

## 3DIC-619

(warning) Cannot honor %s %.3f setting. Use internal calculated vaule to create TSV.

**Description**

The -delta and -offset settings are soft constraints. If TSV arrary cannot be created with these values, command uses internal calculated vaule to create TSVs.

**What Next**

Adjust the option input.

## 3DIC-622

(error) the design type of lib cell '%s' is not flip_chip_pad but it has pin or shape on the off-die layer.

**Description**

The design type of lib cell must be flip_chip_pad when it has pin or shape on the off-die layer.

Feedback

**What Next**

Please contact foundry or bump cell library provider.

---

## 3DIC-623

(error) commit pseudo %s failed. %d objects have been deleted.%s

**Description**

Error happened during commit pseudo bumps or tsvs. Please check the bump region setting.

**What Next**

NA.

---

## 3DIC-624

(warning) The bump %s is connected to multiple probe pads %s.

**Description**

The bump can only connect to one probe pad.

**What Next**

Please check the 'connected_bumps' attribute setting.

---

## 3DIC-627

(warning) backside bump %s is not assigned to TSV, it will be ignored for net assignment.

**Description**

Bumps in the backside must be assigned to TSV, otherwise it will not be used to net assignment. TSV is used to construct the connection between frontside and backside bumps.

**What Next**

NA.

---

## 3DIC-628

(warning) It is obsolete to use manufacturing shape to represent %s of die %s, please use 'create_keepout_margin -type %s' to recreate %s object.

Feedback

**Description**

It is obsolete to use manufacturing shape to represent seal_ring or assembly_die of a die.

**What Next**

please use 'create_keepout_margin -type seal_ring / assembly_die' to recreate object.

---

## 3DIC-629

(error) the bump %s with attribute 'is_direct_probe' as true and 'is_probe_pad' as false is invalid in chip %s.

**Description**

NA.

**What Next**

Please check the attribute setting.

---

## 3DIC-630

(warning) The %s of reference lib cell or via def '%s' is not equal with the diameter of pseudo tsv def '%s' in pseudo tsv '%s'.

**Description**

NA.

**What Next**

NA.

---

## 3DIC-631

(error) These tsvs that are mapped with pseudo tsv '%s' of def '%s' and using lib cell or via def '%s' to committed will be overlapped.

**Description**

The committed tsvs will be overlapped, because the sum of spacing or diameter in pseudo tsv def is less than the width or height of reference lib cell or via def, this phemomenon is illegal.

**WHAT NE**

Check the pseudo tsv def setting or adjust reference lib cell or via def.

Feedback

## 3DIC-640

(warning) no 3DBlox %s.

**Description**

No 3DBlox %s in current design.

**What Next**

Please check the 3DBlox settings.

## 3DIC-641

(error) the region %s is not entirely inside die %s.

**Description**

A region must be entirely inside a die.

**What Next**

Please check the 3DBlox settings.

## 3DIC-642

(error) the region %s overlaps with region %s in the die %s.

**Description**

Two regions on the same side of a die must not overlap. Regions of same die on different sides have no such restriction.

**What Next**

Please check the 3DBlox settings.

## 3DIC-643

(error) the region %s and %s are overlaped but not covered with each other.

**Description**

If two regions belong to different chiplets, check that either the first region completely contains the second region or vice versa in the XY dimension.

**What Next**

Please check the 3DBlox settings.

Feedback

## 3DIC-644

(error) the connection %s connects two regions %s and %s which are from the same die %s.

**Description**

Two regions of a connection must be from different dies.

**What Next**

Please check the 3DBlox settings.

## 3DIC-645

(error) there is connection %s that from %s to %s, connection %s that has opposite direction is prohibited.

**Description**

If there is a connection from die_A to die_B, then connection from die_B to die_A is prohibited. It will lead to inconsistency of the top-bottom relationship.

**What Next**

Please check the 3DBlox settings.

## 3DIC-646

(error) Based on connection %s, the connection %s is invalid, it will cause the inconsistency of the top-bottom relationship.

**Description**

Two connections with the same bottom region must have the same Z-elevation, otherwise it will cause the inconsistency of the top-bottom relationship.

**What Next**

Please check the 3DBlox settings.

## 3DIC-647

(error) The die %s is isolated from the spcified connectivity.

**Description**

The die %s is totally isolated from the connectivity specified in 3DBlox input.

Feedback

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-648

(error) the path assertion %s has less than 2 regions.

**Description**

The path assertion should contain more than 2 regions.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-649

(error) Assert path %s. Assert result: FAIL.

**Description**

There is no valid path to satisfy the path assertion %s.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-650

(error) The connection %s is invalid. The top region %s is on the chiplet instance %s and the bottom region %s is on the chiplet instance %s, but chiplet instance %s is not on the top of %s.

**Description**

In a connection, the top die should be on the top of the bottom die.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-651

(error) the connection %s connects two regions whose parent die %s and %s are not neighboring dies.

Feedback

**Description**

A connection should connect two regions in the neighboring dies.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-652

(error) The connection %s is invalid, the %s region %s is on the %s side of face %s chiplet instance %s.

**Description**

In a connection, the bottom region should be on the front side of face up chiplet instance or the back side of face down chiplet instance, the top region should be on the back side of face up chiplet instance or the front side of face down chiplet instance.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-653

(warning) Basic Connectivity Check failed, skip %s Check.

**Description**

Basic Connectivity Check failed, the top-bottom relationship of all chiplets are inconsistent, skip %s Check.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-654

(error) the connection %s connects two regions %s and %s which are not physically connected.

**Description**

A connection should connect two regions which are physically overlapped.

**What Next**

Please check the 3DBlox settings.

Feedback

## 3DIC-655

(error) the bump %s is not on the %s manufacturing grid. The grid is %s.

**Description**

All bumps in 3D design must be placed on the manufacturing grid.

**What Next**

Please check the 3DBlox settings.

## 3DIC-656

(error) based on connection %s, the connection %s will cause extra cycle.

**Description**

Two connections with the same start must have the same Z-elevation, otherwise it will cause extra cycle.

**What Next**

Please check the 3DBlox settings.

## 3DIC-657

(error) Assert connection %s, the calculated stacking height(z) of die %s is %s, the stacking height(z) value in 3DBlox is %s. Assert result: FAIL.

**Description**

If two regions in connection are both on the die border, then it should satisfy the stacking hieght check "conn.top.z = conn.bot.z + conn.bot.thickness + conn.thickness".

**What Next**

Please check the 3DBlox settings.

## 3DIC-658

(error) For ChipletDef %s, assert levelness of region %s with layer %s. Assert result: FAIL. %s

Feedback

**Description**

For the layer definition in the region, it should satisfy: 1. each region has a layer definition. 2. the layer definition matches the side definition. 3. the bumps in the bmap haves shape on the layer.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-659

(error) The connections %s form a loop.

**Description**

The loop connections will lead to inconsistency of the top-bottom relationship.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-660

(error) Current design is not a valid 3DIC design. All chiplet instance's z_level are 0.

**Description**

A valid 3DIC design should have dies with different z_level. If the design is read in by "read_3dblox", please check the 'Connection' setting in the 3DBlox file.

**What Next**

Please check the 3DBlox settings.

---

## 3DIC-661

(error) Multiple %s ports %s are connected to the probe bump %s.

**Description**

The probe bump can only connect to one signal/PG port.

**What Next**

Please check the connection.

Feedback

## 3DIC-662

(warning) The port %s is connected to multiple probe pads %s.

**Description**

The port can only connect to one probe pad.

**What Next**

Please check the connection.

## 3DIC-663

(error) the pitch between probe %s %s and %s is %s, it's less than the minimum value %s in chip %s.

**Description**

The rule value of the pitch between two probe bumps is set by app option 'plan.3dic.min_3dblox_probe_pitch'; Probe bump: is_probe_pad is true, is_direct_probe is true. Probe pad: is_probe_pad is true, is_direct_probe is false.

**What Next**

Please adjust the placement of probe bumps.

## 3DIC-664

(error) the top net %s does not have both in and out direction ports.

**Description**

The top net cannot have the same in/out direction.

**What Next**

Please check the connection.

## 3DIC-665

(error) the bump %s cannot be covered by bump region %s in chip %s.

**Description**

The bump must be covered by the bump region which has the same name with the bump's associated edit group.

Feedback

**What Next**

Please adjust the placement of bumps.

---

## 3DIC-666

(error) %s %s does not physically connect to the %s on the adjacent side of the vertical neighboring chip.

**Description**

Found single bump or bond pad on the chip. These single bump and bond pad cannot be used to construct physical connections.

**What Next**

Adjust the location of chips or remove the single bump/bond pad or use create_3d_mirror_bumps to create bump pair/bond pad pair.

---

## 3DIC-667

(warning) the bump %s cannot find any associated bump region in chip %s.

**Description**

The bump must be associate with one bump region.

**What Next**

Please add the bump to the correct bump region.

---

## 3DIC-668

(warning) the bump %s in bbox {%s} will be overlapped with %s %s, skip create it.

**Description**

The shape in the created bump cell will be overlapped with the existed shape/blockage/ stiching zone. it violates drc rules.

**What Next**

Check the command option setting.

---

## 3DIC-669

(warning) the %s %s which is committed with %s will be overlapped with %s %s, skip commit it.

Feedback

**Description**

The shape in the committed cell/bond pad will be overlapped with the existed shape/ blockage/stiching zone. it violates drc rules.

**What Next**

Check the bump region setting.

---

## 3DIC-670

(Error) Cannot find the result '%s' in the thermal database.

**Description**

The specified result name cannot be found in the current thermal database.

**What Next**

Run analyze_3d_thermal with the specified result name first.

---

## 3DIC-671

(Error) Cannot find the data of %s thermal analysis with given result name '%s'.

**Description**

The given type of thermal analysis result cannot be found in the current result.

**What Next**

Run analyze_3d_thermal with the specified result name and analysis type.

---

## 3DIC-672

(Information) Finished thermal report generation successfully.

**Description**

The reports of the thermal analysis has been generated, containing summary report and detailed report.

**What Next**

Refer to the path ${THERMAL_DATABASE}/${RESULT}/${ANALYSIS_TYPE} for the reports.

Feedback

## 3DIC-673

(Error) Invalid value '%s' specified for design '%s' of app option '3dic.thermal.power_depth_ratio'.

**Description**

The value is not allowed in the app option '3dic.thermal.power_depth_ratio'.

**What Next**

The value of power depth ratio can only be: - Floating point from 0.0 to 100.0 - "substrate"

## 3DIC-674

(Warning) '%s' value '%s' is ignored in the command set_thermal_grid.

**Description**

The specified region does not intersect with the boundary of the instance.

**What Next**

Make sure the specified region intersects with the boundary of the instance.

## 3DIC-675

(Error) Failed to generate the thermal report.

**Description**

The reports of the thermal analysis cannot be generated properly.

**What Next**

Refer to the path ${THERMAL_DATABASE}/${RESULT}/${ANALYSIS_TYPE} for the reasons.

## 3DIC-676

(Error) Cannot find the stage '%s' in the thermal database.

**Description**

The specified stage name cannot be found in the current thermal database.

**What Next**

Run analyze_3d_thermal with the transient analysis first.

Feedback

## 3DIC-679

(warning) the bond pad %s in bbox {%s} will be overlapped with %s %s, skip create it.

**Description**

The shape in the created bond pad will be overlapped with the existed shape/blockage/ stiching zone. it violates drc rules.

**What Next**

Check the command option setting.

## 3DIC-680

(error) %s in the chip %s %s correctly cover %s in the chip %s, the reason is '%s'.

**Description**

The check will be done when the app option plan.3dic.probe_cover_dummy_bump is true, and plan.3dic.probe_cover_dummy_bump_size can set the column and row, default is 2*2.

**What Next**

Please check the bump location.

## 3DIC-681

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The enclosure spacing between the bump shapes in different layers violate the constraint.

**What Next**

Please contact foundry or bump cell library provider.

## 3DIC-682

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The area_ratio of toal area of utag objects in specific region between area of specific region violates the constraint.

Feedback

**What Next**

Adjust the location of some utag objects or remove/add some utag objects.

---

## 3DIC-683

(error) The %s between %s and %s is %s which is %s than the constraint <%s> setting, the valid range is {%s %s}.

**Description**

The area_count of tag objects in specific region between area of specific region violates the constraint.

**What Next**

Adjust the location of some tag objects or remove/add some tag objects.

---

## 3DIC-684

(error) The direct probe bump %s cannot have any associated bumps in attribute connected_bumps.

**Description**

For a direct probe bump probing, its connected_bumps should be empty, and it can’t connect to a probe pad.

**What Next**

NA.

---

## 3DIC-685

(warning) The probe pad %s has no values in attribute connected_bumps.

**Description**

The connected_bumps for every probe pad instance is supposed to have value.

**What Next**

NA.

---

## 3DIC-686

(error) The attribute 'connected_bumps' of %s %s and bump %s do not contains each other.

Feedback

**Description**

If the value of probe bump/pad pInst1's connected_bumps is bInst1, then the value of bInst1's connected_bumps must include pInst1.

**What Next**

NA.

---

## 3DIC-687

(error) The %s %s and its connected_bump %s are not logically connected.

**Description**

If the bump is set to the attribute connected_bump of one probe bump/pad, these bumps must have the same logical connection.

**What Next**

NA.

---

## 3DIC-688

(error) The %s %s and its connected_bump %s are not at the same side of chip %s.

**Description**

The bump and pad associated can only be at the same side of chip.

**What Next**

NA.

---

## 3DIC-689

(warning) The %s %s cannot set connected_bumps with %s %s because it's %s.

**Description**

pInst: attribute is_probe_pad is true, is_direct_probe is false; bInst: attribute is_probe_pad and is_direct_probe is both true or false; pInst only have bInst in connected_bump, bInst only have pInst in connected_bump.

**What Next**

NA.

Feedback

## 3DIC-695

(warning) the new mirrored %s from source %s %s in bbox {%s} will be overlapped with %s %s, skip create it.

**Description**

The shape in the mirrored bump or bond pad will be overlapped with the existed shape/ blockage/stiching zone. it violates drc rules.

**What Next**

NA.

## 3DIC-700

(error) net %s and net %s cross different subchannels.

**Description**

The tool partitions the routing tasks into subchannels. Therefore, all nets must be within the same subchannel. The tool finds nets crossing subchannels, causing the tool to error out.

**What Next**

Adjust bump-to-net assignment.

## 3DIC-701

(error) %d nets cannot be selected for routing.

**Description**

One or more nets cannot be routed since there is no enough space within the specified region. Namely, there are too many nets in the routing region. The tool calculated the maximal number of nets that can be routed, which is less than the total net count.

**What Next**

Add more routing layers or reduce routing pitches. It is also possible to resolve this issue by adjusting the routing region.

## 3DIC-702

(error) either pitch in x or y, %s or %s, is smaller than the size in x or y of %s, %s or %s, and thus they are in conflict.

Feedback

**Description**

Pitches from users' input should be smaller than the die size or larger than the size of bump/tsv lib cell. If the pitches are larger than the die size, no single bump/tsv can be created. If the pitches are smaller than the size of bump/tsv lib cell, each bump/tsv would overlap with another bump/tsv as invalid condition.

**What Next**

Please adjust and ensure the both pitches are larger than the size of bump/tsv lib cell as well as smaller than the die size.

---

## 3DIC-703

(warning) Detected short violation for nets %s on bumps/bond_pads (%s) and tap point (%s).

**Description**

Taps are created on top of bumps/bondPads of different nets.

---

## 3DIC-704

(Warning) Detected floating taps %s on net %s.

**Description**

Taps are not created on any bump/bond_pads.

---

## 3DIC-705

(warning) Detected redundant %s taps on %s..

**Description**

More than one tap are added on bumps/bond_pads.

---

## 3DIC-706

(warning) Detected missing tap vioation on net %s.

**Description**

There's no tap created on PG net. Please use create_taps command to create tap points.

Feedback

## 3DIC-707

(Information) The lengths of %s in x and y are %s mm and %s mm, respectively.

**Description**

The lengths in x and y of an rectangular object like PCB or package are shown in the unit of millimeter (mm) before sanity check in command estimate_3d_thermal.

**What Next**

Please check if the input of lengths is provided or within common industry standard.

## 3DIC-708

(Information) The ratio of size of pcb over package is %s.

**Description**

The ratio of sizes of PCB to package are shown before sanity check in command estimate_3d_thermal. Given a pcb is commonly larger than a package, the ratio is the maximum dimension of the PCB to the minimum dimension of the package.

**What Next**

Please check if the ratio is within common industry standard.

## 3DIC-709

(Information) The lengths of %s in x and y are %s um and %s um.

**Description**

The length in x and y of a die are shown before sanity check in command estimate_3d_thermal. The sanity check is to verify if the length is within common industry standard

**What Next**

Please check if the lengths within common industry standard.

## 3DIC-710

(Information) The ratio of die sizes is %s.

Feedback

**Description**

The ratio of sizes of dies is shown before sanity check in command estimate_3d_thermal. Given multiple dies are in an analysis, the ratio is the maximum dimension among the dies to the minimum dimension among the dies.

**What Next**

Please check if the ratio and length are within common industry standard.

---

## 3DIC-711

(Information) The height of %s is %s um.

**Description**

1.) The height of a bump array is shown before sanity check in command estimate_3d_thermal. If there are multiple bump arrys, the heights of all bump arrays are listed, respectively.

2.) The height of a die is shown before sanity check in command estimate_3d_thermal. If there are multiple dies, the heights of all dies are listed, respectively.

**What Next**

1.) Please check if the height of each bump array is within common industry standard.

2.) Please check if the height of each die is within common industry standard.

---

## 3DIC-712

(Warning) PG tap %s of die %s cannot form external electrical connection because the die is not located at the lowest Z-level.

**Description**

Taps are not created in the correct die. Please correct.

**What Next**

report_taps

---

## 3DIC-713

(Warning) PG tap %s of a die %s on metal layer %s cannot form external electrical connection because it is not the outer-most metal layer.

Feedback

**Description**

Taps are not created in the correct layer of bottom die. Please correct.

**What Next**

report_taps

---

## 3DIC-714

(Error) Syntax error found in 3dic.rail.expanded_pg_pattern.

**Description**

There is syntax error in the expanded PG pattern string.

**What Next**

Check 3dic.rail.expanded_pg_pattern man-page.

---

## 3DIC-715

(error) Net %s cannot be connected to bumps during die-to-die bus routing.

**Description**

Congestion causes open nets.

**What Next**

Adjust bumps of the net so that they are aligned along the channel direction. If bumps cannot be modified, fix routing manually.

---

## 3DIC-716

(error) Bumps of different types are not allowed in each region of die-to-die routing.

**Description**

Bumps of each region must be of the same type during die-to-die routing.

**What Next**

Adjust bump lib cells if needed. If bumps cannot be modified, consider disconnecting the nets of the bumps. Apply different routing methods to these nets after die-to-die routing.

---

## 3DIC-717

(error) cannot derive pin bbox for bump %s.

Feedback

**Description**

It is assumed that a bump should have one and only one pin on the bump layer. The tool either finds no pin or multiple pins on the bump layer.

**What Next**

Please check the bump and fix its reference if needed. User can define the bump layer using via_def in the pattern file.

---

## 3DIC-718

(warning) Only the last %s section is considered.

.SH DESCRIPTION

There are multiple inclusion and/or exclusion sections in the pattern file. The tool only considers the last one.

**What Next**

Please merge the multiple inclusion and/or exclusion sections in the pattern file.

---

## 3DIC-719

(error) The shielding option cannot be selected in multithreaded mode in current version of the tool.

**Description**

The shielding option cannot be selected in multithreaded mode in current version of the tool.

**What Next**

Please either use single threaded mode or removing the shielding option. Alternatively, please find newer version of the tool, which support multi-threaded shielding.

---

## 3DIC-720

(Warning) Template setting/values for %s are brought in via command set_thermal template.

**Description**

The template setting/values is brought in and may replace any setting before set_thermal template.

Feedback

**What Next**

If customized inputs are needed, Please be aware of using set_app_options after command set_thermal template.

---

## 3DIC-721

(Warning) skipping %s template input.

**Description**

Template input is skipped.

**What Next**

Please be aware of using set_app_options for customized inputs.

---

## 3DIC-730

(error) The current shielding pattern is not supported: %s.

**Description**

The shielding pattern specified by the user is not supported during 3D routing.

**What Next**

Please use create_rdl_shields to perform the shielding task after 3D routing is completed.

---

## 3DIC-731

(warning) some %s is in both inclusion and exclusion sections of the pattern file.

**Description**

Same net or bump is found in both inclusion and exclusion sections of the pattern file.

**What Next**

Net or bump in both inclusion and exclusion sections will not be processed. Please adjust the pattern file if needed.

---

## 3DIC-732

(warning) shielding constraints are ignored.

Feedback

**Description**

Shielding is impossible due to the lack of shielding net. So shielding related constraints in the pattern file are ignored.

**What Next**

Please check the netlist and add power or ground nets.

---

## 3DIC-739

(Error) The power can not be negative.

**Description**

The power must be non-negative

**What Next**

Specify non-negative power value

---

## 3DIC-740

(Error) The region is invalid.

**Description**

The region is invalid for the bounding box.

**What Next**

Check the coordinate of the bounding box.

---

## 3DIC-741

(Error) Duplicate probes.

**Description**

There is another probe having the same name.

**What Next**

Give the probe another name.

---

## 3DIC-742

(Error) Invalid Thermal Profile file format.

Feedback

**Description**

The Profile file is invalid. Its kind must be "Thermal Profile".

**What Next**

Use the Thermal Profile file.

---

## 3DIC-743

(Error) Invalid Probe Profile file format.

**Description**

The Profile file is invalid. Its kind must be "Probe Profile".

**What Next**

Use the Probe Profile file.

---

## 3DIC-744

(Warning) User defined %s in 3dic.thermal.heat_spreader is too small. %s is used instead.

**Description**

The specified size of heatspreader is ignored because it is does not cover the bbox of the topmost dies.

**What Next**

Make sure the specified value is large enough to cover the bbox of the topmost dies.

---

## 3DIC-748

(Error) The value of the duration time of stage %s must be greater than 0.

**Description**

The value of the stage duration time must be greater than 0.

**What Next**

Assign the duration time with a non-negative value instead.

---

## 3DIC-749

(Error) The step time is longer than the duration time in stage %s.

Feedback

**Description**

Since the step time is the temporal resolution of the output result, the step time should be shorter than or equal to the duration time in the stage.

**What Next**

Assign a value for the step time, which should be smaller than or equal to the duration time.

---

## 3DIC-750

(Error) No die for thermal analysis.

**Description**

After filtering the dies, there is no valid one for thermal analysis.

**What Next**

Please check the design type of the cells first, then use the *get_thermal_cells* command with *-ignore* option to see what dies are ignored and use the *set_thermal_cells* command to specify the filter for ignoring the thermal dies.

---

## 3DIC-751

(Error) Unable to find Power Profile of transient thermal analysis.

**Description**

The Power Profile of transient thermal analysis does not exist in the thermal database.

**What Next**

None

---

## 3DIC-752

(Error) The probe name %s has been added already.

**Description**

The probe name has been added already. It cannot have two probes named the same.

**What Next**

Use another name for the probe.

Feedback

## 3DIC-753

(Error) Unable to find %s's Probe Profile file %s.

**Description**

Unable to find the Probe Profile file.

**What Next**

Check whether the probe file exists or not.

## 3DIC-754

(Error) Unable to find thermal profile of transient thermal analysis.

**Description**

The thermal profile of transient thermal analysis does not exist in the thermal database.

**What Next**

Transient thermal analysis does not generate the thermal profile. Use Probe Profile to view the transient result instead.

## 3DIC-755

(Warning) Layer will be ignored in mhs format.

**Description**

The mhs format does not store the date layer-wisely.

**What Next**

Check the data is not layer-wise.

## 3DIC-756

(Error) Fail to parse the design bbox from %s.

**Description**

The input should be four double numbers.

**What Next**

Follow the input format to specify the region of the bbox.

Feedback

## 3DIC-757

(Warning) Fail to set fixed temperature boundary condition '%s'.

**Description**

Fail to set fixed temperature boundary condition because it cannot be applied on the prototype package and prototype PCB now.

**What Next**

Check app options 3dic.thermal.package_file and 3dic.thermal.pcb_file if the prototype package and prototype PCB are used.

## 3DIC-758

(Information) The design box of profile %s is %s that mismatches the design boundary box %s.

**Description**

The design box of the disk profile file is different from the design boundary box of the targeted design.

**What Next**

Use center-center alignment to map the data of the disk profile to the targeted design.

## 3DIC-759

(Warning) The design box size of profile %s mismatches the size of design boundary box.

**Description**

The design box size of the disk profile file is different from the design boundary box size of the targeted design.

**What Next**

Use center-center alignment to map the data of the disk profile to the targeted design.

## 3DIC-760

(Error) The stacking from %s to %s is invalid.

**Description**

The z-offset of the above die is greater than the z-offset of the below die.

Feedback

**What Next**

Check z-offset of the dies.

---

## 3DIC-761

(Error) The height of the containing die %s is smaller than the sinking die %s.

**Description**

The height of the containing die is higher than the sinking die.

**What Next**

Check the z-offsets and z-span of the containing die and the sinking die.

---

## 3DIC-762

(Error) %s's number of z-span heights is %d, but the z-span is %d.

**Description**

Inconsistent number of z-span heights.

**What Next**

Check the die heights.

---

## 3DIC-763

(Error) No power map file specified for any of the die instances in transient flow.

**Description**

No power map file is specified for die instance in transient analysis.

**What Next**

Use *set_thermal_transient_sequence* and *set_thermal_transient_stage* to specify the power map file.

---

## 3DIC-764

(Error) Either PCB or Package has to be specified.

**Description**

At least one of PCB or Package needs to be specified.

Feedback

**What Next**

Specify the PCB or package using the app options.

---

## 3DIC-765

(Error) The fusion power file %s is allowed only in fusion thermal engine.

**Description**

The fusion power file is only supported for fusion thermal engine.

**What Next**

Use other kind of power map.

---

## 3DIC-766

(Error) The power file %s is not supported.

**Description**

The power file is not supported.

**What Next**

Use other kind of power map.

---

## 3DIC-767

(Warning) The lid mode is not supported in current setting. The plate heatsink is used instead.

**Description**

The lid heatsink can be specified only when package size is available and a valid void space can be found.

**What Next**

None

---

## 3DIC-768

(Error) There should be at least 1 transient stage.

**Description**

At least one transient stage shoud be specified.

Feedback

**What Next**

Use *set_thermal_transient_sequencefP to add transient stages.*

---

## 3DIC-769

(Information) For details, please refer to below file(s):%s.\nPlease note that some files might not be generated if any error occurs during analysis.

**Description**

Detailed information are provided in the listed file(s), but some files might not be generated if any error occurs during analysis.

**What Next**

Check the files for details if needed.

---

## 3DIC-770

(Error) %s is an invalid value for %s attribute in app option %s.

**Description**

This occurs when the value is not valid.

**What Next**

Correct the value.

---

## 3DIC-771

(error) In option '%s', '%s' is not a valid 3DIC die instance name.

**Description**

Please provide a valid die instance name for the -inst_name.

**What Next**

Correct the option input.

---

## 3DIC-772

(Warning) There is no Power Profile to be removed.

**Description**

There is no Power Profile to be removed.

Feedback

**What Next**

Check the Power Profile exists or not.

---

## 3DIC-773

(Warning) There is no Thermal Profile to be removed.

**Description**

There is no Thermal Profile to be removed.

**What Next**

Check the Thermal Profile exists or not.

---

## 3DIC-774

(warning) Subchannel %d is placed too close to other subchannels.

**Description**

The minimal bus width is the routing pitch times the number of nets to be routed on the same layer. If two subchannels are placed too close, the bus routing of the two subchannels can overlap, leading to open nets or routing rule violations.

**What Next**

Please adjust the bump placement or use smaller routing width and/or spacing.

---

## 3DIC-775

(Error) Thermal model files of the instance %s are incomplete in the thermal database.

**Description**

There are top, middle, and bottom thermal model files for each instance per simulation run. Some of the files are missing in the thermal database.

**What Next**

Check the log file under the current working directory.

---

## 3DIC-776

(Warning) Thermal model files of the instance %s are missing in the thermal database.

Feedback

**Description**

All thermal model files of the instance are not presented in the thermal database. This may happen because the instance is ignored in the thermal analysis.

**What Next**

None

---

## 3DIC-777

(Error) The value %s of %s is not supported by built-in thermal engine.

**Description**

The specified value is not supported by built-in thermal engine.

**What Next**

Specify a supportd value.

---

## 3DIC-778

(warning) Wire length of net %s is 0.

**Description**

This error occurs when users do the check on an unrouted design or there exists an open net.

**What Next**

Please do the check on a routed design and check if there is an open net.

---

## 3DIC-779

(error) %s.

**Description**

This error occurs when users do not specify the channel_boundaries so that all 3D channels are treated as one 3D channel. which may cause some bumps cannot be identified which subchannels they belong to. Therefore, a subchannel may have odd number of bumps, which is not allowed.

**What Next**

Please specify the 3D channel boundaries by -channel_boundaries.

Feedback

## 3DIC-780

(warning) Non-two-bump net %s exists.

**Description**

This error occurs when there is a non-two-bump net. It will be skipped for the current check. The non-two-bump net may be a design issue or it is in control channel. If the net is in control channel, please ignore it.

**What Next**

Please check the design.

## 3DIC-781

(warning) The option %s is obsolete. Please use %s instead.

**Description**

The given option is obsolete and will be removed from the future release. Please change to use other options or a new command instead, which has similar functionality.

**What Next**

Check the command man page to see the correct options to use.

## 3DIC-782

(Warning) %s connection check error.

**Description**

The server connection is failed.

**What Next**

Please check whether the license of the Ansys tool is associated with the server that can not be connected.

## 3DIC-783

(Warning) %s.

**Description**

There is no specified license of Ansys tool.

Feedback

**What Next**

Please check whether the license of the Ansys tool exists.

---

## 3DIC-784

(Warning) %s.

**Description**

The available licenses issued is occupied.

**What Next**

Please check whether the license of the Ansys tool is occupied.

---

## 3DIC-785

(Error) Erratic net pattern detected. Cannot identify the net pattern.

**Description**

The net pattern of the followed objects cannot be identified to horizontal or vertical. All of the followed objects touching the same stripe must be fully inside the stripe unless the stripe width is smaller than the object size.

**What Next**

Please check the direction of the net pattern of the followed objects. If the direction is feasible but the pattern cannot be identified, it could be due to the absence of stripe width on the objects' layer.

The stripe width will be determined based on the following priorities: 1. The stripe width on the followed objects' layer specified in the -pg_constraints. 2. The existing stripe width on the followed objects' layer. 3. One of the followed objects' size.

---

## 3DIC-786

(warning) shielding constraints cannot be honored for layer %s.

**Description**

Either width or spacing or both of shielding cannot be satisfied. Please adjust the values. The shielding constraints must fit the routing width and spacing constraints.

**What Next**

The tool will try to complete the routing and/or shielding. But the shielding rate will be low since the constraints cannot be honored. Please adjust the values if needed.

Feedback

## 3DIC-787

(Error) %s.

**Description**

The license is expired.

**What Next**

Please check whether the license of the Ansys tool is expired.

## 3DIC-788

(Warning) %s.

**Description**

The specified file was not generated successfully.

**What Next**

Please check whether the file is generated successfully.

## 3DIC-789

(Error) %s.

**Description**

Cannot find the RedHawk-SC(ET) binary.

**What Next**

Please check whether the binary of RedHawk-SC(ET) exists.

## 3DIC-790

(Error) %s.

**Description**

Cannot detect the RedHawk-SC(ET) version.

**What Next**

Please check whether the version shows up by adding flag -v to RedHawk-SC(ET) binary.

Feedback

## 3DIC-791

(Warning) %s.

**Description**

There is layer inconsistence between Ansys and Synopsys techfile.

**What Next**

Please check the layer order between Ansys and Synopsys techfile.

## 3DIC-792

(Error) %s.

**Description**

There is a net cannot be found in the die or there is no port can be found on a net.

**What Next**

Please check the specified net name in -nets or the port setup on the net.

## 3DIC-793

(Error) %s.

**Description**

Fail to copy the library(block).

**What Next**

Please check whether the copied library(block) name exists.

## 3DIC-794

(Error) %s.

**Description**

Fail to add the copied library in ref_libs.

**What Next**

Please check whether the path of the copied library exists.

Feedback

## 3DIC-795

(Warning) %s.

**Description**

There is no instance information in the specified file.

**What Next**

Please check whether the file is generated successfully with instance information.

## 3DIC-796

(Error) %s.

**Description**

The specified variable is not set.

**What Next**

Please check whether the specified variable is set.

## 3DIC-797

(Error) %s.

**Description**

Library coverage check is failed.

**What Next**

Please check whether the library information for Ansys tool is complete.

## 3DIC-798

(Error) No tsv def found in the design.

**Description**

Cannot find any TSV def in the design to create TSV instance.

**What Next**

Please check the TSV def is valid or net.

Feedback

## 3DIC-799

(Error) %s.

**Description**

There is no license exists or all licenses are expired.

**What Next**

Please check whether the license of the Ansys tool exists or all the license of the Ansys tool is expired.

## 3DIC-800

(Error) %s.

**Description**

Fail to execute command analyze_rail.

**What Next**

Please check whether the command analyze_rail can be used.

## 3DIC-801

(Error) %s.

**Description**

Fail to open(remove) the copied library(block).

**What Next**

Please check whether the copied library(block) cannot be opened(removed).

## 3DIC-802

(Error) %s.

**Description**

Fail to set the reference of the specified die.

**What Next**

Please check whether the specified die cannot change the reference library.

Feedback

## 3DIC-803

(Warning) %s.

**Description**

Fail to parse Synopsys or Ansys techfile.

**What Next**

Please check whether the Synopsys techfile or the Ansys techfile exists or the csv file has the correct format.

## 3DIC-804

(Warning) No flyline is created on net: %s in die instance: %s. There is no bump connected to the corresponding port.\n

**Description**

Failed to create flyline since there is no bump connected to the corresponding port.

**What Next**

Please check the port of the net and create the corresponding bump.

## 3DIC-805

(Warning) No flyline is created on net: %s in die instance: %s. There is only one bump connected to the corresponding port.\n

**Description**

Failed to create flyline since there is only one bump connected to the corresponding port.

**What Next**

Please create more than one bump connected to this port.

## 3DIC-806

(Warning) No flyline is created on net: %s in die instance: %s. Bumps connected to the corresponding port do not have valid direction.\n

**Description**

Failed to create flyline since the bumps connected to the corresponding port do not have valid direction.

Feedback

**What Next**

Please check the direction of the bumps connected to the corresponding port.

---

## 3DIC-807

(Warning) %s.

**Description**

The specified check of Redhawk-SC(ET) setup is failed.

**What Next**

Please check whether the specified check is failed.

---

## 3DIC-808

(Error) Pseudo objects and physical objects have conflicts in die inst %s.

**Description**

A pseudo bump (TSV) and a physical bump (TSV) are overlapped. Command create_*_template_obejcts would not create objects in this case.

**What Next**

Please remove overlaps or make two objects be connected to the same net and at the same center location.

---

## 3DIC-809

(Error) The pseudo %s %s and the phyiscal %s %s are overlapped and at different center locations.

**Description**

A pseudo bump (TSV) and a physical bump (TSV) are overlapped. Command create_*_template_obejcts would not create objects in this case.

**What Next**

Please remove overlaps or make two objects be connected to the same net and at the same center location.

---

## 3DIC-810

(Error) The lib_cell bump %s in -lib_bump_cell cannot be found on layer %s.

Feedback

**Description**

The specified lib_cell bump cannot be found in the library or don't contain any pin on the layer corresponding to the specified side.

**What Next**

Please check the name, side and the pin's layer of the specified bump.

---

## 3DIC-811

(Error) Net %s is trying to be specified with lib_cell bump %s in -lib_bump_cell, but the net has been specified with the lib_cell bump %s.

**Description**

The net has been already specified with a bump and can only be specified with one bump.

**What Next**

Please don't specify multiple bumps with the same net, or check if the net is wrongly specified to a used net.

---

## 3DIC-812

(Error) Cannot specify lib_cell bump %s as default in -lib_bump_cell. The default lib_cell bump %s has been specified.

**Description**

There is only one default lib_cell bump can be specified in -lib_bump_cell.

**What Next**

Please don't specify multiple bumps as default, or check if the pg net is missed.

---

## 3DIC-813

(Error) TSV %s has no %s.

**Description**

The TSV's def or library is incomplete.

**What Next**

Please check the TSV's def or library.

Feedback

## 3DIC-814

(Error) No lib_cell bump found on layer %s.

**Description**

Cannot find any lib_cell bump which has any pin on the layer corresponding to the specified side.

**What Next**

Please check if there is at least a feasible lib_cell bump in the library.

## 3DIC-815

(warning) %d existing shapes in 3D channel.

**Description**

This occurs when there are pre-existing shapes in 3D channels. It may block the subchannels and cause routing quality degradation due to detour. However, some shapes may not significantly impact routing quality. Therefore, if the tool successfully completes the routing, please just ignore this warning.

**What Next**

Please check the design.

## 3DIC-816

(warning) There is no channel marking result in 3D channel.

**Description**

This occurs when there is no channel marking in 3D channel. Therefore, users cannot use any tcl command with the subchannel index attribute, since the attribute is set to -1 by default. Channel marking will be done automatically during 3D channel routing. However, the post-route report can still be generated. Please just ignore this warning if users do not need to use the attribute. Note: The subchannel index attribute of all non-3D channel nets will be set to -1 by default.

**What Next**

Please use the 3D channel routing command then use the report command.

## 3DIC-817

(warning) %s.

Feedback

**Description**

This occurs when there is no pattern file specified in the option, or the pattern file cannot be saved into the attribute. Therefore, users cannot use any tcl command with the pattern file attribute, However, if users do not need to use the attribute, please just ignore this warning.

**What Next**

Please check the command line and the pattern file.

---

## 3DIC-818

(warning) %s.

**Description**

This occurs when there is a value that does not meet the constraints of tech file, or some settings are not set correctly. However, some may not significantly impact the routing quality.

**What Next**

Please check the command line, the pattern file, and the design to see if they are as expected.

---

## 3DIC-819

(error) %s.

**Description**

This occurs when bumps are not aligned in bump region, which may cause the channel identification or routing fail. Bumps should be aligned along the channel direction.

**What Next**

Please check the bump arrays.

---

## 3DIC-820

(Warning) Cannnot find any pseudo bump in the specified region, please use create_bump_region_pattern and create_bump_region to create pseudo bumps first.

**Description**

There is no pseudo bump to be read when -read_object_type pseudo|all is specified in the command create_rail_template_objects.

Feedback

**What Next**

Please use create_bump_region_pattern and create_bump_region to create pseudo bumps first.

---

## 3DIC-821

(Warning) Cannnot find any pseudo TSV in the specified region, please use create_pseudo_tsv_def, create_bump_region_pattern and create_bump_region with -tsv_pattern to create pseudo TSVs first.

**Description**

There is no pseudo TSV to be read when -read_object_type pseudo|all is specified in the command create_rail_template_objects.

**What Next**

Please use create_pseudo_tsv_def, create_bump_region_pattern and create_bump_region to create pseudo TSVs first.

---

## 3DIC-822

(error) Complex bump %s exists in 3D channels.

**Description**

This occurs when there are complex bumps in the 3D channels, which means that some bumps are connected to multiple nets. Currently, the tool does not support complex bumps with multiple pins.

**What Next**

Please check the bump arrays.

---

## 3DIC-823

(Error) Pixel model %s already exists.

**Description**

The pixel model already exists.

**What Next**

Specify a different pixel model name.

Feedback

## 3DIC-824

(Error) Unable to find pixel model %s.

**Description**

The pixel model does not exists.

**What Next**

Specify a valid pixel model name.

## 3DIC-825

(Error) Unable to remove pixel model %s because it is referenced by voltage model %s.

**Description**

The pixel model is referenced by the voltage model and cannot be removed.

**What Next**

Remove the voltage models that are referencing the pixel model.

## 3DIC-826

(Error) The region is not a rectilinear polygon.

**Description**

The voltage model must have a rectilinear region.

**What Next**

Specify a rectilinear polygon.

## 3DIC-827

(Error) The voltage model region is not enclosed by %s's boundary bbox.

**Description**

The voltage model region must be enclosed by die boundary bbox.

**What Next**

Specify a rectilinear polyrect inside the die boundary bbox.

Feedback

## 3DIC-828

(Error) Voltage model %s already exists.

**Description**

The voltage model already exists.

**What Next**

Specify an unique voltage model name.

## 3DIC-829

(Error) Unable to find voltage model %s.

**Description**

The voltage model does not exists.

**What Next**

Specify a valid voltage model name.

## 3DIC-830

(error) %s.

**Description**

This occurs when there is a value that does not meet the constraints of tech file, or some settings are not set correctly. The issues will cause routing to fail or design rule violations.

**What Next**

Please check the command line, the pattern file, and the design to see if they are as expected.

## 3DIC-831

(Error) Voltage area %s is overlapped with other voltage area that shares the same net.

**Description**

Overlapping voltage area of the same die can not share the same net.

**What Next**

Remove the overlapping voltage area.

Feedback

## 3DIC-832

(error) adjusting via_def and metal layers failed for layer %s.

**Description**

This error occurs when via_def and metal layer cannot be adjusted for the specified top layer name. Please check whether the name is correct.

**What Next**

Please check the tech file and specified layer name.

## 3DIC-833

(error) The constraint {%s} is ignored.

**Description**

This occurs when the constraints in pattern files, which should be specified in a particular section, are not added correctly. It may lead to the channel identification or routing fail.

**What Next**

Please check the constraints in pattern file and specify them in a correct section.

## 3DIC-834

(info) Merging subchannel %u and %u due to cross-subchannel net %s.

**Description**

This occurs when there is a cross-subchannel net originally and the subchannels are merging due to the cross-subchannel net. Therefore, the net will no longer cross subchannels.

**What Next**

Please check if the merge is as expected.

## 3DIC-835

(error) Net %s is still crossing subchannels since subchannel %u and %u cannot be merged as %s.

Feedback

**Description**

This occurs when the tool tries to merge the subchannels due to a cross-subchannel net. However, due to the given reason, the merge fails and the cross-subchannel net still exists.

**What Next**

Please check the bump arrays and the corresponding nets.

---

## 3DIC-836

(Warning) Fail to get the custom pixel model resistance from %s. All resistances will set to default value 0.

**Description**

The spice file can not find the subckt name, or the file format is incorrect.

**What Next**

Check the spice file.

---

## 3DIC-837

(error) Fail to route using side-RV mode because %s.

**Description**

Customer choose top_layer_no_via and via_under_bump in the pattern file. As a result, the route will place routing tracks on the side of each bump column. However, the routing cannot be completed successfully due to the given reason.

**What Next**

Correct the input netlist or choose a different routing mode.

---

## 3DIC-838

(warning) Some sideband nets are assigned to bumps of different columns.

**Description**

The two bumps of a net should be assigned to bumps of the same column for easy routing. If bumps of different columns are chosen, net flylines might crossover each other, leading to open nets during routing.

Feedback

**What Next**

Check the routing result. If open nets are found, please consider adjusting net-bump assignments.

---

## 3DIC-839

(error) %s.

**Description**

This occurs when lower-level vias do not meet the design rules. Although the tool may still finish the routing, there will be design rule violations. Please adjust the dimension of lower-level vias.

**What Next**

Please check the lower-level vias and adjust them if needed.

---

## 3DIC-840

(error) no pre-routes are allowed in the channel for side-via routing mode.

**Description**

If side-via routing mode is selected, there cannot be any pre-routes in the channel.

**What Next**

Please check the design and remove any pre-routes. If the pre-routes cannot be removed, try to use another routing mode.

---

## 3DIC-841

(Error) The detected net pattern is different from the specified direction and the preferred routing direction of the layer %s.

**Description**

The direction of the followed objects' net pattern is different from the direction of the layer specified in *set_3d_template -pg_constraints* and the preferred routing direction of the specified layer in the tech file.

**What Next**

Please check the direction of the followed objects' net pattern and *-coordinates*/*-coordinate_system*. If *-coordinates* is set too large, it may lead to the wrong results of net pattern detection.

Feedback

# ABS

## ABS-007

(Information) Block %s is a design view. No constraint comparison will be run.

**Description**

The block specified is linked as a full design view. When checking the constraint consistency between abstracts and top-level, this block will be skipped.

**What Next**

This is an informational message. No action needed.

## ABS-008

(information) Did not find any mismatched constraints between abstract '%s' (reference : '%s') and top level.

**Description**

This message is issued when the constraint consistancy between the abstract and top-level is checked and no mismatches are found.

**What Next**

No action is necessary.

## ABS-009

(error) Found %d mismatched constraints between abstract '%s' (reference : '%s') and top level.

**Description**

This message is issued when the constraint consistancy between the abstract and top-level is checked and some mismatches are found.

**What Next**

Update the top and/or the block constraints to ensure that both the top-level and the block designs have the correct constraints. If the block constraints were changed re-create the abstract.

Feedback

## ABS-034

(Error) Can't split UPF because it's not loaded yet.

### Description

UPF has not been loaded in the design. Hence split_constraints -upf_only cannot proceed.

### What Next

Load the UPF and try the command again.

### See Also

- load_upf
- source

## ABS-100

(warning) Abstract view '%s' is not being saved. Library '%s' is in read mode.

### Description

The specified block view is not saved because its library is open in read mode.

### What Next

Use "save_lib -as" to save the current library as some other library. You can then use that other library to access the block.

```
prompt> save_lib -as <new_library_name>
```

### See Also

- open_block
- open_lib

## ABS-101

(error) Cannot merge pin guide/blockage %s which is associated with objects other than ports and nets.

### Description

You get this message when the tool tries to merge data from the outline view to the design view, or from the abstract view to the design view, or from the design view to the abstract view.

Feedback

This message indicates that there is a pin guide or pin blockage in the outline view, or the abstract view, or the design view that is associated with objects of a type that is not port or net.

The tool does not support merging this type of pin guide or pin blockage between views. As a result, the corresponding pin guide or pin blockage created in the design or abstract view might have incomplete data. This might cause the pin guide or pin blockage affect objects that they are not intended to affect. This might also cause the pin guide or pin blockage to take no effect on the objects they are intended to affect.

**What Next**

If the pin guide or pin blockage is no longer needed, please delete it. If it is still needed, please delete it and recreate it in the design view after the data is merged or in the abstract view after it is created.

**See Also**

- create_pin_guide
- create_pin_blockage

---

## ABS-110

(Error) Some objects in the collection used for the -include_objects command option are not valid in the current block.

**Description**

When the create_abstract command is run with the -include_objects option, all the objects in the collection given to that option need to be ports, pins or nets that are valid in the current block. This error message is issued if some of the objects in the collection are invalid, or belong to a different block (or a different view).

**What Next**

Examine the collection used and remove/add objects to ensure that all objects in the collection are valid ports, pins or nets in the current block.

**See Also**

- create_abstract
- filter_collection
- remove_from_collection
- add_to_collection

Feedback

## ABS-115

(Warning) The 'none' option value for -timing_level option of create_abstract command is deprecated and will be removed in a future release.

### Description

The option value 'none' for the command option -timing_level of create_abstract command is deprecated. It will be removed in the coming release.

## ABS-125

(error) The abstract view was not created from this version of design view. Changes from abstract view cannot be merged back to design view. Aborting merging changes.

### Description

The present abstract view was not created from this version of the associated design view. Under such conditions, changes cannot be merged from abstract view to design view.

### What Next

Make sure the abstract view is alwasy associated with the design view, from which it was created.

### See Also

- create_abstract

## ABS-130

(error) cell '%s' has no reference module.

### Description

This message is issued during abstract merging when there is a cell in abstract view that does not have reference module.

### What Next

This error happens when the specified cell has no reference module. This could happen if the reference library is not set up properly.

Please check reference library settings and make sure the reference library for the cell is set properly.

Feedback

## ABS-150

(Warning) Property changes detected for routing rule '%s'. User need to manually update the routing rule.

**Description**

This warning message comes when property changes are detected for some routing rule. ECO changelist will not update these properties. User need to manually review for the property changes and update the routing rule accordingly.

**What Next**

If the property changes are needed, then manually update the routing rule.

## ABS-152

(Information) Eco change list files with header description '%s' will be written in directory '%s'.

**Description**

This information message specifies the location where eco files will be written for abstracts. At the specified location, sub-directories will be created for individual blocks. Each block specific directory will contain a 'eco.tcl' file which would have the eco changes written in tcl format.

If the eco write out is happening in the same location multiple times, each sub-block specific 'eco.tcl' will be appended with new eco changelist.

The 'eco.tcl' files will contain a header description and the users will be informed about this header in this information message. If the eco write out is happening in the same location multiple times, each 'eco.tcl' will contain multiple headers.

**What Next**

This is an informational message. No action needed.

## ABS-187

(Error) Invalid value %f for option -min_segment_percent

**Description**

You are getting this message because you specified a value that is not between 0.0 and 0.5 for the option -min_segment_percent.

Feedback

The value given with the -min_segment_percent option is a percentage of the clock period. The tool computes the minimum budget for the budget segments by multiplying the value specified here with the clock period.

**What Next**

Please specify a value that is between 0 and 0.5.

---

## ABS-188

(Error) Command option '%s' is not supported when app option '%s' is set to %s.

**Description**

The given option of this command is not supported with the given setting of the app option.

**What Next**

Please change the setting of your app option, or do not use this command option.

---

## ABS-189

(Error) Module '%s' has been specified twice.

**Description**

You have specified the given module name to a -design_subblocks, -hier_abstract_blocks, or -shell_subblocks option. But this name has appeared twice in one list, or is in two separate lists. Each name can only appear once.

**What Next**

Please remove the redundant name.

---

## ABS-190

(Error) Module '%s' is not a valid budget block.

**Description**

You have specified the given module name to a -design_subblocks, -hier_abstract_blocks, or -shell_subblocks option. But the module name does not correspond to any of the instances you are trying to budget.

You need to specify a module that corresponds to one of the instances you supplied with the "set_budget_options -add" command. For example, if you specify module "CPU", an instance of CPU (perhaps called my_cpu_inst) my appear like:

set_budget_options -add my_CPU_inst

Feedback

### What Next

Make sure that the module you specify corresponds to one of the instances you supplied with the "set_budget_options -add" command. You can add new instances to consider by calling set_budget_options.

---

## ABS-191

(Error) Can't find installation of Library Compiler%s. Budget shell cannot be created.

### Description

When creating a budget shell, it is necessary to invoke Synopsys Library Compiler. And often, the Library Compiler executable is installed in another directory and not with ICC2. This error indicates that icc2_shell was unable to locate your Library Compiler installation.

### What Next

Please set the SYNOPSYS_LC_ROOT environment varible to point to the directory where Library Compiler is installed. For example, if you set

setenv SYNOPSYS_LC_ROOT /remote/depot/lc

then the icc2_shell will expect to find a library compiler executable at /remote/depot/lc/bin/lc_shell. It will also expect to find an executable under an machine-specific directory. For example, if you are using linux64, then you should see this executable:

/remote/depot/lc/linux64/lc/lc_shell_exec

If you do not see this executable, then please check your installation.

You can set the SYNOPSYS_LC_ROOT environment variable in your ICC2 tcl script, if you wish. But it is often more convenient to set the environment variable in your .cshrc or at the unix prompt. If you set the environment variable in unix, you must set it before starting your icc2_shell program.

---

## ABS-192

(Warning) At budget pin %s, exception of type '%s %s' is overridden by '%s %s' because precedence has changed.

### Description

In SDC, there is a "precedence" that determines what happens when two timing exceptions overlap on the same timing path. Please refer to the man page for set_multicycle_path to see details on exception precedence.

Feedback

When you create a budget for a lower-level block, the precedence for an exception may change. For example, at the top level, you might have the following exception:

set_multicycle_path 2 -from reg1/CP

When you create a budget, this constraint changes at the block level:

set_multicycle_path 2 -from virtual_clock -through block_port

The budgeted exception has lower precedence and has the potential to be dominated by a different constraint in your block. This can cause the constraint to change.

When budgeting detects that your budgeted top-level exception has been overridden by a block exception, this warning is printed.

**What Next**

No action is required on your part because the budget will adapt to compensate for the change in exception. You will not get an overconstrained budget.

If you want to get rid of this message, you can do one of the following:

1. Suppress the message by setting:

```
set_app_options -name plan.budget.report_exception_precedence \\
       -value false
```

2. Change your constraints so they are consistent. For example, if you have a path across a block boundary with two exceptions:

```
set_multicycle_path 3 -from reg1/CP
set_multicycle_path 2 -to block/reg2/D
```

   then you will trigger this warning. If you use "set_multicycle_path 2" for both constraints, there will be no warning, because the constraint remains the same.

---

## ABS-193

(Warning) The current scenario must have setup analysis activated. Timing analysis disabled.

**Description**

This command analyzes the setup times in the current scenario. Either the current_scenario has not been specified or the current_scenario does not have setup analysis activated.

The analysis will continue using only connectivity and no timing.

Feedback

**What Next**

Set your current scenario to an appropriate choice using "current_scenario", or activate setup timing with "set_scenario_status".

---

## ABS-194

(warning) Clipped %d %s values by an average of %s.

**Description**

You have set the app option plan.budget.clip_unoptimized_values to true. As a result, whenever the budgeter sees a delay or capacitance that seems unreasonably high, it will choose a lower value to use in its analysis.

This message gives you a general idea of how much values have been reduced.

**What Next**

Please see the man page for plan.budget.clip_unoptimized_values for more details. In general, you should only be using this app option in early phases of design, when timing accuracy is less important.

---

## ABS-195

(warning) Budget shell for corner %s will be given default PVT values.

**Description**

In order to properly use budget shells, you should assign each of your top-level design's corners "process", "voltage", and "temperature" (PVT) values.

No values were assigned for the given corner, so the internal processing has assigned default values for you. These values are not really used, and will not effect the outcome of budget shell timing. But they may appear confusing if you see them in some reports.

**What Next**

To get rid of this warning, fill in PVT values for all of your corners. This assignment can be done either with the set_operating_conditions command or with the set_process, set_voltage, and set_temperature commands.

---

## ABS-196

(error) Unable to generate db files for the budget shells: %s

Feedback

**Description**

Something has gone wrong with processing. The budget shells could not be processed.

**What Next**

If you have ruled out problems with your network, such as running out of disk space, please contact Synopsys and report this problem.

---

## ABS-197

(error) Cannot generate budgets shells because of %s in your installation.

**Description**

Generation of budget shells requires auxiliary files in the installation root. If you get this message, it means that your installation is incomplete.

**What Next**

Ensure that the software is installed correctly and all files in the installation are present.

---

## ABS-198

(warning) The -hold option is no longer needed. Setting plan.budget.write_hold_budgets to true.

**Description**

The -hold options are no longer needed in order to generate hold budgets. They are now ignored. Hold constraints will automatically be generated by the write_budgets command whenever the plan.budget.write_hold_budgets app option is set to true. The app option has been set for you.

**What Next**

Please modify your script. Remove the -hold option from compute_budget_constraints and set_pin_budget_constraints. Instead, add this to your script:

set_app_options -name plan.budget.write_hold_budgets -value true

---

## ABS-199

(error) Can't process leaf instance '%s'. Skipping.

**Description**

Split_constraints and write_budget can only be performed on hierarchical instances. You have asked to process a leaf instance.

Feedback

**What Next**

Double check the results of design linking. Perhaps a problem there caused the hierarchy to not be loaded. If this really is a leaf instance, you should remove it from your list of budgeted blocks.

---

## ABS-200

(error) Pin '%s' is not on a budgeted block. Cannot set budget.

**Description**

Pin budgets can only be set on budgeted blocks.

**What Next**

Use add_budget_block to select a block for budgeting.

---

## ABS-201

(error) Aborting after %d errors.

**Description**

The command only executed until the specified number of errors occurred.

**What Next**

Fix the specified errors. For the set_budget_options command, consider using the -all flag.

---

## ABS-202

(error) Budget includes a shell for cell '%s', but the cell is not in the design.

**Description**

At the time write_budgets was run, the -shell_subblocks option was applied to a cell of this name in the design. In order to use this budget, the given cell must still exist in the design. It does not.

Because of the problem, the constraints have not been loaded.

**What Next**

If you expected this cell to exist, you should check to see if your design has been properly linked. If this cell is no longer important, you need to use write_budgets to generate a new budget based on the current design.

Feedback

## ABS-203

(error) Can't apply budget because it assumes that cell '%s' is an abstract.

**Description**

At the time write_budgets was run, the hierarchy corresponding to the given cell was treated as an abstract. This means that constraints were generated for the interface of the cell, but not for the internal paths.

There are two possible reasons why write_budgets may have written constraints for an abstract rather than a full design.

1. You failed to supply the proper -design_subblocks option to write_budgets.
2. At the time your budget was created, the given cell was represented as an abstract, not a full design.

In your current design, one of the following problems has occurred:

1. The cell is missing. Constraints in the budget cannot be applied.
2. The cell is has been replaced by a budget shell or ETM. Constraints in the budget cannot be applied.
3. The cell corresponds to a full design netlist, not an abstracted version. Constraints in the budget are incomplete.

Because of the problem, the constraints have not been loaded.

**What Next**

If you expected the cell to be an abstract, you should check to see if your design has been properly linked. If you now want the cell to be something other than an abstract, you need to use write_budgets to generate a new budget based on the current design. Make sure that you specify the correct -design_subblocks option.

## ABS-204

(error) '%s' has not been declared as a budget block.

**Description**

Budgeting can only act on instances that have been added to the budget block list. Also, the instance must point to a logical or physical hierarchy. It is not legal to budget a leaf cell.

**What Next**

Use "set_budget_options -add_blocks" to add your instance to the budget list. Make sure that the instance you are adding corresponds to a hierarchy.

Feedback

## ABS-205

(error) Can't open '%s' for writing.

**Description**

The file could not be opened. The budget has not been written.

**What Next**

Check unix permissions on the target directory and file.

## ABS-206

(warning) When writing multiple budgets, the file_name must contain `%%d'

**Description**

When writing multiple budgets, you need to specify %d somewhere in the file name. The %d characters will automatically be replaced by the name of the budgeted design. If the design has multiple constraint modes, you should also use %m, which will be replaced with the mode name. Failure to use %d would cause multiple budgets to dump to the same file and overwrite each other.

**What Next**

Use %d in at least one place in your file name specification. You can also use %m for the constraint mode of the block.

## ABS-207

(error) Cannot find -source pin for generated clock '%s' in block '%s'. Master clock does not propagate to the block boundary. Output will be incorrect.

**Description**

When budgeting a generated clock within a lower level block, you must conform to the following two rules:

rule 1

Generated clocks should be "expanded" in the full design to resolve their master clock. If the generated clock is not expanded before budgeting, it is not be possible to expand it in the budgeted block.

rule 2

If a master clock source is outside of the block and the generated clock source is inside, the master must propagate to the block boundary.

Feedback

If you received this message, rule 2 has been violated, and it is not possible to generate a legal definition for the generated clock -- because the master clock source is not available. The output SDC file will not be usable until the problem is corrected.

You should look in your program output directly before this error message. You will see information that is useful in figuring out why your master clock did not propagate to the block boundary.

**What Next**

This problem is very serious and it should be fixed. Certainly, you should not start post-CTS optimization with the bad generated clock. However, if you want to continue with prects optimization you can set:

```
set_app_options -name plan.budget.allow_disconnected_gclocks -value true
```

This will generate a budget that will let you continue. Please refer to the app option man page for details.

To correct problems with rule 1, make sure that a master clock is listed for every generated clock shown by the report_clocks command.

You can correct the problem with rule 2 by ensuring that either the master clock propagates to the block boundary or the generated clock is declared at or outside of the boundary.

For example -- consider this verilog for top and block:

```
module top;
    PLL   my_pll(.CLKOUT(clk));
    DFF   reg1(.CLK(clk), .Q(divclk));
    block b1(.clkin(divclk));
    endmodule

    module block(clkin);
    input clkin;
    BUF clkbuf(.A(clkin), .Y(clkin2));
    DFF reg2(.CLK(clkin2));
    endmodule
```

An error will result while budgeting block "b1" if you define your top level SDC as:

```
create_clock -name clock my_pll/CLKOUT
    create_generated_clock -name gclock \\
            -source my_pll/CLKOUT b1/clkbuf/Y
```

This is because clock "clock" propagates only to reg1 and not the block boundary.

Feedback

You can fix the problem in 3 ways:

fix 1

Declare your generated clock at the block boundary:

```
create_clock -name clock my_pll/CLKOUT
    create_generated_clock -name gclock \\
            -source my_pll/CLKOUT b1/clkin
```

fix 2

Declare your generated clock before the block boundary:

```
create_clock -name clock my_pll/CLKOUT
    create_generated_clock -name gclock \\
            -source my_pll/CLKOUT reg1/Q
```

fix 3

Declare an intermediate generated clock at or before of the block boundary, and then make the intermediate clock act as the master for your generated clock.

```
create_clock -name clock my_pll/CLKOUT
    create_generated_clock -name intermediate \\
            -source my_pll/CLKOUT reg1/Q
    create_generated_clock -name gclock \\
            -source reg1/Q b1/clkbuf/Y
```

---

## ABS-208

(warning) Clock '%s' crosses boundary of block '%s' in both inverted and non-inverted sense.

**Description**

A clock at the boundary of a block can only be characterized in one of inverted and non-inverted sense at one time. In this case, two separate clock definitions are needed. This can sometimes be a problem. For example, a generated clock may depend on the clock in this warning message. Since a generated clock may only have one "master", the generated clock will only depend on the positive sense of the clock, not the negative.

**What Next**

To avoid this warning, allow only one sense of the clock to cross the block boundary.

---

## ABS-209

(warning) Generated clock '%s' has sources both inside and outside block '%s'.

Feedback

**Description**

In order to properly time a generated clock, the "master" clock must be visible in the current context. This means that generated clock sources which are outside of the block, but propagate to the block boundary must be converted into regular (not generated) clocks. They will no longer be part of the generated clock with sources inside of your block. Also, if your generated clock propagates out of the block and then back in, the re-entering part of the clock will be converted to a regular clock.

**What Next**

To avoid this warning, declare generated clock sources either all inside or all outside of your block. Additionally, you should avoid having generated clocks that propagate outside of the block and then re-enter.

---

## ABS-210

(warning) Cannot propagate master of generated clock '%s' to input '%s' of block '%s'.

**Description**

In your design, the given pin hierarchical pin lies between the given generated clock source and the generated clock's master clock "source pin". However, it is not possible to trace directly from the master clock to the hierarchical pin. This may have occurred for a few different reasons:

+ There is a register between the master clock and the hierarchical pin.

+ Clock propagation from master clock to generated clock is tracing through registers that you don't intend. This may or may not be a problem.

**What Next**

This warning is not a problem unless all of the paths from a master clock to the block boundary of a generated clock are untracable. In this case, you will also receive an ABS-207 error. Please refer to the manual page of ABS-207 for details.

---

## ABS-211

(warning) Propagating clock '%s' to boundary of block '%s'.

**Description**

In your top level design, the given clock does not usually propagate to the boundary of the given block. This is probably because some generated clock's source sits between the given clock and the block boundary.

Feedback

For the purpose of budgeting, the given clock will appear on the boundary of the given block. This is necessary because the given clock is the master of a generated clock within your block.

**What Next**

If you don't want the given clock to appear at the boundary of your block, you must change the master of the generated clock that is inside of your block. The generated clock inside your block should only depend on clocks which propagate to your block boundary.

---

## ABS-212

(warning) Pin '%s' is missing budget specifications.

**Description**

When creating budgets, you must use the set_pin_budget_constraints command to specify how each interface pin of a block is to be budgeted. The given pin has no specification or has a subset of paths that have no specification.

**What Next**

If you want the pin to receive a budget, specify a budget with set_pin_budget_constraints. If you want the pin to receive no budget, you can use "set_pin_budget_constraints -none" to explicitly select no budget. This warning message will then be supressed.

You can use "report_budget -pin" to see more details about how your current budget specification has been applied to paths through this pin.

---

## ABS-213

(warning) %d pin(s) are missing budget specifications.

**Description**

When creating budgets, you must use the set_pin_budget_constraints command to specify how each interface pin of a block is to be budgeted. The given number of pins have no specification.

**What Next**

If you want the pin to receive a budget, specify a budget with set_pin_budget_constraints. If you want the pin to receive no budget, you can use "set_pin_budget_constraints -none" to explicitly select no budget. This warning message will then be suppressed.

Use "report_budget -warning_pins" or use the -verbose flag of the write_budgets command to see a list of all of the pins with no budget specification.

Feedback

You can use "report_budget -pin" to see more details about how your current budget specification has been applied to paths through a pin.

## ABS-214

(warning) Pin '%s' has no timing paths. No budget created for this pin.

### Description

You have asked for a budget on the given pin, but there are no valid timing paths through the pin. This may be caused by missing clock or datapath connections. It might also be caused by set_false_path specifications. It is expected that non-datapath pins (such as clocks) will have no timing paths.

### What Next

You should use timing constraints to create a path through the given pin. Alternatively, you can use the black-box-timing set of commands to add a "virtual" timing path to your block. For example:

```
set_blackbox_clock_port CLK
    create_blackbox_delay -rise_from CLK -to dataOut -value 1.0
```

Once the timing path has been added, you can create a budget for it.

## ABS-215

(warning) %d pin(s) have no timing paths. No budget created for these pins.

### Description

You have asked for a budget on the given number of pins, but there are no valid timing paths through the pins. This may be caused by missing clock or datapath connections. It might also be caused by set_false_path specifications. It is expected that non-datapath pins (such as clocks) will have no timing paths.

### What Next

Use "report_budget -warning" or use the -verbose option of write_budgets to see a list of pins with no timing path.

You should use timing constraints to create a path through the given pin. Alternatively, you can use the black-box-timing set of commands to add a "virtual" timing path to your block. For example:

```
set_blackbox_clock_port CLK
    create_blackbox_delay -rise_from CLK -to data_out -value 1.0
```

Feedback

Once the timing path has been added, you can create a budget for it. A budget cannot be created for pins with no timing path.

---

## ABS-216

(information) Forcing clock %s (%c) for budgeting at pin %s

**Description**

You have used the -force option of the set_pin_budget command to declare a clock which does not yet exist in your real circuit and/or constraints. The time budget will be created as if the clock actually exists.

**What Next**

No action is necessary.

---

## ABS-217

(information) %d pin(s) in the budget have forced clocks.

**Description**

You have used the -force option of the set_pin_budget command to declare a clock which does not yet exist in your real circuit and/or constraints. The time budget will be created as if the clock actually exists.

**What Next**

For more details, you can recreate your budget using the -verbose option.

---

## ABS-218

(error) %s is not a %spin of a budgeted block.

**Description**

You can only query pins of a block that has been added to the budget with "set_budget_options -add_block".

**What Next**

Add the block with set_budget_options. Or perhaps you have tried to access an input/output pin with specified direction output/input.

Feedback

## ABS-219

(error) The same pin (%s) cannot be used as both -from pin and -to pin in the set_segment_budget_constraints command.

**Description**

This message indicates that in the set_segment_budget_constraints command the same pin was used as both a -from and a -to pin

It is required that the -from and -to pins are two different pins that are adjacent along a timing path.

**What Next**

Correct the pins used in the set_segment_budget_constraints command to indicate a correct budget segment.

## ABS-220

(warning) There are %d pin constraints that appear impossible to meet.

**Description**

Some of the timing paths in your design have constraints that appear too tight to meet. There are several possible causes, which should be fixed if possible. The causes include: Paths with negative slack and only non-optimizable (fixed delay) logic. Very bad clock skews Missing or inconsistent clock_latency declarations Errors in the SDC specification Missing clock_group, false_path or multicycle_path declarations Extremely large fanout nets which have not been declared ideal Excessively large set_input_delay or set_output_delay in the top-level SDC Paths leading to macros with very large setup time, where the macro's clock has not been adjusted. Failure to use estimated timing on an unoptimized netlist.

**What Next**

The automatic budgeter has isolated the paths that appear impossible and budgeted them separately. But the budgets are probably not achievable. You should fix the timing problem on these paths and run the automatic budgeter again to get a high-quality budget.

You can use "report_budget -warning_pins" to see a list of pins which seem to have bad constraints. You can use "report_budget -pins" to see an overview of the bad budget timing. You can use "report_timing -through" to see a detailed timing path.

## ABS-221

(warning) No Timing information found for lib_cell %s.

Feedback

**Description**

The specified cell does not have timing information. This means that timing paths will not propagate through this cell. And constraints that apply to such paths may be lost.

**What Next**

It is OK to get this warning for physical-only cells like antenna diodes. If you see this warning issued for standard logic cells or timed macros, you should check to see if your library has been properly built.

---

## ABS-222

(Information) Retaining interface logic of lower level sub-blocks.

**Description**

This message is generated during abstract creation. It indicates that the interface to lower-level blocks will be retained in the abstract to facilitate MPH budgeting.

**What Next**

This is an informational message. No action needed.

---

## ABS-223

(warning) Clock '%s' has unknown period

**Description**

The waveform of the given clock could not be determined during timing analysis, so the clock has been given an arbitrary period in the output constraints. The clock does not propagate to the current block so the arbitrary period will not adversely affect your timing.

**What Next**

Check the warnings that occur during regular timing analysis. It is likely that you have a generated clock with no master clock driving it. If you fix or remove the generated clock, this error message should go away.

---

## ABS-224

(error) Clock '%s' has unknown period. The resulting constraints may be incorrect.

**Description**

The waveform of the given clock could not be determined during timing analysis. So the clock has been turned into a virtual clock (with no sources) and has been given an

Feedback

arbitrary period in the output constraints. This clock is defined in or propagates to the edge of the current block. In your original design, the paths relating to this clock cannot be timed. In your budgeting design, the timing paths will not even be defined.

**What Next**

Check the warnings that occur during regular timing analysis. It is likely that you have a generated clock with no master clock driving it. If you fix or remove the generated clock, this error message should go away.

---

## ABS-225

(warning) The created abstract has no active %s corners for mode %s. Timing will be omitted.

**Description**

When you create an abstract, timing information is recorded for each corner that is active when the abstract is created. If you have active setup corners, long timing paths will be recorded. If you have active hold corners, short timing paths will be recorded. If you have no active corners, then the abstract will contain no timing paths. The abstract will not be useful for timing analysis.

**What Next**

Use the set_scenario_status command to make sure that you have active setup and hold corners set before calling create_abstract. Otherwise, the abstract will not be useful for the corner of interest.

---

## ABS-226

(error) You must have at least one active corner for abstraction.

**Description**

When an abstract is created, the current timing of one of more modes is needed to so that cells may be selected to be in the abstract. Currently, none of the declared operating modes has timing activated in any corner.

**What Next**

Use set_scenario_status to turn on setup and/or hold timing in at least one mode. Or you can use the -physical_only flag of create abstract is you really don't care about timing.

Feedback

## ABS-227

(information) Information for mode %s is not available in abstract view of design %s for block %s.

**Description**

Data for the specified mode doesn't exist on the specified abstract view or cannot be opened to read.

**What Next**

If the top mode should use data from a different block mode, please use the set_block_to_top_map command to set it up. If the block should have this mode, please make sure the abstract view was created successfully and check the read permission of the design.

## ABS-228

(warning) Port '%s' of design '%s' is driven by both zero and one.

**Description**

When creating budgets, top-level constant values usually cause a set_case_analysis statement to be set for input ports of the budgeted block.

But in this case, the block design has been multiply instantiated. And some of the connections to the given port have a constant zero and others have a constant one. As a result, no set_case_analysis has been applied for this port.

**What Next**

If you want a set_case_analysis statement to appear in the budget, you must make sure that all instances of the design are driven by the same constant.

## ABS-229

(warning) %d port(s) of design '%s' are driven by both zero and one.

**Description**

When creating budgets, top-level constant values usually cause a set_case_analysis statement to be set for input ports of the budgeted block.

But in this case, the block design has been multiply instantiated. And some of the connections to the ports have constant zero and others have constant one. As a result, no set_case_analysis has been applied for the ports.

Feedback

**What Next**

If you want a set_case_analysis statement to appear in the budget, you must make sure that all instances of the design are driven by the same constant.

Use "report_budget -warning" or use the -verbose flag of the write_budgets command to see a list of all of the ports driven by both one and zero.

---

## ABS-230

(warning) Port '%s' of design '%s' is driven by both constants and non-constants.

**Description**

When creating budgets, top-level constant values usually cause a set_case_analysis statement to be set for input ports of the budgeted block.

But in this case, the block design has been multiply instantiated. And some of the connections to the given port have a constant and others don't. As a result, no set_case_analysis has been applied for this port.

**What Next**

If you want a set_case_analysis statement to appear in the budget, you must make sure that all instances of the design are driven by the same constant.

---

## ABS-231

(warning) %d port(s) of design '%s' are driven by both constants and non-constants.

**Description**

When creating budgets, top-level constant values usually cause a set_case_analysis statement to be set for input ports of the budgeted block.

But in this case, the block design has been multiply instantiated. And some of the connections to the ports have constant and others don't. As a result, no set_case_analysis has been applied for the ports.

**What Next**

If you want a set_case_analysis statement to appear in the budget, you must make sure that all instances of the design are driven by the same constant.

Use "report_budget -warning" or use the -verbose flag of the write_budgets command to see a list of all of the ports driven by both constants and non-constants.

Feedback

## ABS-232

(Error) Budget block "%s" has no linked design.

**Description**

The given block currently is not linked to any design. Since the block cannot be timed, budgets cannot be created.

**What Next**

Please make sure that the block is correctly linked, and then try creating the budget again.

## ABS-233

(Error) Cannot mix pin budget constraints with budget pin controls.

**Description**

It is not supported to mix budget pin constraints like -from_percent or -to_delay with budget pin controls like -same_as_pin or -frozen.

**What Next**

Please use two separate set_pin_budget_constraints commands, one with a budget constraint and one with budget controls.

## ABS-234

(warning) Design %s.%s is not abstract view.

**Description**

The specified design is not of abstract view. The command only takes abstract view design.

**What Next**

Please check the view type of the specified design.

## ABS-235

(Warning) Corner '%s' is not currently defined.

**Description**

You have created a constraint for a corner that is not currently defined. This is OK. You can choose to define the corner later. Otherwise the constraint will be ignored.

Feedback

**What Next**

If you has typed the wrong name for your intended corner, you can simply ignore the constraint from this command and retype the command with the correct corner name.

---

## ABS-236

(Error) Budget boundary '%s' is not defined.

**Description**

In order to apply a budget boundary constraint, you must first define the constraint using the set_budget_boundary command.

**What Next**

Use the set_budget_boundary command to create the constraint.

---

## ABS-237

(Warning) Top-level mode '%s' has no setup corners for budgeting.

**Description**

In order to generate a budget associated with a top-level mode, it must be possible to trace delays through timing paths. Because your mode has no corners with setup enabled, no set_input_delay or set_output_delay can be generated for setup timing. Only virtual clocks and exceptions will be generated.

**What Next**

If you want budgets for setup, please enable setup timing for at least one corner in the mode.

---

## ABS-238

(Warning) No budget information is available for %s '%s'.

**Description**

The budget information you are reading was created without information for the given mode or corner. No budget will be applied for this mode or corner. Any old budget information which may have been applied will be retained.

**What Next**

Consider regenerating the budget information. Make sure that the desired mode or corner is defined at the top level.

Feedback

## ABS-239

(Warning) Budget information could not be applied for %s '%s'.

**Description**

Budget information is available for the given mode or corner, but your current design does not have this mode or corner defined.

**What Next**

In order to apply a budget to a block, you must first have constraints for the block defined. The budget data is merely an overlay on top of the defined constraints. It defines new constraints at the block boundary.

## ABS-240

(Information) Budget for this design will be based on estimated_corner delays.

**Description**

By default, automatic budgeting creates constraints based on the worst delays across all active timing corners. But currently, the automatic budgeter for this design is in "estimate_timing mode" and will base the budget only on delays in the estimated_corner. This is desirable when some or all of your design is unoptimized.

**What Next**

The default value for the app option "plan.budget.estimate_timing_mode" is "auto". When "auto" is selected, estimate_timing budgeting will be used whenever a estimated_corner is defined.

You can force regular budgeting by either removing the estimated_corner or by setting.

set_app_option -name plan.budget.estimate_timing_mode -value false

## ABS-241

(Information) Restoring the reg2reg timing paths across sub-blocks previously ignored by command set_timing_paths_disabled_blocks.

**Description**

Budgeting restores the reg2reg timing paths across sub-blocks by running remove_timing_paths_disabled_blocks internally.

Feedback

### What Next

No action is required. The block internal timing paths can be disabled again after budgeting by running the command

set_timing_paths_disabled_blocks -all_sub_blocks

---

## ABS-242

(Warning) The estimated_corner is not initialized for mode '%s'. Estimated timing budget not generated for this mode.

### Description

You have asked for "estimate_timing mode" budgets in this design, but the "estimated_corner" for this timing mode does not exist or is not active. No set_input_delay or set_output_delay can be generated and old budgets will be kept. Only virtual clocks and exceptions will be updated.

Note that the estimated_corner is only created for setup analysis and not hold, and estimate_timing-based analysis only works for setup_delay budgeting. So if the given mode has no setup scenarios, then it does not make sense to use estimate_timing for budgeting on the mode.

### What Next

You can create the estimated_corner by using the "estimate_timing" command. Or you can choose not to use the estimated corner by using the "-no_estimate_timing" option of this command. You can also turn off estimate_timing mode budgeting for this design by using one of the following:

set_app_option -name plan.budget.estimate_timing_mode -value false

set_app_option -name plan.budget.estimate_timing_mode -value auto

---

## ABS-244

(warning) Cannot propagate master of generated clock '%s' to input '%s' of block '%s'. Consider using "create_generated_clock -combinational".

### Description

In your design, the given pin hierarchical pin lies between the given generated clock source and the generated clock's master clock "source pin". However, it is not possible to trace directly from the master clock to the hierarchical pin. This probably occurred because you have not used the -combinational option of create_generated_clock.

Feedback

When you do not use the -combinational flag, clock propagation from master clock to generated clock may be tracing through registers that you don't intend. The tracing through registers triggers this warning. You might want to consider using the -combinational option of create_generated_clock when you use "-divide_by 1".

**What Next**

This warning is not a problem unless all of the paths from a master clock to the block boundary of a generated clock are untraceable. In this case, you will also receive an ABS-207 error. Please refer to the manual page of ABS-207 for details.

You should consider using the -combinational option with create_generated_clock. That option will make this warning go away.

---

## ABS-245

(error) Cannot overwrite the existing abstract view. Changes pending merge from abstract view to design view.

**Description**

You get this message when running create_abstract command. The error message is issued because there are changes in the abstract view of the design that has not been merged back to the design view yet. The tool cannot create a new abstract view to overwrite the old abstract view from an out-of-date design view.

**What Next**

You should run merge_abstract first.

If you are sure that you want to abandon the data in the current abstract view and create a new abstract view from the out-of-date design view, you can consider using remove_blocks to delete the existing abstract view from both in-memory and on-disk. Then, you can proceed with create_abstract.

---

## ABS-246

(error) cell %s has no reference module.

**Description**

You get this message when running create_abstract command. The error message is issued because, in order to have a leaf cell in the abstract view, it has to have reference module.

Feedback

**What Next**

This error happens when the specified cell has no reference module. This could happen if the reference library is not set up properly.

Please check reference library settings and make sure the reference library for the cell is set properly, then run create_abstract again.

If you are running RTL Floorplanning flow, please run *estimate_design* command to generate physical views for unmapped logic.

---

## ABS-247

(Information) %s abstract for block %s:%s has been saved to disk.

**Description**

The given abstract is now written to disk and can be linked by other blocks. You will not be allowed to save read-only abstracts later.

**What Next**

You might see future information messages that the read-only abstract cannot be saved. This is OK, because it was saved in this step.

---

## ABS-248

(Warning) Design %s.%s is of version %u.0 which is not compatible with current version.

**Description**

The specified abstract view design contains annotation data that is of an older version that is no longer supported. This abstract view can no longer correctly represent the corresponding design view with the executable your are using.

**What Next**

If there is any modification on the abstract view that you need to merge back to the design view, please do so by calling merge_abstract. Then, use the current executable and run create_abstract to create a new version of the abstract view.

If you want to discard the existing abstract view, please use remove_abstract command to remove it. Then, use the current executable and run create_abstract to create a new version of the abstract view.

---

## ABS-249

(Warning) The design '%s' has no abstract view.

Feedback

**Description**

There is no abstract view, so merge_abstract cannot be performed.

**What Next**

Abstracts are create by the create_abstract command. If you ran create_abstract, perhaps you also called remove_abstract by accident.

It is also possible that this design was created by using copy_block or "save_block -as". Neither of these commands will copy original design's abstract.

---

## ABS-250

(warning) Missing timing constraints. Abstract may be incorrect.

**Description**

When an abstract is created, the current timing of one of more modes is needed to so that cells may be selected to be in the abstract. None of your modes have declared clocks, and it is possible that the improper timing paths are being represented in the abstract. A top-level timing report that uses this abstract may not show the worst timing path.

The requirements for your block constraints are different, depending on whether you are using "compact" abstracts or "full" abstract.

Full abstract are bigger, but they require less complete constraints at the block level. Before making a full abstract, the block should have the following defined:

- All clocks and all generated clocks

Compact abstracts are significantly smaller than full abstracts. This will give you a significant memory and CPU advantage when processing a top-level design. Before making a compact abstract, the block should have the following defined:

- All clocks and all generated clocks
- All set_case_analysis and set_disable_timing
- All exception constraints (set_false_path, set_multicycle_path) that affect timing paths that enter or leave the block.

**What Next**

If your block really has no clocks in it, then everything is OK. Otherwise, you should make sure to load your block SDC constraints before creating an abstract.

Feedback

## ABS-251

(warning) This abstract cannot be used for timing analysis.

### Description

The created abstract is not intended to be used for timing operations such as report_timing or optimization. If you instantiate this abstract at the top level, your timing information may be misleading or incorrect. In particular, the delay values might be incorrect and the worst timing path might not be represented.

### What Next

Create a new abstract with timing information.

## ABS-252

(information) Input port '%s' has high fanout. Some fanouts filtered from the abstract.

### Description

"Full" abstracts contain nearly all of the boundary (donut) logic that can be found in the original design. But some of the boundary logic is filtered out in order to keep the abstract size reasonable. In particular, logic connected only to high-fanout networks is filtered. Usually, the filtered logic includes clock networks, scan enable, and reset. For these signals, only the essential part of the logic is kept, instead of all of the logic.

### What Next

You can use the "abstract.high_fanout_limit" app option to adjust the filtering behavior.

## ABS-253

(warning) Top-level clock '%s' cannot be mapped to a block-level clock. Assuming the block and top use the same clock name.

### Description

It is possible that clocks defined in your blocks have names that do not match connected top-level clock names. For example, a top level clock named "SYS_CLK" may be connected to a block-level clock named "CLK". The *write_budgets* command understands that names may not match, and will automatically derive the mapping between top-level and block-level clocks. This allows *write_budgets* to generate the proper constraints for the block.

This warning informs you that the given top-level clock connects to the block, but write_budgets cannot figure out which block-level clock is connected. write_budgets

Feedback

assume that the block-level clock name matches the top-level clock name. If this is a bad assumption, then the constraints generated by write_budgets will be incorrect.

**What Next**

Make sure that your block has constraints specified, and then use set_block_to_top_map to specify the clock association.

---

## ABS-254

(warning) %d clocks top-level clocks(s) cannot be mapped to block-level clocks. Assuming the block and top use the same clock name.

**Description**

It is possible that clocks defined in your blocks have names that do not match connected top-level clock names. For example, a top level clock named "SYS_CLK" may be connected to a block-level clock named "CLK". The *write_budgets* command understands that names may not match, and will automatically derive the mapping between top-level and block-level clocks. This allows *write_budgets* to generate the proper constraints for the block.

This warning informs you that some of the clocks in this block could not be mapped to top level clocks. write_budgets assume that the block-level clock name matches the top-level clock name. If this is a bad assumption, then the constraints generated by write_budgets will be incorrect.

**What Next**

Make sure that your block has constraints specified, and then use set_block_to_top_map to specify the clock association.

Use the -verbose option of write_budgets to see a list of clocks with no name mapping.

---

## ABS-255

(warning) No clocks defined for mode '%s'. Block constraints should be loaded prior to applying budget.

**Description**

By default, the write_budgets command only writes constraints that apply to a subblock boundary. The output of write_budgets is not a complete set of constraints for a block unless you use the -full_budget_blocks option. Rather, the output is intended to be

Feedback

"layered" on top of your existing block constraints. So, in order to use the budget file from write_budgets, you need to perform the following steps:

- Load your block
- Apply your regular block constraints
- At the top level, obtain budget constraints automatically by using compute_budget_constraints or manually using budget option commands.
- Write budget SDC using write_budgets
- Source the output from write_budgets into your block

**What Next**

If your block really should have no clocks or registers in it, then you are OK. Otherwise, you need to follow the procedure above or use the -full_budget_blocks option of write_budgets.

If you do not have regular block constraints, consider using the split_constraints command to derive block-level constraints based on chip-level constraints.

---

## ABS-256

(error) This command must be run on a 'design' view. Your current block is a '%s' view.

**Description**

The command was not designed to run on the current view.

**What Next**

Open the 'design' view of your block. If you only have an 'outline' view, you need to run the expand_outline command.

---

## ABS-257

(error) No block specified.

**Description**

You are seeing this message because you ran *create_abstract* or *merge_abstract* with option *-host_options* but did not specify the blocks you want to create or merge abstract view for.

Feedback

**What Next**

Please use option *-blocks* to specify the blocks you want the tool to create or merge abstract view for. Or, use option *-all_blocks* if you want all child blocks' abstract view to be created or merged.

---

## ABS-258

(error) Cell %s does not belong to root design %s.

**Description**

You are seeing this message because you ran *create_abstract* or *merge_abstract* with option *-blocks* but the block cells do not belong to the same root design.

When the specified cells do not belong to the same root design, it is not possible for the tool to figure out block dependencies. In order to run the blocks in the correct order, the tool has to know their dependencies of each other and maybe dependencies to other designs.

**What Next**

Please specify block cells that belong to the same root design.

---

## ABS-259

(error) Wire parasitics are too low. Can't buffer properly.

**Description**

The tool has detected a problem with the parasitic settings in your design. With the current values, it appears as if wires will have no delay and should never be buffered. The current parasitic settings, TLU+ or tech file information is probably wrong.

**What Next**

Please check the timing and parasitic settings of your design.

---

## ABS-260

(error) Cannot find reference design for cell %s.

**Description**

This message indicates that the design is not fully linked. The specified physical block cell has no reference design.

Feedback

**What Next**

Please check your reference library settings to make sure that the design is linked successfully.

---

## ABS-261

(error) Cannot open file %s to %s.

**Description**

This message indicates that the tool cannot open the mentioned file for the specified operation.

**What Next**

Please check file and directory permissions.

---

## ABS-262

(error) Syntax error in line %u of file %s.

**Description**

This message indicates that there is a syntax error in the block constraint mapping file.

The correct syntax for each line of the block constraint mapping file is: <block_design_name> <constraint_type> <file_name> where, *constraint_type* is one of UPF, SDC, DEF, BUDGET, CLKNET, PG_CONSTRAINT, COMPILE_PG, ETM_UPF, CTS_CONSTRAINT, BTM, FLOORPLAN.

**What Next**

Please check the content of the block constraint mapping file and fix any syntax error.

---

## ABS-263

(error) Cannot find block with design name %s.

**Description**

This message indicates that there is no physical block in current design with the specified reference design name.

**What Next**

Please check the content of the block constraint mapping file and the reference design name of the physical block.

Feedback

## ABS-264

(warning) Design %s for block %s has no design view.

**Description**

This message indicates that there is no design view for the specified design.

You are calling an operation that requires the design has design view. Since the block has no design view, the block is skipped.

**What Next**

Please check if there should be a design view for the specified design.

## ABS-265

(error) Timing is not available for this budget.

**Description**

It is not possible to budget or report on timing in the current mode. This is probably caused by missing process corners for the mode.

Possibly you have asked for a estimated_corner budget when the estimate_timing command has not been run. If you see a ABS-240 message, please read the man page for that message.

**What Next**

Make sure that the current mode has a corner defined. Make sure you have an estimated_corner when your budget is looking at estimate_timing delays.

## ABS-266

(warning) Abstract design %s.%s cannot be used for timing analysis.

**Description**

The specified abstract is not intended to be used for timing operations such as report_timing or optimization. By instantiating this abstract at the top level, your timing information may be misleading or incorrect. In particular, the delay values might be incorrect and the worst timing path might not be represented.

**What Next**

If you want to look at timing related to the instantiation of this abstract, create a new abstract with timing information.

Feedback

## ABS-267

(error) No abstract design to remove.

**Description**

Either the specified abstract design is not present in the library or there are no abstract designs for remove_abstract to work on.

**What Next**

Please check the name of the abstract design to be removed and if there are any abstract designs to be removed.

## ABS-268

(Warning) Top-level mode '%s' has no hold corners for budgeting.

**Description**

In order to generate a budget associated with a top-level mode, it must be possible to trace delays through timing paths. Because your mode has no corners with hold enabled, no set_input_delay or set_output_delay can be generated for hold timing. Only virtual clocks and exceptions will be generated.

**What Next**

If you want budgets for hold, please enable hold timing for at least one corner in the mode.

## ABS-269

(Warning) The current mode has no defined clocks. Skipping timing evaluation for path analysis.

**Description**

Flyline analysis for paths can only use timing information if your design has clocks defined. Analysis will continue for path counts, but not for timing.

**What Next**

Provide timing constraints (including clocks) prior to running path analysis.

## ABS-270

(Information) Flyline analysis for paths %s include timing information.

Feedback

### Description

This message tells you whether or not timing analysis will included when performing flyline analysis for paths. If you have received a ABS-269 message, please refer to that message for details. Otherwise, the behavior is controlled by the plan.path_analysis.enable_timing app option. Set the option to true to analyze timing, or false to save runtime during analysis.

### What Next

Set the app option appropriately if it isn't already, and then click the "reload" button in the GUI. To set the app option use:

set_app_option -name plan.path_analysis.enable_timing -value false

or

set_app_option -name plan.path_analysis.enable_timing -value true

---

## ABS-271

(Warning) There is no constraint mapping file for the design.

### Description

This message tells you that the constraint mapping file is missing for the current design.

The constraint mapping file tells the tool where the constraints (for example, DEF, UPF, SDC, BUDGET, etc.) are for the current design as well as each sub-block reference designs. The tool picks up the information and loads the necessary constraints to each block and top level at different stages during the design planning flow when it creates the sub-blocks' abstract view.

If you started the design with a full design SDC and UPF file and ran *split_constraint*, the command generates a mapfile with the UPF and SDC information for the top level and each sub-block.

*write_budget* writes out a mapfile with BUDGET constraints for each sub-block.

User can write the mapfile manually if they have the constraint files for the top and blocks.

To learn more about the constraint mapping file, please refer to the man page for command *set_constraint_mapping_file*.

### What Next

If you don't have the constraints yet and want to continue without the constraints, you can ignore this warning.

Feedback

If you have the constraints but forgot to set the mapping file, please set the mapping file and re-create the abstract views.

---

## ABS-272

(Warning) Block signal pins (e.g. %s) tied directly to power/ground net '%s' will not be budgeted.

### Description

The given net has been identified as power or ground and also crosses a budgeted block boundary. The signal cannot be timed, so block crossings associated with this net will not get a budget. The proper set_case_analysis *will* still be in the budget.

### What Next

If you want this signal to be considered despite its constant value, please isolate it from the rails by using a buffer or a tie cell.

---

## ABS-273

(Error) The current scenario must have setup analysis activated.

### Description

This command analyzes the setup times in the current scenario. So you must activate setup timing in the current scenario to continue.

### What Next

Set your current scenario to an appropriate choice using "current_scenario", or activate setup timing with "set_scenario_status".

---

## ABS-274

(Error) One or more block(s) failed. Please look for more detailed error message(s) earlier in the log.

### Description

The command tried to do some operations on the child blocks and some block(s) failed. There should be script and log file for each block. The location of these files should be stated in the current log file before this message, "*all scripts and log files are under ...*". There should also be *CDPL-XXX* or *ABS-296* error messages before this message to indicate which block(s) failed.

Feedback

**What Next**

Please check the log for the failed block(s) to find more information about the reason behind the failed job. If there are no log files for the blocks, then this most likely means the distributed processing mechanism failed. Check the cdpl_log/*.err file. This may give more insight into the distributed processing failure. You can then use the check_host_options command to see if your host option setting is properly set up.

Check the time stamp when looking at the log files. Because log files are not removed by default, you may accidentally look at an old log file, not the one from the current run.

If the log file for a failed block seems to end before finishing the block's script but without any error message, it is most likely that the job crashed. You should be able to verify the crash by running the tcl script for the block. The tcl script for the block is located under the same directory where the block's log file is.

---

## ABS-275

(Error) Instance %s (module %s) must not be an abstract.

**Description**

When creating budgets for multiple levels of hierarchy, only the leaf levels of hierarchy may be represented as abstracts. The top level hierarchy and intermediate level hierarchies must be full "design" views, that contain the full netlist.

**What Next**

Change the given hierarchy to a full design view, or you can remove nested hierarchies from the list of budgeted modules.

---

## ABS-276

(Error) Instance %s (module %s) may not be an abstract when plan.budget.all_design_subblocks is set to "true".

**Description**

When the app option plan.budget.all_design_subblocks is set to "true" you may not use abstract blocks in your hierarchy. Please refer to the man page of plan.budget.all_design_subblocks for further details.

**What Next**

You can change to full designs using change_abstract, or you can reset plan.budget.all_design_subblocks option using the set_app_options command.

Feedback

## ABS-277

(Error) Your library must have technology information in order to use budget shells.

**Description**

In order to make a budget shell, the technology information (the tech file) must be known.

**What Next**

Include a library with technology information in the reference libraries.

## ABS-278

(Error) Instance %s (module %s) cannot be made into a budget shell.

**Description**

In order to make a budget shell for an instance, the instance must be associated with an independently linkable design hierarchy. The instance may not be a leaf cell, a simple logic hierarchy, or unresolved.

**What Next**

Make sure your instance links properly to an independent block.

## ABS-279

(Information) Abstract view of design %s is not changed since its creation. No merge needed.

**Description**

Upon loading a design view or when *merge_abstract* is called, the tool checks whether the abstract view (if one exists) has been changed since it was created. You are getting this message because the abstract view of the specified design has not been changed.

**What Next**

This is an informational message. No action needed.

## ABS-280

(Information) Abstract view of design %s is read-only. No merge needed.

Feedback

### Description

Upon loading a design view or when *merge_abstract* is called, the tool checks whether there is anything in the abstract view that need to be merged to the design view. You are getting this message because the abstract view of the specified design is read-only.

### What Next

This is an informational message. No action needed.

---

## ABS-281

(Information) Abstract view of design %s is not changed since last merge. No merge needed.

### Description

When switching the current design or when *merge_abstract* is called, the tool checks whether there is anything in the abstract view that need to be merged to the design view. You are getting this message because the abstract view of the specified design has not been changed since the last merge.

### What Next

This is an informational message. No action needed.

---

## ABS-282

(Information) Abstract view of design %s is changed since last merge.

### Description

When switching the current design or when *merge_abstract* is called, the tool checks whether there is anything in the abstract view that need to be merged to the design view. You are getting this message because the abstract view of the specified design has changed since the last merge which indicates that another merge is needed.

### What Next

This is an informational message. No action needed.

---

## ABS-283

(Error) Design view of design %s is changed since last merge. Cannot merge new abstract changes to the design view.

Feedback

### Description

When switching the current design or when *merge_abstract* is called, the tool checks whether there is anything in the abstract view that need to be merged to the design view.

You are getting this message because both the design view and the abstract view of the specified design has changed which makes it impossible for the tool to perform view merge.

### What Next

You need to decide whether to keep the content of the design view and discard the abstract view or keep the content of the abstract view discard the changes in the design view.

If you choose to keep the content of the design view, please call remove_abstract then continue with your flow.

If you choose to keep the content of the abstract view, please close and purge the design view and open it again. To close and purge the design view, you can call the command *close_block -purge -force*.

---

## ABS-284

(Error) No blocks have been specified for splitting/budgeting. Nothing done.

### Description

Before you run split_constraints or write_budgets, you must declare which instances you want to operate on. This is done with the -add_block option of the set_budget_options command. No instances have been declared, or you are trying to operate on instances that have not been declared.

### What Next

Make sure you declare all budgeted blocks with the -add_block option of the set_budget_options command.

---

## ABS-285

(Error) None of the shell_subblocks listed are budget instances.

### Description

When you use the shell_subblocks option, you must specify the module name of one of the instances that you are budgeting. The given names do not match nay of the instance modules.

Feedback

### What Next

Please give the module name of one of the budgeted instances, or do not use the shell_subblocks option.

---

## ABS-286

(error) Cannot find -source pin for generated clock '%s' in block '%s'. Master clock does not propagate to the generated clock. Output will be incorrect.

### Description

When budgeting a generated clock within a lower level block, you must conform to the following two rules:

rule 1

Generated clocks should be "expanded" in the full design to resolve their master clock. If the generated clock is not expanded before budgeting, it is not be possible to expand it in the budgeted block.

rule 2

If a master clock source is outside of the block and the generated clock source is inside, the master must propagate to the block boundary.

If you received this message, there is no path that leads from the master clock to the generated clock source. This means that it is impossible to determine the correct point for the master clock to enter your block. It also means that it is not possible to generate a legal definition for the generated clock. The output SDC file will not be usable until the problem is corrected.

### What Next

This problem is very serious and it should be fixed. Certainly, you should not start post-CTS optimization with the bad generated clock. However, if you want to continue with prects optimization you can set:

```
set_app_options -name plan.budget.allow_disconnected_gclocks -value true
```

This will generate a budget that will let you continue. Please refer to the app option man page for details.

You need to make sure that there is a legal path between the master clock and the generated clock. You should also make sure that the clock path is not stopped by set_disable_timing or set_clock_sense. Also pay attention to situations where clock gating, clock muxing, or case analysis may be switching off the path that crosses between the master clock and the generated clock.

Feedback

Note that when the master clock is cut off by clock gating or clock muxing, the latency to your generated clock will not be propagated. So you could consider removing the generated clock completely, since the timing is not correct in any case.

If you don't care about the path from the master clock to the generated clock (because you don't care about tracing the clock latency between the master and generate clocks), then consider changing your generated clock in a regular clock.

---

## ABS-287

(information) Using latencies from corner '%s' as the default for other corners.

**Description**

When setting budget latency targets, each of the currently defined corners is analyzed and assigned appropriate values. For any new corner and for the estimated_corner, a default value will be set that is copied from the given corner.

**What Next**

No action is necessary.

---

## ABS-288

(warning) Html output may be too big for your browser. Consider using -html_dir.

**Description**

The -html option of the report_budget command writes a single large file. The files produced by -html can be very large and most browsers do no perform well on large files.

**What Next**

If you encounter problems due to a large report file, try using the -html_dir option.

The -html_dir option splits the report across many files in the specified directory to allow easier browsing and to avoid overwhelming the browser with one large file. The command creates the index.html file in the specified directory to contain a table of contents that references the individual files.

---

## ABS-289

(error) You must define budget latencies before setup delays in mode '%s'.

Feedback

**Description**

In order for budgeting to work properly, you must define budget target latencies for your clock. The relative values of the target latencies will indicate to the budgeter if you want purposeful clock skew or OCV in you blocks.

Your current circuit either has propagated clocks or user defined set_clock_latency values, indicating that there can be clock skew or OCV intended in your circuit. But no budget target latencies have been set.

**What Next**

You can manually set budget target latencies by using the set_latency_budget_constraints command. If you want to set all target latencies to zero, use:

set_latency_budget_constraints -early_latency 0 -late_latency 0 -default

Alternatively, you can automatically set up budget target latencies based on actual latencies in your current circuit. This is done by using:

compute_budget_constraints -latency_targets actual -balance true

Please refer to the respective command man pages for more details.

---

## ABS-290

(error) Cannot do %s on design %s because it is not saved after rename.

**Description**

You are getting this message because you are trying to do an operation that would trigger the tool to automatically save the design. But this design was renamed from another design and there is no user-specified save after the design was renamed. A partial automatic save design on a design that is potentially a part of a set of designs that was renamed would corrupt the database and cause a severe error down the flow. That is why this operation is not allowed.

**What Next**

If you have not called rename_block command explicitly, there might be some commands that you call from the top level to operate on child blocks that would do rename internally to avoid committing any changes to disk without user calling save command.

If you want to continue with the operation, you can do a *save_lib -all* to save the designs first, then continue.

---

## ABS-291

(error) Cannot create abstract view for block %s because %s.

Feedback

### Description

You are getting this message because you are trying to run create_abstract on a block that it is not allowed for the specified reason.

### What Next

Here are the possible reasons you might see from the message and what you can do next.

*plan.flow.design_view_only is true*: Use *report_app_options* or *get_app_option_value* to check the app option setting on the specified block. The tool is not allowed to create abstract view for a block with this app option set to true.

*It is instantiated in another block with abstract view*: This indicates that this block is instantiated in another block which has an abstract view. The tool can only create abstract view at one level of physical hierarchy. If an ancestor block has abstract view, the descedent blocks are not allowed to have abstract view.

*It contains a partition*: This block has no abstract view, yet it has a child physical hierarchy which is represented in the form of a partition. This situation should not happen. Please review the flow.

*Has lower level block that can be abstract view*: The tool creates abstract view for the lowest level of physical hierarchy that is allowed. You get this error either because there is one or more lower level blocks in the specified block can be abstract view, or because one or more lower level blocks already has an abstract view. If a lower level blocks already has an abstract view, you need to remove the abstract view. If none of the lower level blocks has abstract view, that means one or more lower level blocks has plan.flow.design_view_only setting to false, so the abstract view should be created at a lower level, not this block level. If you want to create abstract view for this block, please set the app option plan.flow.design_view_only to true and remove any existing abstract view for all the lower level blocks.

*It has no write permission on disk*: You have no write permission for the on-disk data for this block. Since creating abstract for a block means writing data to the block's on-disk database, if you do not have disk write permission, the tool cannot create abstract for the block.

*The tool cannot find the block*: If the message provides a name for the block that it complains about, check whether the block is instantiated anywhere in the current block or its child blocks. If so, whether it is linked properly.

---

## ABS-292

(warning) Cannot create abstract view for block %s because %s.

Feedback

### Description

You are getting this message because you are trying to run a command that is attempting to create abstract on a block that it is not allowed for the specified reason.

### What Next

Here are the possible reasons you might see from the message and what you can do next.

*abstract.allow_all_level_abstract is false*: Use *report_app_options* or *get_app_option_value* to check the app option setting on the specified block. The tool is not allowed to create abstract view for a block with this app option set to false.

*It is instantiated in another block with abstract view*: This indicates that this block is instantiated in another block which has an abstract view. The tool can only create abstract view at one level of physical hierarchy. If an ancestor block has abstract view, the descedent blocks are not allowed to have abstract view.

*It contains a partition*: This block has no abstract view, yet it has a child physical hierarchy which is represented in the form of a partition. This situation should not happen. Please review the flow.

*Has lower level block that can be abstract view*: The tool creates abstract view for the lowest level of physical hierarchy that is allowed. Since there is one or more lower level blocks in the specified block can be abstract view, the abstract view should be created at a lower level, not this block level. If you want to create abstract view for this block, please set the app option abstract.allow_all_level_abstract to false for all the lower level blocks.

*It has no write permission on disk*: You have no write permission for the on-disk data for this block. Since creating abstract for a block means writing data to the block's on-disk database, if you do not have disk write permission, the tool cannot create abstract for the block.

*The tool cannot find the block*: If the message provides a name for the block that it complains about, check whether the block is instantiated anywhere in the current block or its child blocks. If so, whether it is linked properly.

---

## ABS-293

(Error) Cannot operate on current design %s.outline, because it is already expanded to design view.

### Description

You are getting this message because you are trying to run a command on outline view of a design, but the design view of the same design already exists because *expand_outline* was called previously.

Feedback

**What Next**

If you intend to open the design view, please close the current design and use *open_block* to load the design view and continue.

If you intend to discard the existing design view, please use *remove_block* to explicitly delete it. Please also delete the abstract view and/or frame view of the same design, if they exist.

---

## ABS-294

(warning) Cannot find -source pin for generated clock '%s' in block '%s'. Master clock does not propagate to the block boundary. Generated clock will be converted to a regular clock.

**Description**

You have set the app_option plan.budget.allow_disconnected_gclocks to true, which has caused you to receive this "warning" message instead of an ABS-207 "error" message.

The generated clock in your budget has been changed into a regular clock, which means that clock latency will no longer be propagated to this clock. This will be a serious problem for post-CTS optimization.

**What Next**

Please refer to the man page for ABS-207 for details on how to address this problem. You should fix this problem and then reset the plan.budget.allow_disconnected_gclocks app_option back to false.

---

## ABS-295

(warning) Cannot find -source pin for generated clock '%s' in block '%s'. Master clock does not propagate to the generated clock. Generated clock will be converted to a regular clock.

**Description**

You have set the app_option plan.budget.allow_disconnected_gclocks to true, which has caused you to receive this "warning" message instead of an ABS-286 "error" message.

The generated clock in your budget has been changed into a regular clock, which means that clock latency will no longer be propagated to this clock. This will be a serious problem for post-CTS optimization.

**What Next**

Please refer to the man page for ABS-286 for details on how to address this problem. You should fix this problem and then reset the plan.budget.allow_disconnected_gclocks app_option back to false.

Feedback

## ABS-296

(error) Block %s failed.

**Description**

You get this error message because you are running a command that does block level jobs from top level, and the job for the specified block failed.

**What Next**

Please check the log file for the specified block to find out what exactly failed.

To find the location of the log file for the block, search the main log file before this message for "*all scripts and log files are under ...*". The log file for the block can be found in a sub-directory there with the same name as the block.

## ABS-297

(error) Could not find any instantiation for the given block(s).

**Description**

You get this error message because you are running a command that does block level jobs from top level for a specified set of blocks. But the tool is unable to find any instantiation of the given blocks in the current block.

**What Next**

Please check the blocks you specified and their view names.

Please check the reference block attributes of a cell to get the library name, reference block name and reference view name.

## ABS-298

(error) Current design is read-only. Cannot save the modified design and launch jobs for child blocks.

**Description**

You get this error message because you are running a command that does block level jobs from top level. In preparation to start running the child blocks, the tool saves and closes the top level. But the tool is unable to do so because the top level design is modified and the top level design is read-only.

Feedback

### What Next

Please check the write permission of the top level design on disk. If the design has no disk write permission, you can use *save_block -as* to save the design to another design and continue with the operation.

If the design has disk write permission, please check if there is an editable abstract view for the current design. If there is, you can either call *remove_abstract* to remove the abstract view and make the current design editable, or call *reopen_block -edit* to promote the current design to edit mode, and then continue with the flow.

---

## ABS-299

(warning) Placement abstract views are always editable abstracts, option -read_only is ignored.

### Description

You get this error message because you are running a command that tries to create placement abstract view with option *-read_only* specified for command *create_abstract*.

A placement abstract view is always an editable abstract view. An editable abstract view doesn't necessarily mean that the top level operations are allowed to modify this block. An editable abstract view just means that the design view of the block is locked and that the abstract view has the latest data of the design.

### What Next

If you want the block to be read-only for commands issued from the top level where this block is instantiated, you can set_editability to restrict modifications to this block. Another option is to remove the write unix write permission for the disk directory where this block is stored.

---

## ABS-300

(error) Block level clock '%s' at pin '%s' maps to multiple top level clocks for mode '%s'.

### Description

There are multiple top level clocks with the correct waveform that propagate to the given pin. It is not possible to automatically determine which top level clock you wish to associate with your top level clock.

### What Next

You need to set the association manually using the set_block_to_top_map command.

Feedback

## ABS-301

(error) Block level clock '%s' at pin '%s' does not match any top level clocks for mode '%s'.

**Description**

The clocks that propagate to the given pin of your block boundary have a waveform that is different than what the clock expects.

**What Next**

You must either supply the correct clock at the top level or change the clock definition in your block. You might want to consider declaring another operating mode for your block which has the appropriate clock frequency.

## ABS-302

(warning) Block level clock '%s' at pin '%s' has no top level clocks that correspond to it in mode '%s'.

**Description**

There are no top-level clocks that propagate to the source pin of your block's clock.

**What Next**

You can force a top-level clock source to be declared at you block boundary by using the -map option of the set_block_to_top_map command.

## ABS-303

(error) Block level clock '%s' in cell '%s' maps to top level clock '%s' and '%s' for mode '%s'.\n",

**Description**

The clock in your block has multiple sources, but the sources are connected to different clocks at the top level.

**What Next**

You should fix your top level clocks to supplies both block sources the same way. Alternatively, you can declare two separate clocks in your block.

## ABS-305

(information) %s clock '%s' created in cell '%s' for mode '%s'.

Feedback

**Description**

It was not possible to connect your block clock to a clock at the top level. A top-level clock source has been created to correspond to your block-level clock source. Timing analysis will use this clock source, but it is not necessarily electrically correct.

**What Next**

You should check if this clock is electrically correct. If it's not, consider removing it later in the design flow.

---

## ABS-306

(error) Clock '%s' in cell '%s' has a waveform that doesn't match top level clock '%s' in mode '%s'.

**Description**

The two named clocks cannot be connected together because their waveforms are different. A separate unconnected clock will be created for use in the block.

**What Next**

You should fix the waveforms to be the same and then manually reassociate the clocks using set_block_to_top_map. Alternatively, you can force the clock to be associated, even though their waveforms mismatch, by using set_block_to_top_map.

---

## ABS-307

(error) No constraint data found for instance '%s'. Mapping not applied.

**Description**

It is not possible to error check the setting of set_block_to_top_map for this instance. Either the instance does not represent independently linkable design hierarchy or the instance has no valid constraints. You must load your block constraints and save the design before using set_block_to_top_map at the top level.

**What Next**

Make sure your instance points to a constrained design.

If you wish, you can use the -path option of set_block_to_top_map to skip error checking. Please refer to the man page for details.

---

## ABS-308

(error) The '%s' specification must have %d values.

Feedback

**Description**

The given command line option is not formatted correctly. For example, a mode option with 2 values should be formatted as:

-mode {block_mode top_mode}

**What Next**

Refer to the man page for more details.

---

## ABS-309

(error) The top level %s '%s' does not exist.

**Description**

The mapping cannot be completed because the given object was not defined at the top level.

**What Next**

Make sure you map from/to existing objects. Use report_block_to_top_map to see a list of objects that exist.

---

## ABS-310

(error) Top level clock '%s' in mode '%s' does not connect to block level clock %s source in block %s.

**Description**

The top level clock does not connect to the block level clock as it should. For block clock sources on the block boundary, the top level clock should propagate to that boundary. For block clock source within the block, the top level clock source must be on the same pin.

Another possible problem is that your current block abstraction does not contain the block clock's source.

**What Next**

You can force the top level clock and block level clock to be related by using set_block_to_top_map command. This will confirm your intention to subsequent budgeting and abstraction commands. Timing constraints created by the budgeter will work at the block level, but you may encounter problems when you assemble your final blocks at the top level.

Feedback

## ABS-311

(error) The %s '%s' does not exist in block '%s'.

**Description**

The mapping cannot be completed because the given object was not defined in the block.

**What Next**

Make sure you map from/to existing objects. Use report_block_to_top_map to see a list of objects that exist.

## ABS-312

(error) Cannot find %s in block '%s' corresponds to %s '%s' at top level.

**Description**

The mode/corner mapping between top level and the specified block is not available.

**What Next**

Make sure your modes/corners are properly set up at the top level as well as inside the block. By default, block modes/corners are associated with top modes/corners if they have the same name. If your mode/corner names have different names at the top level and at the block level, please use set_block_to_top_map command to set up the desired mapping.

## ABS-313

(error) Cannot open file to write. Abstract annotations cannot be saved.

**Description**

The tool cannot open the file to save abstract data. So some important data with the abstract view will not be saved.

**What Next**

Please check free disk space and write permission of the design library. Make sure you have the write permission to create abstract view for the design, and there is enough free disk space.

## ABS-314

(error) Abstract %s (ref: %s) does not have information for %s. Activate %s at block level and re-create abstract.

Feedback

**Description**

Relevant data for the specified mode/corner and early/late is not available for the specified block abstract.

**What Next**

If there is mismatch between top and block mode/corner names, please use the set_block_to_top_map command to set up the mapping.

The message is issued for a particular mode/corner if a certain optimization type (setup/hold) is only enabled at top-level but not at the block level. You can do *report_abstract* at the top level or *report_scenario* in the block's design view to find out. Please recreate the abstracts by enabling the needed optimization type in block-level.

---

## ABS-315

(warning) Subdesign %s (instance %s) has no constraints

**Description**

Block to top mapping cannot be performed on this block because it appears to have no local constraints. This is OK if you don't intend to create budgets for or promote constraints from this block.

**What Next**

If you want to budget this block or promote constraints from this block, you need to apply SDC constraints to it. This is done by using open_block or current_design to make the subdesign the current design. Then you can use create_mode, create_corner, and create_clock on the subdesign.

It is possible that you only have SDC constraints for a top-level block, and not your subdesign. In this case, consider using the "split_constraints" command to generate SDC constraints for your lower-level block.

---

## ABS-316

(information) Mapped %d clocks. %d clocks could not be resolved.

**Description**

This is just a summary of set_block_to_top -auto. If you used the -report_only option, then no mappings have actually been changed.

Feedback

### What Next

If some clocks have not been mapped, you might want to run "set_block_to_top -auto" again to see if more clocks will propagate. Or you could use the -promote option and select "local" or "all".

---

## ABS-317

(warning) Cannot resolve clock latencies for non-block '%s' (instance '%s').

### Description

You have asked to budget a logical hierarchy which is not a block in the physical hierarchy, so the budgeter is unable to determine what constraints will be applied to the logical hierarchy if it is optimized independently.

The budgeter will assume that this logical hierarchy will not be subject to clock tree synthesis or to the actions of the compute_clock_latency command, since those commands require a physical hierarchy. So the budget will constrain the logic hierarchy as if it has zero clock latency.

### What Next

If possible, you should be budgeting and optimizing physical hierarchies. If you really want to budget and optimize this logic hierarchy that has non-zero clock latencies, then you will need to manually account for clock latency at the boundaries of the logic hierarchy.

---

## ABS-318

(warning) No block latencies available for block '%s' (instance '%s') mode '%s'.

### Description

There is no mode information stored for the given block. So none of the top level clocks can be mapped to block level clocks, and clock latencies cannot be adjusted. The budgeter will assume the clock latencies in the block are zero.

Please refer to the man page for ABS-320 for more details.

### What Next

Perhaps you have specified an incorrect mode mapping with the set_block_to_top_map command. Or perhaps you have neglected to specify the given mode in the block. Use report_block_to_top_map to get more details.

Feedback

## ABS-319

(warning) No block latencies available for '%s' (instance '%s') mode '%s' corner '%s'.

**Description**

There is no corner information stored for the given block. So none of the top level clocks can be mapped to block level clocks, and clock latencies cannot be adjusted. The budgeter will assume the clock latencies in the block are zero.

**What Next**

Perhaps you have specified an incorrect corner mapping with the set_block_to_top_map command. Or perhaps you have neglected to specify the given corner in the block. Use report_block_to_top_map to get more details.

## ABS-320

(warning) For block '%s' (instance '%s'), %d top-level clock(s) could not be mapped to block-level clocks.

**Description**

The top-level design defines clocks which overlap the given lower-level block. But the block has not declared clocks in the equivalent places. Because of this, there is no way to determine the clock latency of these clocks in the block. This means that the latency adjustment of the write_budgets command cannot be correctly performed. The budgeter will assume the clock latencies in the block are zero.

You should refer to the man page of the write_budgets command for more details concerning clock latency adjustment.

**What Next**

You need to define the block's clocks in SDC input that is loaded at the block level. If you have done this, then perhaps you have specified an incorrect mode or corner mapping with the set_block_to_top_map command. Or perhaps you have neglected to specify the clocks in the block.

If your budgeted block will not be implemented as a separate physical hierarchy, then you do not need to worry that latency has not been adjusted. If this message refers to a block that is not budgeted, then you do not need to worry.

Use report_block_to_top_map and "report_budget -latency" to get more details.

Feedback

## ABS-321

(error) Multiply instantiated instance '%s' must have the same adjust_latency setting as instance '%s' (%s versus %s).

**Description**

The set_budget_options command allows you to set different "adjust_latency" settings for different block instances. If a block is multiply instantiated, then the setting must be the same for all instances of the block.

**What Next**

Please use the set_budget_options command to set all multiply instantiated instances to have the same "adjust_latency" setting.

## ABS-322

(warning) Cannot find %s '%s' in block '%s' that corresponds to top-level %s '%s'. Clock mapping cannot be performed.

**Description**

The given mode is not defined in the given block. This means that there will be no mapping for any clocks in this mode and block. Please refer to the man page for ABS-320 to learn more about clock mapping.

**What Next**

Please refer to the man page for ABS-320 to learn more about clock mapping, and what you might need to do next.

## ABS-323

(warning) Propagated clock latencies in block '%s' have not been updated for mode '%s' corner '%s'.

**Description**

In the given block, the clocks have been set to propagated, but the update_clock_latency command has never been run. Because of this the actual clock latencies in the block have never been recorded, and budgeting cannot properly adjust the latencies in the budget. Budgeting will assume the latencies in the block are zero.

**What Next**

Load each of your blocks and run "update_clock_latency -real_only". Then save the block database to disk. This will cause current latency each of your block's clocks to be

Feedback

recorded. After the block latencies have been recorded, budgeting at the top level can adjust for them.

## ABS-324

(warning) Information for %s is missing in abstract view of design %s for block %s.

**Description**

You are getting this message because you are doing timing operations involving estimated_corner. The specified data is not available in the abstract view for the specified block.

This could happen if *estimated_corner* did not exist inside the block when *create_abstract* was executed and *-estimate_timing* option was not specified for *create_abstract*.

**What Next**

If the abstract view was created before any timing optimization was done on the block design, this could be a serious problem that affect top level *estimate_timing* quality.

If timing optimization was performed on the block design before *create_abstract*, this warning can be ignored as the situation would not cause any issue for *estimate_timing*.

## ABS-325

(warning) Reference %s is unbound.

**Description**

You are getting this message because you are attempting to *change_abstract* for cell instances of the specified reference when the cells are unbound.

This could happen if you have missing reference library.

**What Next**

Check whether the specified reference design was correctly created. If it is supposed to be from a reference library, find out which library the specified reference design is located, check if the library is a reference library of the current library.

## ABS-326

(error) Can't change reference '%s' because library '%s' is not in the necessary ref_lib lists.

Feedback

**Description**

When using change_abstract, references can only be changed if the target block is inside one of the libraries listed in the ref_lib list of the current design. Additionally, if the block is instantiated at lower levels of hierarchy, those ref lib lists must also include the library.

No changes will be made for any reference.

**What Next**

Make sure that the target library is the library you want. If it is, you need to add the library to your ref_lib list by using the set_ref_libs command.

---

## ABS-327

(error) Can't change reference '%s' because block '%s' does not exist.

**Description**

The block you have specified does not exist.

No changes will be made for any reference.

**What Next**

Make sure that this is the block that you want. You might want to adjust your parameters to change_abstract if you wanted a different lib, block, label, or view.

---

## ABS-328

(error) The ports of reference %s do not match block %s.

**Description**

By default, change_abstract requires that the ports of the newly inserted block be identical to the original ports. The change cannot be performed.

**What Next**

You can use the -force option of change_abstract to force the change to be made. Be careful, because connections and constraints to the reference will be dropped if ports are missing.

---

## ABS-329

(error) Nested blocks found: cell %s (reference: %s) is an ancestor of cell %s (reference: %s).

Feedback

**Description**

You are getting this message because change_abstract or change_view is called on two blocks that have ancestor-descendant relationship.

When this happens, it is unclear to the tool whether the descendant block in the ancestor block's current view should be changed or whether the descendant block in the ancestor block's new changed-to view should be updated.

**What Next**

Please use separate change_abstract or change_view calls for the ancestor block and the descendant block.

---

## ABS-330

(warning) The constraint map contains no information for the %s constraints for block %s.

**Description**

You are getting this message because the tool cannot find the specified information in the block constraint map in the current block.

This might cause missing constraints for some blocks down the flow.

**What Next**

Please use *report_constraint_mapping_file* to check the current block constraint map. You can use the *set_constraint_mapping_file* command to add information to the block constraint map.

---

## ABS-331

(warning) Could not find the Verilog file %s for module %s of outline view block %s.

**Description**

You are getting this message because the tool cannot find the Verilog file that would be needed to do *expand_outline* for the specified block.

This might cause error when you do *expand_outline* on the specified block.

**What Next**

Please find the Verilog file that was originally used by *read_verilog_outline* and make sure that it is where it was.

Feedback

## ABS-332

(warning) The design has no %s.

**Description**

You are getting this message because the tool cannot find a timing corner named *estimated_corner* or a timing scenario associated with *estimated_corner*.

If the netlist is not optimized and you do timing budgeting on this design, you might get bad timing budgets.

**What Next**

Check your flow and see if you need to run *estimate_timing* first and then use the result of *estimate_timing* to guide timing budgeting to get a more reasonable timing budget for your blocks.

## ABS-333

(error) %s is not one of: DEF, UPF, ETM_UPF, SDC, BUDGET, CLKNET, PG_CONSTRAINT, COMPILE_PG, CTS_CONSTRAINT, BTM, FLOORPLAN.

**Description**

The constraint type name is not valid. For constraint type names, only DEF, UPF, ETM_UPF, SDC, BUDGET, CLKNET, PG_CONSTRAINT, COMPILE_PG, CTS_CONSTRAINT, BTM, FLOORPLAN are valid.

**What Next**

Please check the specified constraint type name to make sure that it is one of: DEF, UPF, ETM_UPF, SDC, BUDGET, CLKNET, PG_CONSTRAINT, COMPILE_PG, CTS_CONSTRAINT, BTM, FLOORPLAN.

## ABS-334

(error) Option -remove_all should not be used together with option -remove_blocks or option -remove_types.

**Description**

Command update_constraint_mapping_file has three options: -remove_all, -remove_blocks and -remove_types. When -remove_all is used, all constraint entries for all blocks in the map will be removed, so it could not be used together with -remove_blocks or -remove_types.

Feedback

**What Next**

Please check the options of command update_constraint_mapping_file. Do not use -remove_all and -remove_blocks, or -remove_all and -remove_types at the same time.

---

## ABS-335

(error) Must specify at least one option for command update_constraint_mapping_file.

**Description**

Command update_constraint_mapping_file has three options: -remove_all, -remove_blocks, and -remove_types. This command could not be used if no option is specified.

**What Next**

Please check whether command update_constraint_mapping_file is used without any option. Specify at least one option for this command.

---

## ABS-340

(error) Abstract %s (ref: %s) does not have enough parasitic data. Activate needed scenarios at block level and re-create abstracts.

**Description**

Enough parasitic data is not available for the specified block abstract. At Block level, please recreate abstract after activating all scenarios which are needed for TOP level flow.

**What Next**

Please make sure the abstract view was created successfully and check the read permission of the design.

If there is mismatch between top and block mode/corner names, please use the set_block_to_top_map command to set up the mapping.

---

## ABS-345

(warning) Parasitic data for the following corner(s) is not present in the abstract %s (ref: %s). Tool will use minimal R,C values for them.

**Description**

At Top level, enough parasitic data is not available for the specific corner(s) of the block abstract. As a result, tool will use very small R,C values for them. User can choose to either stay with these values or fix the corner related mismatch between top and abstracts.

Feedback

### What Next

Please make sure the abstract view was created successfully and check the read permission of the design.

If all this looks good, then follow one of the ways to fix the mismatch. One way is to use set_block_to_top_map command to set up the mapping between extra corner at TOP and an existing corner in block. Another way is to reacreate abstract after creating extra corners/scenarios which are needed for TOP level flow. For such situation, try to match parasitic parameters between block and TOP before re-creating abstracts. report_parasitic_parameters can be used for that purpose.

### See Also

- report_parasitic_parameters
- set_block_to_top_map

---

## ABS-350

(error) Abstract created with '-placement' option cannot be used in top-level implementation.

### Description

The abstract created with no timing information cannot be used in top-level implementation flow. The value for '-target_use' option of the *create_abstract* command is implementation. However, the other options provided conflicts with the targeted use.

### What Next

Check and correct the options of the *create_abstract* command. If the abstract is intended to be used for top-level implementation, create an abstract with timing information. Else, if the abstract is intended to be used for planning, specify planning as the value for target_use option.

### See Also

- create_abstract

---

## ABS-351

(error) Application option 'abstract.allow_all_level_abstract' is not enabled. Failed to create abstract on %s which has lower level block(s) that can be abstract view.

Feedback

### Description

The application option 'abstract.allow_all_level_abstract' is set to false. If abstracts need to be created on designs that are already linked with lower level physical hiearchies, this application option needs to be set to true.

### What Next

Check and correct the value of application option 'abstract.allow_all_level_abstract'

### See Also

- abstract.allow_all_level_abstract

---

## ABS-352

(warning) Application option 'abstract.allow_all_level_abstract' is not enabled. Failed to create abstract on %s which has lower level block(s) that can be abstract view.

### Description

The application option 'abstract.allow_all_level_abstract' is set to false. If abstracts need to be created on designs that are already linked with lower level physical hiearchies, this application option needs to be set to true.

### What Next

Check and correct the value of application option 'abstract.allow_all_level_abstract'

### See Also

- abstract.allow_all_level_abstract

---

## ABS-353

(error) No valid block(s) specified for abstract creation.

### Description

The block(s) specified for option *'-blocks'* are invalid. No such block(s) are found. The abstract creation has failed.

### What Next

Check and correct the blocks specified for the *'-blocks'* option of *create_abstract* command. Specify list of valid block designs for which abstract has to be created.

Feedback

**See Also**

- create_abstract

---

## ABS-354

(error) The leaf cell %s is unmapped. Abstract cannot be created for the current design.

**Description**

The specified leaf cell in the current design is unmapped. Abstracts can be created on a design only when all the leaf cells are mapped. So, abstract creation on the current design will be aborted.

**What Next**

Please go through the appropriate synthesis flow to avoid any unmapped netlist.

**See Also**

- create_abstract

---

## ABS-355

(error) Current design has %d unmapped leaf cell instance(s). Abstract cannot be created for the current design.

**Description**

Some leaf cell(s) in the current design are unmapped. Abstracts can be created on a design only when all the leaf cells are mapped. So, abstract creation on the current design will be aborted.

**What Next**

Look out for ABS-354 messages that report the unmapped cells. ABS-354 message limit may need to be increased to view complete list of unmapped cells. Please go through the appropriate synthesis flow to avoid any unmapped netlist.

**See Also**

- create_abstract
- ABS-354
- set_message_info

Feedback

## ABS-356

(error) Creation of abstract with target use DCNXT is not allowed in default IC Compiler II shell.

**Description**

Abstract targeted for use in DCNXT cannot be directly created in IC Compiler II shell.

**What Next**

Use *import_ndm_block* in DCNXT to create and use IC Compiler II abstract in DCNXT.

## ABS-400

(error) Top level area '%s' already exists.

**Description**

You must give a unique name to each top-level area.

**What Next**

Remove the existing area with the same name or use another name.

## ABS-401

(error) Can't add bound '%s' to the top-level area.

**Description**

You are only allowed to add move bounds, macro instances, and pad instances to the top level area. Other types of bounds and instances are not allowed.

**What Next**

If you are trying to add standard cell instances, you must first put them in a move bound. Then you can add the move bound.

## ABS-402

(error) Top level area has not been declared.

**Description**

You must give a unique name to each top-level area.

Feedback

**What Next**

Add the area by using the -add_top_area option.

---

## ABS-403

(error) Instance '%s' is not a hierarchical block.

**Description**

This option only works on instances of hierarchical blocks. It does not work on hard macros or standard cells.

**What Next**

Please use these options only on design hierarchy instances.

---

## ABS-404

(warning) Can't add %d standard cells to the top-level area.

**Description**

You are only allowed to add move bounds, macro instances, and pad instances to the top level area.

**What Next**

If you are trying to add standard cell instances, you must first put them in a move bound. Then you can add the move bound.

---

## ABS-405

(error) Can't add %d ports to the top-level area.

**Description**

You are only allowed to add placed ports to the top level area. These ports were not placed.

**What Next**

Ports may be placed by reading a DEF file or by running place_pins at the chip level and pushing down pin locations.

---

## ABS-406

(error) Tool currently does not support SI timing with abstracts.

Feedback

**Description**

The tool currently does not support signal integrity timing on top-level designs linked with abstracts. The tool proceeds with this error but signal integrity timing might not be accurate.

**What Next**

Set the *time.si_enable_analysis* application option to *false* and proceed with the non-signal-integrity flow.

---

## ABS-407

(warning) Skipping coupling capacitance of %s net %s of block %s which has no para annotation.

**Description**

The net does not have base parasitics annotated to it in the abstract. Hence the coupling capacitance of the net is also not saved to the abstract.

**What Next**

Check the nature of the net. It may be a dangling net in abstract, ideal net or a high fanout net.

---

## ABS-408

(warning) Net %s%s does not have expected parasitic information.

**Description**

The net does not have parasitics annotated to it in the abstract.

**What Next**

Check if the net has parasitics present in design view of the block. Check the nature of the net. It may be a dangling net in abstract.

---

## ABS-409a

(warning) %d eligible %snet(s) do not have parasitics%s.%s

**Description**

The given number of nets do not have base parasitics annotated in the abstract. For a timing abstract, nets eligible for parasitic annotation include all the non-HFN and non-

Feedback

ideal nets of the abstract. For an abstract with estimated timing, nets eligible for parasitic annotation include only the non-HFN and non-ideal boundary nets of the abstract.

The eligible nets without parasitic annotation will be estimated in top-level and if SI is enabled,the coupling capacitance of these nets will also be affected. This can lead to some timing inaccuracy.

The HFN and ideal nets without parasitic annotation can be ignored. These nets may impact timing only if the nature of the net changes when the abstract gets linked to a higher level.

**What Next**

If this message is issued during create_abstract, check if the parasitics are present in design view of the block using *report_parasitics* or *write_parasitics* command. If this message is issued during timing update in top-level, look out for ABS-409a message in the abstract creation log of the corresponding block. If parasitics are missing during abstract creation itself, check for parasitics in the block level, otherwise look out for ABS-411 messages in the top-level timing update which indicate failure in loading of parasitics from the abstract.

**See Also**

- ABS-409
- ABS-411
- report_parasitics
- write_parasitics

---

## ABS-409b

(information) %d eligible %snet(s) do not have parasitics%s.%s

**Description**

The given number of nets do not have base parasitics annotated in the abstract. For a timing abstract, nets eligible for parasitic annotation include all the non-HFN and non-ideal nets of the abstract. For an abstract with estimated timing, nets eligible for parasitic annotation include only the non-HFN and non-ideal boundary nets of the abstract.

The eligible nets without parasitic annotation will be estimated in top-level and if SI is enabled,the coupling capacitance of these nets will also be affected. This can lead to some timing inaccuracy.

The HFN and ideal nets without parasitic annotation can be ignored. These nets may impact timing only if the nature of the net changes when the abstract gets linked to a higher level.

Feedback

In optimizable abstracts, it is expected to have some nets missing parasitics and they can be ignored.

**What Next**

If this message is issued during create_abstract, check if the parasitics are present in design view of the block using *report_parasitics* or *write_parasitics* command. If this message is issued during timing update in top-level, look out for ABS-409a message in the abstract creation log of the corresponding block. If parasitics are missing during abstract creation itself, check for parasitics in the block level, otherwise look out for ABS-411 messages in the top-level timing update which indicate failure in loading of parasitics from the abstract.

**See Also**

- ABS-409
- ABS-411
- report_parasitics
- write_parasitics

---

## ABS-409

(information) %d nets (%.2f%% of eligible nets) of %s%s%s%s have parasitics.

**Description**

The given number of nets have base parasitics annotated in the abstract. For a timing abstract, nets eligible for parasitic annotation include all the non-HFN and non-ideal nets of the abstract. For an abstract with estimated timing, nets eligible for parasitic annotation include only the non-HFN and non-ideal boundary nets of the abstract.

If less than 100% eligible nets have parasitics, the eligible nets without parasitic annotation will be estimated in top-level and if SI is enabled, the coupling capacitance of these nets will also be affected. This can lead to some timing inaccuracy.

**What Next**

If this message is issued during create_abstract and reports less than 100% eligible nets with parasitics, check if the parasitics are present in design view of the block using *report_parasitics* or *write_parasitics* command. If this message is issued during timing update in top-level and reports less than 100% eligible nets with parasitics, look out for ABS-409 message in the abstract creation log of the corresponding block. If parasitics are missing during abstract creation itself, check for parasitics in the block level, otherwise look out for ABS-411 messages in the top-level timing update which indicate failure in loading of parasitics from the abstract.

Feedback

## ABS-410

(information) %d nets of %s.abstract%s have load/delay annotation for corner %s (HFN: %d, Ideal: %d, others: %d).

### Description

The given number of nets have load/delay value annotated to them in the abstract. These load/delay values will be used in top-level delay calculation.

### What Next

This is an informational message. No action needed.

## ABS-411

(warning) Failed to load parasitics for net %s. Coupling cap with %d nets are affected. %s

### Description

The base parasitics of the net failed to load from the abstract. Hence the coupling capacitance of the net is also not loaded from the abstract. This may lead to timing inaccuracy.

### What Next

Check the nature of the net and its connections. It may be a dangling net in abstract.

### See Also

- ABS-409
- ABS-409a

## ABS-412

(information) Optimizable net %s%s does not have expected parasitic information and will be estimated in top-level.

### Description

The optimizable net does not have parasitics annotated to it in the abstract. This is an expected behavior and the net will be estimated in top-level.

### What Next

This is an information message and no action needs to be taken.

Feedback

## ABS-413

(warning) Extractor is not initailized. No parasitics will be saved to %s.abstract.

### Description

Extractor is not initialized for this design. Hence no net prarasitics is available for annotation onto the nets of the abstract. The parasitics file annotated to the abstract will be empty. The nets of the abstract will be estimated in top-level. This can lead to timing inaccuracy. If SI is enabled in top-level,the coupling capacitance of these nets will also be affected.

### What Next

Check for TIM-102 message that indicates that the extractor is not initialized. Fix the reason for extractor not being initialized. If TIM-102 is not present, it might have happened that the extractor got uninitialized by an issue in tool.

### See Also

- TIM-102

- ABS-409
- ABS-409a
- report_parasitics
- write_parasitics

## ABS-414

(warning) Failed to load coupling caps for %s (victim) - %s (aggressor) pair from abstract instance %s.

### Description

Coupling caps could not be loaded for a victim-aggressor pair because of the presence of invalid nodes (para node ID is greater than the maximum node ID in the net's base parasitics). Correlation issues might exist due of missing of coupling cap information.

## ABS-415

(warning) Some coupling caps couldn't be loaded for %s (victim) - %s (aggressor) pair from abstract instance %s.

Feedback

### Description

Some coupling caps could not be loaded for a victim-aggressor pair because of the presence of invalid nodes (para node ID is greater than the maximum node ID in the net's base parasitics). Correlation issues might exist due of missing of some coupling cap information.

---

## ABS-416

(warning) Zero Interconnect Delay is used. So no parasitic data will be saved to %s.abstract.

### Description

Zero Interconnect Delay calculation style is used, so no parasitic data will be saved to the block abstracts.

### What Next

If parasitics are required to be saved with the abstract, set any other valid delay calculation style which is required to generate non-zero delay along with valid interconnect parasitics and then call *create_abstract*.

### See Also

- time.delay_calculation_style

---

## ABS-417

(warning) Zero Interconnect Delay had been used during abstract creation. %s

### Description

Zero Interconnect Delay calculation style is used during creation of block abstract and hence no parasitics data was saved for those blocks. So parasitics data cannot be loaded for such blocks.

### What Next

If parasitics need to be loaded from abstract, set any other valid delay calculation style which is required to generate non-zero delay along with valid interconnect parasitics and then call *create_abstract*.

### See Also

- ABS-416
- time.delay_calculation_style

Feedback

## ABS-444

(error) Disconnecting pin/port %s from partially retained net %s in %s.abstract. This change may not merge back into %s.design.

**Description**

Pins/Ports connected to partially retained nets in abstract should never be disconnected. Such changes may not be merged back.

## ABS-445

(error) Modifying connection of dangling pin/port %s in %s.abstract. This change will merge back into %s.design; but there can be netlist issues.

**Description**

Pins/Ports that are dangling in abstract due to abstraction should never be modified. Such changes will be merged back; but there can be netlist issues.

## ABS-446

(error) Found logical hierarchy mismatch between views of design %s: %s.

**Description**

This message indicates that the information merging from one view of a design to another view of the same design detected mismatch in the logical hierarchy of the two views of the same design.

It is required that the logical hierarchy stay the same between different views of the same design in order to perform merge.

**What Next**

Find out what caused the logical hierarchies to be different.

If you are encountering this error during *expand_outline*, check if any setting for verilog loading is changed after *read_verilog_outline* and before *expand_outline*.

If you are encountering this error during merge from abstract view to the design view, please review the flow after the last *create_abstract* operation for this design to find which step changed the logical hierarchy in the abstract view.

Feedback

## ABS-447

(error) Block %s has no outline view or design view. This should never happen. Please check your flow to see when the database is broken.

**Description**

Any block should have at least a design view or an outline view. If a block is found to have neither of these two views, something must have gone wrong earlier in the flow before the command which issued this error message.

**What Next**

Go back in the flow to the time when the design view or the outline view is created, trace it step by step to find out when it disappeared.

## ABS-448

(error) The physical hierarchy in the %s view and the %s view of design %s:%s do not match.

**Description**

This message indicates that the information merging from one view of a design to another view of the same design detected mismatch in the physical hierarchy of the two views of the same design.

It is required that the physical hierarchy stay the same between different views of the same design in order to perform merge.

**What Next**

Find out what caused the physical hierarchies to be different.

Please check if there is any link error.

If you are encountering this error during merge from abstract view to the design view, please also review the flow after the last *create_abstract* operation for this design to find which step could have changed the physical hierarchy in the abstract view.

## ABS-449

(error) Cell %s is a physical block in %s view but not in %s view.

Feedback

**Description**

This message indicates that the information merging from one view of a design to another view of the same design detected mismatch in the physical hierarchy of the two views of the same design.

It is required that the physical hierarchy stay the same between different views of the same design in order to perform merge.

**What Next**

Find out what caused the physical hierarchies to be different.

Please check if there is any link error.

If you are encountering this error during merge from abstract view to the design view, please also review the flow after the last *create_abstract* operation for this design to find which step could have changed the physical hierarchy in the abstract view.

---

## ABS-450

(information) Instance %s with reference block %s has the correct abstract view type, no update needed.

**Description**

This message indicates that the specified block has an existing abstract view with the correct type that the current command requires.

Since the existing abstract view type is correct, there is no need to create a new abstract view for the block. So the command will skip abstract creation for this block.

**What Next**

If you want to force the tool to re-create abstract view for the block, there are two choices.

One is to open the block's design view and call *create_abstract*.

The other is, at the top level, use the *-force_recreate* option with the *create_abstract* command and *-all_blocks* or *-blocks* option.

---

## ABS-451

(warning) Reference change for physical hierarchy instance %s cannot be merged after linking. Use change_abstract to change the reference to %s.

Feedback

### Description

This message indicates that the reference for the specified physical hierarchy instance in the abstract view is different from the design view. This change has not been merged since the design view is already in a linked state. The tool proceeds with the original reference in the design view and this can lead to unexpected results.

### What Next

Check and correct any usage of non-recommended abstract related app options that can affect merge_abstract functionality. Look out for the block references to which the design has linked with. Manually perform the reference change using *change_abstract* as needed.

### See Also

- change_abstract
- change_view
- set_reference

---

## ABS-452

(warning) Cannot find block with design name %s.

### Description

This message indicates that there is no block in current design with the specified reference design name.

### What Next

Please check the content of the block constraint mapping file and the reference design name of the block.

---

## ABS-480

(warning) Boundary change detected for editable abstract block '%s'. Command will skip this block.

### Description

Command 'update_block_views' works only for readonly abstract blocks.

### What Next

Check the abstract creation step for this block. Recreate a readonly abstract.

Feedback

**See Also**

- create_abstract

---

## ABS-501

(error) False path constraint mismatch between block and top level.

**Description**

A false path constraint referencing a pin in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-502

(error) Multicycle path constraint mismatch between block and top level.

**Description**

A multicycle path constraint referencing a pin in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-503

(error) set_min_delay/set_max_delay constraint mismatch between block and top level.

**Description**

A set_min_delay or a set_max_delay constraint referencing a pin in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

Feedback

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-504

(error) Data sense constraint mismatch between block and top level.

**Description**

A set_sense -type data constraint referencing a pin in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-505

(error) Clock source mismatch between block and top level.

**Description**

A clock source defined on a pin in the interface of an abstract is mismatched. The clock source exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-506

(error) Generated clock source mismatch between block and top level.

**Description**

A generated clock source defined on a pin in the interface of an abstract is mismatched. The generated clock source exists either in the block or at top-level but not in both.

Feedback

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-507

(error) Case analysis mismatch between block and top level.

**Description**

A set_case_analysis constraint defined on a pin in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-508

(error) Disable timing mismatch between block and top level.

**Description**

A set_disable_timing constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-509

(error) CTS delay point mismatch between block and top level.

**Description**

A CTS delay point constraint defined in the interface of an abstract (using the command set_clock_balance_points) is mismatched. The constraint exists either in the block or at top-level but not in both.

Feedback

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-510

(error) CTS ignore point mismatch between block and top level.

**Description**

A CTS ignore point constraint defined in the interface of an abstract (using the command set_clock_balance_points -consider_for_balancing false) is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-511

(error) Clock sense constraint mismatch between block and top level.

**Description**

A set_sense -type clock constraint referencing a pin in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-512

(error) Timing derate mismatch between block and top level.

**Description**

A timing derate constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

Feedback

### What Next

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-514

(warning) Abstract %s (ref: %s) does not have information for %s.

### Description

Relevant data for the specified mode/corner and early/late is not available for the specified block abstract.

### What Next

If you are getting this message for late (setup), please contact Synopsys.

If you are getting this message for early (hold), please check whether there are data-to-data checks in the design or timing window analysis during crosstalk analysis enabled only in top-level which internally enables the hold analysis. Activate hold at the block level and re-create the abstract view.

Data-to-data check can come from two places: non-sequential check arc of lib cell and SDC set_data_check constraint.

To find which library cell has data check, use:

foreach_in_collection lib [get_libs *] { report_lib -timing_arcs $lib }

Then search for *nonseq_* in the output. Those would be the non-sequential check arcs on the lib cells. But non-sequential check arc does not necessary mean that the instantiation is data-data check if the reference pin is a clock pin. It is only when signals reaching both pins are data signals when instantiated, the non-sequential check arc is data check.

User have two choices to resolve this warning message caused by data-data check. And the decision is based on whether data-data check can be ignored at top-level.

If data check can be ignored, then, remove set_data_check constraints if the data-data check is from SDC, or set the following app option if it is from library: *set_app_options name time.enable_non_sequential_checks value false*

If data check cannot be ignored, please go to the block level, activate hold for all the scenarios needed by the top level, and re-create the abstract view.

Check if timing window analysis during crosstalk analysis is enabled in top-level by reporting the value of application option 'time.enable_si_timing_windows'. If it is necessary but enabled only in top-level, enable it in block-level also and re-create the abstract view.

Feedback

## ABS-515

(error) Temperature mismatch between block and top level.

**Description**

A set_temperature constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

## ABS-516

(error) Process label mismatch between block and top level.

**Description**

A process label constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

## ABS-517

(error) Process number mismatch between block and top level.

**Description**

A process number constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

## ABS-518

(error) Clock latency mismatch between block and top level.

Feedback

**Description**

A clock latency constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-519

(error) Clock gating check mismatch between block and top level.

**Description**

A clock gating check constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-520

(error) Input delay mismatch between block and top level.

**Description**

An input delay constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-521

(error) Output delay mismatch between block and top level.

Feedback

**Description**

An output delay constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-522

(error) Max time borrow mismatch between block and top level.

**Description**

An set_max_time_borrow constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-523

(error) Data check mismatch between block and top level.

**Description**

An set_data_check constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-524

(error) Annotated delay mismatch between block and top level.

Feedback

**Description**

An set_annotated_delay constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-525

(error) Annotated transition mismatch between block and top level.

**Description**

An set_annotated_transition constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-526

(error) Latch loop breaker mismatch between block and top level.

**Description**

An set_latch_loop_breaker constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-527

(error) Cell mode mismatch between block and top level.

Feedback

**Description**

An set_cell_mode constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-528

(error) AOCVM coefficient mismatch between block and top level.

**Description**

A set_aocvm_coefficient constraint defined in the interface of an abstract is mismatched. The constraint exists either in the block or at top-level but not in both.

**What Next**

Check the constraints both at the top level and in the block and modify them to ensure that the correct constraints appear in both designs. If the block constraints were changed, create the abstract again using the create_abstract command.

---

## ABS-530

(Information) Including all high-fanout interface nets in the abstract.

**Description**

This message is generated during abstract creation. It indicates that all high-fanout interface nets will be traced and included in the abstract.

This behavior can be turned off using: set_app_options -name abstract.full_interface_unfiltered -value false

**What Next**

This is an informational message. No action needed.

---

## ABS-531

(Information) Preparing fault-in information for all the cells in the block

Feedback

### Description

This message is generated during abstract creation. It indicates that for every cell in the block fault-in information will be computed and stored. The default behavior is to compute and store fault-in information only for cells that are on the interface of the block.

This behavior can be turned off using: set_app_options -name abstract.full_interface_unfiltered -value false

### What Next

This is an informational message. No action needed.

---

## ABS-532

(error) No timing constraints found for mode '%s'. Clock longest and shortest paths will not be traced.

### Description

A specific timing mode is defined, but it doesn't have complete timing constraints associated with it. The longest and shortest clock paths for this mode cannot be computed and retained.

### What Next

Make sure that timing constraints are defined for the mode and that there is an active scenario associated with it.

---

## ABS-549

(warning) Application option '%s' will be made block-scoped in the upcoming %s release.

### Description

The specified application option will be changed from global-scoped to block-scoped and persistant in the upcoming release. Block-scoped application options will work for only the particular block for which it is set against.

### What Next

Correct scripts in the upcoming release to ensure the application option is set for appropriate block.

### See Also

- set_app_options

Feedback

## ABS-550

(info) The default value of app-option %s will be changed to %s in %s.

**Description**

There is a change in default value.

**What Next**

No action necessary.

## ABS-551

(error) The valid views are "design" and "abstract".

**Description**

The valid views of the value specified are design and abstract.

**What Next**

Need to change the input view specified.

## ABS-552

(warning) Missing leaf driver and/or loads in -include_objects for global net %s. No connections will be retained.

**Description**

For any net to be included, at least one of the load and a driver pin/port needs to be provided with -include_objects option.

**What Next**

Check -include_objects option to make sure a leaf driver and a leaf load are specified for each net to be included.

**See Also**

- create_abstract

## ABS-553

(information) Keeping objects with timing constraints in the abstract.

Feedback

### Description

This message indicates that objects that have timing constraints defined on them will be kept in the placement abstract.

This could cause a substantial increase in the size of the abstract, in cases where the design has many constrained objects.

### What Next

If you want to avoid retaining objects with timing constraints in the placement abstract you can set the app option *abstract.keep_constrained_objects* to false.

set_app_options -name abstract.keep_constrained_objects -value true

### See Also

- create_abstract
- abstract.keep_constrained_objects

---

## ABS-554

(warning) Deletion of hierarchical cell %s will not be merged to design view.

### Description

Hierarchical cell deletion is not supported in abstract view. The cell will get deleted in abstract view but will not be merged back to design view.

### See Also

- merge_abstract

---

## ABS-555

(Error) Clock Trunk Planning needs to be run before using the -latency_targets estimated option in the compute_budget_constraints command.

### Description

When the *-latency_targets estimated* option is used in the *compute_budget_constraints* command, estimated clock latencies are used. Estimated clock latencies are queried from the "clock trunk planning" tool, so in order for the option to work correctly, clock trunk planning needs to run first. This error message indicates that the *-latency_targets estimated* was used without running clock trunk planning.

Feedback

**What Next**

Either run clock trunk planning, or use *-latency_targets actual*

**See Also**

- compute_budget_constraints

---

## ABS-556

(Information) Using estimated clock latencies from clock trunk planning.

**Description**

This message is generated during budgeting, when the option *-latency_targets estimated* is used. It indicates that the estimated clock latencies from clock trunk planning will be used.

**What Next**

This is an informational message. No action needed.

**See Also**

- compute_budget_constraints
- synthesize_clock_trunks

---

## ABS-560

(Information) Using a min segment percent budget value of %f.

**Description**

This message is generated during budgeting, when the option *-min_segment_percent* has been set to a positive number. It indicates that the budgeting computation will try to give to each non-fixed budget segment at least the percentage of the clock cycle that has been specified by the option.

Other constraints as well as zero-slack budgeting will be also taken into account, so the precise specified percentage might not be reached.

**What Next**

This is an informational message. No action needed.

Feedback

**See Also**

- set_budget_options
- compute_budget_constraints

---

## ABS-570

(error) Cannot specify option '-format' without also specifying option '-shell_subblocks'.

**Description**

The write_budgets command was used with the option *-format*, but without the option *-shell_subblocks*. The option *-format* affects only the creation of budget shells, so the option should only be used when budgets shells are created.

**What Next**

Please specify the blocks for which budget shells are needed, using the option *-shell_subblocks*.

**See Also**

- write_budgets

---

## ABS-571

(error) Cannot specify '-format' other than 'icc2' and 'dc'.

**Description**

In the *write_budgets* command the option *-format* was used with a value other than *icc2* or *dc*. Only the above two formats are supported by *write_budgets*.

**What Next**

Please specify the tool you need to create budget shells for by using either *icc2* or *dc* for the *-format* option.

**See Also**

- write_budgets

---

## ABS-572

(Error) Can't find installation of Library Manager %s. LEF file cannot be created.

Feedback

### Description

When creating a LEF file for the ICC2 -> DC flow, it is necessary to invoke Synopsys Library Manager. And sometimes, the Library Manager executable is installed in another directory and not with ICC2. This error indicates that icc2_shell was unable to locate your Library Manager installation.

### What Next

Please set the SYNOPSYS_LM_ROOT environment varible to point to the directory where Library Manager is installed. For example, if you set

setenv SYNOPSYS_LM_ROOT /remote/depot/lm

then the icc2_shell will expect to find a Library Manager executable at /remote/depot/lm/bin/lm_shell. It will also expect to find an executable under an machine-specific directory. For example, if you are using linux64, then you should see this executable:

/remote/depot/lm/linux64/lm/icc2_lm_exec

If you do not see this executable, then please check your installation.

You can set the SYNOPSYS_LM_ROOT environment variable in your ICC2 tcl script, if you wish. But it is often more convenient to set the environment variable in your .cshrc or at the unix prompt. If you set the environment variable in unix, you must set it before starting your icc2_shell program.

---

## ABS-573

(Information) Creating LEF with %s.

### Description

This message is generated during budgeting, when the options *-shell_subblocks* and *-format dc* have been used. Budgeting will generate LEF files to be used by DC, by running the script indicated in the message.

### What Next

This is an informational message. No action needed.

### See Also

- write_budgets

---

## ABS-574

(Error) Can't find installation of Milkyway executable%s. Milkyway libraries cannot be created.

Feedback

### Description

When creating Milkyway libraries for the ICC2 -> DC flow, it is necessary to invoke Synopsys Milkyway. This error indicates that icc2_shell was unable to locate your Milkyway installation.

### What Next

Please set the SYNOPSYS_MW_ROOT environment varible to point to the directory where Milkyway is installed. For example, if you set

setenv SYNOPSYS_MW_ROOT /remote/depot/mw

then the icc2_shell will expect to find a Milkyway executable at that location, under a machine specific directory. For example, if you are using linux64, then you should see this executable:

/remote/depot/mw/bin/linux64/Milkyway

If you do not see this executable, then please check your installation.

You can set the SYNOPSYS_MW_ROOT environment variable in your ICC2 tcl script, if you wish. But it is often more convenient to set the environment variable in your .cshrc or at the unix prompt. If you set the environment variable in unix, you must set it before starting your icc2_shell program.

---

## ABS-575

(Information) Creating Milkyway libraries with %s.

### Description

This message is generated during budgeting, when the options *-shell_subblocks* and *-format dc* have been used. Budgeting will generate Milkyway libraries to be used by DC, by running the script indicated in the message.

### What Next

This is an informational message. No action needed.

### See Also

- write_budgets

---

## ABS-576

(Error) Failed to create %s. Cannot complete file generation for the ICC2->DC budget shell flow.

Feedback

### Description

Budgeting tried to create all the files needed for the ICC2 -> DC budget shell flow but was not successful.

### What Next

Please check that the output directory given in the command *write_budgets* has the correct write permisions and that there is enough disk space. Also check that the environment variables *SYNOPSYS_LM_ROOT* and *SYNOPSYS_MW_ROOT* have been set to point to the correct executable location.

### See Also

- write_budgets

---

## ABS-577

(Information) Writing DC design loading wrapper script at %s.

### Description

This message is generated during budgeting, when the options *-shell_subblocks* and *-format dc* have been used. Budgeting will generate a wrapper script to help load the design in DC and save it in the indicated location.

### What Next

This is an informational message. No action needed.

### See Also

- write_budgets

---

## ABS-578

(Error) Can't find installation of Library Compiler%s given by SYNOPSYS_LC_ROOT. Budget shell cannot be created.

### Description

When creating a budget shell, it is necessary to invoke Synopsys Library Compiler. And often, the Library Compiler executable is installed in another directory and not with ICC2. This error indicates that icc2_shell was unable to locate your Library Compiler installation. Specifically, the variable SYNOPSYS_LC_ROOT was set to point to a location that did not contain an installation of Library Compiler.

Feedback

**What Next**

Please set the SYNOPSYS_LC_ROOT environment varible to point to the directory where Library Compiler is installed. For example, if you set

setenv SYNOPSYS_LC_ROOT /remote/depot/lc

then the icc2_shell will expect to find a library compiler executable at /remote/depot/lc/bin/lc_shell. It will also expect to find an executable under an machine-specific directory. For example, if you are using linux64, then you should see this executable:

/remote/depot/lc/linux64/lc/lc_shell_exec

If you do not see this executable, then please check your installation.

You can set the SYNOPSYS_LC_ROOT environment variable in your ICC2 tcl script, if you wish. But it is often more convenient to set the environment variable in your .cshrc or at the unix prompt. If you set the environment variable in unix, you must set it before starting your icc2_shell program.

---

## ABS-579

(Error) Can't find installation of Library Compiler. Please set SYNOPSYS_LC_ROOT.

**Description**

When creating a budget shell, it is necessary to invoke Synopsys Library Compiler. And often, the Library Compiler executable is installed in another directory and not with ICC2. This error indicates that icc2_shell was unable to locate your Library Compiler installation.

**What Next**

Please set the SYNOPSYS_LC_ROOT environment varible to point to the directory where Library Compiler is installed. For example, if you set

setenv SYNOPSYS_LC_ROOT /remote/depot/lc

then the icc2_shell will expect to find a library compiler executable at /remote/depot/lc/bin/lc_shell. It will also expect to find an executable under an machine-specific directory. For example, if you are using linux64, then you should see this executable:

/remote/depot/lc/linux64/lc/lc_shell_exec

If you do not see this executable, then please check your installation.

You can set the SYNOPSYS_LC_ROOT environment variable in your ICC2 tcl script, if you wish. But it is often more convenient to set the environment variable in your .cshrc or at the unix prompt. If you set the environment variable in unix, you must set it before starting your icc2_shell program.

Feedback

## ABS-580

(Error) Can't find installation of Library Manager%s as given by SYNOPSYS_LM_ROOT. LEF file cannot be created.

### Description

When creating a LEF file for the ICC2 -> DC flow, it is necessary to invoke Synopsys Library Manager. And sometimes, the Library Manager executable is installed in another directory and not with ICC2. This error indicates that icc2_shell was unable to locate your Library Manager installation. Specifically, the variable SYNOPSYS_LM_ROOT was set to point to a location that did not contain an installation of Library Manager.

### What Next

## ABS-583

(Error) Can't find installation of Milkyway executable. Please set SYNOPSYS_MW_ROOT.

### Description

When creating Milkyway libraries for the ICC2 -> DC flow, it is necessary to invoke Synopsys Milkyway. This error indicates that icc2_shell was unable to locate your Milkyway installation.

### What Next

Please set the SYNOPSYS_MW_ROOT environment varible to point to the directory where Milkyway is installed. For example, if you set

setenv SYNOPSYS_MW_ROOT /remote/depot/mw

then the icc2_shell will expect to find a Milkyway executable at that location, under a machine specific directory. For example, if you are using linux64, then you should see this executable:

/remote/depot/mw/bin/linux64/Milkyway

If you do not see this executable, then please check your installation.

You can set the SYNOPSYS_MW_ROOT environment variable in your ICC2 tcl script, if you wish. But it is often more convenient to set the environment variable in your .cshrc or at the unix prompt. If you set the environment variable in unix, you must set it before starting your icc2_shell program.

## ABS-584

(warning) clocks associated with instance %s for the block %s will not be considered for create_clock

### Description

In case of multi instantiated block ,the split_constraint flow will take the first instance defined in set_budget_options as the reference for clock.If different clocks say clk and clk2 (create_clock at top at different port) reach instances of the block (inst1 and inst2) then first instance (inst1) of the block which has clk reaching it will be used to write the block level clock (create_clock -name {clk} [get_ports {clk}]) The other clk2 clock will be defined as virtual clock at the block level.

### What Next

if you want to change the clock defined in the block level according to the instance 2 then define that instance prior in the list of set_budget_options.

Feedback

## ABS-585

(warning) Pin '%s' of design '%s' is driven by both zero and one.

**Description**

When creating budgets, top-level constant values usually cause a set_case_analysis statement to be set for input ports of the budgeted block.

But in this case, the block design has been multiply instantiated. And some of the connections to the given port have a constant zero and others have a constant one. As a result, no set_case_analysis has been applied for this port.

**What Next**

If you want a set_case_analysis statement to appear in the budget, you must make sure that all instances of the design are driven by the same constant.

## ABS-586

(warning) set_case_analysis constraint is missing for '%s' instance.

**Description**

When creating budgets, top-level constant values usually cause a set_case_analysis statement to be set for input ports of the budgeted block.

But in this case, the block design has been multiply instantiated. And some of the MIM instances are not considered for set_case_analysis.

**What Next**

If you want a set_case_analysis statement to appear in the budget, you must make sure that all instances of the design are included for set_case_analysis and are driven by the same constant.

## ABS-587

(warning) The value provided is out of range. Using %d as the default percentage value for computation.

**Description**

The percent value cannot be greater than 100 or lesser than zero.

**What Next**

Need to change the percent value. Entered value is either greater than 100 or lesser than zero.

Feedback

## ABS-588

(warning) Options -internal_percent and -logic_depth are specified together. Calculating the delay on the basis of logic_depth.

**Description**

Options -internal_percent and -logic_depth cannot be specified together.

**What Next**

Need to specify either -internal_percent or -logic_depth option for split_constraints command.

## ABS-589

(warning) Option %s should be specified with two percentage values, an input delay percentage and an output delay percentage.

**Description**

This option should be specified with two percentage values, the input delay percentage and the output delay percentage.

**What Next**

Need to specify two percentage values with this option for split_constraints command.

## ABS-590

(error) Block level virtual clock '%s' cannot be mapped top level clocks for mode '%s'. Relevant exceptions are dropped.

**Description**

There are no top level clocks with the correct waveform that propagate to the I/O delay pin set wrt to this virtual clock.

**What Next**

You need to set the association manually using the set_block_to_top_map command.

## ABS-591

(Error) Option %s should not be specified without option(s) %s.

Feedback

**Description**

The first option should not be specified without the second option(s).

**What Next**

Need to specify the first option together with the second option(s) for split_constraints command.

---

## ABS-592

(Warning) Abstract for the block %s cannot be created since the block or it's parent block is read only.

**Description**

You get this error message because you are creating abstract for a block that is read-only or it's parent block is a read only block.

**What Next**

Please check the write permission of the block/parent block on disk. If the design has no disk write permission, you can use *save_block -as* to save the design to another design and continue with the operation.

If the design has disk write permission, please check if the block and it's parent block have their editability set as true. This can be done using *set_editability* command.

---

## ABS-593

(Warning) The setting %s will cause negative constraints. Please refer to the file "segment_budget_reset.tcl" for segment budget constraints removal.

**Description**

When the write_budgets command is used with -check_segment_constraints option, any segment budgets given by the user utilizing the set_segment_budget_constraint commands are reviewed while writing out the budgets. If any of them are too large, causing negative *set_input_delay* or *set_output_delay* constraints, this warning is generated.

Also, a command that can be used to remove this user constraint is generated and written out in the file segment_budget_reset.tcl in the budget output directory.

**What Next**

Please examine the file segment_budget_reset.tcl in the budget output directory and use the commands in the file to remove the segment budgets that are not necessary.

Feedback

## ABS-594

(Warning) Budget margins set using the %s option are not supported for hold budgeting.

**Description**

The command *set_budget_margins* can be used to add margins to budgets computed for specific blocks. The tool supports defining the margin as a percentage of the allowable delay on the budgeted path, using the options *-launch_percent* and *-capture_percent*. This capability works only for setup budgeting. Margins defined in this way will not affect the budgets in hold budgeting.

This warning is given when a percent-based margin for hold budgeting is considered, to notify the user that it will not be taken into account.

**What Next**

Please use *-setup* together with the *-launch_percent* and *-capture_percent* options of the *set_budget_margins* command to avoid getting this warning.

## ABS-596

(warning) Option %s is specified with more than two percentage values. Only the first two values are taken into consideration.

**Description**

This option should be specified with only two percentage values, the input delay percentage and the output delay percentage. When more than two values are specified with this option then only the first two values would be considered.

**What Next**

Need to specify only two percentage values with this option for split_constraints command.

## ABS-597

(Error) Constraint promotion may only be performed on immediate (direct children) blocks. Block '%s' is not a direct child of top.

**Description**

The given block is not a direct child of the top. Constraint promotion can only be performed on immediate blocks which are direct children of the top.

**What Next**

Need to specify a block which is a direct child of the top for promotion.

Feedback

## ABS-598

(error) Cannot open Block clock Mapping file %s .

### Description

This message indicates that the tool cannot open the mentioned file for the specified operation.

### What Next

Please check file location and directory permissions.

## ABS-600

(Warning) Input/output delay constraints for budget pin %s create an exception precedence problem. Block-level timing through the pin will not correlate with top-level timing.

### Description

When creating constraints for the pins of the block, budgeting checks if the constraint will change the precedence of exceptions associated with the pin. If the input/output delay written out would change the exception precedence and make the timing more pessimistic, the input/output delay constraint is dropped by default.

The user can change the default behavior by setting the app option *plan.budget.output_bad_precedence_delay* to true. When this app option is true and an input/output delay that creates pessimistic timing is written out, this warning is printed.

### What Next

If you want to get rid of this message, you can do one of the following:

1. Change the value of the app option *plan.budget.output_bad_precedence_delay* to false.

   ```
   set_app_options -name plan.budget.output_bad_precedence_delay \\
          -value false
   ```

2. Change your constraints so they are consistent. For example, if you have a path across a block boundary with two exceptions:

   ```
   set_multicycle_path 3 -from reg1/CP
   set_multicycle_path 2 -to block/reg2/D
   ```

   then you will trigger this warning. If you use "set_multicycle_path 2" for both constraints, there will be no warning, because the constraint remains the same.

Feedback

## ABS-601

(Error) In mode '%s', the node is invalid at connection source '%s' of the block clock '%s' for the instance '%s'.

**Description**

The node corresponding to the block clock's connection source is invalid. Top clock points won't be written out.

**What Next**

Please review the block and top designs, block clock's connection source.

## ABS-602

(Information) Instance : '%s' Mode : '%s' Possible top clock port for block clock '%s' create_clock -name <fill> -period <period> -waveform <fill> [get_ports '%s']

**Description**

This is a probable top clock port for the unmapped block clock.

**What Next**

Please review the top clock points and create clocks if required.

## ABS-603

(Information) Instance : '%s' Mode : '%s' Possible top generated clock point for block clock '%s' create_generated_clock -name <fill> -source '%s' -divide_by <fill> [get_pins '%s']

**Description**

This is a probable top generated clock point for the unmapped block clock.

**What Next**

Please review the top clock points and create clocks if required.

## ABS-610

(warning) Cannot optimize budgets for pin '%s'.

**Description**

When creating budgets, a cost computation is used to decide the optimal value for the budgets allocated to both sides of each pin.

Feedback

But in this case, the cost function could not be computed accurately and the budgets for some paths through the pin might not be optimal.

**What Next**

Check the timing through the indicated pin to verify that it is properly constrained.

---

## ABS-611

(Information) Restoring the reg2reg timing paths across lower level sub-blocks previously ignored by command set_timing_paths_disabled_blocks.

**Description**

Budgeting restores the reg2reg timing paths across lower level sub-blocks by running set_app_options -list {time.ignore_sub_block_internal_paths_use_common_ancestor false} internally

**What Next**

No action is required. The block internal timing paths that cross lower level blocks can be disabled again after budgeting by running the command

set_app_options -list {time.ignore_sub_block_internal_paths_use_common_ancestor true}

---

## ABS-612

(Information) time.ignore_sub_block_internal_paths is set to true.

**Description**

The design has time.ignore_sub_block_internal_paths set to true while running budgeting.

**What Next**

No action is required. If reseting the value of the app option is needed, the command

set_app_options -name time.ignore_sub_block_internal_paths -value false

can be used.

---

## ABS-613

(Warning) budgeting with time.ignore_sub_block_internal_paths set to true is not recomended for MPH designs.

Feedback

**Description**

While running budgeting commands, it was detected that the app option time.ignore_sub_block_internal_paths is true and the design has multiple levels of physical hierarchy. This combination is not recomended, because setting time.ignore_sub_block_internal_paths to true might hide some interface paths of lower level blocks.

**What Next**

You can change the app option value using the command:

set_app_options -name time.ignore_sub_block_internal_paths -value false

and run budgeting again.

---

## ABS-614

(Error) No budget segments found '%s'.

**Description**

While running the report_budget -segment_delay command, no segments were specified by the options used (-from, -to or -segment). No report can be generated.

**What Next**

Review the options used in the command to ensure that at least one segment is specified.

---

## ABS-700

(information) Top-level clock '%s' mapped with block level clock '%s' in mode '%s' for block instance '%s'. The list of other top-level clocks reaching the same block-pin include: %s.

**Description**

There are multiple top level clocks that propagate to the given pin. If one of the top-level clocks has same name as block clock, mapping happens with that top-level clock. The rest of the top-level clocks reaching the block pin will not be mapped to the block-level clock.

---

## ABS-701

(warning) Top-level clock '%s' mapped with block level clock '%s' in mode '%s' for block instance '%s'. The list of other top-level clocks reaching the same block-pin include: %s.

Feedback

**Description**

There are multiple top level clocks that propagate to the given pin. If one of the top-level clocks has same name as block clock, mapping happens with that top-level clock. The rest of the top-level clocks reaching the block pin will not be mapped to the block-level clock.

---

## ABS-702

(warning) In mode %s, multiple block clocks are defined for block pin %s. The list of clocks: %s.

**Description**

Multiple block clocks are defined on the same block pin to which a top-level clock is propagated. The tool maps all the block clocks on the block pin to the top clock irrespective of the name.

**What Next**

All the block level clocks defined on the block pin are listed. User can set the constraints manually.

---

## ABS-703

(Error) Top-level %s '%s' could not be mapped to any block %s for block instance '%s'.

**Description**

Top-level mode/corner is not mapped to a block-level mode/corner. Promotion will not happen for these top-level objects.

**What Next**

Use set_block_to_top_map to set the mapping.

---

## ABS-704

(Error) Block-level clock '%s' could not be mapped to any top-level clock in mode '%s' for block instance '%s'.

**Description**

Block-level clock is not mapped to a top-level clock. Promotion of constraints from this block clock will not happen.

**What Next**

Use set_block_to_top_map to set the mapping.

Feedback

## ABS-705

(warning) Top-level clock '%s' is not mapped to any block-level clock in any mode.

**Description**

Given top-level clock is not mapped to a block-level clock in any mode. Promotion will not happen for this top-level clock.

**What Next**

Use set_block_to_top_map to set the mapping.

## ABS-706

(warning) Skipped reason reporting for %d %s objects.

**Description**

Reason(s) for inclusion to abstract is stored only for abstract and non-hierarchical netlists. If reason is requested for a non-abstract or hierarchical object, the object is skipped.

**What Next**

Plese provide only abstract and non-hierarchical objects for reporting reasons.

## ABS-707

(Error) The option '%s' is obsoleted and will be removed in subsequent release. %s

**Description**

The given command option is obsoleted. Please see the man-page of the command for migration assistance.

**What Next**

Please change the setting of your app option, or do not use this command option.

## ABS-708

(Error) The option '%s' is obsoleted and will be removed in subsequent release. Since, the app option "plan.budget.estimate_timing_mode" and the option '%s' are conflicting to each other, compute_budget_constraints command will error out. Please set app-option correctly to continue.

Feedback

**Description**

The command option and the app option "plan.budget.estimate_timing_mode" value are conflicting. Please see the man-page of the command for migration assistance.

**What Next**

Please check the command option and the app option "plan.budget.estimate_timing_mode" value.

---

## ABS-709

(warning) The multi_clock_mapping has been enabled and '%s' flow is disabled under N-1 clock mapping setting.

**Description**

The promote_constraints command supports N-1 clock mapping, where N top clocks are mapped to a single block top. However the budgetting flow does not support the sdcs generated from N-1 promotion flow.

**What Next**

Use report_block_to_top to check the mappings.

---

## ABS-710

(Error) Instance %s is not a budget block.

**Description**

The command set_budget_options -add_master_blocks was used to define the master of an MIB family for split_constraints and budgeting, but one of the blocks in the command is not a budget block.

**What Next**

Please use the command set_budget_options -add_blocks to add the missing block to the budgeted blocks. Or check the command option and remove any blocks that are not defined as budget blocks.

---

## ABS-711

(Information) Instance %s is already defined as a primary block.

Feedback

**Description**

The command set_budget_options -add_primary_blocks was used to define the primary of an MIB family for split_constraints and budgeting, but one of the blocks in the command has alreadt be defined as a primary block.

**What Next**

This is only an information message, no further action is needed.

---

## ABS-712

(Error) Instance %s with reference %s cannot be a primary block, a primary instance for this reference has already been defined.

**Description**

The command set_budget_options -add_primary_blocks was used to define the primary of an MIB family for split_constraints and budgeting, but one of the blocks in the command belongs to an MIB family that has already a primary defined.

**What Next**

In order to define a new primary for this MIB family, please use the command set_budget_options -remove_primary_blocks first, to remove the already defined primary block.

---

## ABS-713

(Error) Two instances with the same reference %s are defined as primary.

**Description**

The command set_budget_options -add_primary_blocks was used to define the primary of an MIB family for split_constraints and budgeting, but two of the blocks in the command belong to the same MIB family.

**What Next**

Please check the instances in the command and select only one from each MIB family to be the primary instance.

---

## ABS-714

(Error) Instance %s is not a primary block.

Feedback

**Description**

The command set_budget_options -remove_primary_blocks was used to remove a primary block definition of an MIB family for split_constraints and budgeting, but the specified instance was not previously defined as a primary.

**What Next**

Please check the instances in the command and and use only the instances that have been defined as a primary instance.

---

## ABS-715

(Information) Selecting primary instance %s.

**Description**

The command split_constraints chose the indicated instance to be the primary for an MIB family.

**What Next**

This is only an information message, no further action is needed. If another instance is prefered as the primary, please set it explicitly, by using the command *set_budget_options -add_primary_blocks [instance]* before running the split_constraints command.

---

## ABS-716

(Information) Disabling the physical mode of abstract creation since the flow is non-physical.

**Description**

The flow is non-physical and hence switching to non-physical mode of abstract creation.

**What Next**

This is an informational message. No action needed.

---

## ABS-720

(Information) split_constraints - %s.

**Description**

The command split_constraints is currently performing the operation indicated.

Feedback

**What Next**

This is only an information message, no further action is needed.

---

## ABS-721

(Information) split_constraints - %s.

**Description**

The command split_constraints is currently writing out mode constraints for the indicated block or for the top-level

**What Next**

This is only an information message, no further action is needed.

---

## ABS-722

(Information) split_constraints - %s.

**Description**

The command split_constraints is currently writing out corner constraints for the indicated block or for the top-level.

**What Next**

This is only an information message, no further action is needed.

---

## ABS-723

(Information) split_constraints - %s.

**Description**

The command split_constraints is currently writing out scenario constraints for the indicated block or for the top-level

**What Next**

This is only an information message, no further action is needed.

---

## ABS-724

(Information) split_constraints - %s.

Feedback

**Description**

The command split_constraints is currently processing the specified type of constraints and writing the result to the output files.

**What Next**

This is only an information message, no further action is needed.

### ABS-725

(information) clocks associated with instance %s for the block %s will be considered for create_clock

**Description**

In case of multi instantiated block ,the split_constraint flow will take the first instance defined in set_budget_options as the reference for clock.If different clocks say clk and clk2 (create_clock at top at different port) reach instances of the block (inst1 and inst2) then the first instance (inst1) of the block which has clk reaching it will be used to write the block level clock (create_clock -name {clk} [get_ports {clk}]) The other clk2 clock will be defined as virtual clock at the block level.

**What Next**

If you want to change the clock defined in the block level and use the clocks associated with instance 2, then define that instance prior in the list of set_budget_options.

## ACG

### ACG-001

(error) %s.

**Description**

Analog constraint groups related error message. The message is self explanatory allowing proper actions to be taken.

## ADES

### ADES-021

(info) Running user-defined checker : %s.

Feedback

**Description**

This status message is printed during *check_constraints*, while running user-defined checkers. It shows the currently running user-defined checker.

(error) Design view name '%s' is not supported by %s. View name should be 'design'.

**Description**

Only design view is supported in AIF read/write.

---

## AIF-002

(error) Incomplete/incorrect physical data : %s.

**Description**

Physical data might not have been read in or the data is incorrect like no bounding box, invalid pin shape, etc. Output error message provides more details.

**What Next**

open_block or report_attribute commands can be executed before read_aif to clear the error which is caused by physical data haven't been read.

---

## AIF-003

(warn) Incomplete/incorrect physical data : %s.

Feedback

**Description**

Physical data might not have been read in or the data is incorrect like no bounding box for bump instances. These bump instances will be skipped.

---

## AIF-004

(error) Missing connectivity : %s.

**Description**

Net or port is missing or the connectivity between them or the association with a cell is missing. Output error message provides more details.

---

## AIF-005

(warn) Missing connectivity : %s.

**Description**

Port is missing or there are no connections for bump instance. Output warning message provides more details.

---

## AIF-006

(information) There are no bump cell instances to be put in AIF.

**Description**

No bump cell instances are present in the design.

---

## AIF-007

(warn) Input AIF '%s' was generated with -hierarchy. It will not be read in.

**Description**

AIF generated with -hierarchy option is not read back in a design.

---

## AIF-008

(error) Syntax error : %s.

**Description**

Refers to syntax errors in input AIF like fields missing, wrong values, wrong types, etc. or in input string -pad_to_ref_list. Output error message provides more details.

Feedback

## AIF-009

(information) Number of entries is 2 in value {%s} given with -pad_to_ref_list. Assuming orientation to be N.

**Description**

Pattern given in -pad_to_ref_list switch must be of the form {{str1 str2 str3} {...} ...}. str1 is reference bump cell in AIF, str2 is target reference bump cell and str3 is target orientation and is optional. Default target orientation is N.

## AIF-010

(error) Reference library error : %s.

**Description**

Reference library cell is not found, is not of bump cell type or the instance is unbound.

## AIF-011

(error) Can't create bump cell instance '%s'.

**Description**

Bump cell instance couldn't be created.

## AIF-012

(warn) Bound library bump cell '%s' for instance '%s' doesn't match reference library bump cell '%s' given in AIF.

**Description**

Bump instance is bound to a different reference library bump cell than what is given in the input AIF.

## AIF-013

(warn) Cannot find parent cell for string '%s' given in AIF.

**Description**

Check the parent cell is available or not for the string given in the input AIF. Only when the parnt cell is available, the string-specific object is legal.

Feedback

# ALCP

## ALCP-001

(Warning) You did not select all lib cells from some variant groups, so the variant pass rate reported by analyze_lib_cell_placement may be inaccurate.

### Description

The lib cells that you passed to *analyze_lib_cell_placement* partially covered one or more variant groups. This might lead to false variant group pass rate output. Any line in the ALCP report which has ** next to the variant pass rate indicates a lib cell that is part of an incomplete group.

### What Next

Pass all lib cells in a variant group to *analyze_lib_cell_placement* to get correct variant pass rate.

## ALCP-002

(Warning) lib cell %s failed at {%g %g}:%s

### Description

When using *analyze_lib_cell_placement* with the *-verbose* option, a lib cell failed to be legalizable in any of the tested orientations. The lib cell name, the origin of the test site, and the reason are given. The reason may be a single rule that applies to all orientations, like "Basic Rules" or "pin_color_align", or it may be a string of reasons, one per orientation, like "R0 Basic Rules; MX legal_orient;" and so on.

### What Next

In addition to the message, the application wrote a Tcl script file per lib cell with failures which when sourced, annotates the GUI with shapes to represent each failure. You can use this feature to further analyze the failures.

## ALCP-003

(Warning) No legal site row for reference %s/%s

### Description

When using *analyze_lib_cell_placement*, you passed in a lib cell (reference) which requires a specific site row (from the *site_name* attribute on the lib cell). There are no site rows in the design matching the requirement.

Feedback

**What Next**

If you are expecting to use this lib cell in your design, you need to ensure that the floorplan has site rows for it.

---

## ALCP-004

(Warning) No legal sites for reference %s in region {{%g %g} {%g %g}}

**Description**

When using *analyze_lib_cell_placement*, you passed in a lib cell (reference) which requires a specific site row (from the *site_name* attribute on the lib cell). There are site rows in the design matching the requirement, but you have most likely used *-region* to narrow the focus for the command, and the area you selected does not have any of the required sites.

**What Next**

For the given reference, use a different region, or none.

---

## ALCP-005

(Warning) No frame view found for design %s

**Description**

When using *analyze_lib_cell_placement*, you passed in a lib cell (reference) which does not have a frame view. The lib cell is ignored.

**What Next**

Only pass lib cells with frame views to this command.

---

## ALCP-006

(Warning) No library cells are available to analyze

**Description**

When using *analyze_lib_cell_placement*, all of the lib cells you passed in were unable to be analyzed for various reasons like no legal site rows, no legal sites, and so on.

**What Next**

Choose a different set of lib cells, or use a wider region

Feedback

## ALCP-007

(Information) The "pass_rate" attribute has been created on %d lib cells processed by analyze_lib_cell_placement. The attribute is not persistent

**Description**

When *analyze_lib_cell_placement* completes, it sets a "pass_rate" attribute on each lib cell which was analyzed. The attribute lasts throughout the session, but it is not saved.

# APPOPT

## APPOPT-001

(Error) Value %s for %s is not in range: must be %s.

**Description**

The specified numeric value is not in the range. Ranges are either within a minimum and maximum value, greater than or equal to a minimum value, or less or equal to a maximum value. This message text indicates violation of range constraint.

**What Next**

Enter an appropriate value for the app-option. In case of typed_value for physical quantites, please qualify the numeric value with SI prefix and unit. Example: 10nm is the typed_value for length that represents the physical quantity 1.0e-8 meter, where "10" is the numeric value, 'n' is the SI prefix for "nano" and 'm' is the symbol of SI unit of length meter. Similarly, 34.56kOhm is the typed_value for resistance that represents the physical quantity 3.456e4 Ohm, where "34.56" is the numeric value, 'k' is the SI prefix for "kilo" and "Ohm" is the symbol of SI unit of resistance Ohm.

## APPOPT-002

(Error) Value %s for %s is not valid. Specify one of: %s.

**Description**

The specified string value is not one of the valid strings defined for the app-option. This message text indicates the allowable values.

**What Next**

Enter an appropriate value for the app-option.

Feedback

### APPOPT-003

(Information) Value %s for %s is ignored. Reason: %s.

**Description**

The specified string value is ignored and has no effect because of the reason is that is mentioned. This message is issued when the functionality you are trying to get with the setting is already available with another feature.

**What Next**

Should you need this setting to take effect, see if there is any other way to achieve this based on the reasoning mentioned in the message.

### APPOPT-004

(Information) The two application options "design.disable_auto_link" and "gui.auto_link_blocks" are linked together, which means changing the value of one will update the value of the other.

**Description**

The specific application option has been made deprecated and will hence be removed in a future release. The man page of the particular application option will have details about the required migration activity.

**What Next**

See the man page for this application option for migration assistance.

## APS

### APS-001

(error) No scenario with setup timing found

**Description**

The current design does not contain any valid scenario with setup timing. To run estimate_timing atleats one one such scenario much exist.

**What Next**

Create a scenario with proper setup timing.

Feedback

**See Also**

- create_scenario
- create_mode
- report_scenarios

---

## APS-002

(error) Cannot find current design and/or its hierarchy

**Description**

The tool cannot find any valid design and/or hierarchy. To run estimate_timing a valid design and/or hierarchy must exist.

**What Next**

Load a valid design.

---

## APS-003

(error) Cannot find hierachical root of current design

**Description**

The tool cannot find the hierarchical root for the current design.

**What Next**

Load a valid design that has a proper hierarchical root.

---

## APS-004

(error) Cannot find timing library for current design

**Description**

The tool cannot find any timing library in the libraries loaded.

**What Next**

Make sure the libraries in the design contains atleast one timing library.

Feedback

## APS-005

(error) Cannot create estimated_corner because current_corner is the default corner without user settings.

### Description

The tool has detected only one corner which is also the default one. Since the default corner does not have any manual setting, estimate_timing cannot be run on this corner.

### What Next

Create a corner containig manual settings and this will override the default corner.

### See Also

- create_corner

## APS-006

(error) Cannot find block design for current module

### Description

The tool cannot find any blocks in the current module.

### What Next

Create a block inside the current module to run estimate_timing.

## APS-007

(Information) Top %d layers are not good for layer optimization.

### Description

User will see this message because the tool finds the average unit length delay of user selected top layers is equal to or greater than average unit length delay of all layers. So there will be no benefit to do layer promotion in estimate_timing on this design even if layer promotion is on.

### What Next

User does not need to take any action. If user still wants layer promotion happens in estimate_timing, please try to set another promoted layers count.

Feedback

**See Also**

- estimate_timing
- plan.estimate_timing.optimize_layers
- plan.estimate_timing.optimize_layers_count

---

## APS-008

(error) No scenario enabled for setup analysis

**Description**

To run estimate_timing, there must exist a scenario enabled for setup analysis.

**What Next**

Create a setup scenario, then rerun estimate_timing.

**See Also**

- create_scenario
- set_scenario_status
- report_scenarios

---

## APS-009

(error) A user defined estimated_corner already exists

**Description**

To run estimate_timing, the user defined estimated_corner should be deleted.

**What Next**

Delete estimated_corner, then rerun estimate_timing.

**See Also**

- create_scenario
- set_scenario_status
- report_scenarios

Feedback

## APS-010

(warning) %s will be made obsolete and removed from future releases starting with the %s release.

**Description**

This is a warning message indicating the specified command, option or variable is in the process of being obsoleted and will not be supported in future releases.

**What Next**

Please consult Synopsys Application Consultant for more details about the obsolescence, and whether there are alternative approaches or replacements for this feature being obsoleted.

## APS-011

(warning) Tcl variable %s has become obsolete since the %s release.

**Description**

This is a warning message indicating the specified command, option or variable is obsolete.

**What Next**

Please consult Synopsys Application Consultant for more details about the obsolescence, and whether there are alternative approaches or replacements for this feature being obsoleted.

## APS-012

(warning) The %s annotation to net %s, pin %s failed

**Description**

Annotation of optimized net/cell delay value to the specified net/cell failed.

**What Next**

Annotation may have failed due to scenario specific setup/hold mismatch.

## APS-013

(warning) The cell delay annotation for arc %s > %s %s failed.

Feedback

**Description**

Annotation of optimized cell delay value to the specified cell failed.

**What Next**

Annotation may have failed due to scenario specific setup/hold mismatch.

---

## APS-014

(Warning) Existing congestion map is not detected. estimate_timing is generating it.

**Description**

Virtual layer promotion in estimate_timing relies on congestion map to measure whether net could be promoted to higher metal layer or not. By default, estimate_timing will generate the congestion map from scratch. However, user could control estimate_timing to re-use existing congestion map. This message just reminds user that there is no existing congestion map in current design so estimate_timing will still generate it anyway.

**What Next**

Nothing.

**See Also**

- estimate_timing

---

## APS-015

(Warning) estimate_timing rule %s on net %s does not exist.

**Description**

estimate_timing honors layer or buffer specific rule on nets. Tool will check the attribute estimate_timing_net_rule set by the user. If the attribute exists, command will look for the rule by the attribute value in current design. If the rule is not defined, user will see this message and command will treat the net like there is no rule on it.

**What Next**

User needs to confirm whether rule is expected on the net. If not, remove estimate_timing_net_rule attribute, else re-define the rule by set_net_estimation_rule.

Feedback

**See Also**

- estimate_timing
- set_net_estimation_rule
- net_attributes

---

## APS-016

(warning) Current scenario is not enabled for setup analysis. Updating current scenario to %s which has setup analysis enabled.

**Description**

To run estimate_timing, there must exist a scenario enabled for setup analysis.

**What Next**

Tool will update current scenario to a setup scenario. User does not need to do anything

**See Also**

- create_scenario
- set_scenario_status
- report_scenarios

---

## APS-017

(Warning) net %s is skipped for layer promotion since target layer for promotion is out of the range of net's layer constraint.

**Description**

estimate_timing layer promotion honors net specific layer constraints. Layer constraints could be from routing rule or estimate_timing_net_rule attribute on the net. Only when layer promotion's layer range is within net's layer constraint, the net become a candidate for layer promotion. Otherwise, the net will not be considered for layer promotion.

**What Next**

User needs to double confirm whether layer constraints on the net is expected and the layer range for layer promotion is expected. If no, adjust layer constraints or layer range and run estimate_timing again.

Feedback

**See Also**

- estimate_timing
- set_net_estimation_rule
- net_attributes
- set_routing_rule
- plan.estimate_timing.optimize_layers
- plan.estimate_timing.optimize_layers_count

---

## APS-018

(information) Using user specified %s %s layer for chain buffer model creation.

**Description**

Using user specified layer for chain buffer model creation

**What Next**

This message is to inform user input is taken or not

---

## APS-019

(information) Using user specified %s buffer library cell for chain buffer model creation.

**Description**

Using user specified buffer lib cell for chain buffer model creation

**What Next**

This message is to inform user input is taken or not

---

## APS-020

(error) Something is wrong and optimization cannot start

**Description**

Something is wrong and optimization cannot start. Please check previous messages.

**What Next**

check previous messages to know the actual reason

Feedback

## APS-021

(error) Current scenario should be setup and active for create_ml_data -mode postOpt

**Description**

To run create_ml_data -mode postOpt, the current scenario must be enabled for setup analysis.

**What Next**

Create a setup scenario and set it to current scenario, then rerun create_ml_data -mode postOpt.

**See Also**

- create_scenario
- set_scenario_status
- report_scenarios

## APS-022

(warning) Pin %s is skipped from estimate_timing since it has an overlap pin %s.

**Description**

This message indicates that the pins with overlap pin(s) are skipped during estimate_timing. This message will appear if and only if route support feature in estimate_timing is enabled through the app option plan.estimate_timing.honor_routes.

**What Next**

Make Sure pins doesn't overlap.

## APS-101

(error) Block %s does not have valid %s.

**Description**

To run estimate_timing, the block should have valid corner, mode and setup scenario.

**What Next**

Please check the timing constraint setup for the current block.

Feedback

**See Also**

- create_corner
- create_mode
- create_scenario
- estimate_timing

---

## APS-102

(warning) Block %s with placement abstract is compromising the check.

**Description**

The specified block is currently referencing to placement abstract view. There is not enough information to perform the necessary checks before *estimate_timing* for blocks referencing to placement abstract views..

**What Next**

No action is needed from the user.

**See Also**

- create_abstract

---

## APS-103

(error) Instance %s is referencing to %s view.

**Description**

In order to run estimate_timing, a child block should reference to either abstract view or design view.

**What Next**

Please check your flow to see why the block is not referencing to abstract view or design view.If the block is still referencing to outline view, make sure that DEF with the full block placement information is properly loaded or set in the constraint mapping file, before proceeding to estimate_timing.

**See Also**

- create_abstract

Feedback

## APS-104

(error) Cannot find %s in block '%s' corresponds to %s '%s' at top level.

### Description

The mode/corner of scenario mapping between top level and the specified block is not available.

### What Next

Make sure your modes/corners of scenario are properly set up at the top level as well as inside the block. By default, block modes/corners are associated with top modes/corners if they have the same name. If your mode/corner names have different names at the top level and at the block level, please use set_block_to_top_map command to set up the desired mapping.

## APS-200

(Error) Annotation file of previous timing estimation is not found in incremental timing estimation mode.

### Description

This error message will be reported when user want run incremental timing estimation, however, there is no annotation file generated by previous full chip timing estimation.

### What Next

Run full chip timing estimation.

### See Also

- create_scenario
- create_mode
- estimate_timing

## APS-201

(Warning) Skip because net %s is not a signal net, also, this net is not a signal net or a clock net when doing clock tree synthesis timing estimation.

### Description

During incremental timing estimation, user must guarantee that specified net is signal net while specified pin should be connected to signal net. For clock tree synthesis timing

Feedback

estimation mode, user must guarantee that specified net is signal net or clock net. Otherwise, the warning message would be reported.

**What Next**

No action is needed from the user.

**See Also**

- estimate_timing

---

## APS-202

(Warning) Layer optimization is automatically disabled with incremental timing estimation.

**Description**

Incremental timing estimation does not support layer promotion strategy currently.

**What Next**

Run incremental timing estimation without layer optimization.

**See Also**

- estimate_timing

---

## APS-203

(Warning) The reference design of block instance %s is not in supported view.

**Description**

Only design view, vipo abstract view is supported for incremental timing estimation.

**What Next**

Check the view of reference block for corresponding instance.

**See Also**

- estimate_timing

---

## APS-204

(Warining) Library cells with inverter/buffer types are useless due to zero input capacitance. For example, Library cell %s has zero input capacitance.

Feedback

### Description

This particular library has buffer or inverter cells with zero input capacitance, and cannot be used for estimate_timing.

### What Next

Check the library to provide enough usefull library buffer or inverter cells.

### See Also

- estimate_timing

---

## APS-205

(warning) The block %s is a read-only block. This may affect the results of estimate_timing.

### Description

The design containts read-only blocks. The estimate_timing optimizes only boundary nets of these read-only blocks. The delay of nets and cells inside the read-only blokcs will not be estimated. This leads to non-optimimal results.

### What Next

Check why these blocks are read-only and if possible make them editable to get optimal results.

---

## APS-250

(error) A corner named estimated_corner is already exist

### Description

To run estimate_timing with "force_user_corner", the corner named estimated_corner should be deleted.

### What Next

Delete estimated_corner, then rerun estimate_timing.

### See Also

- create_scenario
- set_scenario_status
- report_scenarios

Feedback

## APS-251

(error) Cannot run estimate_timing because current scenario is not enabled for setup analysis

**Description**

To run estimate_timing, the current scenario should be enabled for setup analysis.

**What Next**

Enable setup analysis for current scenario or set the current scenario properly, then rerun estimate_timing.

**See Also**

- create_scenario
- set_scenario_status
- report_scenarios

## APS-252

(information) Changing the corner %s back to normal corner from estimated_corner

**Description**

Set the estimated_corner back tonormal corner.

**What Next**

Set the estimated_corner back tonormal corner.

**See Also**

- create_scenario
- set_scenario_status
- report_scenarios

## APS-253

(Warning) The design already has an estimated_corner and one/many user corner/corners is/are also estimated corner.

Feedback

### Description

When estimate_timing is ran with force_user_corner, it converts user corner to estimated corner. The command reset_et_corner reverts the user corner back to normal corner. If design already has a corner named estimated_corner and user tries to run reset_estimated_corner, this message identifies such situation.

### What Next

Please check why user corner is estimated corner and a separate estimated_corner present in the design. Please delete estimated_corner and rerun estimate_timing with/without force_user_corner based on user requirement.

### See Also

- estimate_timing

---

## APS-254

(error) One/more blocks are in abstract view, cannot run estimate_timing with plan.estimate_timing.force_user_corner option true.

### Description

One/more blocks are in abstract view, Cannot run estimate_timing with plan.estimate_timing.force_user_corner option true.

### What Next

Turn off plan.estimate_timing.force_user_corner option and rerun estimate_timing.

---

## APS-255

(Information) The app option plan.estimate_timing.force_user_corner is true, so the command estimate_timing uses current corner to annotate estimated value.

### Description

As the app option plan.estimate_timing.force_user_corner is true, the command estimate_timing will not create estimated_corner separately. Instead, it will use current user setup corner to annoate estimated values.

### What Next

Informational message printed by the command estimate_timing.

Feedback

**See Also**

- estimate_timing

## APS-260

(error) MV initialization Errors, can not run estimate_timing.

**Description**

MV initialization Errors, can not run estimate_timing. Please turn off "plan.estimate_timing.check_et_errors" and turn on "plan.estimate_timing.ignore_mv_errors" to continue. Alternatively, please fix the MV errors to continue.

**What Next**

Please turn off "plan.estimate_timing.check_et_errors" and turn on "plan.estimate_timing.ignore_mv_errors" option and rerun estimate_timing.

## APS-261

(error) estimate_timing errors out as zero interconnect delay is set for "time.delay_calculation_style".

**Description**

zero interconnect model is set for "time.delay_calculation_style", can not run estimate_timing. Please change it or turn on the app option "plan.estimate_timing.ignore_extractor" to continue.

**What Next**

Please change "time.delay_calculation_style" to non-zero interconnect model or turn on the app option "plan.estimate_timing.ignore_extractor" and rerun estimate_timing.

# ASDP

## ASDP-1000

(information) Auto SDP events will generate for the command(s) %s.

**Description**

Auto SDP events will generate for the commands which was specified with the app option "shell.common.auto_sdp_commands".

Feedback

## ASDP-1001

(information) Auto SDP stack_tracer frequency is set to %s.

**Description**

Auto SDP is set with the frequency which was specified with the app option "shell.common.auto_sdp_stack_trace_frequency".

## ASDP-1002

(information) Auto SDP crte timeperiod is set to %s.

**Description**

Auto SDP is set with the crte timeperiod which was specified with the app option "shell.common.auto_sdp_crte_timeperiod".

## ASDP-1003

(information) Removing old \'sdp\' directory.

**Description**

Auto SDP is removing the existing sdp directory before creating the new sdp directory.

## ASDP-1004

(information) Auto SDP has stopped.

**Description**

Auto SDP has stopped, which was unset using the app option "shell.common.auto_sdp" (or) the shell has exit from the current state.

## ASDP-1005

(information) SDP directory is compressed via tar and gzip.

**Description**

SDP directory is compressed via tar and gzip.

## ASDP-1006

(information) Auto SDP started for the command %s.

Feedback

**Description**

Auto SDP has started for the command which was specified with the app option "shell.common.auto_sdp_commands".

# ATR

## ATR-010

(warning) Unable to %s attribute '%s' for %s %s

**Description**

The attribute you are referencing cannot be set or removed by the user using set_attribute or remove_attributes, respectively. There might be other commands which allows you to set or remove the attribute.

**What Next**

Consult the documentation to determine if it is possible to set or remove this attribute.

## ATR-011

(warning) User attributes cannot be defined for '%s' objects

**Description**

The specified object class does not allow user attributes.

**What Next**

Make use of existing attributes.

## ATR-012

(warning) Attribute '%s' is already defined in class '%s'

**Description**

While defining a new user attribute, you specified an attribute name that is already defined. There is no mechanism to change an attribute definition.

**What Next**

Make use of the existing attribute or use another name for the new attribute.

Feedback

## ATR-013

(Error) Attribute '%s' is already defined as %s for another class.

**Description**

While defining a new user attribute, you specified an attribute name which is in use for another object class, but the data type which you specified was not the same as for the other object class. An attribute must have the same data type for all object classes for which it is defined.

**What Next**

Determine which is the correct data type, and re-define the attribute for each affected class.

## ATR-014

(warning) Persistent user attributes cannot be defined for '%s' objects

**Description**

The specified object class does not allow persistent user attributes.

**What Next**

Use a non-persistent attribute.

## ATR-015

(warning) Attributes of type '%s' cannot be persistent.

**Description**

The specified attribute type cannot be used for persistent user attributes.

**What Next**

Use a non-persistent attribute, or a type (integer, Boolean, float, double, or string) that can be persistent.

## ATR-016

(Error) Attribute '%s' is not user-defined for class(es): '%s'. Cannot undefine it.

Feedback

**Description**

The attribute you are referencing is an application attribute for some( or all) classes. Application attributes can't be undefine using undefine_user_attribute.

**What Next**

Remove the classes from class-list for which given attribute is an application attribute. And then try to undefine the attribute.

---

## ATR-017

(info) Attribute '%s' has been undefined from class(es): '%s'.

**Description**

The class-list contains some(or all) classes who do not support user defined attributes. The message is giving information about the classes from which attribute has been undefined.

**What Next**

This is informational message only. To turn it off, use quiet option of the command.

---

## ATR-018

(Error) Attribute '%s' has been set for object(s) of following class(es): '%s'. Cannot undefine it.

**Description**

The attribute you are undefining has been set for some objects of the class(es) given in the class list. The command cann't undefine the attribute successfully because it would cause loss of attribute information.

**What Next**

To undefine the attribute from such class(es) use '-force' option of the command.

---

## ATR-019

(Error) %s does not support more than one attribute name at a time.

**Description**

The command will take one attribute name at once. Please provide attribute name without spaces as the command support only one attribute name at a time.

Feedback

### ATR-020

(warning) %s does not support '%s' objects.

**Description**

The specified object class does not supported by the command.

## ATTR

### ATTR-1

(warning) Attribute '%s' has not been defined for the %s object class.

**Description**

The attribute you are referencing is not defined for the object class you are using. It is possible that the attribute is not defined at all.

Application attributes are all defined at runtime by the application. You can create user-defined attributes at any time.

**What Next**

Verify that the attribute name is spelled correctly. If this is a user-defined attribute, ensure that you have defined the attribute for all appropriate classes.

### ATTR-2

(warning) Attribute '%s' is not user-defined for %ss; can't %s it

**Description**

The attribute you are referencing is an application attribute. These cannot be set or removed by the user using set_user_attribute or remove_user_attribute, respectively. There might be other commands which allows you to set or remove the attribute.

**What Next**

Consult the documentation to determine if it is possible to set or remove this attribute.

### ATTR-3

(warning) Attribute '%s' does not exist on %s %s

Feedback

**Description**

The attribute you are trying to get is not found on the object, or is out-of-date. If the attribute is out-of-date, a timing update may establish its value. There is a way to suppress this message if you desire. For example, if this is in a loop or in a procedure (-quiet?)

---

## ATTR-4

(warning) Value '%s' is not valid for '%s' on %ss

**Description**

The value you are trying to set on the attribute cannot be converted to the data type defined for the attribute. For example, if the attribute is defined as "float", setting the attribute to "true" is not valid.

**What Next**

Enter an appropriate value for the attribute.

---

## ATTR-5

(warning) Value '%s' for '%s' is not in range (%s)

**Description**

The numeric value you are trying to set on the attribute is not in the range specified for the attribute. Ranges are either within a minimum and maximum value, greater than or equal to a minimum value, or less or equal to a maximum value. The message text indicates the violated constraint.

**What Next**

Enter an appropriate value for the attribute.

---

## ATTR-6

(warning) Value '%s' for '%s' is not valid. Specify one of: %s

**Description**

The string value you are trying to set on the attribute is not one of the valid strings defined for the attribute. The message text indicates the allowable values.

**What Next**

Enter an appropriate value for the attribute.

Feedback

## ATTR-7

(information) Inferred definition of the '%s' attribute for the '%s' class because it is imported for the '%s' class.

### Description

You used the *define_user_attribute* command to define a design or port attribute, and asked for it to be imported from .db files. Because design attributes are inherited onto cells (an instance of a design) and port attributes are inherited onto pins (an instance of a port), the attribute you defined for a design or port must also be defined for a cell or pin, respectively. The tool defines the attribute for you if you have not already done so, and issues this message.

### What Next

If you want to remove this message, add the appropriate class to the list of classes in your *define_user_attribute* command, or add a dedicated *define_user_attribute* command earlier in the script to define the attribute for the cell or pin class.

### See Also

- define_user_attribute

## ATTR-8

(error) Illegal min/max layer constraint.

### Description

This error occurs when the min layer constraint is on a higher layer than the max layer constraint. This constraint is ignored for the net.

### What Next

Please redefine the min/max layer constraint.

## ATTR-9

(warning) Net '%s' already had '%s' constraint set to '%s', which will be overwritten.

### Description

A min/max layer constraint has already been applied to this net. The new constraint will overwrite it.

Feedback

## ATTR-10

(warning) The min layer constraint is on a higher layer than the max layer constraint.

**Description**

Please redefine the min/max layer constraint.

## ATTR-11

(information) The returned value for %s '%s' is the design specific attribute override defined within the current block '%s'.

**Description**

This command returned the design specific attribute value from the current block, instead of the actual value from the library. Within the block, the design specific attribute value overrides the library value. It was set previously by the *set_attribute* command, because library settings may not be overwritten. This override may be removed by the *remove_attributes* command.

## ATTR-12

(information) The design specific attribute override for %s '%s' is set in the current block '%s', because the actual library setting may not be overwritten.

**Description**

This command set the design specific attribute value in the current block, instead of the actual value in the library, because library settings may not be overwritten.

Within the block, the design specific attribute value overrides the library value, and will be persistently stored in the block when saved. This attribute value is returned by the *get_attribute* command, and may be be removed by the *remove_attributes* command.

## ATTR-13

(information) The design specific attribute override for %s '%s' is removed from the current block '%s'.

**Description**

This command removed the design specific attribute value from the current block. Within the block, the design specific attribute value overrides the library value. It was set previously by the *set_attribute* command, and was returned by the *get_attribute* command.

Feedback

Now that the design specific attribute value is removed, the *get_attribute* command will return the library value.

---

## ATTR-14

(information) Attribute %s will be obsoleted, please use %s instead.

**Description**

This message informs you that the attribute specified in the information message is becoming obsolete. You are advised to use the specified replacement attribute instead.

**What Next**

Use the replacement attribute instead.

---

## ATTR-15

(error) Cannot set design specific attribute override for %s '%s' because current block is not defined.

**Description**

Library settings cannot be directly modified within this tool. However you can override the library setting within the scope of a design. In order to do so, there must be a current block in which to store the override.

**What Next**

Open or create the current block and then call *set_attributes* to set the override. Or use Library Manager to directly modify the library setting.

---

## ATTR-18

(error) Cannot set the attribute because %s.

**Description**

The attribute is settable only if the current mismatch config is "prototype".

**See Also**

- get_current_mismatch_config
- set_current_mismatch_config

Feedback

## ATTR-19

(error) Unable to set the lib pin "direction" attribute because %s.

**Description**

There are some restrictions for lib_pin "direction" attribute set.

The lib_pin object "direction" attribute can only be set when the following listed conditions are satisfied:

(1) under lm_shell (2) the current mismatch config is "prototype". (3) the lib_pin is not used in logic function. (4) no timing delay arc on the lib_pin. (5) the lib_pin is not bus port.

**See Also**

- get_current_mismatch_config
- set_current_mismatch_config

## ATTR-20

(warning) setting dont_touch attribute on unmapped %s '%s' is not supported.

**Description**

If set_dont_touch is applied on cells, designs or modules, the objects have to be mapped to accept the dont_touch attribute.

## ATTR-21

(warning) Cannot set size_only on hierarchical cell '%s'.

**Description**

Only leaf cells can accept the size_only attribute.

## ATTR-22

(information) Duplicate '%s' attribute value to '%s' view.

**Description**

When set indicated attribute, the value will be duplicated to all views to keep it consistent between different views.

Feedback

## ATTR-23

(error) Cannot set lib-cell attribute %s in ICC2 shell.

### Description

It is not possible to change the named lib-cell attribute from inside ICC2 shell. There are three types of lib-cell attributes. Some cannot be changed after the lib-cell library is built. Others cannot be changed outside of the ICC2 Library Manager because the checks which make sure the value is changed properly only exist within the Library Manager. Still others can be changed from inside the ICC2 shell, but only when the app option design.enable_lib_cell_editing is set to "mutable".

### What Next

If the value must be changed, return to the original ICC2 Library Manager setup used to create the library and change the value before the workspace is checked and committed.

## ATTR-24

(error) Cannot set unsafe lib-cell attribute %s in ICC2 shell.

### Description

It is not possible to change the named lib-cell attribute from inside ICC2 shell. There are three types of lib-cell attributes. Some cannot be changed after the lib-cell library is built. Others cannot be changed outside of the ICC2 Library Manager because the checks which make sure the value is changed properly only exist within the Library Manager. Still others can be changed from inside the ICC2 shell, but only when the app option design.enable_lib_cell_editing is set to "mutable".

### What Next

If the value must be changed, return to the ICC2 Library Manager and use the edit flow to change this value. Optionally, you can return to the original setup used to create the library and change the value before the workspace is checked and committed.

## ATTR-25

(error) Cannot set mutable lib-cell attribute %s in ICC2 shell.

### Description

It is not currently possible to change the named lib-cell attribute from inside ICC2 shell. There are three types of lib-cell attributes. Some cannot be changed after the lib-cell library is built. Others cannot be changed outside of the ICC2 Library Manager because the checks which make sure the value is changed properly only exist within the Library

Feedback

Manager. Still others can be changed from inside the ICC2 shell, but only when the app option design.enable_lib_cell_editing is set to "mutable".

**What Next**

If the value must be changed, set the app option design.enable_lib_cell_editing to "mutable". Optionally, you can return to the Library Manager and use the edit flow to change this value. Additionally, you can return to the original setup used to create the library and change the value before the workspace is checked and committed.

---

## ATTR-26

(information) Setting unsafe lib-cell attribute %s in ICC2 shell.

**Description**

The lib-cell attribute was changed inside ICC2 shell. It is considered an "unsafe" attribute in that the checks which make sure the value is changed properly only exist within the Library Manager. This means that changing the value to an improper one may lead to improper results or even a crash inside ICC2.

**What Next**

If you would like to have the changed value checked, you can choose to return to the Library Manager and use the edit flow. Under these circumstances the new value will be checked and validated as consistent.

---

## ATTR-27

(warning) There's no user set dont_touch attribute on %s '%s'.

**Description**

Only user set dont_touch attribute can be overwritten by user command set_dont_touch false.

---

## ATTR-28

(warning) Cannot set size_only on unmapped DesignWare cell '%s'.

**Description**

User can not set size_only attribute on unmapped DesignWare. Only leaf cells can accept the size_only attribute.

Feedback

## ATTR-29

(error) Cannot set attribute '%s' on cell '%s' which is not from top-level of 3d design.

**Description**

The specified attribute can be set only on cells of top-level 3d design.

## ATTR-30

(error) Cannot set package_type on block '%s' since it is not a top-level 3D IC design.

**Description**

The package_type attribute can only be set on a top-level 3D IC design. In other words, the design_type of the current_design must be "3dic".

## ATTR-31

(error) Design types 'rtl', '3dic', 'bridge', 'interposer', 'substrate', 'package'and 'analysis' are read-only and cannot be changed.

**Description**

The design_type settings 'rtl', '3dic', 'bridge', 'interposer', 'substrate', 'package' and 'analysis' reflect underlying characteristics of the design and cannot be changed.

## ATTR-32

(warning) Attribute '%s' does not exist on %s of type %s

**Description**

The attribute you are trying to get or set is not found on the object of given type.

# ATTRDEF

## ATTRDEF-001

(error) This visual (%s) does not exist.

**Description**

This visual does not exist. Please check the visual name.

Feedback

## ATTRDEF-002

(error) Internal error. Not valid type set %s.

**Description**

Type set is not valid.

## ATTRDEF-003

(error) Not valid class name.

**Description**

Design object class is not valid. Please, specify one of the following: %s

## ATTRDEF-004

(error) (error) Incompatible type and subtype values.

**Description**

Subtype can be specified only if type is string.

## ATTRDEF-005

(error) (error) Type must be specified.

**Description**

Type must be specified if subtype is presented.

## ATTRDEF-006

(error) Incompatible type and format values.

**Description**

Format can be specified only if type is int or double.

## ATTRDEF-007

(error) Type must be specified.

**Description**

Type must be specified if format is presented.

Feedback

## ATTRDEF-008

## ATTRDEF-026

(error) Attribute %s is application defined.

**Description**

Specified attribute is aplication defined and can not be deleted.

## ATTRDEF-027

(error) Attribute %s is user-defined.

**Description**

Specified attribute is user-defined. Options -width, -show|-hide, and -show_infotip|-hide_infotip are valid for this type of attribute.

## ATTRDEF-028

(error) Content of attribute group %s is system defined.

**Description**

Specified attribute group is system defined and cannot be deleted or modified.

# AUTOREAD

## AUTOREAD-100

(information) Adding '%s'.

**Description**

This information message occurs when the autoread feature finds an HDL file that will be used in future *analyze* commands, if needed, or a directory that contains HDL sources.

**What Next**

This is an information-only message. No action is required.

However, you might want to analyze the HDL file.

## AUTOREAD-101

(information) Removing from autoread database '%s'.

Feedback

### Description

This information message occurs when autoread determines that the specified file or directory is no longer needed or that it was not specified in the current autoread command.

The reason for the file or directory deletion from the autoread database may be the following:

1. The source is no longer provided in the list of sources of the command line.
2. The source belonged to a directory, and the directory or the source is no longer available.
3. There is no HDL language bound to the source file extension, therefore, it does not need to be analyzed later.

The file or directory is removed logically only from the internal autoread database, but it is not removed from the disk.

### What Next

This is an information-only message. No action is required.

---

## AUTOREAD-102

(information) Source %s ignored by autoread due to filtering.

### Description

This information message occurs when the autoread feature finds an HDL source file or directory that appears in the exclude list you provided.

The file is not read for direct analyze.

### What Next

This is an information-only message. No action is required.

However, if the file requires being analyzed directly, remove the file from the list provided by the *-exclude* option in the *analyze -autoread* or *read_file -autoread* command.

---

## AUTOREAD-103

(information) HDL language of file %s is not defined.

### Description

This information message occurs when the specified file does not match with any file extension known to be related to HDL, such as VHDL or Verilog.

Feedback

### What Next

This is an information-only message. No action is required.

However, if the result is not what you intended, and the file is known to belong to HDL, add its extension to the *hdlin_autoread_verilog_extensions* or *hdlin_autoread_vhdl_extensions* variable.

---

## AUTOREAD-104

(information) Recursion disabled for directory %s.

### Description

This information message occurs when the source directory cannot be scanned for new HDL sources because recursion is disabled for autoread.

By default, when autoread scans the contents of a directory, it does not recursively scan any subdirectory found.

### What Next

This is an information-only message. No action is required.

However, if you want to enable recursion, use the *-recurse* argument in the *analyze -autoread* or the *read_file -autoread* command.

---

## AUTOREAD-105

(warning) Adding missing directory to search_path - '%s'.

### Description

This warning message occurs when a source directory is passed to autoread through the command line, but the directory is not available in the *search_path* system variable.

To avoid future errors, autoread added the new directory to the previously defined *search_path*, appending it to the end.

### What Next

This only a warning message. No action is required.

If the directory added is always used, add it manually to the *search_path* system variable.

### See Also

- search_path

Feedback

## AUTOREAD-106

(information) Setting new value for search_path - '{ %s }'.

**Description**

This information message occurs when autoread changes the system variable *search_path* to the value shown in the message.

The change in the search path ensures that all files will be reachable for later analyze processes.

**What Next**

This is an information-only message. No action is required.

A change in the search path by autoread means that it did not find the required files using the original *search_path* value.

You can set the *search_path* variable to the desired value before calling autoread to prevent autoread from setting a new value.

**See Also**

- search_path

## AUTOREAD-107

(warning) Defining design library '%s' at directory '%s'.

**Description**

This warning message occurs when autoread detects that a design library is being used by a design, but the design has not been mapped to a UNIX directory.

Autoread is adding a mapping pointing to the *LIB_NAME*_autoread directory.

**What Next**

This is only a warning message. No action is required.

However, you can prevent this warning message when you manually configure the design library mapping by setting the mapping in your script using the *define_design_lib* command.

## AUTOREAD-108

(warning) Using user-excluded file '%s'.

Feedback

**Description**

This warning message occurs when autoread detects that a file is needed or is being used by the HDL languages, but the file was previously marked as excluded.

A typical scenario is a Verilog `include macro that forces the inclusion and usage of a file, but that file is marked as excluded. As the excluded file is being requested by the HDL language, the autoread feature cannot block its usage.

**What Next**

This is only a warning message. No action is required.

However, if the result is not what you intended, check if the file really needs to be excluded for a proper analyze and elaborate flow. Modify the `include macro or the HDL expression that forces the file inclusion.

---

## AUTOREAD-109

(warning) Using HDL language defined via -format for file '%s'.

**Description**

This warning message occurs when a file does not have a valid extension, and the command-line format (*-format* option) was defined.

Autoread will use the HDL language defined by -format, even if it cannot be deduced from the file's extension.

**What Next**

This is only a warning message. No action is required.

However, if the file does not belong to the HDL language defined by *-format*, analyze errors will occur later.

Add the file extension to the corresponding file extension variables with the *hdlin_autoread_verilog_extensions* variable.

---

## AUTOREAD-200

(error) Source %s not found.

**Description**

This error message occurs when the source provided for autoread was not found in the search path.

Feedback

The source might come from the command line or it might be mentioned in another HDL source as an included file.

**What Next**

Add the file path to the *search_path* variable and run the command again.

---

## AUTOREAD-201

(error) Error accessing to source %s.

**Description**

This error message occurs when the autoread feature finds an HDL source that cannot be properly accessed.

**What Next**

Check that the source file or directory exists and that you have the proper file system permissions to read it.

---

## AUTOREAD-202

(error) No HDL source files found.

**Description**

You receive this error message because the autoread feature is unable to detect or find valid HDL source files with which to work.

**What Next**

Check that the source files are provided in command-line arguments.

Check that directories provided at the command line contain valid HDL source files.

Check if you need to provide the *-recurse* option to allow autoread to scan subdirectories where the HDL source files may be located.

Check that the language extensions variables are properly set for the file extensions you are using.

Check that you are not incorrectly excluding valid HDL sources.

---

## AUTOREAD-203

(error) Design library '%s' is not writeable.

Feedback

### Description

This error message occurs because the autoread feature was unable to write to the design library.

### What Next

Check that the mapped directory exists and that it has the correct permissions for writing.

---

## AUTOREAD-204

(warning) Broken link %s.

### Description

This error message occurs when a source found in a directory is a broken symbolic link or it is not reachable.

### What Next

This is only a warning message. No action is required.

However, if the result is not what you intended, you can do the following:

- If the source is a symbolic link, verify that the link is valid.

- Check for file permissions.

---

## AUTOREAD-205

(error) Conflicting language extension mapping '%s'.

### Description

This error message occurs when the autoread language extension mapping receives a file extension that is already in use for a different language.

For example, this error occurs if you add extension ".v" to SystemVerilog extensions specified with the *hdlin_autoread_sverilog_extensions* variable, while the same extension is also defined in Verilog extensions with the *hdlin_autoread_verilog_extensions* variable.

### What Next

Check the content of the *hdlin_autoread_verilog_extensions*, *hdlin_autoread_vhdl_extensions*, and *hdlin_autoread_systemverilog_extensions* system variables and ensure every extension appears only on a single variable.

Feedback

## AUTOREAD-300

(information) HDL source file %s is out-of-date.

**Description**

This information message occurs when the autoread feature detects that a file is new or has changed since the last time it was reviewed.

**What Next**

This is an information-only message. No action is required.

However, the out-of-date status may trigger future *analyze* commands over the file or their related dependencies.

## AUTOREAD-301

(information) Dependencies changed. File '%s' has to be analyzed.

**Description**

This information message occurs when the autoread feature detects that the file is up-to-date, but because of dependencies on other files that are out of date, the file must be marked as out of date.

**What Next**

This is an information-only message. No action is required.

However, be aware that the out of date status might trigger future *analyze* commands over the file or related dependencies.

## AUTOREAD-302

(information) Source file %s marked as up to date because it does not require analyze.

**Description**

This information message occurs when the autoread feature determines that the specified file is out-of-date, but the file does not require the *analyze* command to be invoked.

This message might occur because other HDL sources depend on this file. Since the file is included, it will be read when the other HDL sources run their own *analyze* command.

**What Next**

This is an information-only message. No action is required.

Feedback

However, the out-of-date status might trigger future *analyze* commands over the file-related dependencies.

## AUTOREAD-303

(information) Scanning file %s.

**Description**

This information message advises you that the autoread feature is reading the HDL source file and detecting the language abstractions defined, declared, and used in the file that lead to dependencies from other source files.

**What Next**

This is an information-only message. No action is required.

After all files are read and their abstractions found, the autoread algorithm is able to calculate the HDL sources' dependencies, and analyze the sources in the correct order to prevent *analyze* command errors.

## AUTOREAD-304

(warning) %s:%d: error at or near '%s' prevents file scanning.

**Description**

This warning message occurs when the autoread feature of *read_file* or *analyze* commands tried to read the content of a RTL file to detect the possible HDL abstraction declared on it, but possible syntax errors prevented the process from completing.

This message might be issued if an HDL file depends on a file that should be read together with additional sources. For example, in Verilog when a file uses a macro while a different Verilog file defines it.

This messages does not stops the autoread flow for continuing with *analyze* (and *elaborate*) stages.

After an AUTOREAD-304 warning *autoread* will stop reading the reported file at the line reported. If there are language constructs that generates file dependencies after the reported line then those construct will not be visible for dependency analysis, and the file could be not included for *analyze*/*elaborate* flow, leading to an incomplete design building.

This message is not a replacement of the *analyze* command internal analysis for syntax and semantic errors in the RTL source, therefore the absence of this message for a RTL file is not a guarantee that the file will not have syntax/semantic errors during *analyze* stage.

Feedback

Note that AUTOREAD-304 message is issued before the dependency analysis stage of *autoread*, and the offending file may not be analyzed later or being part of the designs elaborated. Therefore if you want to debug all your RTL sources having every RTL source file analyzed, you must use the *analyze* command with *-autoread* option but without using *-top* option. Doing that will force *autoread* to analyze every non-excluded RTL file, and then every possible syntax/semantic error will be properly reported by *analyze*.

**What Next**

Review the reported file and line number to check if a typo or evident error triggers the warning. If so, fix the RTL file.

If the file is not intended for being read or it is not required for the top-down elaboration the user needs, the file could be excluded using the *-exclude* command line option to prevent this warning message from being issued.

---

## AUTOREAD-305

(information) HDL language of file %s not supported for autoread scanning.

**Description**

This information message occurs because the autoread feature does not support the HDL language of the specified file for scanning the internal HDL abstractions that it contains.

**What Next**

This is an information-only message. No action is required.

---

## AUTOREAD-320

(information) Generic dependency: '%s' depends on '%s'.

**Description**

This information message occurs when the autoread feature detects that the first file contains HDL abstractions that depend on the content of the second file.

The file dependency helps autoread to determine the proper file ordering to analyze all sources without ordering errors.

**What Next**

This is an information-only message. No action is required.

However, depending on the file changes, some of the files may require running the *analyze* and/or *elaborate* command on the contained designs.

Feedback

## AUTOREAD-321

(information) Analyze dependency: '%s' depends on '%s'.

**Description**

This information message occurs when the autoread feature detects that the first file contains HDL abstractions that depend on the content of the second file in a way that the second file must be successfully analyzed prior the analysis of the first file.

The file dependency helps autoread to determine the proper file ordering to analyze all sources with no errors caused by incorrect ordering.

If the second file is changed and requires a new *analyze* command, the first file will also require analysis. This will be detected and performed automatically by autoread.

**What Next**

This is an information-only message. No action is required.

However, depending on whether any of the files change, some of the files may require the *analyze* and/or *elaborate* commands be run on the contained designs.

## AUTOREAD-322

(information) Elaborate dependency: '%s' depends on '%s'.

**Description**

This information message occurs when the autoread feature detects that the first file contains HDL abstractions that depend on the content of the second file in a way that the second file must be successfully analyzed before elaborating any design defined in the first file.

The file dependency helps autoread to determine the proper file ordering to analyze all sources without ordering errors.

This dependency requires that the second file be analyzed for a proper elaboration of the first file, but the analyze order is not critical between the two files.

**What Next**

This is an information-only message. No action is required.

However, depending on the file changes, some of the files may require running the *analyze* and/or *elaborate* command on the contained designs.

Feedback

## AUTOREAD-323

(information) Include dependency: '%s' depends on '%s'.

**Description**

This information message occurs when the autoread feature detects that the first file contains HDL abstractions that directly include the contents of the second file (like `include in Verilog language).

The file dependency helps autoread to determine the proper file ordering to analyze all sources without ordering errors.

The second file may not require direct analysis if it is directly included from all sources where it is needed.

**What Next**

This is an information-only message. No action is required.

However, depending on the file changes, some of the files may require running the *analyze* and/or *elaborate* command on the contained designs.

## AUTOREAD-324

(information) Compilation unit dependency: '%s' depends on '%s'.

**Description**

This information message occurs when the autoread feature detects that the first file contains HDL abstractions that depend on the content of the second file in a way that the second file must analyze in the same compilation unit of the first file in order for the analysis to succeed.

The file dependency helps autoread to determine the proper file ordering to analyze all sources without ordering errors.

If the second file is changed and requires a new *analyze* command, the first file will also require analysis. This is detected and performed automatically by autoread.

**What Next**

This is an information-only message. No action is required.

However, depending on the file changes, some of the files may require running the *analyze* and/or *elaborate* command on the contained designs.

Feedback

## AUTOREAD-330

(error) Multiple definitions found for %s.

**Description**

This error message occurs when the autoread feature detects multiple definitions of a language element such as Verilog modules, VHDL architectures, and so on. The autoread feature cannot safely determine the correct one to choose as the right dependency.

**What Next**

Depending on the nature of the duplicated definitions, you can do any of the following:

- Rename one of the element's definitions and its valid usages inside of the HDL sources.
- Avoid adding one of the sources that defines the duplicated element.
- Exclude the undesired source that defines the duplicated element using the *-exclude* option of *analyze* or *read_file* commands.
- For Verilog macros and SVerilog $UNIT definition the AUTOREAD-330 error could be solved using `include for the file that contains the right definitions in the RTL file that requires them, resolving the definition ambiguity.

## AUTOREAD-331

(error) No design found for '%s'.

**Description**

This error message occurs when the autoread feature tries to determine the source file where a named design is defined, but the element (Verilog module, VHDL entity, and so on) is not found inside the autoread database.

**What Next**

Check the following:

- Check that the file that defines the design element exists and that it is being added to the *autoread* command properly.
- Check if there are parsing errors while reading the file that prevents reading it properly.
- Check that there are no typographical errors in the design name you are providing through the command-line *-top* argument.

Feedback

## AUTOREAD-332

(warning) Unsolvable dependency loop found.

### Description

This warning message occurs when the autoread feature detects a dependency loop inside the list of files and directories provided.

The loop could be unsolvable if every file requires that a different file must be analyzed first to succeed at its own *analyze* command call, but there is no way of analyzing one of the files as head of the dependency chain due the dependency loop.

This kind of loop might produce errors at analyze time.

### What Next

This is only a warning message. No action is required.

However, if Presto generates an error due the loop, fix the error using the information provided by Presto.

## AUTOREAD-333

(error) Ambiguous dependency resolution for symbol '%s'.

### Description

This error message occurs when the autoread feature detects multiple valid definitions of a language element such as SystemVerilog typedef, localparams, or function, but it cannot safely determine the correct one to choose as the right dependency because all are valid definitions.

For example, this error is issued when a definition declared at $unit scope is also available as a wildcard import from a SV Package:

```
== File package.sv ==
        package P;
                localparam VAL = 1;
        endpackage

== File unit.sv ==
        localparam VAL = 2;

== File module.sv ==
        import P::*;
        module #(parameter LOCAL_VAL = VAL) top();
        // ...
====================
```

Feedback

Given the above RTL files, the VAL symbol could be valid used from the package P definition; therefore, autoread could behave as if there were two consecutive calls to the *analyze* command:

```
prompt> analyze -f sverilog package.sv

prompt> analyze -f sverilog module.sv
```

Or, as an another valid alternative, autoread could analyze the module.sv file as a single compile unit with the unit.sv file; therefore, VAL will be used from the $unit scope VAL localparam, behaving as this call to analyze:

```
prompt> analyze -f sverilog { unit.sv module.sv }
```

As there is no way autoread could determine your intentions, autoread cannot safely select the right alternative for defining the VAL symbol.

**What Next**

Depending on the nature of the duplicated definitions, you can do any of the following:

- Rename one of the element's definitions and its valid usages inside of the HDL sources to avoid the symbol clash.
- Avoid adding one of the sources that defines the duplicated element.
- Move one of the sources that defines the duplicated element to the exclude list.
- Include the definitions of $unit scope directly using`the include directive to disambiguate the symbol to be used.
- Explicitly import the symbol from the package to disambiguate the symbol to be used.

---

## AUTOREAD-334

(warning) Cannot determine dependencies for %s.

**Description**

This warning message occurs because the autoread feature is unable to determine the real dependency for the element listed.

This message could be issued if some designs will be linked later to precompiled designs.

The message could warn about missing files that define the elements mentioned and that must be added to the autoread command-line call to allow the tool find them.

**What Next**

This is only a warning message. No action is required.

Feedback

However, be aware that if the files are not provided properly, black-box cells might be created later, and link errors could occur.

## AUTOREAD-335

(error) Detected potential side effect of conditional compilation directive '%s'.

**Description**

This error message is issued because the autoread feature determines several HDL source files need to be analyzed together, but joining them would alter how the RTL of the files is interpreted because there is a side effect of a conditional compilation directive.

Error arises when a (S)Verilog file contains an `ifdef/`ifndef conditional compilation directive that could be altered by a dependency file that contains a `define/`undef entry for the same identifier. Adding the dependency file or altering the analyze order could alter the RTL being analyzed by HDL Compiler.

Allowing the analyze/elaborate flow to continue under that circumstances may lead to bad logic or unexpected synthesis outcomes. Therefore autoread stops the flow for safety reasons.

For example, given this two files:

== File top.sv == localparam P = EXT_P;

`ifndef SYN_DISABLED module bottom (); endmodule `endif ==========

== File define.sv == localparam EXT_P = 64; `define SYN_DISABLED ==========

When autoread first read the files, identifier SYN_DISABLED is not defined, therefore autoread dependency analysis will detect file top.sv declares design bottom, but also requires an external symbol EXT_P. Later, when dependencies are resolved, autoread will determine that file "define.sv" that declares the localparam EXT_P symbol must be analyzed together with the first file to succeed analyze. But doing that will make the macro SYN_DISABLED visible to file "top.sv", altering the RTL being analyzed.

**What Next**

Fix the RTL code to explicitly include the file that defines the macro, forcing the RTL to be always the same no mather what the read order is.

If the files are not required for top design elaboration, exclude them.

## AUTOREAD-400

(information) Invoking analyze command for file %s.

Feedback

**Description**

This information message occurs when the autoread feature detects that the file is required to be analyzed by Presto.

**What Next**

This is an information-only message. No action is required.

If the analyze command succeeds, the file is marked as up to date, and no other analyze commands should be needed until the file or its dependencies change.

---

## AUTOREAD-401

(error) Cannot analyze file %s because the HDL language is unknown.

**Description**

This error message occurs when the autoread feature determines that the file needs to be analyzed by Presto, but the HDL language of the file is unknown.

**What Next**

Check that the file extension is registered with a known HDL language, such as VHDL or Verilog. Use the *hdlin_autoread_vhdl_extensions* or *hdlin_autoread_verilog_extensions* variable, or explicitly define the file format using the *-format* argument of the appropriate command.

---

## AUTOREAD-402

(warning) Analyze command for file %s did not succeed.

**Description**

This warning message occurs because after the autoread feature determines that the file must be analyzed by Presto, the *analyze* command returns an error status on the specified file.

The error during *analyze* prevents the designs from being elaborated.

**What Next**

This is only a warning message. No action is required.

However, if the result is not what you intended, you can check the *analyze* command output to identify the HDL errors in the source files. After making the necessary corrections, run the command again.

Feedback

## AUTOREAD-500

(error) Autoread internal error.

### Description

This error message occurs if the Autoread feature encounters an internal error and cannot proceed. The command shell is not affected by this failure, so your work session can continue without loss of data. Internal errors in the Autoread feature are usually related to one or two constructs that can be recoded to work around the problem until Synopsys releases a new compiler free of this defect.

The Autoread feature of Presto HDL Compiler contains several internal checks on its operation designed to catch miscompilation problems as close as possible to their source. Internal errors prevent the production of incorrect results.

### What Next

If you encounter an internal error when using the most recent release from Synopsys, submit a test case that reproduces the problem to the Synopsys Support Center by using Enter A Call at http://solvnet.synopsys.com/EnterACall.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at http://solvnet.synopsys.com/ReleaseLibrary.

For information about creating, packaging, and sending a test case, go to http://www.synopsys.com/testcase.

## AUTOREAD-600

(error) The source file for the following VHDL unit was not found: '%s'.

### Description

This error message occurs when the autoread feature cannot find a source file containing the selected VHDL design unit.

### What Next

Resolve the error by doing the following:

1. Check that the file that defines the design unit really exists and has been added to the autoread command properly.
2. Check if there are parsing errors while reading the file that prevents reading it properly.

Feedback

## AUTOREAD-602

(error) Unit %s must be analyzed in libraries %s and %s. This is not yet supported.

**Description**

Autoread infers that a unit must go in library L if it appears as L.unit in a use clause or an explicit reference inside the source code. Other constraints include all units in the same file must go in the same library, the primary unit (for example the entity) must go in the same library as its secondary units (the architecture), and so on.

Some designs may appear conflicting, such as L1.unit and L2.unit. This requires that the unit be analyzed twice, once in library L1 and once in library L2. This is currently not supported by autoread.

**What Next**

Resolve the error by doing the following;

1) Check if the unit appears referenced simultaneously as L1.unit and L2.unit.

2) Check if 2 units inferred to be in different libraries belong to the same file.

3) Check if the entity and architectures have been inferred to be in different libraries.

## AUTOREAD-603

(error) The following VHDL unit is not supported: '%s'.

**Description**

This error message occurs when autoread finds that the top requested design is a configuration. This feature is not currently supported by autoread.

**What Next**

Avoid configurations when using autoread.

## AUTOREAD-604

(warning) The following VHDL unit is not supported: '%s'.

**Description**

This warning message occurs when a reference is done on a VHDL configuration. This feature is not currently supported by autoread. The analysis will fail if this configuration is required by the design.

Feedback

### What Next

Avoid configurations when using autoread.

---

## AUTOREAD-2100

(error) The program cannot find all initialization files.

### Description

You receive this message because the program did not find all files that are necessary for proper initialization. The Synopsys software installation is incomplete or corrupted.

### What Next

Reinstall the software to fix the problem. You can continue working with the current installation, although some functionality is not available.

---

## AUTOREAD-2101

(error) %s

### Description

You receive this message because an error occurs when the *acs_read_hdl* command is scanning through the source files to detect interfile dependencies. It has found either a syntax error or an unsupported construct.

### What Next

Fix the syntax error or work around the unsupported construct. Another way to avoid this error message is to run the *acs_read_hdl* command with the *-no_dependency_check* option. This omits dependency checking so you should specify all source files in the proper order. For Verilog source, this means that files included by any other file should not appear in the *hdl_source* list. VHDL files defining any library objects should be specified before any files using those objects.

---

## AUTOREAD-2102

(error) Internal error: The '%s' command is not available.

### Description

You receive this message because an internal error occurred during the initialization phase. The described command could not be registered with the shell. It is not available. This error should not occur under normal circumstances.

Feedback

**What Next**

Reinstall the software to fix the problem. You can continue working with the current installation, although the described functionality is not available.

---

## AUTOREAD-2103

(error) Internal error: Some functions are not available.

**Description**

You receive this message because an internal error occurred during the initialization phase. An ACS command could not be registered with the shell. Some ACS functionality will not be available. This error should not occur under normal circumstances.

**What Next**

Reinstall the software to fix the problem. You can continue working with the current installation, although you should not use any AUTOREAD commands.

---

## AUTOREAD-2104

(error) The above libraries are not readable.

**Description**

You receive this message because the specified design libraries are used in the design, but are not currently mapped to a valid directory name.

**What Next**

Use the *define_design_lib* command to create a new design library. The directory to which the library is mapped must exist and should have read permissions set. To analyze HDL source files into a specific library, the directory to which the library is mapped should also have write permissions set.

---

## AUTOREAD-2105

(error) Cannot access file '%s'.

**Description**

You receive this message because an attempt failed to retrieve information about the specified file from the operating system.

Feedback

### What Next

In most cases this error should not cause any problems. However, if the specified file is an include file, it may be analyzed and cause analyzer errors. If you run the command again, the error should not reoccur.

---

## AUTOREAD-2106

(information) The file '%s' appears more than once in the source file list. Ignoring all further occurrences.

### Description

You receive this message because you specified an HDL source file more than once in the source file list of the *acs_read_hdl* command. It is analyzed only once.

---

## AUTOREAD-2107

(information) All use statements of the form 'use <LIB>.all' are ignored during dependency checking.

### Description

The *acs_read_hdl* command attempts to detect interfile dependencies to analyze files in the correct order. You receive this message because the above statement creates a dependency that is too general to be of any use. Thus it is ignored.

### What Next

If the *acs_read_hdl* command cannot resolve all dependencies and analysis of the source code fails, it may help if you replace 'use <lib>.all' statements with more-specific 'use <lib>.<package>' statements in the HDL source code.

---

## AUTOREAD-2108

(error) Cyclic dependencies are detected in the above source files.

### Description

The *acs_read_hdl* command attempts to detect interfile dependencies to analyze source files in the correct order. Definitions of library objects must be analyzed before the object is used.

You receive this message because this is not possible for all library objects with the current source files. The above list shows the cyclic dependency in the files.

Feedback

### What Next

Change your source files and move object definitions so that the files can be analyzed correctly. The above list gives hints about the files and library objects that are involved in the cyclic dependency. There are some implicit dependencies, such as a package body that depends on its package definition or an architecture that depends on its entity. Use of a package implies a dependency on the package body.

---

## AUTOREAD-2109

(error) Library object(s) are multidefined.

### Description

The list above this error message shows all library objects that are defined in more than one file and the corresponding filenames. You receive this message because it is not clear which definition to use.

### What Next

Modify the source files, deleting all definitions except one for each multidefined object, or remove the source files containing the additional definitions from the source file list.

---

## AUTOREAD-2110

(error) Multiple architectures are defined for one entity.

### Description

The list above this error message shows all files defining architectures for each entity with multiple architectures. You receive this message because it is not clear which architecture to use.

### What Next

Modify the source files, deleting all architecture definitions except one for each entity, or remove the source files containing the extra architecture definitions from the source file list.

---

## AUTOREAD-2111

(error) You cannot specify -recursive when using the search_path as a Verilog source file list.

Feedback

### Description

You receive this message because using the *-recursive* option in conjunction with the *search_path* variable can cause unexpected behavior. For the command to recursively look for source code files in directories, you cannot use the *search_path* variable to specify the same directories.

### What Next

Use the *acs_hdl_source* variable or the *-hdl_source* option to specify the source directories (using the *-recursive* option, if needed), and include the names of all include directories in the *search_path* variable.

---

## AUTOREAD-2112

(error) Cannot detect source language of file '%s'.

### Description

This error message occurs when the specified file exists in the HDL source list, but has none of the language-specific extensions. The *acs_read_hdl* command cannot determine the source language of the file, because the *-format* option is not set.

### What Next

Do either of the following:

- Specify the *acs_read_hdl* command with the *-format* option. A side effect of this is that it analyzes only Verilog or VHDL files (with an extension from the corresponding *acs_verilog_extensions* or *acs_vhdl_extensions* variable).
- Add the extension of the identified file to one (or both) of the *acs_verilog_extensions* and *acs_vhdl_extensions* variables to indicate the source language. This causes all files with this extension to be analyzed, not only the one specified above.

---

## AUTOREAD-2113

(error) File '%s' is specified twice in the HDL source files list.

### Description

You receive this message because you explicitly specified the mentioned file twice in the HDL source files list for the *acs_read_hdl* command. If you have symbolic links in your source directories, different paths may specify the same file.

### What Next

Remove the specified filename from the HDL source files list.

Feedback

## AUTOREAD-2114

(warning) No source files are found for '%s'.

**Description**

You receive this message because you specified an item in the HDL source files list that could not be expanded to any filename. If the specified item is a file, that file was not found; if it is a directory, that directory does not contain any source files.

**What Next**

You can ignore the warning if all of your source files have been analyzed. Remove the specified HDL source list item from the HDL source files list to eliminate this warning. If the *acs_read_hdl* command has found source files matching the expression, check the syntax of that item, and check the *acs_exclude_extensions*, *acs_exclude_list*, *acs_verilog_extensions*, and *acs_vhdl_extensions* Tcl variables.

## AUTOREAD-2115

(error) No input files specified.

**Description**

You receive this message because you specified an empty HDL source file list.

**What Next**

Set the *acs_hdl_source* Tcl variable to a non-empty list of file and directory names or specify that list by using the *-hdl_source* option at the command line.

## AUTOREAD-2116

(error) No top-level module name specified.

**Description**

You receive this message because the command requires the name of the top-level module to elaborate the design.

**What Next**

Specify the top-level module name at the command line. You can also set the *-no_elaborate* option, which prevents the *acs_read_hdl* command from performing elaboration.

Feedback

## AUTOREAD-2117

(error) An error or unsupported construct is detected during the Verilog include file detection phase.

### Description

You receive this message because an error or unsupported construct was detected during the Verilog include file detection phase. It is also possible that all specified source files are include files so no files are left to be analyzed.

### What Next

Correct all syntax errors or work around unsupported constructs, and rerun the command. Another workaround for this error message is to use the *acs_read_hdl* command with the *-no_dependency_check* option. This prevents the command from detecting Verilog include files; however, you have to manually remove all include files from the HDL source files list.

## AUTOREAD-2118

(warning) Mixed language designs are not automatically elaborated.

### Description

You receive this message because the tool has implicitly set the *-no_elaborate* flag, since it cannot elaborate a design that has Verilog and VHDL source code parts.

### What Next

After the command finishes you must manually do the elaboration. Execute the *elaborate* command separately for each top-level module of each language, doing the design top-level module last.

## AUTOREAD-2119

(information) Autoread is analyzing Verilog file '%s'.

### Description

This information message occurs when the *acs_read_hdl* command is analyzing a Verilog file.

### What Next

This is an information-only message. No action is required.

If you do not want to see these messages, remove the *-verbose* option from the command line.

Feedback

## AUTOREAD-2120

(information) Autoread is analyzing VHDL file '%s' into library '%s'.

**Description**

This information message occurs when the *acs_read_hdl* command is running.

**What Next**

This is an information-only message. No action is required.

If you prefer not to view these messages, remove the *-verbose* option from the command line.

## AUTOREAD-2121

(error) No files have been analyzed.

**Description**

You receive this message because either you have not specified an HDL source files list or the *acs_read_hdl* command has not found any source files in the specified locations.

**What Next**

Include all directories containing source files in the HDL source files list, and properly set the exclude and extensions variables.

## AUTOREAD-2122

(warning) Analyzer ended with errors.

**Description**

You receive this message because analyzer ended for one or more files with errors. You used the *-ignore_analyze_errors* option at the command line, so this message informs you only that one or more errors occurred and does not describe the errors.

**What Next**

Ignore this message or fix the problems that generated the errors and rerun the command.

## AUTOREAD-2123

AUTOREAD is elaborating module '%s'.

Feedback

**Description**

You receive this message because the *acs_read_hdl* command is describing its activity.

**What Next**

No action is necessary. The result is informative. Remove the-*verbose* option from the command line if you prefer not to view these messages,

---

## AUTOREAD-2124

(error) More than one module with name '%s' found.

**Description**

You receive this message because you specified a top-level module name that is not unique. Another design has the same name in memory. The current design cannot be set. The GTECH result of the *acs_error_user* command is still in memory.

**What Next**

Ensure that the *current_design* variable is set to the top-level module of your design.

---

## AUTOREAD-2125

(warning) The command line argument '%s' overrides the Tcl variable '%s'.

**Description**

You receive this message because you have assigned a value to the specified Tcl variable and you are providing an option at the command line that specifies the same thing. This warning just informs you that the *acs_read_hdl* command ignores the value of the Tcl variable.

**What Next**

Nothing to do, if this doesn't surprise you.

---

## AUTOREAD-2126

(error) Invalid file or directory name: '%s' is ignored.

**Description**

You receive this message because you specified an invalid item in a file list. The invalid expression is specified in the message. The invalid item is ignored.

Feedback

**What Next**

This error message may be caused by an unknown user (in a "~<user>" expression) or an inaccessable current working directory (if you specified "."). You do not have to take any action unless you require the ignored expression as part of your specification of the source code location.

---

## AUTOREAD-2127

(error) Invalid extension: '%s' is Ignored.

**Description**

You receive this message because you used an invalid extension in one of the extensions lists. The invalid extension is specified in the message and is ignored. The slash character (/) and backslash character (\\) are not allowed in extensions.

**What Next**

Remove the invalid extension from the list. If you actually have a source code file with a slash or backslash character in the extension you must rename it.

---

## AUTOREAD-2128

(information) AUTOREAD is starting Verilog include file detection.

**Description**

You receive this message because the AUTOREAD *acs_read_hdl* command is reporting its current activity: starting Verilog include file detection.

---

## AUTOREAD-2129

(information) AUTOREAD is star VHDL dependency extraction.

**Description**

You receive this message because the AUTOREAD *acs_read_hdl* command is reporting its current activity: starting VHDL dependency extraction.

---

## AUTOREAD-2130

(information) AUTOREAD is starting Verilog analysis.

Feedback

**Description**

You receive this message because the AUTOREAD *acs_read_hdl* command is reporting its current activity: starting Verilog analysis.

---

## AUTOREAD-2131

(information) AUTOREAD is starting VHDL analysis.

**Description**

You receive this message because the AUTOREAD *acs_read_hdl* command is reporting its current activity: starting VHDL analysis.

---

## AUTOREAD-2132

(error) DC-Expert license for AUTOREAD is not enabled.

**Description**

You receive this message because the license feature DC-Expert is not available. Every AUTOREAD command checks it.

---

## AUTOREAD-2133

(error) No additional DC-Expert licenses are available.

**Description**

You receive this message because all your licenses are already checked out. The command you executed failed to retrieve one.

Each dc_shell using an AUTOREAD command checks out one license of the DC-Expert feature. Other commands might also be using this license feature.

**What Next**

Do one of the following, and then try again to execute the command:

- Quit any other dc_shell that uses DC-Expert licenses.
- Wait until any other dc_shell that uses DC-Expert licenses is done.
- Obtain more licenses.

---

## AUTOREAD-2134

(information) Starting Design Compiler Design Budgeting.

Feedback

**Description**

You receive this message to inform you that Design Compiler (DC) is reporting its current activity: starting Design Budgeting.

**What Next**

This is an informational message only. No action is required on your part.

---

## AUTOREAD-2135

(information) Starting PrimeTime Design Budgeting.

**Description**

You receive this message because PrimeTime is reporting its current activity: starting Design Budgeting.

---

## AUTOREAD-2136

(error) Variable '%s' must be a value between 0 and 100.

**Description**

You receive this message because the variable value is not between 0 and 100.

---

## AUTOREAD-2137

(warning) The current design contains less than %d levels of hierarchy.

**Description**

You receive this message because you used the *-level* option to specify where to set the compile partitions on the design, but the number of hierarchy levels in the design is less than the specified value.

**What Next**

Take either of the following actions:

- Specify a different hierarchy level (a lower number) that contains instances with the *-level* option.
- Use a different option to specify where to set compile partitions. For detailed information, see the *set_compile_partitions* man page.

Feedback

## AUTOREAD-2138

(error) Unresolved Multiple Instances.

### Description

You receive this message because there are multiply-instantiated modules in the design and the settings of the *MasterInstance* attribute are not correct.

### What Next

See the *MasterInstance* man page or the *AUTOREAD, User Guide* for more detailed information. If the directions you find there for resolving this problem are not acceptable, take one of the following actions:

- Uniquify the design.
- Set the *MasterInstance* attribute on exactly one instance of each multiply-instantiated design.
- Set the *dont_touch* attribute on the multiply-instantiated design.
- Set the *dont_touch* attribute on all but one instance of the multiply-instantiated design.

### See Also

- set_attribute
- uniquify

## AUTOREAD-2139

(error) Design '%s' is not part of the current design.

### Description

You receive this message because the command works only with modules that are linked to the *current design*. The *current_design* command is set to a design that, within its hierarchy, does not instantiate the specified design.

### What Next

Perform one of the following tasks:

- Call the command with a design that is part of the *current design*.
- Set the *current_design* command to a parent module of the specified design.
- Set the *current_design* command to the design itself.

Feedback

**See Also**

- current_design

---

## AUTOREAD-2140

(warning) MasterInstance of module '%s' is not found in design '%s' children. Randomly choosing '%s' instance instead.

**Description**

You receive this message because you specified the *-master_only* command line option, but one of the following conditions applies to the instance that has the *MasterInstance* attribute set:

- It is not a child of the specified design.
- It is not in the design subtree (if the *-hierarchy* option was set).
- The master instance does not qualify with respect to the other options (for example like *-dt_only* or *-ndt_only*).

The command returns an instance representing the module, but it is not the master instance.

**What Next**

Do one of the following:

- Specify a design that has the master instance of the specified module in its subtree
- Change the other command line options so that the master instance is not filtered out.
- Change the *MasterInstance* attribute settings.

**See Also**

- report_attribute
- set_attribute

---

## AUTOREAD-2141

(warning) Multiple master instances found for design '%s': '%s' and '%s'. Randomly choosing '%s' instance.

Feedback

### Description

You receive this message because you specified the *-master_only* command line option, and the command found two instances of the same design that have the *MasterInstance* attribute set. This compromises the concept of the master instance, which is that you can have only one.

### What Next

Remove the *MasterInstance* attribute from one of the specified instances.

### See Also

- report_attribute
- set_attribute

---

## AUTOREAD-2142

(error) Multiple designs are found matching the '%s' name.

### Description

You receive this message because you specified a name that is not unique.

### What Next

When designs with identical names are loaded into memory, the filename is added to the design name to make it unique. You can use the *find* and *get_designs* commands to determine the unique name of the design that you want to specify.

### See Also

- get_designs

---

## AUTOREAD-2143

(error) No parent partition found in the current design for design '%s'.

### Description

You receive this message because you need to set your compile partitions in order for this command to work properly, and the current_design has to be set to a design that has partitions in its subhierarchy (or is a partition itself).

### What Next

Set the compile partitions on the current design, or set the *current design* to a design (preferably the top level module) that has partitions in its design subtree.

Feedback

### See Also

- current_design

---

## AUTOREAD-2144

(error) Multiply-instantiated design '%s' is not a compile partition.

### Description

You receive this message because the specified design is a parent module in the logical hierarchy of the module for which you want to find the parent partition. It is impossible to find the parent partition as it might be different for the different instances. The design is multiply-instantiated, but is not marked as partition. This should not happen if the compile partitions are correctly set.

### What Next

Correctly set the compile partitions on the current design. This entails either of the following:

- The design must be made unique by using the *uniquify* command.
- All multiply-instantiated designs and the top level module must be partitions, and an instance must be picked as master instance.

### See Also

- current_design
- uniquify

---

## AUTOREAD-2145

(error) Directory %s, which should contain the mapped design, does not exist.

### Description

You receive this message because the directory which should contain the mapped designs does not exist. This is either the default directory (pass0) or a directory you specified by using the *-mapped* and *-type* options of the *acs_merge_design* command. The program cannot merge the designs in the process of being updated into the mapped designs.

### What Next

Use the *acs_merge_design* command with the *-mapped* option at the command line to specify a directory for the mapped designs.

Feedback

## AUTOREAD-2146

(error) No unique top design '%s' after merge from unmapped directory '%s'.

### Description

You receive this message because after the merge from the directory specified by the *-unmapped* option (default: elab/db) to the design specified by the *-mapped* option (default: pass0) there does not exist a unique top design. Either there is no top design at all because the unmapped directory does not contain this design, or there are several top designs with the same name because there are several db files in the unmapped directory containing the top design.

### What Next

Ensure that in the unmapped directory there exists a complete unique design database containing exactly one version of the top design.

## AUTOREAD-2147

(warning) Previous partition '%s' does not have\n \ta corresponding design after the merge.

### Description

You receive this message because the design specified by the *-mapped* option of *acs_merge_design* command contained a partition whose associated design does no longer exists in the design hierarchy after merging the updated designs. Thus, the previous partition will no longer be present in the updated design. This can happen if your design updates contains changes to the design hierarchy, e.g. if you have ungrouped or flattened some design within the updated design part.

### What Next

No action is necessary if this is what you expected. However, after major changes to the design hierarchy it is recommended to re-partition the design and map it from scratch using *acs_compile_design*.

## AUTOREAD-2148

(error) The top design '%s' does not\n \tlink after merging updates from directory '%s' specified\n \tby the -unmapped option (elab/db by default).

Feedback

**Description**

You receive this message because the design does not link completely after the *acs_merge_design* command has merged in the updated designs from the directory specified by the *-unmapped* option (elab/db by default).

**What Next**

Ensure that the specified unmapped design directory contains a complete design database for the top design which is consistent with the mapped design specified by option '-mapped' for acs_merge_design.

---

## AUTOREAD-2149

(warning) Designs are merged into mapped designs \n \tin default mapped path %s.

**Description**

You receive this message because you did not use the *-mapped* option of the *acs_merge_design* command in the command line to provide a directory for the mapped designs. This warning message informs you that the program is using the default directory for the mapped designs.

**What Next**

No action is necessary, if this is what you expected.

---

## AUTOREAD-2150

(warning) Using unmapped designs in default directory elab/db.

**Description**

You receive this message because you did not use the *-unmapped* option of the *acs_merge_design* command in the command line to provide a directory for the unmapped designs and designs being merged. This warning message informs you that the program is using the default directory for the unmapped designs.

**What Next**

No action is necessary, if this is what you expected.

---

## AUTOREAD-2151

(warning) MasterInstance of the '%s' module is not found. \n \tRandomly choosing the '%s' instance instead.

Feedback

### Description

You receive this message because you specified the *-master_only* command line option, but the instance that has the *MasterInstance* attribute set is not found for the specified module.

### What Next

Perform one of the following tasks:

- Specify a module that has a master instance.
- Change the *MasterInstance* attribute settings on one of the instances of the specified module.

### See Also

- report_attribute
- set_attribute

---

## AUTOREAD-2152

(warning) Report for design %s might not be valid.

### Description

You receive this message because the compile flow is a bottom-up compile. At the end of the compile on the top level design, the *compile* command is run with the *-top* option, which might cause changes in subpartitions. Thus, reports generated immediately after the compile of the subpartitions might be invalid after running after *compile -top*.

### What Next

You can either choose not to use custom report scripts on subpartitions, or choose to ignore the warning message, but consider that the subpartition reports you have might be invalid.

---

## AUTOREAD-2153

(warning) No area estimation numbers are available yet.

### Description

You receive this message because the *report_partitions* command has been executed before any area estimation has been done. Area estimation is performed only by the "auto partitioning" command, which is the *-auto* option of the *set_compile_partitions* command. At this time the report of the design partitions shows only zeros in the percentage column.

Feedback

### What Next

No action is necessary, if this is what you expected. However, if it is necessary to get useful percentage numbers, run the *set_compile_partitions* command with the *-auto* option.

---

## AUTOREAD-2154

(error) Cannot open file '%s' for reading.

### Description

You receive this message from the *acs_read_hdl* command because the tool is unable to open (or read data or text from) the named file in the message.

### What Next

Verify the existence and correct spelling of the file you specified and that you have read privileges to this file and all directories leading to it. Also check to confirm that you spelled correctly the path to the file. Make any necessary corrections. Then run the *acs_read_hdl* command again.

---

## AUTOREAD-2155

(information) Expanding the search_path with '%s'.

### Description

You receive this message from the *acs_read_hdl* command to let you know that, because AUTOREAD detects that HDL Analyzer might not be able to locate some of the HDL files you listed in the *search_path* variable, AUTOREAD is appending one or more paths to the variable.

If you specified the *-recurse* option of the *acs_read_hdl* command, the tool might see more Verilog include files than the *analyze* command sees, because the *analyze* command does not search recursively the directories of the files listed in the *search_path* variable.

This automatic expansion of the search path eliminates your having to enter manually into the *search_path* variable all paths to Verilog include files.

### What Next

This message is informational only and requires no action on your part.

### See Also

- search_path

Feedback

## AUTOREAD-2156

(information) Found %d include files in the search_path matching '%s'.

### Description

You receive this message from the *acs_read_hdl* command to inform you that AUTOREAD has encountered an include Verilog preprocessor directive that gives the file name of the include file but does not specify the path to the include file.

After searching all directories in the order in which they are listed in the *search_path* variable, the tool has found more than one file with the same name as that given in the preprocessor directive. AUTOREAD is assuming that the first matching file is the one you want to include.

### What Next

This message is informational only and requires no action on your part. However, because the Design Compiler *analyze* and *read_verilog* commands will show the same behavior, and because the behavior of these commands is always implementation- and release-dependent, it is no doubt wise to identify the correct path information and add it to the preprocessor directive. Then run the *acs_read_hdl* command again.

### See Also

- search_path

## AUTOREAD-2157

(warning) Could not locate include file %s, included by file %s.

### Description

You receive this message from the *acs_read_hdl* command because Automated Chip Synthesis (ACS) encountered an include Verilog preprocessor statement that does not specify a path to the include file.

ACS first tries to locate the file by searching all the directories listed in the *search_path* variable. If this search is not successful, ACS then searches all of the directories of all files listed in the *-hdl_source* option (if defined) of *acs_read_hdl*.

If you also specified the *-recurse* option of *acs_read_hdl*, ACS searches further all of the subdirectories of all the files listed in the *-hdl_source* option of *acs_read_hdl*.

The *-recurse* option of *acs_read_hdl* does not search all subdirectories listed in the *search_path* variable, however. (In this respect, the command mimics the behavior of the *analyze* and *read_verilog* commands.)

Feedback

After searching all of these directories, ACS did not find the missing include file.

**What Next**

This warning message alerts you to a possible conflict, which, if not resolved, might prevent a later *analyze* command being able to find the include file, resulting in an error.

To ensure a smooth process here, it is no doubt preferable to locate and identify the correct include file and add its path to the statement or to the *search_path* variable. Then run the *acs_read_hdl* command again.

**See Also**

- search_path

---

## AUTOREAD-2158

(warning) Found more than one matching include file %s, wanted by file %s.

**Description**

You receive this message from the *acs_read_hdl* command because AUTOREAD encountered an include Verilog preprocessor statement that does not specify a path to the include file.

ACS first tries to locate the file by searching all the directories listed in the *search_path* variable. If this search is not successful, AUTOREAD then searches all of the directories of all files listed in the *-hdl_source* option (if defined) of *acs_read_hdl*.

If you also specified the *-recurse* option of *acs_read_hdl*, AUTOREAD searches further all of the subdirectories of all the files listed in the *-hdl_source* option of *acs_read_hdl*.

The *-recurse* option of *acs_read_hdl* does not search all subdirectories listed in the *search_path* variable, however. (In this respect, the command mimics the behavior of the *analyze* and *read_verilog* commands.)

Although AUTOREAD could not find the include file in the directories listed in the *search_path* variable, it did locate, by searching all directories (and possibly subdirectories) listed in the *-hdl_source* option of *acs_read_hdl*, more than one include file with the same name. (The implicit assumption is that the *search_path* variable presents an ordered list of directories, but this assumption does not apply to the list of directories in the *-hdl_source* option.)

**What Next**

This warning message alerts you to a possible conflict, which, if not resolved, might prevent a later *analyze* command being able to find the include file, resulting in an error.

Feedback

To ensure a smooth process here, it is no doubt preferable to identify the correct include file and add its path to the *search_path* variable. Then run the *acs_read_hdl* command again.

**See Also**

- search_path

---

## AUTOREAD-2159

(warning) Multiple Master Instances found for design '%s'. Using instance '%s'.

**Description**

You receive this message because you've specified multiple Master Instances for a multiply instantiated design. You've also specified the '-force' option with the 'set_compile_partitions' command, causing the command to pick the alphabetically smallest instance as Master Instance now.

**What Next**

There is nothing to do, if the instance mentioned in the warning is the instance you want to use as Master Instance for this design. If you want to specify a different instance as Master Instance you would need to remove the *MasterInstance* attribute on all but the desired instance of this design.

See the *MasterInstance* man page or the *AUTOREAD, User Guide* for more detailed information.

**See Also**

- set_attribute
- uniquify

---

## AUTOREAD-2160

(warning) No qualifying designs are found in level '%d'.

**Description**

You receive this message because you used the *-level* option to specify where to set the compile partitions on the design, but no design at this hierarchical level qualified to become a partition. Only standard hierarchical cells can be treated as partitions. A cell will not be treated as partition if it is not hierarchical, dont touched, or a DesignWare part.

Feedback

**What Next**

Take either of the following actions:

- Specify a different hierarchy level (a lower number) that contains instances with the *-level* option.
- Use a different option to specify where to set compile partitions. For detailed information, see the *set_compile_partitions* man page.

---

## AUTOREAD-2161

(warning) Executable '%s' does not exist.

**Description**

You receive this message because the specified executable could not be found. This is often due to a wrong setting of the AUTOREAD variable *acs_dc_exec*. If one of these variables is set, ACS will use the specified executable instead of the default ones.

**What Next**

Take either of the following actions:

- Check the ACS variables listed above for typographical errors.
- Use absolute path descriptions instead of relative ones.

---

## AUTOREAD-2162

(warning) You do not have execute permissions for file '%s'.

**Description**

You receive this message because you do not have the right permissions to execute the specified file.

**What Next**

Take either of the following actions:

- Try to set the execute-permission (e.g., with 'chmod' on UNIX platforms).
- Ask your system administrator for help.

---

## AUTOREAD-2163

(information) Starting Design Compiler Design Budgeting.

Feedback

### Description

This message indicates that AUTOREAD is using Design Compiler for slack allocation (budgeting).

AUTOREAD distinguishes between RTL budgeting and gate-level budgeting. RTL budgeting is performed, e.g., by the *acs_compile_design* command and utilizes Design Compiler's built-in design budgeting facilities.

Gate-level budgeting is performed, e.g., by the *acs_recompile_design* and *acs_refine_design* command. ACS offers three different methods for gate-level slack allocation: Design Compiler budgeting, PrimeTime budgeting, and budgeting via a user budgeting script. Design Compiler budgeting is the recommended way for design budgeting and selected by default. PrimeTime budgeting is deprecated and currently kept for backwards compatibility.

### What Next

If you wish to use a custom budgeting script for gate-level budgeting, please place a script named *budget.scr* into the directory defined by the *user_budget_script* file type.

---

## AUTOREAD-2164

(information) Starting PrimeTime Design Budgeting.

### Description

This message indicates that AUTOREAD is using PrimeTime for slack allocation (budgeting).

AUTOREAD distinguishes between RTL budgeting and gate-level budgeting. RTL budgeting is performed, e.g., by the *acs_compile_design* command and utilizes Design Compiler's built-in design budgeting facilities.

Gate-level budgeting is performed, e.g., by the *acs_recompile_design* and *acs_refine_design* command. AUTOREAD offers three different methods for gate-level slack allocation: Design Compiler budgeting, PrimeTime budgeting, and budgeting via a user budgeting script. Design Compiler budgeting is the recommended way for design budgeting and selected by default. PrimeTime budgeting is deprecated and currently kept for backwards compatibility.

### What Next

If you wish to use a custom budgeting script for gate-level budgeting, please place a script named *budget.scr* into the directory defined by the *user_budget_script* file type.

Feedback

## AUTOREAD-2165

(information) Using custom budgeting script '%s'.

**Description**

This message indicates that AUTOREAD is using a custom busgeting script for slack allocation (budgeting).

AUTOREAD distinguishes between RTL budgeting and gate-level budgeting. RTL budgeting is performed, e.g., by the *acs_compile_design* command and utilizes Design Compiler's built-in design budgeting facilities.

Gate-level budgeting is performed, e.g., by the *acs_recompile_design* and *acs_refine_design* command. AUTOREAD offers three different methods for gate-level slack allocation: Design Compiler budgeting, PrimeTime budgeting, and budgeting via a user budgeting script. Design Compiler budgeting is the recommended way for design budgeting and selected by default. PrimeTime budgeting is deprecated and currently kept for backwards compatibility.

**What Next**

If you do not wish to use a custom busgeting script, please remove file *budget.scr* from the directory defined by the *user_budget_script* file type.

## AUTOREAD-2166

(information) Compile design '%s' in '%s'.

**Description**

This message is issued by *acs_compile_design* and indicates the source where the specified design is loaded from.

## AUTOREAD-2167

(information) Compile design in memory.

**Description**

This message is issued by *acs_compile_design* and indicates that ACS is going to compile the in-memory design.

## AUTOREAD-2168

(information) Re-compile design '%s' in '%s'.

Feedback

**Description**

This message is issued by *acs_recompile_design* and indicates the source where the specified design is loaded from.

---

## AUTOREAD-2169

(information) Re-compile design in memory.

**Description**

This message is issued by *acs_recompile_design* and indicates that ACS is going to re-compile the in-memory design.

---

## AUTOREAD-2170

(information) Refine design '%s' in '%s'.

**Description**

This message is issued by *acs_refine_design* and indicates the source where the specified design is loaded from.

---

## AUTOREAD-2171

(information) Refine design in memory.

**Description**

This message is issued by *acs_refine_design* and indicates that AUTOREAD is going to refine the in-memory design.

---

## AUTOREAD-2172

(information) Reading partition '%s' from '%s'.

**Description**

This message is issued whenever a partition is read into memory.

---

## AUTOREAD-2173

(information) Writing partition '%s' to '%s'.

**Description**

This message is issued whenever a partition is written to disc.

Feedback

## AUTOREAD-2174

(information) Deriving budgets from gate-level design in '%s'.

### Description

This message is issued by *acs_recompile_design* and indicates the source of the gate-level design that is utilized for slack allocation (budgeting). Note that in *acs_recompile_design*, the design used for budgeting is different than the design to be compiled.

## AUTOREAD-2175

(information) Removing designs from memory.

### Description

This message indicates that all in-memory designs are discarded. Design deletion takes place at the end of each invocation of *acs_compile_design*, *acs_recompile_design*, and *acs_refine_design* in order to avoid confusion between the pre-compiled and the post-compiled designs. If designs were not deleted, a possible confusion could occur, e.g., if *acs_refine_design* is called right after *acs_compile_design*. The refine command would compile the design in memory which is unchanged and not the result of *acs_compile_design*. The automatic design deletion ensures than *acs_refine_design* does not find any design in memory and therefore reads the design, by default, from the destination directory of *acs_compile_design*.

## AUTOREAD-2176

(information) Using user override procedure for command '%s'.

### Description

This message indicates that AUTOREAD has found a user override procedure for the specified command. This procedure will be executed instead of the default one. User override procedures can be defined for the commands *acs_compile_design* (procedure *acs_compile_design_user*), *acs_recompile_design* (procedure *acs_recompile_design_user*), and *acs_refine_design* (procedure *acs_refine_design_user*). The easiest way to set up a user override procedure is to customize one of the predefined *.template* files *acs_compile_design.template*, *acs_recompile_design.template*, and *acs_refine_design.template*.

### What Next

If you do not wish to override the default behaviour, delete the procedures *acs_compile_design_user*, *acs_recompile_design_user*, and *acs_refine_design_user*.

Feedback

## AUTOREAD-2177

(Error) ILM design '%s' is a subdesign of ILM design '%s'.

### Description

You receive this message because you have nested ILMs in your design. This is not supported yet. ILMs are detected by testing the *is_interface_model* or the *useILM* attribute. The first indicates that a design is an ILM, the latter tells AUTOREAD to create an ILM for the design. In your current design the mentioned designs are ILMs (or are tagged to become ILMs), but the first is instantiated in the logical hierarchy of the other. This is currently not allowed.

### What Next

Make sure you don't have nested ILMs in your design and you don't set the *useILM* attribute on any design that is instantiated in the logical hierarchy of another ILM (or a design with the "useILM" attribute set). You can either remove the "useILM" attribute from the specified designs, or make sure that the full design representation of the designs is linked in, instead of the ILM representation.

### See Also

- set_attribute

## AUTOREAD-2178

(Error) Partition '%s' is inside the ILM design '%s'.

### Description

You receive this message because you have marked the specified design as AUTOREAD partition, but it is instantiated in the logical hierarchy of the ILM design. Part of the ILM design is or will be cut out which may lead to unexpected constraints for the partition. This is why partitions inside ILMs are not allowed.

### What Next

Make sure you only created ILMs for designs marked as partitions or designs below partitions. Also, don't set the *useILM* attribute on a design above an AUTOREAD partition.

### See Also

- set_attribute

Feedback

## AUTOREAD-2179

(Error) ILM design '%s' contains an unresolved reference '%s'.

### Description

You receive this message because you have marked the specified design with the *useILM* attribute to become an ILM, but it instantiates a design that couldn't be resolved by the linker.

### What Next

Make sure your *search_path* and *link_library* are set correctly (see the man page of the *link* command).

### See Also

- set_attribute

## AUTOREAD-2180

(Error) ILM design '%s' detected in full design.

### Description

You receive this message because you are trying to compile a design in memory with *acs_refine_design* and this design contains an ILM. The AUTOREAD flow needs the full design representation (in memory or in the source pass) in order to run a useful ILM based flow. The ILM in your design will be considered as full design representation for this partition (i.e. the "is_interface_logic" attribute will be removed). The post_compile db file created by acs_refine_design will contain only the functionality contained in the mentioned ILM design.

## AUTOREAD-2182

(warning) Multiple instances found for design '%s'. Using instance '%s'.

### Description

You receive this message because the design you specified is multiply instantiated and cannot be uniquely identified with a single instance in the design. Therefore, the command you invoked has selected an arbitrary cell instance to proceed.

Feedback

### What Next

There is nothing to do, if the instance mentioned in the warning is the one you want to use as instance for this design. If the wrong instance has been chosen, you might want to uniquify the design in order to eliminate multiple instances in your design.

### See Also

- uniquify

---

## AUTOREAD-2183

(error) Option '%s' can be used only inside of another tool.

### Description

This error occurs because because you have used an option that is not supported in this tool. For example, physical AUTOREAD rtl2pg and gates2pg flow can be applied only inside a different tool than the one you are currently using.

---

## AUTOREAD-2184

(error) Option '%s' is not comatible with the update option.

### Description

You receive this message because you have specified an option that cannot be combined with the 'update' feature. E.g., the physical AUTOREAD flows cannot be used inside an update flow.

---

## AUTOREAD-2185

(error) Option '%s' is not comatible with physical AUTOREAD flows.

### Description

You receive this message because you have specified an option that cannot be combined with the physical AUTOREAD flows.

---

## AUTOREAD-2186

(warning) Option '-ignore_analyze_errors' of command 'acs_read_hdl' is no longer supported.

Feedback

### Description

This warning message occurs when the specified option is no longer supported.

Even with this option set, the *analyze* command used by *acs_read_hdl* internally halts upon encountering an error and forgets all data obtained during that call to *analyze*. As *acs_read_hdl* always tries to implicitly call *analyze* with as many files as possible, the result of this option is not exactly what you would expect.

Preceding internal calls to *analyze* and following calls to *analyze* are still executed. Therefore, you can still use this option for a trial analysis.

### What Next

This is only a warning message. No action is required.

---

## AUTOREAD-2187

(warning) false dont_touch attribute is detected on object '%s'. It may be lost or AUTOREAD may not be able to complete successfully.

### Description

This message indicates that there is dont_touch being set to false in your design. Right now, AUTOREAD cannot guarantee that AUTOREAD could complete successfully if your design has false dont_touch attribute and the object who has false dont_touch is a multiply instantiated design or is an instance of a multiply instantiated design. Or, the false dont_touch attribute is not be hornored if the object who has false dont_touch is a singly instantiated non-partition design or its instance, and this false dont_touch attribute may cause long runtime on the upper level partitions' compile (object who has false dont_touch attribute may be re-compiled during upper level partitions' compile). Or, the false dont_touch attribute may be lost after compile by using AUTOREAD if the object who has false dont_touch is a singly instantiated partition design or its instance.

### What Next

You need to optimize/compile the design (who or whose instance has false dont_touch) independently, and remove the false dont_touch attribute on your design before AUTOREAD to make sure that AUTOREAD could run through successfully. It is not recommended to apply false dont_touch attribute on your design when you use AUTOREAD.

---

## AUTOREAD-2188

(error) '%s' is not an autoread-supported attribute.

Feedback

### Description

This error message occurs when the specified attribute is not currently supported by autoread.

### What Next

To view the complete list of attributes supported by autoread, their valid values and their default values, see the *acs_set_attribute* man page.

---

## AUTOREAD-2190

(error) Top module does not link.

### Description

This error message occurs when the the *link* command issued within the AUTOREAD auto update flow fails. The failure occurs when the GTECH library or the target Technology library is omitted or incorrectly specified.

### What Next

Ensure that the *search_path* is set correctly and that all of the source directories are specified in the *-hdl_source* option of the *acs_read_hdl* command.

### See Also

- current_design

---

## AUTOREAD-2191

(error) Corrupt elab_times table.

### Description

This error message occurs when the design's elab_times table is corrupted.

The elab_times table is an ASCII table created during the AUTOREAD auto update flow to keep track of the update times of the designs in the design hierarchy. The default location for the table is elab/db.

### What Next

To continue, delete the design's elab_time table. Then regenerate the table using the *acs_read_hdl* command with the *-auto_update* or *-update* option.

Feedback

## AUTOREAD-2192

(warning) Cell '%s' does not have reference design.

### Description

This message is printed because AUTOREAD could not locate referencing design for the cell.

### What Next

Take either of the following actions:

- Make sure design is properly linked.
- Make sure all design units are read properly and there are no syntax errors.

## AUTOREAD-2193

(error) Valid target library for cell '%s' could not be found.

### Description

AUTOREAD issues this error when valid target library for cell could not be found. This can happen when libraries which are characterized for specified operating condition are not found. AUTOREAD also issues this message when target library subset and library set characterized for operating conditions have no common elements.

### What Next

- Make sure operating conditions and target library subset is properly specified.

### See Also

- set_target_library_subset
- set_operating_conditions

## AUTOREAD-2194

(error) Attribute '%s' is no longer supported by AUTOREAD.

### Description

AUTOREAD issues this message when attempting to set an obsolete AUTOREAD attribute. AUTOREAD attributes become obsolete when their corresponding DC commands become obsolete.

The list of obsolete attributes and the corresponding DC commands is given below.

Feedback

```
Attribute Name               Design Compiler Command
-------------------------------------------------------------------
HasArithmetic                transform_csa
PartitionDP                  partition_dp
```

**What Next**

Remove the obsolete attribute from the compilation scripts and re-run AUTOREAD.

## AUTOREAD-2195

(warning) Attribute '%s' set on partition '%s' is obsolete and will be ignored.

**Description**

AUTOREAD prints this message when it finds an obsolete attribute on a partition. Please refer to the AUTOREAD Users Guide or the acs_set_attribute man page for a list of supported attributes.

**What Next**

Remove the obsolete attribute from the partition and run AUTOREAD again.

# BBT

## BBT-001

(information) Port %s already has %s setting, overwriting.

**Description**

This message indicates that the specified port already has its load or drive information set by a previous call of set_blackbox_port_load or set_blackbox_port_drive. The more recent call to set_blackbox_port_load or set_blackbox_port_drive is overwriting the previous setting.

**What Next**

No action is needed if this intended.

## BBT-201

(warning) Port %s does not belong to the current block.

Feedback

### Description

The command only takes port objects that are ports of the current block. The specified port is not a port of the current block. It is ignored by the command.

### What Next

If the current block is the block you are trying to create BBT for, no action is needed.

---

## BBT-202

(warning) Port %s is a feedthrough port.

### Description

You are getting this message because you attempted to specify blackbox timing information for a feedthrough port created by the tool.

A feedthrough port created by the tool is either connected directly to another non-feedthrough port of the design and is going to share the same timing characteristics as the other port, or connected to an existing path going through the design in which case the connected netlist is going to be used to time through the port. Either case, user cannot specify blackbox timing on a feedthrough port. The specified timing information for this port is ignored.

### What Next

No action is needed.

---

## BBT-203

(warning) Failed to find a default %s lib cell.

### Description

You are getting this message because you attempted to create timing model for a blackbox design, and the tool could not find certain type of library cell to use in order to construct the model. This may cause the model to be incomplete.

### What Next

Please note that the tool cannot use any MV cell, such as level shifter, isolation cell, or always-on cell, for the purpose of building the blackbox timing model. It is also not allowed to use any lib cell marked as don't use.

Please check reference libraries to make sure that there is useable lib cell of the specified type.

Feedback

## BBT-204

(warning) Clock %s does not belong to the current block.

**Description**

The command only takes clock objects that are clocks of the current block. The specified clock is not a clock of the current block. It is ignored by the command.

**What Next**

If the current block is the block you are trying to create BBT for, no action is needed.

## BBT-301

(error) Value %f for option %s is invalid.

**Description**

The command option only accepts positive number.

**What Next**

Please correct the value.

## BBT-302

(error) Cannot specify %s without -type.

**Description**

The specified option can only be specified when option -type is specified. Specifying the option without -type is meaningless.

**What Next**

Please correct the command and re-issue.

## BBT-303

(error) Must specify one of %s.

**Description**

Must specify one of the specified options. Not specifying any of them is meaningless.

**What Next**

Please correct the command and re-issue.

Feedback

## BBT-304

(error) Value %d for option %s is invalid.

**Description**

The command option only accepts positive number.

**What Next**

Please correct the value.

## BBT-305

(error) Design %s already has BBT defined.

**Description**

You are getting this message because you are calling a BBT (blackbox timing) command for the design which already has BBT defined.

**What Next**

If you are trying to add information to the existing BBT, please use *write_blackbox_timing_script <file_name>* to write out a script containing commands that can re-create the existing BBT, then edit the script to add the things you want to add. After you finish editing the script, please do a remove_blackbox_timing then source the script.

## BBT-306

(error) Value %s for option -edge is invalid.

**Description**

Valid values for the option are *rise* and *fall*.

**What Next**

Please correct the value.

## BBT-307

(error) Cannot find blackbox timing data for non-PG port %s.

**Description**

This message indicates that the tool cannot find the specified non-PG port in the blackbox timing model which is being defined through a set of tcl commands.

Feedback

If you are getting this message but find the port exists on the current block, there are two possibile reasons:

1. BBT (Blackbox Timing) does not allow user to specify any constraint for an output/inout port if the port already has a driver in the existing netlist, or an input/inout port if the port already has load in the existing netlist. If the specified port falls into this category, you cannot create blackbox timing constraint on this port.
2. The first blackbox timing model command issued on the current block would take a snapshot of the ports of the block. All commands that define the blackbox timing for the current block are expected to be issued in one shot without any netlist modification during the process. Please check your scripts to make sure that no netlist change has been done after issuing the first blackbox timing model command.

**What Next**

Check if you specify the name correctly. If it is correct, check if the port has existing connection in the netlist. If so, do not use this port in BBT. If you really need to use this port in BBT, see if you can disconnect it from its existing driver/load. Or, if it is a port that you created after issing the first blackbox timing command, please change your flow to add the port before issuing any blackbox timing command, or do a *remove_blackbox_timing* after adding the port and re-issue all the blackbox timing commands.

---

## BBT-308

(error) Module %s is not a %s.

**Description**

The specified module is not of the right type. The command needs a library cell which is a buffer or inverter.

**What Next**

Correct the command and re-issue.

---

## BBT-309

(error) Cannot find %s type %s.

**Description**

The tool cannot find the load or drive type with the specified name. It is possible that it was never created or was not created successfully.

To create a load type, use the command *create_blackbox_load_type*. To create a drive type, use the command *create_blackbox_drive_type*.

Feedback

**What Next**

Please check to make sure that the specified load or drive type is created successfuly.

---

## BBT-310

(error) Cannot get mode and corner information.

**Description**

Mode and corner information are needed for creating BBT, even for a single mode single corner design.

You are getting this error message because the tool cannot find mode or corner information.

**What Next**

Please check if design is loaded and linked successfully.

---

## BBT-311

(error) Port %s is not a clock input port for BBT.

**Description**

You are getting this message because you are calling *create_blackbox_clock_network_delay* or *create_blackbox_constraint -from* for the specified port. But the port is not a clock input port.

Only clock input port can have network delay information or be the from port of a constraint path.

**What Next**

Please check if the specified port is an input port and a clock typed port or have run set_blackbox_clock_port on it.

---

## BBT-312

(error) Port %s is not input or inout type.

**Description**

Only input or inout type ports can have load setting, or be the from port of a delay path, or be a from/to port of a constraint path.

Feedback

**What Next**

Please check the type of the specified port.

---

## BBT-313

(error) Port %s is not output or inout type.

**Description**

Only output or inout type ports can have drive setting or be the to port of a delay path.

**What Next**

Please check the type of the specified port.

---

## BBT-314

(error) Port %s already has a driver.

**Description**

BBT (Blackbox Timing) does not allow user to specify any constraint for an output/inout port if the port already has a driver in the existing netlist, or an input/inout port if the port already has load in the existing netlist.

**What Next**

Please do not use this port in BBT. If you really need to use this port in BBT, see if you can disconnect it from its existing driver/load.

---

## BBT-315

(error) Port %s already has a driver.

**Description**

BBT (Blackbox Timing) does not allow user to specify any output port constraint for an inout port if the port already has a driver in the existing netlist.

**What Next**

Please do not specify any constraint that is intended for an output port on this inout port in BBT. If you really need to use this port, see if you can disconnect it from its existing driver.

---

## BBT-316

(error) Load cap value %f is smaller than cap value %f of lib pin %s/%s.

Feedback

**Description**

You are getting this message because you specified a load capacitance value for a port of the design and the value is too small.

The tool uses the smallest buffer library cell's input pin capacitance as a guideline to check whether the load cap user specifies is reasonable.

**What Next**

Please specify a value larger than the lib pin's cap indicated in the message.

If you want to use the input pin cap of a specific buffer or inverter cell, please use *create_blackbox_load_type* and *set_blackbox_port_load -type*.

---

## BBT-317

(error) Invalid value %f for option -value in presence of -clock.

**Description**

You are getting this message because you specified a value that is not between 0.0 and 1.0 for option *-value* while you also specified option *-clock*.

When option *-clock* is specified, the meaning of *-value* changes from the absolute delay value to the percentage number of the clock period. The tool multiply the value of *-value* with the period of the specified clock to derive the absolute delay value.

**What Next**

Please specify a value that is larger than 0 and no larger than 1. Or, if you want to specify the absolute delay value, please remove the *-clock* option.

---

## BBT-318

(error) Current design is not design view.

**Description**

You are getting this message because you are trying to specify blackbox timing information for the current design which is not design view.

Blackbox timing can only be specified when the current design is design view.

**What Next**

Please open the design view of the blackbox design to continue.

If you only have the outline view of the design and do not have the design view yet, please do *expand_outline* to get the design view.

Feedback

## BBT-319

(error) Cannot find blackbox timing data for clock %s.

**Description**

This message indicates that the tool cannot find the specified clock in the blackbox timing model which is being defined through a set of tcl commands.

If you are getting this message but find the clock exists on the current block, there are two possibile reasons:

1. BBT (Blackbox Timing) does not allow user to specify any constraint for an output/inout port if the port already has a driver in the existing netlist, or an input/inout port if the port already has load in the existing netlist. If the specified port falls into this category, you cannot create blackbox timing constraint on this port.
2. The first blackbox timing model command issued on the current block would take a snapshot of the ports of the block. All commands that define the blackbox timing for the current block are expected to be issued in one shot without any netlist modification during the process. Please check your scripts to make sure that no netlist change has been done after issuing the first blackbox timing model command.

**What Next**

Check if you specify the name correctly. If it is correct, check if the port has existing connection in the netlist. If so, do not use this port in BBT. If you really need to use this port in BBT, see if you can disconnect it from its existing driver/load. Or, if it is a port that you created after issing the first blackbox timing command, please change your flow to add the port before issuing any blackbox timing command, or do a *remove_blackbox_timing* after adding the port and re-issue all the blackbox timing commands.

## BBT-320

(error) You cannot specify an output port '%s' to be a generated clock master source.

**Description**

A generated clock master can be an input or inout port or a pin.

**What Next**

Determine an appropriate master source for the generated clock.

## BBT-321

(error) Generated clock name %s has been used by other clocks.

Feedback

**Description**

When creating blackbox generated clock using command create_blackbox_generated_clock, the name specified for the generated clock has been used by other clocks.

**What Next**

Please change the name of the blackbox generated clock.

---

## BBT-322

(error) Blackbox generated clock has no master clock source pin/port.

**Description**

Blackbox generated clock must have a master clock pin/port. User could use command create_blackbox_generated_clock -source to specify a master clock source pin/port for the generated clock. If it is not specified, the master clock specified for this generated clock must have a source pin/port.

**What Next**

Please specify a master source clock pin/port for the blackbox generated clock.

---

## BBT-323

(warning) In-memory blackbox timing model for design %s is removed because %s.

**Description**

In blackbox timing model, if user create or remove a mode, corner or port, all the in-memory blackbox timing model information will be deleted. If the blackbox timing model is already committed to disk, the on-disk model is not affected.

**What Next**

Reset the blackbox timing model information if needed.

---

## BBT-501

(error) Incremental blackbox creation failed for designs: %s.

**Description**

Incremental blackbox could not be created for designs in the message. The tool will continue using the blackbox it was using prior to creating this incremental abstract.

Feedback

**What Next**

Check the blackbox script provided in set_bbt_override.

# BLOX

## BLOX-001

(error) %s.

**Description**

The input 3DBlox file(s) may contain syntax error.

**What Next**

Please follow the error message to find if there is syntax error in the input 3DBlox file(s).

## BLOX-002

(error) Python execute file (%s) error, please find detail in file *.debug.log.

**Description**

There occurs error while executing python command. Detail info is dumped in file *.debug.log.

**What Next**

Please get the detail error info and contact AE for help.

## BLOX-003

(error) Syntax error: %s.

**Description**

The input 3DBlox file(s) contains syntax error. Please check the error message.

**What Next**

Please follow the error message to find if there is syntax error in the input 3DBlox file(s).

## BLOX-004

(error) Data error: %s.

Feedback

**Description**

The input 3DBlox file(s) contains wrong data value. Please check with the error message.

**What Next**

Please follow the error message to find if there is data error in the input 3DBlox file(s).

---

## BLOX-005

(warning) Loop connection is found for chiplets: %s in %s.

**Description**

There is loop connection in specified .3dbx file, thus z level of all the chip insts will be set to zero.

**What Next**

Please check the source file to find the loop connection and remove it.

---

## BLOX-006

(error) Invalid library name '%s' specified in '%s' command option of read_3dblox.

**Description**

The library name specified is invalid because it contains spaces.

**What Next**

Ensure that there are no spaces in library name specified.

---

## BLOX-007

(error) %s.

**Description**

The specified library name exists in directory. read_3dblox creates library path under ./refLibs/ directory. The specified library name from 3dblox files already exists.

**What Next**

Please check the existing directory. Back up or delete it, then run read_3dblox again.

---

## BLOX-008

(error) The specified library path '%s' doesn't exist.

Feedback

**Description**

The library name specified by -library contains path, but the path doesn't exist.

**What Next**

Ensure the library path exist.

---

## BLOX-009

(warning) ChipletDef '%s' has different bump thickness (%s and %s) under one region.

**Description**

Bumps belong to one region have different bump thickness.

**What Next**

Check the related bump thickness values are expected or not.

---

## BLOX-010

(warning) The bumps between chiplet instance '%s' and '%s' are with inconsistent thickness %s and %s.

**Description**

A connection is detected by write_3dblox since their bump regions are overlapped. But they have different bump thickness.write_3dblox chooses the top thickness as the connection thickness.

**What Next**

Check the related bump thickness values are expected or not.

---

## BLOX-011

(error) 3Dblox version 1.0 does not support -mode feasibility.

**Description**

3Dblox version 1.0 does not support -mode feasibility, please specify -version upper than 1.0

**What Next**

Please do not use -version 1.0 with -mode feasibility.

Feedback

# BO

## BO-2001

(Information) Setting global option with individual option violates mutual Exclusivity.

**Description**

This message invokes when set_boundary_optimization values are set with auto | none | all along with any of one of more below mentioned options. -constant_propagation, -unloaded_propagation, -equal_opposite_propagation, -phase_inversion. When set_boundary_optimization is set to false | true then there is no issue of mutual exclusivity so as to maintain the backward compatibity. Example set_boundary_optimization [object_list] -false -constant_propagation false | NO ERROR set_boundary_optimization [object_list] -true -constant_propagation false -unloaded_propagation false | NO ERROR set_boundary_optimization [object_list] -auto -constant_propagation false | ERROR set_boundary_optimization [object_list] -none -constant_propagation false -unloaded_propagation false | ERROR

set_boundary_optimization [object_list] -none | NO ERROR set_boundary_optimization [object_list] -constant_propagation false | NO ERROR

## BO-2002

(Information) Global Option Values are not set with auto | none | all.

**Description**

This message invokes when set_boundary_optimization values are not set with auto | none | all. User shall only use any of the above described values while setting set_boundary_optimization command.

## BO-2004

(Information) Please update your script to include the new Boundary Optimization UI. Use all, auto, none instead of true or false.

**Description**

This warning message is invoked when either true of false is used with set_boundary_optimization. Please update your script to include new UI (all, none or auto option with set_boundary_optimization command).

Feedback

## BO-2005

(Error) Boundary optimization settings on %s are inherited from instance %s, please use 'remove_boundary_optimization' on instance.

**Description**

This error message is invoked when remove_boundary_optimization command is executed for pins which have inhereted boundary optimization restriction from their instance.

## BO-2006

(Error) Boundary optimization settings on %s are inherited from module %s, please use 'remove_boundary_optimization' on module.

**Description**

This error message is invoked when remove_boundary_optimization command is executed for pins which have inhereted boundary optimization restriction from their module.

# CAS

## CAS-0001

(Error) Net net has conflicting user case analysis values on load pins.

**Description**

Multiple conflicting case analysis values are specified on load pins of the net. This is a situation that cannot occur in normal circuit operation and may result in incorrect analysis. The specified case values are propagated forward for each conflicting load pin, even though they disagree with one another.

A condition that is not possible in circuit operation will be analyzed. This can result in poor analysis coverage or in the analysis of false timing paths.

**ONE POSSIBLE SCENARIO**

Consider a scenario where a single hierarchical net is driven by a single driver, and connects to two input pins. A set_case_analysis of 0 is set on one of the input pins and a set_case_analysis of 1 is set on the other. Because these two pins are connected to the same net, this condition is not physically possible, and a CAS_0001 rule violation will be issued.

Feedback

**What Next**

The "Violation Details" section will give you the names of the net and its load pins, along with their case values. To find the drivers of the net use the report_net -connections command. For the example scenario, the command can be issued as follows:

rtl_shell> report_net -connections [get_net net1]

**********
Report : net -connections
**********
Connections for net 'net1':
Driver Pins Type
----------
----------
driver/Z Output Pin (AN2)

Load Pins Type
---------- ----------
load2/A Input Pin (IV)
load1/A Input Pin (IV)

The report contains the driver pins for the net as well as its load pins.

**FIX SUGGESTION**

To resolve the issue, move the case value setting to the driver of the net with the appropriate value for this scenario.

For the example scenario, the command can be issued as follows:

set_case_analysis 1 driver/Z remove_case_analysis load1/A remove_case_analysis load2/A

All load pins of the net will have the case value of 1.

set_case_analysis report_net remove_case_analysis

# CATEGORY

## CATEGORY-001

(error) cannot create category rule '%s' since the previously created rule is not built-in.

**Description**

This error message occurs when an attempt is made to create a category rule with the -builtin option even though the previously created rule is not built-in.

**What Next**

Rerun gui_create_category_rule without the -builtin option.

**See Also**

- gui_create_category_rule

Feedback

## CATEGORY-002

(error) cannot create category rule with name '%s' since a rule with that name already exists.

### Description

This error message occurs when an attempt is made to create a category rule with a rule name that is already in use.

### What Next

Rerun gui_create_category_rule with a -name option value which is not a rule name that is already in use.

### See Also

- gui_create_category_rule

## CATEGORY-003

(error) for category rule '%s' cannot add subrule '%s' since no such rule exists.

### Description

This error message occurs when gui_create_category_rule -subrules references a rule which does not already exist.

### What Next

One possibility is that the subrule name was mis-spelled when passed to -subrules. In that case rerun gui_create_category_rule but passing the correctly spelled rule name to -subrules. Another possibility is that the rule name passed to -subrules was correctly spelled but does not yet exist. In that case, create a new rule with that name (using gui_create_category_rule -name) and then rerun the gui_create_category_rule -subrules command that failed.

### See Also

- gui_create_category_rule

## CATEGORY-004

(error) cannot add subrule '%s' since that subrule has already been added to the category rule '%s'.

Feedback

### Description

This error message occurs when gui_create_category_rule -subrules references the same subrule (using the same rule name) more than once in the subrules list.

### What Next

Rerun gui_create_category_rule -subrule but removing duplicate references to the rule name that was listed in the subrules more than once.

### See Also

- gui_create_category_rule

---

## CATEGORY-005

(error) -rule_names or -names contains invalid category rule name '%s'.

### Description

This error message occurs when a command is run which accepts a list of category rule names via -rule_names or -names and that list includes a category rule name which does not exist.

### What Next

Rerun the command with corrected spelling for the rule name (passed to -rule_names or -names) which was mis-spelled.

### See Also

- gui_list_category_rules

---

## CATEGORY-011

(error) cannot create category rule '%s' since it has an error in the category specification string at position %d.

### Description

This error message occurs when gui_create_category_rule is run with a -category option value which has a syntax error.

### What Next

Fix the syntax error in the -category option string value and rerun gui_create_category_rule.

Feedback

**See Also**

- gui_create_category_rule

---

## CATEGORY-012

(error) cannot create category rule '%s' since it has an error in the filter specification string.

**Description**

This error message occurs when gui_create_category_rule is run with a -filter option value which has a syntax error.

**What Next**

Fix the syntax error in the -filter option string value and rerun gui_create_category_rule.

**See Also**

- gui_create_category_rule

---

## CATEGORY-021

(error) cannot remove category rule '%s' since it is in use by one or more existing categories.

**Description**

This error message occurs when gui_remove_category_rule is run to remove a rule that one or more existing categories depends on.

**What Next**

Fix the issue by removing the affected categories and rerun gui_remove_category_rule.

---

## CATEGORY-031

(error) cannot evaluate expression since no attribute '%s' exists for '%s'.

**Description**

This error message occurs when -category or -filter specifications reference an attribute which does not exist for an object that the category rule is executed for.

**What Next**

Revise the -category or -filter specification to use an attribute which exists for the object in question.

Feedback

**See Also**

- gui_create_category_rule

---

## CATEGORY-032

(error) cannot evaluate expression since attribute '%s' is a collection.

**Description**

This error message occurs when -category or -filter specifications reference an attribute whose value is a collection containing multiple objects.

**What Next**

Referencing a collection containing multiple objects is currently not supported in -category or -filter specifications. Use a different attribute instead.

**See Also**

- gui_create_category_rule

---

## CATEGORY-033

(error) cannot evaluate expression since attribute '%s' of type '%s' has sub-attributes.

**Description**

This error message occurs when -category or -filter specifications reference an attribute whose value is a collection containing a single object.

**What Next**

Consider using "dot notation" in -category or -filter specification to access an attribute of the object in the collection. For example, instead of -category <startpoint> try -category <startpoint.full_name>. Use list_attributes to discover the attributes supported for the type mentioned in the error message.

**See Also**

- gui_create_category_rule

---

## CATEGORY-034

(error) cannot evaluate filter expression since attribute '%s' of type '%s' of data type '%s' is not of data type '%s'.

Feedback

### Description

This error message occurs when evaluating a filter expression where an attribute for an object that the category rule is executed for doesn't match a required type in the expression.

### What Next

Revise the -filter specification so that the type for the attribute matches what is required.

### See Also

- gui_create_category_rule

---

## CATEGORY-035

(error) cannot evaluate filter expression because of an operand type mismatch.

### Description

This error message occurs when evaluating a filter expression where a operand type mismatch has occured.

### What Next

Revise the -filter specification so that the operands match in type.

### See Also

- gui_create_category_rule

---

## CATEGORY-036

(error) cannot evaluate filter expression because operator '%s' has a type mismatch.

### Description

This error message occurs when evaluating a filter expression where a operator type mismatch has occured.

### What Next

Revise the -filter specification so that the operators match in type.

### See Also

- gui_create_category_rule

Feedback

## CATEGORY-040

(error) cannot create category tree with name '%s' since a category tree with that name already exists.

### Description

This error message occurs when an attempt is made to create a category tree with a category tree name that is already in use.

### What Next

Rerun gui_create_category_tree with a -name option value which is not a category tree name that is already in use.

### See Also

- gui_create_category_tree

## CATEGORY-052

(error) No current category tree found.

### Description

This error message occurs when the -tree option is omitted when calling one of the category commands, and there is no current category tree. With these category commands, you can pass an explicit -tree option value to specify the category tree to be operated on. If that optional option is omitted, an attempt will be made to use the current category tree. This error happens if there is no current category tree (which can only happen if no category trees exist).

### What Next

Create at least one category tree (so that there will be a current category tree) and rerun the command which generated the error.

## CATEGORY-053

(error) the categorization script file '%s' already exists.

### Description

This error message occurs when the gui_write_category command is run with a -file option value which identifies a file which already exists, and the -overwrite option was not specified.

Feedback

### What Next

Rerun the gui_write_category command specifying the -overwrite option to overwrite the existing file. Or else specify a file which does not yet exist via the -file option.

---

## CATEGORY-054

(error) the categorization script file '%s' could not be opened for write.

### Description

This error message occurs when the gui_write_category command is run with a -file option value which identifies the file to be written, and the file cannot be opened for write.

### What Next

Investigate parent directory permissions to figure out why the file could not be opened for write. Fix any such permissions problems and rerun the gui_write_category command.

---

## CATEGORY-055

(error) cannot create new subcategories of a hierarchical category which already has subcategories that were created via a separator character

### Description

The categorization engine can create category hierarchy as a result of interpreting hierarchical separator characters embedded in the string value produced by a category rule's category specification. This error message occurs when the gui_create_category command is used to try to add additional subcategories to a category which already has one or more subcategories that were created by interpreting a separator character.

### What Next

Choose a different category to pass to the -parent_category option of gui_create_category.

### See Also

- gui_create_category_rule

---

## CATEGORY-056

(error) cannot remove subcategories of a hierarchical category which has subcategories that were created via a separator character

Feedback

### Description

The categorization engine can create category hierarchy as a result of interpreting hierarchical separator characters embedded in the string value produced by a category rule's category specification. This error message occurs when the gui_remove_category command is used to try to remove subcategories of a category which has one or more subcategories that were created by interpreting a separator character.

### What Next

Choose a different category to pass to the -parent_category option of gui_remove_category.

### See Also

- gui_create_category_rule

## CATEGORY-091

(warning) cell '%s' has no block mark.

### Description

This warning message occurs when a command is run to get or remove the block mark of a cell instance which has no block mark.

### What Next

Rerun the command but specify a cell instance for which a block mark has been previously set.

### See Also

- gui_get_cell_block_marks
- gui_remove_cell_block_marks

# CCD

## CCD-001

(info) Skip %s, reason '%s'.

### Description

This information prints the detailed reason why an object is being skipped by CCD. Objects can be clock sinks or intermediate pins in the clock network.

Following are the possible reasons that can cause CCD to skip an object:

**Sink is boundary**

The sink is in the fanin/fanout of I/O ports. So this is considered as a boundary flop. *ccd.optimize_boundary_timing* is set as false and hence boundary flops cannot be skewed by CCD.

**Sink is a fixed balance pin**

The sink has the attribute *cts_fixed_balance_pin* set to true and *ccd.respect_cts_fixed_balance_pins* application option is enabled.

**Pin is not in the balance portion of the clock tree**

Pin is in the ignore portion of the clock tree and CCD will not skew this pin. Use *report_clock_qor -type structure* and *report_clock_balance_points* to confirm that the ignore exception settings are user intended.

**Pin is on dont_touch net**

Clock net connected to the pin is marked as dont_touch. Use *report_dont_touch* on the clock net to check if the dont_touch setting is user intended.

**Pin is on read_only net**

Clock net connected to this pin is marked as read_only. This could be a sub-block not being editable.

**Pin is in abstract or ETM**

Pins in abstracts or ETMS lack proper timing/power models and cannot be power shaped.

**What Next**

See *CCD-002* for the total number of skipped objects for each reason. Review the above details and ensure that all the settings are reasonable and user intended.

---

## CCD-002

(info) There were %d objects skipped by CCD due to the reason '%s'.

**Description**

This information prints the total number of objects skipped by CCD for each reason.

**What Next**

See details of which objects were skipped and their reasons in *CCD-001*.

Feedback

## CCD-003

(info) Using default fall-back value %s for %s: Please set app option %s with desired value.

**Description**

This message indicates that some options have not been set and a fall-back default is used instead.

**What Next**

Set the recommended option to the desired value.

## CCD-004

(info) DPS ignoring effective resistance - %s

**Description**

This message indicates that DPS is ignoring the use of effective resistance feedback. Optimization will continue without it.

**What Next**

Please check that rail results are loaded.

## CCD-005

(error) An error prevented DPS optimization. %s

**Description**

Something in the design or the configuration prevented the successful run of a Dynamic Power Shaping optimization.

**What Next**

It may be necessary to alter the design, configuration or application options to complete the information required for the DPS optimization.

## CCD-006

(warning) No %s scenarios for DPS optimization.

Feedback

**Description**

The DPS optimization step did not find any active setup or hold enabled scenarios. This may result in uncontrollable violations of setup or hold timing.

**What Next**

Add setup or hold scenarios in the place_opt stage to make sure both setup and hold timing is constrained in the DPS optimization.

---

## CCD-007

(error) Design partitioning not possible. %s

**Description**

DPS did not create clock sink partitions which makes it impossible to start a DPS optimization. This could be due to design traits such as abstracts or ETMs, clock nets being marked dont_touch, \ sinks being set as prefixed balance points or ccd.dps.powershape_* app options limiting the number of sinks that can be skewed. CCD-001 and CCD-002 messages in the log may tell what types of settings affected the partitioning.

**What Next**

Change the design traits or app options to allow sinks skewing which will allow creation of sink partitions for optimization.

---

## CCD-008

(warning) Use of property %s is deprecated in use cases.

**Description**

A property which is deprecated has been applied to a DPS use case.

**What Next**

See the man page for ccd.dps.use_cases for a list of valid properties.

---

## CCD-009

(information) %d clock pins are clocked by multiple clocks: %s. Resolved by %s.

Feedback

**Description**

When doing the DPS power simulation clock pins were encountered which were clocked by multiple active clocks. The simulation will pick one of them, if they are identical it takes any, otherwise it picks the fastest of the active clocks.

**What Next**

If you want the simulation to use a different clock you can specify the active clocks in the use case. See the man page for ccd.dps.use_cases for more detail.

---

## CCD-010

(information) %d input ports are constrained by multiple clocks: %s. Resolved by %s.

**Description**

When doing the DPS power simulation input ports were encountered which were constrained by multiple active clocks. The simulation will pick one of them, if they are identical it takes any, otherwise it picks the fastest of the active clocks.

**What Next**

If you want the simulation to use a different clock you can specify the active clocks in the use case. See the man page for ccd.dps.use_cases for more detail.

---

## CCD-011

(Warning) Relocation detects : %s %s

**Description**

The warning shows tool detects multiple driver or pin count of the net is less than 2.

**What Next**

Please check this net in the design.

---

## CCD-012

(error) Errors in supply net connectivity found during DPS initialization. %s

**Description**

Dynamic Power Shaping needs connected supply nets to be able to build a valid power model

Feedback

**What Next**

Make sure the UPF definition is complete. The command 'connect_pg_net -automatic' can be used to check the number of instance connections on each supply net and if there are supply net connections which cannot be resolved.

---

## CCD-014

(info) %s.

**Description**

This message prints the detailed information while executing report_ccd_visualization.

---

## CCD-015

(error) %s.

**Description**

This message prints the detailed error while executing report_ccd_visualization.

---

## CCD-016

(warning) %s.

**Description**

This message prints the detailed warning while executing report_ccd_visualization.

---

## CCD-017

(Warning) Clock buffer chain is longer than 500. From pin %s to sink %s (pin slack: %f, clock: %s)

**Description**

The warning shows unexpected too long clock buffer chain.

**What Next**

Please check the timing on the path in the design.

---

## CCD-018

(error) Invalid CCD reference corner. Corner %s %s

Feedback

**Description**

User specified reference corner via ccd.reference_corner app option, but the corner was not recognized or lacks any timing scenarios.

**What Next**

Fix the reference corner name or make sure there are active timing scenario for that corner.

---

## CCD-019

(warning) CCD reference corner is %s, but previous ccd run used reference corner %s

**Description**

There are different reference corners used for CCD runs in different flow stages. This may lead to mixed offsets with different resolutions as well as occasional mis-interpretation of prepone and postpone limits.

**What Next**

Make sure the available corners are the same throughout the flow, or specify a reference corner to use for all stages in the ccd.reference_corner app option.

---

## CCD-020

(Warning) Compute Useful Skew is running in mixed mode (found %d ideal and %d propagated clocks).

**Description**

This warning indicates that the design contains both ideal and propagated clocks. This will not necessarily work well in the optimization and may result in worse QoR due to many clock sinks being set to fixed-latency.

**What Next**

Please check the clock definitions to make sure all clocks are ideal (for pre-CTS CCD) or all clocks are propagated (for CTO CCD).

---

## CCD-021

(Error) Invalid or missing FSDB file '%s'.

Feedback

**Description**

The provided FSDB file either does not exist or is invalid. The DPS power modelling is unable to continue.

**What Next**

Please check the path is correct.

---

## CCD-022

(Warning) Sink '%s' not found in FSDB file.

**Description**

A sink pin of the design cannot be found in the provided FSDB file. DPS will fallback to use vectorless modelling for the sink. Too many warnings of this kind indicates that the FSDB file is unsuitable for driving the power modelling.

**What Next**

Please make sure that the FSDB file is correct.

---

## CCD-023

(Warning) Pin '%s' not found in FSDB file.

**Description**

A pin of the design cannot be found in the provided FSDB file. DPS will fallback to use vectorless modelling for the corresponding sink. Too many warnings of this kind indicates that the FSDB file is unsuitable for driving the power modelling.

**What Next**

Please make sure that the FSDB file is correct.

---

## CCD-024

(Warning) A total of %d sinks, pins or ports not found in FSDB. %d%% of sinks being randomized.

**Description**

A sumary message indicating how well the provided FSDB matches the netlist. A too high percentage reported indicates that the FSDB does not match the netlist , and the results of the power simulation will not correlate well with the original simulation.

Feedback

**What Next**

Please make sure that the FSDB file is correct.

---

## CCD-025

(error) CCD (Concurrent Clock and Data) optimization failed due to %s.

**Description**

The CCD optimization experienced an error and was not able to complete the optimization. This could be caused by insufficient design data or invalid app options.

**What Next**

Check the error messages and fix the related settings.

---

## CCD-026

(info) Endpoint %s has reached %s limit defined by %s (constraint: %.3f, offset: %.3f)

**Description**

This messages reports information relating the endpoint with the constraint limit which is either reached or is one resolution away from being reached by the skew profile from CUS.

---

## CCD-027

(Information) Skip CCD clock DRC fixing as there is no DRC violation or all DRC violations are not fixable.

**Description**

CCD will not fix the DRC violation on clock since there is no DRC violation or all DRC violations are not fixable.

**What Next**

Please check if there are valid DRC constraints on design/clock/pin. Please check if there are dont_touch attributes on DRC violation pins/nets.

---

## CCD-028

(info) Sink '%s' is marked as boundary.

Feedback

**Description**

This message indicates that the named object is identified as a boundary sink. It will only be output if boundary sinks are treated differently than non-boundary sinks.

**What Next**

Review the reported sinks and ensure that all the settings are reasonable and user intended.

---

## CCD-029

(info) LP solver could not fully converge. Returned result is '%.2f' percent away from the real optimal.

**Description**

This message indicates that the mathematical solver which performed the optimization could not reach the optimal result.

**What Next**

If the user is not satisfied with the returned QoR then they should file a testcase to the CCD team to check if a better result was attainable.

---

## CCD-100

(info) There are %d pins with cts_fixed_balance_pin attribute set to true, which could limit skewing during CCD.

**Description**

When cts_fixed_balance_pin attribute is set on a pin and ccd.respect_cts_fixed_balance_pins is set to true or upstream, CCD will no skew this pin.

---

## CCD-101

(Warning) %s has inconsistent balance points.

**Description**

The pin has inconsistent balance points set on it. For example, balance points are set on some clocks/corners but missing on other clocks/corners. CCD result can be jeopardized because of this.

Feedback

### What Next

Check balance point setting on this pin and make sure it is consistent across clocks and corners.

---

## CCD-102

(Warning) CCD is overwriting exclude exception on %s.

### Description

This pin is skewed by CCD and CCD is applying a balance point on it, which will overwrite user exclude exception.

### What Next

Check the exclude exception on the pin.

---

## CCD-103

(Info) Useful skew copied/scaled %d balance points and %d clock latencies.

### Description

CCD will copy and scale CCD generated balance points and latencies to new clocks and scenarios which are not presented in earlier CCD calls. This will make sure useful skew information is consistent across clocks and scenarios.

---

## CCD-104

(Warning) Unable to apply ccd_max_prepone attribute with value %.3f in order to replace estimated latency value on protected arc to pin %s

### Description

The ccd.skew_opt_max_prepone_override_latency_estimation app option is set to true and CCD therefore attempted to replace the prepone constraint calculated by minimum latency estimation by the value of the ccd_max_prepone attribute. It cannot do so because the arc to the pin is protected, for instance by a dont_touch constraint on the driving net.

---

## CCD-105

(Info) Generated %d seed macro offsets using strategy "%s".

Feedback

**Description**

CCD has adjusted the useful skew in macros according to the selected strategy. The balance points and latencies in macros may change during this step.

# CCGUI

## CCGUI-001

(Error) Custom Compiler failed to open. %s

**Description**

Custom Compiler failed to open.

**What Next**

Custom Compiler failed to open, please look at the previous error messages to understand the reasons for failure.

# CDPL

## CDPL-001

(error) Block ref / task %s, script %s: Run failed to complete.

**Description**

This errors occurs when running the given script on the given block reference (or task not associated with any block) in parallel. This run failed to complete. There are a number of reasons why this could happen. Possibly, the tool could have crashed or the network may have failed.

**What Next**

Look at the log file of the block reference / task run which is in the command specified <work directory>/<block reference> to see why the run failed. If nothing appears to have gone wrong, it could have been a network problem and you can try to rerun the command. If the run failed, then debug it as any normal failure.

You can also run serially to see if that goes through. If not, then there is a script related problem rather than a distributed processing related problem.

Feedback

## CDPL-002

(error) Block ref / task %s, script %s: Script errored out.

**Description**

This errors occurs when running the given script on the given block reference (or task not associated with a block) in parallel. This run failed to complete because one of the commands in the script errored out.

**What Next**

Look at the log file of the block reference / task run which is in the command specified <work directory>/<block reference> or <work directory>/<task name> to see what command errored out. Fix the script to avoid this problem.

It may help to run serially with only the smallest / fastest of the failing blocks / tasks so as to quickly find a fix.

## CDPL-003

(error) Block ref / task %s, script %s: Internal error.

**Description**

This errors occurs when running the given script on the given block reference (or task not associated with any block) in parallel. This run failed to complete because of an unexpected internal error.

**What Next**

Look at the log file of the block reference / task run which is in the command specified <work directory>/<block reference> or <work directory>/<task reference> to see what command errored out. You can try to change the script to avoid this problem.

You can run serially to avoid this issue. If only a few blocks are failing but others are ok, then you can run only the failing ones serially.

Report this issue to Synopsys.

## CDPL-004

(error) Host option %s has not specified any host names.

**Description**

This errors occurs when you are using rsh or ssh for distributed processing but have not allocated any hosts (ie machines) to be used.

Feedback

### What Next

Look at man page of set_host_options to see how to properly set up the host names to be used.

---

## CDPL-005

(error) Distributed run failed. error code: %s.

### Description

This error means that the distributed run failed. There are a number of possibilities for why this might happen. Common issues include lack of compute farm access, lack of network access, or incorrect host_options settings. Another possibility is if you set a timeout, it is possible that the timeout limit was reached.

### What Next

Check that the host_options used is set up properly. Use the check_host_options command for this. If check_host_options command is not successful, then any distributed processing in ICC2 will not work. Try your submit command (from set_host_option -submit_command) at the unix prompt with a trivial job like "xterm". If it doesn't work at the unix prompt, then you should work with your farm administrator on how to get your farm access properly set up.

If you are using a timeout (set_host_option -timeout), it is possible that the timeout limit was reached. Try with a longer timeout.

Another thing is that your work directory must be on a network disk (i.e., not /tmp). That disk must be accessible from all hosts in distributed run because that disk will be used to save log files, etc.. If you did not set the work directory to be a network disk then change this.

There are a couple workarounds, first you can run sequentially rather than distributed, but this could lead to long wall clock run times. Second, if you are having compute farm setup issues, then switch to use rsh or sh in set_host_options -submit_command. This has advantage that it does not need much setup so you can still run distributed while farm issue is being resolved.

---

## CDPL-006

(warning) Characters [] used in -name option were substituted with ().

Feedback

**Description**

This warning is issued to indicate that the characters [ and/or ] were used in the -name option to the *run_blokc_scripts* command. For this option, [ and ] are reserved characters and they were automatically replaced with ( or ).

**What Next**

Pass a value to the -name option that does not contain [ or ].

---

## CDPL-007

Error: CDPL connection to parent process was lost. Exiting.

**Description**

The network connection to the parent process was lost. The child process can no longer communicate with the parent, and any results produced will be lost. To avoid tying up resources, the child process will exit.

This can occur if the distributed command on the parent process is interrupted due to an error in one of the child processes. This can also occur if the user pressed Ctrl-C during read-only jobs, or because the main process was terminated.

**What Next**

Determine why the parent process stopped communicating and resolve the problem.

If this behavior is not desired, disable the distributed process watchdog timer before launching distributed jobs.

set_app_options -name plan.distributed_run.watchdog_timer_enabled -value false

---

## CDPL-008

Error: Distributed processing version mismatch. Main version: %s, worker version %s

**Description**

The worker started as part of a distributed run was not running the same version of the tool as the main process. This will not happen if your distributed (farm) environment is set up the same as that of the main machine. Ensure that the same version of the executable is available from the absolute/real path the main session was started from.

---

## CDPL-009

(error) Cannot reschedule a task whose dependent task didnot complete successfully.

Feedback

### Description

This error means that the task could not be rescheduled. The reason is that the task is dependent on other tasks which were not all successfully completed.

### What Next

Check why the task and the dependent tasks didnot complete successfully.

---

## CDPL-100

(warning) Waiting to start %d distributed jobs.

### Description

This warning indicates that there are a certain number of distributed jobs that have been requested but not been started yet. There are 2 main reasons for this. The first is that your compute farm is busy and thus the distributed job is pending in the farm queue. This is normal and you just need to wait. One thing that could help is to remove any lower priority jobs that you may have running that you can run later. The second is that there is a problem with your farm resource request. For example if you request a resource that is not available on the farm, this request can be pending forever. Also if you request a resource that is incompatible with the tool, then the distributed job will wait forever. Note that if there is at least 1 distributed job running then progress is being made on the run, but it will be slower than if all the distributed jobs are running.

### What Next

Check the farm queue using a command like qstat (SGE) or bjobs (LSF) that is appropriate for your compute farm. You will either see your job pending in queue or you will not see it (to avoid confusion with other runs, only run one distributed job at this time).

1. If you see your job is pending, then check that the resources you requested can be satified by the queue. If so, then wait. If not, then fix the resource request made in *set_host_options*.
2. If you don't see your job in the queue, then it likely failed to run due to a machine and/or operating system incompatibility. In this case change the *set_host_options* resource requirement to ensure all the machines you get are compatible with this version of executable. Note that it is common for a farm to have machines with different operating systems installed. The tool may be incompatible with older versions of operating system.

---

## CDPL-101

(warning) Only able to obtain license for %d distributed processes. %d distributed processes were requested.

Feedback

### Description

This warning indicates that there are a certain number of distributed jobs which will not be actively running because there were not enough licenses for them. When one actively running processes finishes, then a waiting process can start actively running.

### What Next

There is nothing to do but note that your run may take longer to complete because the maximum parallelism is not used. You may see that some processes are not progressing because they are waiting for a license to proceed.

---

## CDPL-102

(warning) Did not recognize protocol setting: %s.

### Description

This warning indicates that you have set a communication protocol that that the tool does not understand. The tool understands protocols like rsh, ssh, lsf, sge, and sh.

### What Next

If the distributed job is running properly, then you can ignore this message. If distributed job is not running, then you may need to set one of the above listed protocols depending on what type of distributed processiong you are using. For example, if you are using an SGE farm, then you can set the sge protocol.

---

# CELLEM

---

## CELLEM-025

(error) Scenario '%s' is not active for cell EM analysis.

### Description

A scenario must be active for cell EM analysis before the analysis can be performed. Either the scenario is not active at all, or its cell_em setting is set false.

### What Next

To perform cell EM analysis, please set the scenario's status to include cell EM.

### See Also

- set_scenario_status

Feedback

# CGR

## CGR-0001

(Error) Clocks generated from the same master clock master_clock are declared as asynchronous.

### Description

Clocks which are generated from the same master clock cannot be asynchronous with each other. Paths between the clocks declared as asynchronous will not be analyzed. In addition, for crosstalk delay, infinite windows analysis is performed on nets in aggressor/victim relationships between the clocks. This can result in overly conservative signal integrity analysis.

### ONE POSSIBLE SCENARIO

Consider a scenario where two generated clocks with the same master clock are declared asynchronous:

create_clock -period 4 clk1 create_generated_clock -source clk1 -divide_by 2 clk2 create_generated_clock -source clk1 -divide_by 4 clk3 set_clock_groups -asynchronous -group {clk2} -group {clk3}

The two generated clocks, clk2 and clk3, cannot be asynchronous because they both have the same master clock, clk1, and a CGR_0001 rule violation will be issued.

### What Next

The "Violation Details" section will give you the names of the clocks which are generated from the same master clock, but declared as asynchronous. You can click on the clock names to see the relevant clock definition, and the location of the problematic clock group definition is also provided.

### FIX SUGGESTION

Consider adjusting the clock grouping relationship of the two clocks. In the preceding example, the asynchronous relationship can be changed by removing the set_clock_groups command:

set_clock_groups -asynchronous -group {clk2} -group {clk3}

Alternatively, you might want to change the master/generated clock relationship such that the reported clocks are not generated from the same source.

### See Also

set_clock_groups create_clock create_generated_clock report_clock report_clock_crossing remove_clock_groups remove_clock remove_generated_clock

Feedback

## CGR-0002

(Error) Clock clock1 is generated directly or indirectly from the clock clock2. They should not be declared as asynchronous.

### Description

Clocks which are generated from one another cannot be asynchronous. Paths between the clocks declared as asynchronous will not be analyzed. In addition, for crosstalk delay, infinite windows analysis is performed on nets in aggressor/victim relationships between the clocks. This may result in overly conservative signal integrity analysis.

### ONE POSSIBLE SCENARIO

Consider a scenario where a generated clock and its master clock are declared asynchronous:

create_clock -period 4 clk1 create_generated_clock -source clk1 -divide_by 2 clk2 set_clock_groups -asynchronous -group {clk1} -group {clk2}

The clock, clk2, is a generated clock with master clock, clk1. Because clk2 is generated from clk1, they cannot be asynchronous to each other, and a CGR_0002 rule violation will be issued.

### What Next

The "Violation Details" section will give you the names of the generated clock and the master clock that are declared as asynchronous. You can click on the clock names to see the relevant clock definition, and the location of the problematic clock group definition is also provided.

### FIX SUGGESTION

To resolve this issue, consider adjusting the clock grouping relationship of the two clocks. In the preceding above, the asynchronous relationship can be changed by removing the set_clock_groups command:

set_clock_groups -asynchronous -group {clk1} -group {clk2}

Alternatively, you might want to change the master/generated clock relationship of the reported clocks.

### See Also

set_clock_groups create_clock create_generated_clock report_clock -groups report_clock_crossing remove_clock_groups remove_clock remove_generated_clock

Feedback

## CGR-0003

(Error) Clock clock1 and clock clock2 are defined asynchronous with each other. There are clocks generated directly or indirectly from these clocks which are not defined as asynchronous.

### Description

If two clocks are asynchronous, then all the clocks generated from these clocks should be asynchronous with each other. A generated clock does not inherit the asynchronous properties of its master clock, so it should be declared asynchronous to clocks that are asynchronous with its master clock. For clocks not declared asynchronous, paths between the clocks will be analyzed, possibly resulting in timing violations being reported for false paths. In addition, for crosstalk delay, the timing window relationship will be preserved on nets in aggressor/victim relationships between the clocks. This may result in optimistic signal integrity analysis.

### ONE POSSIBLE SCENARIO

Consider a scenario where two master clocks are declared asynchronous, while no asynchronous relationship is specified between other clock pairs:

create_clock -period 4 clk1 create_clock -period 4 clk2 create_generated_clock -source clk1 -divide_by 2 clk3 create_generated_clock -source clk2 -divide_by 2 clk4 set_clock_groups -asynchronous -group {clk1} -group {clk2}

Two master clocks, clk1 and clk2 are asynchronous to each other. The two generated clocks clk3 and clk4 should also be asynchronous because this is the relationship between their master clocks. Since the generated clocks clk3 and clk4 do not have an asynchronous relationship, a CGR_0003 rule violation will be issued.

### What Next

The "Violation Details" section will give you the names of the clock pairs that are missing asynchronous clock declarations. You can click on the clock names to see the relevant clock definition, and the location of the problematic clock group definition is also provided.

### FIX SUGGESTION

To resolve this issue, consider declaring the clock pairs as asynchronous. In the preceding example, the correct asynchronous relationship can be declared by changing the set_clock_groups command as follows:

set_clock_groups -asynchronous -group {clk1 clk3} \ -group {clk2 clk4}

Alternatively, you can change the master/generated clock relationship of the reported clocks.

### See Also

Feedback

set_clock_groups create_clock create_generated_clock report_clock -groups report_clock_crossing remove_clock_groups remove_clock remove_generated_clock

---

## CGR-0004

(Error) Clock clock1 is missing an asynchronous definition with at least one clock in each of the following asynchronous clock pairs.

### Description

Clocks which are not generated directly or indirectly from either of the two asynchronous clocks should have an asynchronous relationship with at least one of them. A clock cannot be synchronous with two clocks that are not synchronous to each other. For clocks not declared asynchronous, paths between the clocks will be analyzed, possibly resulting in timing violations being reported for false paths. In addition, for crosstalk delay, the timing window relationship will be preserved on nets in aggressor/victim relationships between the clocks. This may result in optimistic signal integrity analysis.

### ONE POSSIBLE SCENARIO

Consider a scenario where two clocks are declared asynchronous. Another clock that is not generated from either of the two clocks is not declared as asynchronous to either one:

create_clock -period 4 clk1 create_clock -period 4 clk2 create_clock -period 4 clk3 set_clock_group -asynchronous -group {clk1} -group {clk2}

The clocks, clk1 and clk2 are asynchronous to each other. The third clock, clk3, should have an asynchronous relationship to either clk1 or clk2. Because clk3 does not have an asynchronous relationship with either clk1 or clk2, a CGR_0004 rule violation will be issued.

### What Next

The "Violation Details" section will give you the names of the clocks pairs which are declared asynchronous. The reported clock should be declared asynchronous to at least one clock in each asynchronous clock pair. You can click on the clock names to see the relevant clock definition, and the location of the problematic clock group definition is also provided.

### FIX SUGGESTION

To resolve this issue, consider declaring the reported clock as asynchronous to at least one clock in each asynchronous clock pair.

### See Also

set_clock_groups create_clock create_generated_clock report_clock -groups report_clock_crossing remove_clock_groups remove_clock remove_generated_clock

Feedback

## CGR-0005

(Error) Clock clock1 is generated directly or indirectly from the clock clock2. They should not be declared as physically exclusive.

### Description

Clocks which are generated from one another cannot be physically exclusive. Paths between the clocks declared as physically exclusive will not be analyzed. An incomplete timing analysis may be performed on the design. In addition, for crosstalk delay, it is assumed that there is no possible crosstalk interaction on nets in aggressor/victim relationships between the clocks. This may result in optimistic signal integrity analysis.

### ONE POSSIBLE SCENARIO

Consider a scenario where a generated clock and its master clock are declared physically exclusive:

create_clock -period 4 clk1 create_generated_clock -source clk1 -divide_by 2 clk2 set_clock_group -physically_exclusive -group {clk1} -group {clk2}

The generated clock, clk2, has clock, clk1, as its master. The two clocks cannot be physically exclusive because they are physically related to each other, and a CGR_0005 rule violation will be issued.

The "Violation Details" section will give you the names of the related clocks that are declared as physically exclusive. You can click on the clock names to see the relevant clock definition, and the location of the problematic clock group definition is also provided.

### FIX SUGGESTION

To resolve this issue, consider adjusting the clock grouping relationship of the two clocks. In the example above, this can be achieved by removing the following command:

set_clock_group -physically_exclusive -group {clk1} -group {clk2}

Alternatively, you might want to change the master/generated clock relationship of the reported clocks.

### See Also

set_clock_groups create_clock create_generated_clock report_clock -groups report_clock_crossing remove_clock_groups remove_clock remove_generated_clock

## CGR-0006

(Warning) Clock clock1 and clock clock2 are defined physically exclusive with each other. There are clocks generated from these clocks which are not defined as physically exclusive.

Feedback

### Description

If two clocks are physically exclusive, then all the clocks generated from these clocks should be physically exclusive with each other. A generated clock does not inherit the physically exclusive properties of its master clock, so it should be declared physically exclusive to clocks that have this relationship to its master clock. For clocks not declared physically exclusive, paths between the clocks will be analyzed, possibly resulting in timing violations due to false paths. In addition, for crosstalk delay, the timing window relationships will be preserved on nets in aggressor/victim relationships between the clocks. This may result in pessimistic signal integrity analysis because physically exclusive clocks assume that there is no possible crosstalk interaction on nets with this relationship.

### ONE POSSIBLE SCENARIO

Consider a scenario where two master clocks are declared physically exclusive, while no physically exclusive relationship is specified between clocks derived from the master clocks:

create_clock -period 4 clk1 create_clock -period 4 clk2 create_generated_clock -source clk1 -divide_by 2 clk3 create_generated_clock -source clk2 -divide_by 4 clk4 set_clock_groups -physically_exclusive -group {clk1} -group {clk2}

Two master clocks, clk1 and clk2, are physically exclusive. The two generated clocks, clk3 and clk4, should also be physically exclusive with each other because this is the relationship between their master clocks. Since the generated clocks clk3 and clk4 do not have a physically exclusive relationship, a CGR_0006 violation will be issued.

### What Next

The "Violation Details" section will give you the names of the clocks pairs which should have been declared physically exclusive. You can click on the clock names to see the relevant clock definition, and the location of the problematic clock group definition is also provided.

### FIX SUGGESTION

To resolve this issue, consider declaring the clock pairs as physically exclusive. In the example above, the correct physically exclusive relationship can be declared by changing the set_clock_groups command as follows:

set_clock_groups -physically_exclusive -group {clk1 clk3} \ -group {clk2 clk4}

Alternatively, you might change the master/generated clock relationship of the reported clocks.

Feedback

## CGR-0007

(Warning) Multiple clocks or a clock with either set_input_delay or set_output_delay are defined at pin/port pin_port. In both cases, (the defined multiple clocks or a defined clock with the reference clock), these clocks should be defined as exclusive/asynchronous.

**Description**

Clocks originating from the same source should be set as physically exclusive. The tools will conservatively analyze all potential coupling conditions between the clocks that are not declared asynchronous or physically exclusive. This may result in poor crosstalk analysis performance and over-conservative analysis result.

**ONE POSSIBLE SCENARIO**

Consider a scenario where two clocks are created on the same port, but no physically exclusive relationship is specified:

create_clock -per 4 -name clk1 clk1 create_clock -per 4 -name clk1_dup -add clk1

Consider another scenario where a clock is defined at a port and a set_input_delay is also specified, but no physically exclusive relationship is specified between the defined clock and the reference clock:

create_clock -per 5 -name jtag_clk jtag_clk set_output_delay 1.4 -clock mclk { jtag_clk }

**What Next**

The "Violation Details" section will give you the names of the clock pairs which should be declared as physically exclusive.

**FIX SUGGESTION**

To resolve this issue, consider declaring the clock given pairs as physically exclusive. In the previous examples, this can be achieved with the following command:

set_clock_group -physically_exclusive -group {clk1} -group {clk1_dup}

**See Also**

report_clock_crossing create_clock set_clock_groups remove_clock_groups

## CGR-0008

(Warning) Multiple clocks defined at pin/port pin_port have false path set between them. For accurate signal integrity results use the set_clock_groups command.

Multiple clocks with false path relationships have been defined at the same source. It is recommended that a clock group relationship be defined in place of the individual false path exceptions. Defining a clock group relationship will disable the timing paths between

Feedback

clocks while allowing more accurate delay calculations in SI mode with PrimeTime. This violation can result in less accurate SI analysis results. Modeling the clocks interactions with set_clock_groups will allow the following nuances in SI delay calculations:

Two clocks defined to be logically exclusive of each other have no logical timing paths between them. PrimeTime does not check the logical timing between the clocks, but PrimeTime SI still checks for possible crosstalk interaction between them.

Two clocks defined to be physically exclusive of each other have no logical timing paths between them, and furthermore, are considered physically isolated from each other. PrimeTime does not check the logical timing between the clocks and PrimeTime SI assumes no possible crosstalk interaction between them.

Two clocks defined to be asynchronous with each other have no timing relationship at all. PrimeTime does not check the logical timing between the clocks, but PrimeTime SI still checks for possible crosstalk interaction between them, using infinite arrival windows.

**ONE POSSIBLE SCENARIO**

Consider a scenario where two clocks are created on the same port, and set_false_path relationships are specified between the two clocks:

create_clock -per 4 -name clk1 clk1 create_clock -per 4 -name clk1_dup -add clk1 set_false_path -from clk1 -to clk1_dup set_false_path -from clk1_dup -to clk1

**What Next**

The "Violation Details" section will give you the names of the clocks that are created on the same port with set_false_path relationships specified.

**FIX SUGGESTION**

To resolve this issue, consider using set_clock_groups to replace set_false_path between clocks. Below is an example of the command to achieve this:

set_clock_groups -physically_exclusive -group {clk1} -group {clk1_dup}

**See Also**

report_clock_crossing set_clock_groups remove_clock_groups

---

## CGR-0009

(Error) Clocks clock1 and clock2 have valid timing paths between them, but their common base period is more than the limit times the clock period.

**Description**

These two clocks should be mutually exclusive even though a valid timing path exists between them. The clocks can be either asynchronous, logically exclusive, or physically

Feedback

exclusive. A CGR_0009 rule violation is triggered when one of the following conditions is met:

The common base period of those two clocks is greater than the *max_period_multiplier* property multiplied by the period of the larger of the two clock periods.

The *min_period_multiplier* property multiplied by the period of the smaller of the two clock periods.

The common base period is the least common multiple between the two clock periods.

If you change the *skip_clocks_with_MCP* property, the tool will not issue CGR_0009 rule violations if there are clock-to-clock multicycle paths between the clocks. Use the set_rule_property command to change the value of properties.

For clocks not defined as asynchronous in the set_clock_groups command, the timing paths between the two clocks will be analyzed, and that can result in large timing violations caused by false paths.

**ONE POSSIBLE SCENARIO**

Consider a scenario in which two functional mode constraints are merged into a single set of constraints. The first functional mode has clocks VCLK1, CLK1, and CLK2. The second functional mode has clocks VCLK1_test, CLK1_test, and CLK2_test. The two virtual clocks VCLK1 and VCLK1_test are missing from the clock group definition.

```
create_clock -name VCLK1 -period 3.1

create_clock -name VCLK1_test -period 11.07

create_clock -name CLK1 -period 3.1 [get_ports cport1] -add

create_clock -name CLK2 -period 6.2 [get_ports cport2] -add

create_clock -name CLK1_test -period 11.07 [get_ports cport1] -add

create_clock -name CLK2_test -period 22.14 [get_ports cport2] -add

set_clock_groups -group {CLK1 CLK2} -group \ {CLK1_test CLK2_test}
-physically_exclusive

set_input_delay 1.23 -clock VCLK1 -add [get_port data1]

set_input_delay 4.23 -clock VCLK1_test -add [get_port data1]
```

Because the clock group for VCLK1 and VCLK1_test has not been defined, CGR_0009 rule violations will be issued:

CGR_0009: Clocks VCLK1 and CLK1_test have valid timing paths between them, but their common base period is more than the limit times the clock period.

Feedback

CGR_0009: Clocks CLK1 and VCLK1_test have valid timing paths between them, but their common base period is more than the limit times the clock period.

**What Next**

The "Violation Details" section identifies the clocks that should be declared asynchronous and the associated clock periods. You can review the clock names for the relevant clock definitions or review the clock periods using the report_clock command.

**FIX SUGGESTION**

To resolve the scenario issue described previously, add the clocks, VCLK1 and VCLK1_test, to separate clock groups and define the clock pair as asynchronous, as shown in the following command:

set_clock_groups -group {CLK1 CLK2 VCLK1} \ -group {CLK1_test CLK2_test VCLK1_test} -asynchronous

*Rule Property*: *max_period_multiplier*

A CGR_0009 rule violation is issued when the base period between the two clocks is greater than this property multiplied by the larger of the two clock periods. Increasing or decreasing the value of this property decreases or increases the number of CGR_0009 violations. The default for this parameter is 101.

Note that the base period expansion is also affected by the *min_period_multiplier* property. The violation is issued only if the common base period exceeds the smaller of the following two values:

max_period_multiplier times larger clock period

min_period_multiplier times smaller clock period

*Rule Property*: *min_period_multiplier*

A CGR_0009 rule violation is issued when the base period between the two clocks is greater than this property multiplied by the smaller of the two clock periods. Increasing or decreasing the value of this property decreases or increases the number of CGR_0009 violations. The default for this parameter is 1000.

Note that the base period expansion is also affected by the *max_period_multiplier* property. The *min_period_multiplier* value should be set to a number greater than or equal to the *max_period_multiplier* value. If not, the *max_period_multiplier* value is used as the multiplication factor for smaller periods as well. The violation is issued only if the common base period exceeds the smaller of the following two values:

max_period_multiplier times larger clock period

min_period_ multiplier times smaller clock period

*Rule Property*: *skip_clocks_with_MCP*

Feedback

By default, a violation is issued for all pairs of interacting clocks that satisfy the period checks described previously. However, if there are MCPs between the two clocks, they might not cause timing violations even if the clocks are not defined as asynchronous or physically exclusive. You can avoid issuing violations in this situation by enabling the *skip_clocks_with_MCP* rule property. Note:

It is recommended that the clocks be declared asynchronous or physically exclusive. This ensures that the paths between the two clocks are not timed and also takes care of signal integrity effects.

*Rule Property*: *skip_clocks_with_max_delay*

By default, a violation is issued for all pairs of interacting clocks that satisfy the period checks described previously. However, if there are min/max delays between the two clocks, they might not cause timing violations even if the clocks are not defined as asynchronous or physically exclusive. You can avoid issuing violations in this situation by enabling the *skip_clocks_with_max_delay* rule property.

*Rule Property*: *skip_clocks_with_allow_paths*

By default, a violation is issued for all pairs of interacting clocks that satisfy the period checks described previously. However, if there is allow_paths set between the two clocks, they might not cause timing violations even if the clocks are not defined as asynchronous. You can avoid issuing violations in this situation by enabling the *skip_clocks_with_allow_paths* rule property.

**See Also**

set_clock_groups report_clock

---

## CGR-0010

(Error) Clocks clock1 and clock2 might be interacting, but their common base period is more than the limit times the clock period.

Status: Disabled by default

**Description**

The two clocks are likely to be mutually exclusive but are not specified as such. The clocks can be asynchronous or physically exclusive. Note that this rule is an extension of the CGR_0009 rule where all pairs of clocks that are not explicitly defined as asynchronous or physically exclusive are considered for base period expansion. This is because even if valid timing paths do not exist between a pair of clocks, they might still require base clock expansion for signal integrity analysis, therefore this rule is a part of the PrimeTime SI ruleset. This rule is disabled by default. A common base period is the least common

Feedback

multiple between the two clock periods. This violation is issued if the common base period is larger than the smallest of the following two values:

the *max_period_multiplier* property multiplied by the period of the larger of the two clock periods

the *min_period_multiplier* property multiplied by the period of the smaller of the two clock periods

The value of the properties can be changed with the set_rule_property command.

For clocks not defined as asynchronous in the set_clock_groups command, the timing paths between the two clocks will be analyzed, and that can result in large timing violations due to false paths. Also, for signal integrity analysis, the base period expansion might be clipped to a large limit and can lead to large runtimes. For clocks not defined as physically exclusive in the set_clock_groups command, the signal integrity analysis will still be considered which can lead to pessimistic timing results causing timing violations.

**ONE POSSIBLE SCENARIO**

Consider a scenario in which two functional mode constraints are merged into a single set of constraints. The first functional mode has clocks VCLK1, CLK1, and CLK2. The second functional mode has clocks VCLK1_test, CLK1_test, and CLK2_test. The two virtual clocks VCLK1 and VCLK1_test are missing from the clock group definition.

create_clock -name VCLK1 -period 3.1

create_clock -name VCLK1_test -period 11.07

create_clock -name CLK1 -period 3.1 [get_ports cport1] -add

create_clock -name CLK2 -period 6.2 [get_ports cport2] -add

create_clock -name CLK1_test -period 11.07 [get_ports cport1] -add

create_clock -name CLK2_test -period 22.14 [get_ports cport2] -add

set_clock_groups -group {CLK1 CLK2} -group \ {CLK1_test CLK2_test} -physically_exclusive

set_input_delay 1.23 -clock VCLK1 -add [get_port data1]

set_input_delay 4.23 -clock VCLK1_test -add [get_port data1]

Because the clock group for VCLK1 and VCLK1_test is not defined, CGR_0010 rule violations are issued:

CGR_0010: Clocks VCLK1 and CLK1_test might be interacting, but their common base period is more than the limit times the clock period.

Feedback

CGR_0010: Clocks CLK1 and VCLK1_test might be interacting, but their common base period is more than the limit times the clock period.

**What Next**

The "Violation Details" section identifies the clocks that should be declared asynchronous along with their periods. You can review the clock name or names for the relevant clock definition or review the clock periods using the report_clock command.

**FIX SUGGESTION**

To resolve the scenario issue described previously, add the clocks, VCLK1 and VCLK1_test, to separate clock groups and define the clock pair as physically exclusive. The following example syntax shows the clock definition using the set_clock_groups command.

set_clock_groups -group {CLK1 CLK2 VCLK1} \ -group {CLK1_test CLK2_test VCLK1_test} \ -physically_exclusive

The following clock group definition also eliminates the CGR_0010 violation, but it can lead to pessimistic signal integrity results and should not be used.

set_clock_groups -group {CLK1 CLK2 VCLK1} \ -group {CLK1_test CLK2_test VCLK1_test} -asynchronous

*Rule Property*: *max_period_multiplier*

A CGR_0010 violation is issued when the base period between the two clocks is greater than this property multiplied by the larger of the two clock periods. Increasing or decreasing the value of this property will decrease or increase the number of CGR_0010 rule violations. The default for this parameter is 101.

Note that the base period expansion is also affected by the *min_period_multiplier* property. The violation is issued only if the common base period exceeds the smaller of the following two values:

max_period_multiplier times larger clock period

min_period_multiplier times smaller clock period

*Rule Property*: *min_period_multiplier*

A CGR_0010 rule violation is issued when the base period between the two clocks is greater than this property multiplied by the smaller of the two clock periods. Increasing or decreasing the value of this property will decrease or increase the number of CGR_0010 violations. The default for this parameter is 1000.

Note that the base period expansion is also affected by the *max_period_multiplier* property. The *min_period_multiplier* value should be set to a number greater than or equal to the *max_period_multiplier* value. If not, the *max_period_multiplier* value is used as

Feedback

the multiplication factor for the smaller period as well. The violation is issued only if the common base period exceeds the smaller of the following two values:

max_period_multiplier times larger clock period

min_period_ multiplier times smaller clock period

*Rule Property*: *skip_clocks_with_min_max_delay*

By default, a violation is issued for all pairs of interacting clocks that satisfy the period checks described previously. However, if there are min/max delays between the two clocks, they might not cause timing violations even if the clocks are not defined as asynchronous or physically exclusive. You can avoid issuing violations in this situation by enabling the *skip_clocks_with_min_max_delay* rule property.

(error) %s.

**Description**

Cell group creation related error messages.

# CGRR

## CGRR-0001

(info) Register pin %s has been identified as constant by the redundancy removal engine and may be removed as a constant register in later optimization steps.

**Description**

This message is issued when Fusion Compiler's redundancy removal engine identifies an input pin of a register as redundant.

Feedback

Redundancy removal engine identifies register as constant, but does not remove it. The task of removing constant registers is done by register removal engine which is executed later in the compile flow. The register identified as constant may or may not be removed by the register removal engine. For example, such register will not be removed if: (1) User has marked it as dont_touch (2) User has disabled removal of constant registers using compile.seqmap.remove_constant_registers. (3) User has disabled removal of unloaded registers using compile.seqmap.remove_unloaded_registers.

Fusion compiler applies checks (2) and (3) when a register is found to be constant as well as unloaded.

If a register is identified as constant but could not be removed, the registers in its fanout may not get removed if boundary restrictions prevent propagation of constants in the forward direction. Details can be found in man page of set_boundary_optimization.

Command report_transformed_registers can be used to find if a register is removed or preserved as constant.

**See Also**

- report_transformed_registers

---

## CGRR-0002

(info) Register pin %s has been identified as unloaded by the redundancy removal engine and may be removed as an unloaded register in later optimization steps.

**Description**

This message is issued when Fusion Compiler's redundancy removal engine identifies an output pin of a register as unloaded.

Redundancy removal engine identifies register as unloaded, but does not remove it. The task of removing constant registers is done by the register removal engine which is executed later in the compile flow. The register identified as unloaded may or may not be removed by the register removal engine. For example, such register will not be removed if: (1) User has marked it as dont_touch (2) User has disabled removal of constant registers using compile.seqmap.remove_constant_registers. (3) User has disabled removal of unloaded registers using compile.seqmap.remove_unloaded_registers.

Fusion compiler applies checks (2) and (3) when a register is found to be constant as well as unloaded.

If register is identified as unloaded but could not be removed, the registers in its fanin may not get removed if boundary restrictions prevent propagation of unloaded in the backward direction. Details can be found in man page of set_boundary_optimization.

Feedback

Command report_transformed_registers can be used to find if a register is removed or preserved as unloaded.

## CGT-2500

(Warning) Class %s of object %s is not supported by -object command option.

**Description**

The command *set_clock_gate_style* was called with -object option and the existing design, module or instance is not hierarchical.

**What Next**

Check that the objects used for *set_clock_gate_style* are hierarchical.

## CGT-2501

(Warning) There were problems when extracting hierarchies from the object %s.

**Description**

The command *set_clock_gate_style* was called with -object option an object in the design is not hierarchical.

**What Next**

Check that the objects used for *set_clock_gate_style* are hierarchical.

## CGT-2700

(Error) %s was given for more than one option.

**Description**

The command *set_clock_gating_objects* was called with the same object for more than one option, which is not allowed.

Feedback

**What Next**

Check that the objects used for *set_clock_gating_objects* are only present in one of the options.

---

## CGT-2701

(Error) Cannot specify -enable_source without -force or -include

**Description**

The command *set_clock_gating_objects* was called with the option *-enable_source* but without the options *-force* or *-include*.

**What Next**

Check that the options *-force* or *-include* are used when *-enable_source* is used.

---

## CGT-2702

(Error) The provided collection does not contain valid elements. No attribute will be set.

**Description**

The command *set_clock_gating_objects* was called with no valid elements. Valid elements are sequential cells, hierarchies, power domains, and modules.

**What Next**

Check that the objects used for *set_clock_gating_objects* are valid elements.

---

## CGT-2703

(Error) Value for option '%s' must be %s.

**Description**

If the command *set_clock_gate_latency* is called with the option *-stage* the value must be non-negative and the zero is allowed. If the command *set_clock_gate_latency* is called with the option *-levels* the value must be greater than zero.

**What Next**

Check if the *set_clock_gate_latency* command does not have incorrect values.

---

## CGT-2704

(Error) Range %u-%s is overlapping with range %u-%s.

Feedback

**Description**

During the command *set_clock_gate_latency* fanout ranges cannot overlap.

**What Next**

Check the *set_clock_gate_latency command* settings and set ranges that do not overlap.

---

## CGT-2705

(Error) Lower limit for range cannot be zero.

**Description**

In the fanout range the lower limit value cannot be zero.

**What Next**

Check the *set_clock_gate_latency* command and ensure the lower limit is greater than zero.

---

## CGT-2706

(Error) Lower limit %u for range is higher than its upper limit %u.

**Description**

In the command *set_clock_gate_latency* the lower limit value must be lower than its upper limit value.

**What Next**

Check the *set_clock_gate_latency* command settings and change the incorrect value.

---

## CGT-2707

(Error) There are no specified fan-out ranges for -fanout_latency option.

**Description**

The option *-fanout_latency* of the *set_clock_gate_latency* command must be assigned a range of values.

**What Next**

Check the *set_clock_gate_latency* command settings and specify a range for *-fanout_latency* option.

Feedback

## CGT-2708

(Error) Specified delay value for %s %u cannot be negative

**Description**

Range values of the *-fanout_latency* option cannot be negative.

**What Next**

Check the range values of the *-fanout_latency* option and correct them.

## CGT-2709

(Error) For stage 0, only -fanout_latency {{1-inf value}} is accepted.

**Description**

When the option *-stage 0* is specified, the only accepted range is {1-inf}.

**What Next**

Check that only one range at {1-inf} was specified for stage 0 in the *set_clock_gate_latency* command.

## CGT-2710

(Error) Fan-out ranges do not cover the count of %s.

**Description**

The ranges for the option *-fanout_latency* must cover all values in the range {1-inf}.

**What Next**

Check that the range values cover {1-inf} in the *set_clock_gate_latency* command.

## CGT-2711

(Error) Invalid syntax for -fanout_latency option

**Description**

The *fanout_latency* option has an incorrect syntax.

**What Next**

Check and correct the syntax in the *set_clock_gate_latency* command.

Feedback

## CGT-2712

(Error) No clocks found on current the design.

**Description**

When no clock is defined execution will be aborted.

**What Next**

Check the *create_clock* command and create a clock. Verify a clock exists with the *get_clocks* command.

## CGT-2713

(Error) There are no clock gates in the given object_list.

**Description**

No clock gates were found in the argument of *set_clock_gate_transformations*.

**What Next**

Check that the collection of cells passed to *set_clock_gate_transformations* has valid clock gate cells.

## CGT-2714

(Error) There are no clock gates in the given object_list.

**Description**

The *report_clock_gating_enable_condition* command must receive a valid list of clock gates.

**What Next**

Pass a valid list of clock gates in the *report_clock_gating_enable_condition* command.

## CGT-2715

(Error) The provided collection does not contain valid elements. No setting would be stored.

**Description**

The command *set_self_gating_objects* was called with no valid elements. Valid elements are sequential cells, hierarchies, power domains, and modules.

Feedback

### What Next

Check that the objects used for *set_self_gating_objects* are valid elements.

### See Also

- set_self_gating_objects

---

## CGT-2716

(Error) Option -tree_type must be used together with either -include or -force.

### Description

The option *-tree_type* was specified for the *set_self_gating_objects* command, but neither *-include* nor *-force* was specified.

### What Next

Specify one of the *-include* or *-force* options.

### See Also

- set_self_gating_objects
- report_self_gating_objects

---

## CGT-2717

(Error) At least one of the options -include, -exclude, -force, -clear, or -reset must be used.

### Description

The *set_self_gating_objects* command was called with no valid option.

### What Next

Use at least one of the *-include*, *-exclude*, *-force*, *-clear*, or *-reset* options.

### See Also

---

## CGT-2718

(Error) Must specify the -fanout_latency option with the -stage option.

Feedback

**Description**

The command *set_clock_gate_latency* was called with the *-fanout_latency* option and without the *-stage* option, which is not allowed. The option *-fanout_latency* must be used with the *-stage* option.

**What Next**

Check that the option *-fanout_latency* is used with the *-stage* option.

---

## CGT-2719

(Error) Cannot use -level and -stages in the same session.

**Description**

The option of using *-level* and *-stages* in the same session is currently not supported.

**What Next**

Use either *-level* or *-stages* in the *set_clock_gate_latency* command, not both.

---

## CGT-2720

(Error) Cannot combine -include with -enable_source none.

**Description**

The command *set_clock_gating_objects* was called with the option *-enable_source none* and the option *-include*, which is not allowed. The option *-enable_source none* is only allowed with the option *-force*.

**What Next**

Check that the option *-include* is not used with *-enable_source none*.

---

## CGT-2721

(Error) Must specify %s with either the -gated or -gating_elements options.

**Description**

The command *report_clock_gating* was called with either *-origin* or *-type* option and without either the *-gated* option or *-gating_elements* option, which is not allowed. The options *-origin* and *-type* must be used with either the *-gated* option or *-gating_elements* option.

Feedback

### What Next

Check that the options *-origin* or *-type* are used with either the *-gated* or *-gating_elements* option.

### See Also

- report_clock_gating

---

## CGT-2722

(Error) The value specified for -max_bitwidth is smaller than that for -min_bitwidth.

### Description

The max bitwidth value specified for the *set_self_gating_options* command must be equal to or higher than the min bitwidth value.

### What Next

Specify a max bitwidth value that is higher than or equal to the min bitwidth value.

### See Also

- set_self_gating_options

## CGT-2730

(Warning) Overwriting previous clock gating tree option setting on source pin %s of Clock %s.

### Description

The clock gating tree option command is applied to clocks with the same driver more than once. The previous setting will be overwritten.

### What Next

No action is required. For more details check the /fBreport_clock_gating_tree_option command.

---

## CGT-2731

(Warning) Clock %s is invalid. Only clocks with valid clock sources are supported.

Feedback

**Description**

The *set_clock_gating_tree_options* command is applied to clocks with invalid clock sources. Virtual clocks with no clock sources or clocks created on inout ports are not supported.

**What Next**

Check the *create_clock* command settings.

---

## CGT-3000

(Warning) Scan-stitched clock gate %s was removed. %s.

**Description**

Clock Gating optimization ungated the fanout of a pre-existing clock gate whose SE pin was connected to a non-constant signal.

**What Next**

If the removal of the clock gate is expected, Formality directive *set_constant*, for the given port and constant or for the clock gate's SE pin must be used during Formality verification to validate this transformation.

If the removal of this clock gate is not expected, directive *set_clock_gate_transformations* must be used during Synthesis to prevent this transformation.

---

## CGT-3001

(Warning) There are missing latency values specification. Use *report_clock_gate_latency* for more information.

**Description**

There are (latency) values that were not specified or written for the clock gate cells.

**What Next**

Check that stages for all clock gates were specified and use *report_clock_gate_latency* for more information.

---

## CGT-3002

(Warning) There are latency value conflicts on cells. Use report_clock_gate_latency for more information.

Feedback

**Description**

Two consecutive clock gates are presenting conflicting latency values.

**What Next**

For more details check the /fBreport_clock_gate_latency command.

---

## CGT-3003

(Warning) This option %s will be ignored during clock gating insertion/optimizations.

**Description**

The given legacy option is not supported by the tool and will be ignored.

**What Next**

Remove the legacy options since it will have no effect.

---

## CGT-3004

(Warning) For hier %s, given min/max settings (%u/%u), some clock gates might not meet max fanout or minimum bitwidth.

**Description**

The tool cannot ensure that both the minimum bitwidth and maximum fanout will be honored after splitting a large clock gating bank if the minimum bitwidth is greater than half of the maximum fanout.

**What Next**

No action required.

**See Also**

- set_fanin_sequential_clock_gating_options

---

## CGT-3005

(Warning) No valid reference latency value for clock gate %s. Using default value of 0. See documentation of clockgate.ignore_latency_on_pin for more information.

Feedback

### Description

Verify the status of variable *clockgate.ignore_latency_on_pin*. If the variable is set to true, the reference used to compute the latency value in stage 1 is no longer valid and zero is used as a reference.

### What Next

Check the *set_clock_latency* and *set_clock_gate_latency* command settings. Check the variable *clockgate.ignore_latency_on_pin*.

---

## CGT-3006

(Warning) The cell %s has two clocks on pin %s and pin %s. Must have only one clock defined.

### Description

A combinational cell having a clock defined in two input pins is not a valid clock gate.

### What Next

Check that only one clock has been defined for the cell.

### See Also

- get_clock_gates
- report_clock_gating

---

## CGT-3009

(Warning) The register %s is scan stitched and it will not be replaced.

### Description

If a register is a scan stitched, the combinational cell that drives it will not be replaced.

### What Next

Can run *replace_clock_gates before compile command.*

### See Also

- report_clock_gating

Feedback

## CGT-3010

(Warning) The combinational cell %s has more than two input and it will not be replaced.

### Description

The given combinatorial cell has an incorrect number of pins..

### What Next

Verify that all the combinational cells to be replaced have a correct number of pins.

### See Also

- report_clock_gating

## CGT-3011

(Warning) No clocks found on the current design.

### Description

No clocks are found in the current design, a clock must be defined before executing the command *replace_clock_gates*.

### What Next

Check that a clock is defined or create it using *create_clock* command.

### See Also

- create_clock
- report_clock_gating

## CGT-3012

(Warning) The design is already placed and no replacement will be done.

### Description

If the design has already been placed, no replacement will be made for any combinational cell.

### What Next

Verify is the design is already placed.

Feedback

### See Also

- report_clock_gating

---

## CGT-3013

(Warning) The combinational cell %s has edge conflict with the gated registers and it will not be replaced.

### Description

If a combinational cell has edge conflict with any of its gated registers, it will not be replaced.

### What Next

Check the edge sense of the combinational cell and the registers.

### See Also

- report_clock_gating

---

## CGT-3300

(Warning) There is no integrated clock-gating cell in the technology library that satisfies the specified style and operating condition for module %s. No %s insertion will be done in this module.

### Description

No valid integrated clock gating (ICG) library cells can be found for the clock gate style in effect for this module. Clock gating cannot work.

### What Next

Check your library for the existence of the ICG library cells you want to use. Check whether these library cells have the "CTS" purpose. Check whether these library cells do not have the dont_touch attribute and whether the target library subset for this module may exclude these library cells specifically. Check whether the set_clock_gate_style settings in effect for this module match the style of these library cells. The check_clock_gate_library_cell_availability command can give a detailed report on clock gate library cell availability issues.

---

## CGT-3700

(Warning) Some of the elements in the object_list are not clock gating candidates and will be ignored. Attributes will only be set on valid objects.

Feedback

**Description**

The command *set_clock_gating_objects* was called with instances that are not sequential registers, which will not be gated anyways.

**What Next**

No action required.

---

## CGT-4000

(Information) Clock gate %s cannot be collapsed to honor the maximum number of levels.

**Description**

The clock gate cannot be collapsed to meet the constrain set by *compile.clockgate.max_number_of_levels".*

**What Next**

No action required.

---

## CGT-4001

(Information) Collapsing clock gates %s with %s to honor the maximum number of levels.

**Description**

The clock gates are being collapsed to meet the constrain set by *compile.clockgate.max_number_of_levels".*

**What Next**

No action required.

---

## CGT-4002

(Information) Removing clock gate %s by ungating to honor the maximum number of levels.

**Description**

The clock gate is being removed by ungating the gated registers to meet the constrain set by *compile.clockgate.max_number_of_levels".*

**What Next**

No action required.

Feedback

## CGT-4003

(Information) Clock gate %s cannot be removed to honor the maximum number of levels.

**Description**

The clock gate cannot be removed by ungating the gated registers to meet the constrain set by *compile.clockgate.max_number_of_levels".*

**What Next**

No action required.

## CGT-4005

(Information) The automatic clock gate timing flow is activated. Clock latencies set on clock gate cells will be automatically adjusted by an estimate for latency.

**Description**

The automatic clock gate timing flow is activated. Clock latencies set on clock gate cells will be automatically adjusted by an estimate for latency. Clock gate latencies derived from the *set_lock_gate_latency* command will not be used.

**What Next**

To preserve annotated clock latencies from set_clock_latency, set the *dont_estimate_clock_latency* attribute on the clock pin of the clock gating cell. E.g. *set_attribute [get_pins {my_CG/CK}] dont_estimate_clock_latency true*

## CGT-4309

(Information) Activity driven multi level clock gating is enabled.

**Description**

In the activity-driven mode, *Fusion Compiler* considers the switching activities on a clock gate when it performs level expansion. The application option *compile.clockgate.enable_level_expansion* controls whether *compile_fusion* executes clock-gate level expansion in activity-driven mode.

**What Next**

No action required.

Feedback

## CGT-4314

(Information) Clock gate max-fanout specification is not recommended when timing driven clock gate splitting is enabled.

**Description**

In clock gating flow, *Fusion Compiler* performs a timing-driven clock gate splitting. In this mode, not specifying max-fanout setting might yield better Qor. The application option *compile.clockgate.timing_based_split_in_cg_timing_flow* controls whether *compile_fusion* executes timing-driven clock gate splitting.

**What Next**

No action required.

## CGT-5007

(Information) A clock gate was removed which had a connection to pin %s please set to constant %u for verification.

**Description**

A scan-stitched clock gate has been removed by the tool. When removing a clock gate, the enable logic driving the enable pin of the clock gate is transferred to the driven registers while the logic driving the test enable pin of clock gate is dropped. This is because the scan enable logic is used only to bypass the clock gate for DFT purposes and is not needed for functional correctness. Hence for correct functional formal verification, the test enable pin of the clock gate must be set to a non-controlling value on the reference side.

If the reported clock gate needs to be preserved instead, use *set_clock_gate_transformations* command.

**What Next**

Constrain the clock gate test enable pin to a non-controlling constant for verification purposes. Alternatively, the clock gate can be retained using *set_clock_gate_transformations* command.

# CHF

## CHF-001

(error) For command %s option %s: You can only specify one from the list of valid option values: %s.

Feedback

**Description**

For the named command option, only one valid value can be specified.

**What Next**

See command man page for valid option value.

---

## CHF-002

(error) Incorrect command %s option usage. %s.

**Description**

Incorrect command option usage.

**What Next**

See command man page for correct option usage.

---

## CHF-003

(error) %s: Incorrect library cell type specified.

**Description**

Incorrect library cell type specified. Library cell must be one of these sub-types: std cell, physical only or filler.

**What Next**

Please specify library cell with correct library cell type.

---

## CHF-004

(Warning) %s: Reach limit of %d on this message. No more of this message will be printed.

**Description**

The preset limit on number of this message is reach. No more of this message will be shown.

**What Next**

Please check related message for further instruction.

Feedback

## CHF-005

(Warning) cell %s not multiple of row height.

**Description**

This cell is not multiple of row height of filler cells used. This maybe because it is on a unit tile differ from filler cell unit tile. It may also because it is not snap to row/tile.

**What Next**

Please check if this cell is snap to row/tile.

## CHF-006

(Error) filler %s has site %s but filler %s has site %s.

**Description**

All fillers specified in -lib_cells must have same site def

**What Next**

Use correct fillers.

## CHF-007

(Error) %s.

**Description**

create_stdcell_fillers can't continue because of described problem.

**What Next**

Please make necessary correction as explained.

## CHF-008

(Warning) %s.

**Description**

You receive this warning message because your fillers are not specified from largest to smallest. Fillers are inserted in the specified order. If they are not listed from largest to smallest, tool may not be able to fill all gaps.

Feedback

**What Next**

Please check your filler list and make necessary correction.

---

## CHF-009

(Warning) %s.

**Description**

You receive this warning message because without those size fillers, gaps may be left unfilled to prevent leaving gaps smaller than smallest sized cells.

**What Next**

Please check your filler list and make necessary correction.

---

## CHF-010

(Error) filler ref cell %s are not marked filler type.

**Description**

You receive this error message because you have -rules { post_route_auto_delete} turn on but specified filler ref cell is not marked filler type.

**What Next**

Please check your filler ref cell type setting.

---

## CHF-011

(Warning) filler ref cell %s not marked filler type.

**Description**

You received this warning message because your filler ref cell is not marked filler type.

**What Next**

Please check your filler ref cell type.

---

## CHF-012

(Error) Fillers siteDef is %s and there is no placeable row area with same site def.

Feedback

**Description**

You receive this error message because there is no placeable row area for fillers. This can be because all the area is occupied or because rows have different siteDef as fillers

**What Next**

Please check your fillers or design and make necessary corrections.

---

## CHF-013

(Error) Filler %s has no site def set.

**Description**

You receive this error message because this filler ref lib cell's site def is not set.

**What Next**

Please set filler ref cell site def.

---

## CHF-014

(Warning) option -continue_on_error turned on automatically.

**Description**

You receive this warning message because you did not specify -continue_on_error and -rules { no_1x}, and doesn't provide size 1x fillers. Tool therefore turn on -continue_on_error automatically so it will skip unfillable 1x gaps and continue to fill the rest. This may lead to unfillable gaps.

**What Next**

Please include fillers of all needed sizes

---

## CHF-015

(Warning) Center cell %s will be skipped since its cell type is not supported.

**Description**

Incorrect center cell type specified. Center cell must be one of these sub-types: std cell, filler, well tap, end cap, diode or feed through.

**What Next**

Please specify center cell with correct library cell type.

Feedback

## CHF-016

(Error) Site %s of lib cell %s is not compatible with site %s of lib cell %s.

**Description**

All lib cells specified in -lib_cells must have same site def.

**What Next**

Use correct lib cells.

## CHF-017

(Error) Height of center lib cell %s is not multiple integer of the height of %s filler lib cell %s.

**Description**

The height of center lib cells specified must be multiple integer of the height of its corresponding left or right filler lib cells.

**What Next**

Use correct lib cells.

## CHF-018

(Information) Total %d instances of %s filler %s inserted for center cell %s.

**Description**

This message tells you how many left or right filler cells were inserted into the design by the command.

**What Next**

Compare the number of inserted left or right filler cells to what you anticipated.

## CHF-019

(Information) Total %d left right filler cells inserted successfully.

**Description**

This message tells you how many left right filler cells were inserted into the design by the command.

Feedback

**What Next**

Compare the number of inserted left right filler cells to what you anticipated.

---

## CHF-020

(error) Vertical rows are not supported.

**Description**

This command works for designs with only horizontal rows.

**What Next**

Use this command for designs with only horizontal rows.

---

## CHF-021

(info) Boundary cell placement rules are not set.

**Description**

This message indicates no boundary cell placement rules are set by set_boundary_cell_rules.

**What Next**

Use set_boundary_cell_rules to set boundary cell placement rules before running this command.

---

## CHF-022

(Information) Total %d %s rules found in design %s.

**Description**

This message tells you how many rules were set by set_boundary_cell_rules command for this design.

**What Next**

Compare the number of rules to what you anticipated.

---

## CHF-023

(warning) %s rule %s will not be honored by %s.

Feedback

**Description**

This message tells you the rule is not supported for this command.

**What Next**

NA

---

## CHF-024

(Information) No %s violation.

**Description**

This message tells you no violation for this rule.

**What Next**

NA

---

## CHF-025

(error) There is a gap in {{%s, %s} {%s, %s}}.

**Description**

This message indicates that the tool has detected a continuity violation.

**What Next**

Insert an appropriate boundary cell in the gap.

---

## CHF-026

(error) Illegal %s cell %s in {{%s, %s} {%s, %s}}.

**Description**

This message indicates that the tool has detected a corner and boundary cell violation.

**What Next**

Change the illegal corner or boundary cell to appropriate one.

---

## CHF-027

(error) Illegal orientation for cell %s in {{%s, %s} {%s, %s}}.

Feedback

**Description**

This message indicates that the tool has detected an orientation violation.

**What Next**

Change the cell's orientation according to the orientation rule.

---

## CHF-028

(error) Illegal %s abutment cell %s in {{%s, %s} {%s, %s}}.

**Description**

This message indicates that the tool has detected an abutment cell violation.

**What Next**

Change the illegal abutment cell to appropriate one.

---

## CHF-029

(error) There are %d even boundary cells and %d odd boundary cells in vertical edge {{%s, %s} {%s, %s}}.

**Description**

This message indicates that the tool has detected a consistent parity violation.

**What Next**

Remove the inappropriate parity type boundary cells and insert new ones to make all the boundary cells along this vertical edge have the same parity.

---

## CHF-030

(error) Boundary cell parity violation in {{%s, %s} {%s, %s}}, parity in left is %s and parity in right is %s.

**Description**

This message indicates that the tool has detected a boundary cell parity violation.

**What Next**

Change the boundary cells' parity type in left or right side according to the boundary cell parity rule.

Feedback

## CHF-031

(error) %s segment parity violation in {{%s, %s} {%s, %s}}, %s is %s number (%d) %s sites.

**Description**

This message indicates that the tool has detected a segment parity violation.

**What Next**

Insert hard placement blockages in the left/right side or top/bottom of this segment to meet the segment parity rule.

## CHF-032

(error) %s %s violation in {{%s, %s} {%s, %s}}, %s is %s.

**Description**

This message indicates that the tool has detected a short edge or segment violation.

**What Next**

Check the value for the min horizontal jog or min row width to ensure that it is correct. If it is correct modify your floorplan to extend the edge or segment in the error message so that it is longer than the min value.

## CHF-033

(error) No valid segment rule type is specified.

**Description**

This message indicates no segment rule type is specified by the app option plan.flow.segment_rule.

**What Next**

Set the app option plan.flow.segment_rule before running this command.

## CHF-034

Rows with margin(gap or space) are not supported.

Feedback

**Description**

Do not support gaps between site rows (y_margin) or gaps between sites in a row(x_margin).

**What Next**

Check margin value(s). It must be 0.

---

## CHF-035

(error) -smallest_cell_size must be an integer between 1 and 11.

**Description**

You received this error message because you specified invalid value for option -smallest_cell_size

**What Next**

Please see man page for option usage.

---

## CHF-036

(error) inconsistant option usage between -rules {no_1x} and -smallest_cell_size.

**Description**

You received this error message because you specified both -smallest_cell_size and -rules {no_1x}. Please only use -rules {no_1x} if your smallest cell size is 2x. Otherwise, only use -smallest_cell_size.

**What Next**

Please use only one of the option. See man page for more details.

---

## CHF-037

(error) Left boundary cell or right boundary cell is not specified.

**Description**

This message indicates no left boundary cell or right boundary cell is specified by set_boundary_cell_rules.

**What Next**

Use set_boundary_cell_rules to set left boundary cell and right boundary cell before running this command.

Feedback

## CHF-038

(error) %s of the %s separation (%.4f, %.4f), (%.4f, %.4f) is smaller than the allowed minimum value.

**Description**

This message indicates that the tool has detected a short separation violation.

**What Next**

Check the value for the min horizontal separation or vertical separation to ensure that it is correct. If it is correct modify your floorplan to extend the separation in the error message so that it is longer than the min value.

## CHF-039

(Warning) Multi-threading is forced off because multi-height fillers specified.

**Description**

You enabled multi-threading but currently multi-threading is not supported when multi-height fillers specified.

**What Next**

Please turn off multi-threading when multi-height fillers specified.

## CHF-040

(Warning) No advanced rule in design. Multi-threading will not provide noticeable runtime improvement.

**Description**

You received this message because there is no advanced rules( min-vth, TPO, or OD rule) in design and you enabled multi-threading. When no advanced rules, multi-threading will not provide noticeable runtime improvement.

**What Next**

Please turn off multi-threading when there is no advanced rule.

## CHF-041

(error) The area specified by user is not inside block boundary.

Feedback

**Description**

The bbox specified by user should be inside block boundary.

**What Next**

Specify a correct value.

---

## CHF-042

(warning) The area specified should be inside block boundary, the tool will automatically adjusted it.

**Description**

During *create_tap_meshes*, the *-bbox* specified by users should be inside block boundary, otherwise, the tool will adjust it.

**What Next**

N/A

---

## CHF-043

(error) %s: Incorrect library cell type specified for left/right cell.

**Description**

Incorrect library cell type specified. Library cell must be one of these sub-types: std cell, filler, well tap or feed through.

**What Next**

Please specify library cell with correct library cell type.

---

## CHF-044

(warning) Perimeter constraint routing blockage can not be created on design block %s, and only metal created in preferred direction.

**Description**

Perimeter constraint routing blockage can not be created on block.

**What Next**

Please check the block design.

Feedback

## CHF-045

(error) Target filler cell and custom cells have different height or width.

**Description**

You see this error message because you specified target filler cell and custom cells of different size.

**What Next**

Use the custom cells with the same size of target filler cell instead.

## CHF-046

(error) Max vertical constraint violation between cell %s and %s.

**Description**

You see this error message because you specified -check_only to check max vertical constraint violation.

**What Next**

Remove -check_only or use other method to fix the max vertical constraint violation.

## CHF-047

(error) No rules are specified. Please set place.legalize.enable_2D_query_placer_rules.

**Description**

You see this error message because you turned off auto 2D rule setting but specified no rules by place.legalize.enable_2D_query_placer_rules.

**What Next**

Use app option place.legalize.enable_2D_query_placer_rules to specify some rules.

## CHF-048

(warning) There is metal shape %s on layer %s overlaps bbox %s in block %s.

**Description**

This is check_only mode for command derive_perimeter_constraint_objects.

Feedback

**What Next**

Creating perimeter constraint objects.

---

## CHF-049

(Warning) %s.

**Description**

Please set the correct command options.

**What Next**

Please check command options usage.

---

## CHF-050

(warning) There is route guide %s on layer %s overlaps bbox %s in block %s.

**Description**

This is check_only mode for command derive_perimeter_constraint_objects and derive_metal_cut_routing_guides.

**What Next**

Creating perimeter constraint or metal cut route guide objects.

---

## CHF-051

(warning) There is no max pattern perimeter constraint route guide on layer %s in bbox %s in block %s.

**Description**

This is check_only mode for command derive_perimeter_constraint_objects.

**What Next**

Creating perimeter constraint objects.

---

## CHF-052

(warning) Layer '%s' is not a via cut layer.

**Description**

The specified layer is not a via cut layer. The layer must be a via cut layer.

Feedback

**What Next**

Check the technology layer information.

---

## CHF-053

(warning) There is no perimeter constraint metal shape on layer %s in bbox %s in block %s.

**Description**

This is check_only mode for command derive_perimeter_constraint_objects.

**What Next**

Creating perimeter constraint objects.

---

## CHF-054

(warning) The option %s should be used with boundary cell rule -at_va_boundary.

**Description**

The given option should be used with boundary cell rule -at_va_boundary.

**What Next**

Check the command man page to see correct options to use.

---

## CHF-055

(error) Found %s boundary cell %s in {{%s, %s} {%s, %s}}.

**Description**

This message indicates that the tool has detected a redundant extra boundary cell.

**What Next**

Check redundant extra boundary cell.

---

## CHF-056

(warning) The option %s is obsolete, please use %s instead.

**Description**

The given option is obsolete and will be removed from the future release. Please change to use the new option or the new command instead, which has similar functionality.

Feedback

**What Next**

Check the command man page to see correct options to use.

---

## CHF-057

(Error) Option %s's value should not be a negative value.

**Description**

Option value should not be a negative value.

**What Next**

Please set the correct option value.

---

## CHF-058

(error) %s.

**Description**

Errors are found during the processing of the command options.

**What Next**

Please check the manpage of the command to correct any errors related to option settings.

---

## CHF-059

(warning) No preferred routing direction defined for routing layer %s.

**Description**

There is no preferred routing direction defined for a routing layer. The checking is performed for all routing layers if max/min routing layers are not defined. If max/min routing layers are defined, the tool only check layers between max and min layers.

**What Next**

Please set preferred routing layer direction in order for the tool to proceed

Example: set_attribute [get_layers M1] routing_direction horizontal

set_ignored_layers -max_routing_layer METAL -min_routing_layer METAL3

Feedback

## CHF-060

(warning) Perimeter constraint max pattern nonpreferred direction route guide's width is too large for routing layer %s.

**Description**

Max pattern nonpreferred direction route guide's width is too large for perimeter constraint on routing layer.

**What Next**

Please set the correct constraint value of routing guides.

## CHF-061

(Warning) Center cell %s is specified more than one time.

**Description**

Center cell %s is specified more than one time, the latest setting will overwrite previous settings.

**What Next**

Please check -lib_cells settings.

## CHF-062

(error) Creating perimeter constraint objects group failed on design block %s.

**Description**

Errors are found during the processing of perimeter constraint objects group creating on block.

**What Next**

Please check the block design.

## CHF-063

(info) Perimeter constraint objects group %s is created on design block %s.

**Description**

Perimeter constraint objects group is created on block.

Feedback

**What Next**

Please check the block design.

---

## CHF-064

(error) Lib cell %s has site def %s that cannot be found in the site rows of current deign.

**Description**

Incorrect lib cells specified because its site def cannot be found in the site rows of current design.

**What Next**

Please specify correct lib cells.

---

## CHF-065

(error) Please specify option %s's value %s with %s for design block %s.

**Description**

Perimeter constraint objects creating need correct command options setting.

**What Next**

Please check the command options setting.

---

## CHF-066

(warning) There is route blockage %s on layer %s overlaps bbox %s in block %s.

**Description**

This is check_only mode for command derive_perimeter_constraint_objects.

**What Next**

Creating perimeter constraint objects.

---

## CHF-067

(warning) Perimeter constraint short metal is ended in max pattern routing guide on routing layer '%s'.

**Description**

The specified short metal length is too small for the routing layer.

Feedback

**What Next**

Check the short metal length and spacing from boundary.

---

## CHF-068

(warning) Layer '%s' is not a routing layer.

**Description**

The specified layer is not a routing layer. The layer must be a routing layer.

**What Next**

Check the technology layer information.

---

## CHF-069

(warning) Perimeter constraint routing blockage can not be created on design block %s, and only max pattern routing guide created.

**Description**

Perimeter constraint routing blockage can not be created on block.

**What Next**

Please check the block design.

---

## CHF-070

(Error) %s.

**Description**

The specific valid region is too small to place tap cell.

**What Next**

Please check the -bbox settings or other options.

---

## CHF-071

(Error) no edge is detected in the rectangular region prescribed.

**Description**

The region specified by -bbox should touch at least one valid object.

Feedback

**What Next**

Please check the -bbox settings.

---

## CHF-072

(Error) The -skip_fixed_cells option is not supported by the rule specified with -replacement_rule.

**Description**

The -skip_fixed_cells option only supports rules mentioned in the command man page.

**What Next**

Check the man page of -skip_fixed_cells option and specify the supported replacement rule.

---

## CHF-073

(Warning) Smallest filler provided is greater than specified in option place.rules.min_vt_filler_size

**Description**

The smallest fillers specified in "create_stdcell_fillers -lib_cells" is larger than what is specified in app option place.rules.min_vt_filler_size. This may cause unfillable gaps.

**What Next**

Please include missing size fillers in create_stdcell_fillers -lib_cells.

---

## CHF-074

(Warning) User overwrite prefer same VT heuristics

**Description**

User uses app option chf.create_stdcell_fillers.follow_orders to overwrite prefer same VT heuristics. This will increase run time and the increase may be significant.

**What Next**

Only use app option chf.create_stdcell_fillers.follow_orders when absolute necessary. An alternative is use -type_utilization.

Feedback

## CHF-075

(Error) Filler insertion encounters unfillable gaps. Please run check_legality before filler insertion to ensure design is fillable.

**Description**

create_stdcell_fillers encounters unfillable gaps. Please run check_legality before filler insertion to ensure design is fillable.

**What Next**

Please run check_legality before filler insertion to ensure design is fillable.

## CHF-076

(Error) Incomplete/Invalid cell group (variants) defined for lib cell %s.

**Description**

You receive this error because specified lib cell has incomplete/invalid cell group setup.

**What Next**

Please check your cell group (variant) setup for the specified lib cell.

## CHF-077

(error) Same object cannot appear in both option %s and option %s.

**Description**

Incorrect command option usage.

**What Next**

See command man page for correct option usage.

## CHF-078

(warning) There are lib cells in -lib_cells but not in -type_utilization. Option -fill_remaining is not specified.

**Description**

If there are lib cells in -lib_cells but not in -type_utilization, those lib cells can be used by -fill_remaining option. If -fill_remaining is not specified, please check if the option -fill_remaining is missed or it is intentional to specify more lib cells in -lib_cells option.

Feedback

**What Next**

Check if the option -fill_remaining is missed or it is intentional to specify more lib cells in -lib_cells option.

---

## CHF-079

(error) Option %s and %s cannot be specified together.

**Description**

User specified options or value are mutually exclusive.

**What Next**

Please check man page for command option usage.

---

## CHF-080

(Warning) VT leakage order not defined. Command continue without considering VT leakage order.

**Description**

This warning occurs when both -leakage_vt_order option and app option place.legalize.boundary_leakage_info_files not used or tool not able to retrieve valid vt leakage order from them, so create_stdcell_fillers command will run without considering vt leakage order.

**What Next**

Specify -leakage_vt_order option or use app option place.legalize.boundary_leakage_info_files.

---

## CHF-081

(Warning) app option place.legalize.boundary_leakage_info_files specified. -leakage_vt_order option will be ignored.

**Description**

This warning occurs when both -leakage_vt_order option and app option place.legalize.boundary_leakage_info_files is set, so create_stdcell_fillers command will use leakage side files and ignore -leakage_vt_order option.

Feedback

**What Next**

Only use one of -leakage_vt_order option or app option place.legalize.boundary_leakage_info_files.

---

## CHF-082

(Warning) cannot derive vt leakage order from files.

**Description**

This warning occurs when either vt leakage order files not specified, or incorrect value specified in those files. Tool will use orders from -leakage_vt_order option if specified.

**What Next**

Please specify correct vt leakage files, or check the data in the files.

---

## CHF-085

(Information) set_tap_boundary_wall_cell_rules command is executed and it will overwrite all rules defined previously.

**Description**

This message remind user that set_tap_boundary_wall_cell_rules has top priority and it will overwrite all rules defined previously.

**What Next**

User could review if current rules are expected.

---

## CHF-090

(error) Boundary cell %s contains %s layer outside of cell boundary.

**Description**

Boundary cell %s contains %s layer outside of cell boundary.

**What Next**

Please check to see if the legal cells have been specified.

---

## CHF-100

(Information) Total %d %s inserted successfully into %s.

Feedback

**Description**

This message tells you how many cells were inserted into the design by the command.

**What Next**

Compare the number of inserted cells to what you anticipated.

---

## CHF-101

(Error) Cannot place tap cell at location (%f, %f).

**Description**

This error occurs the when the tool cannot place a tap cell in specified location, which is needed to ensure that tap distances are met.

**What Next**

Check the location specified for blockages or pre-existing tap cells that are preventing the tap cell from being inserted.

---

## CHF-102

(Error) Cannot instantiate current_design within itself.

**Description**

The *insert_tap_cell* command was used to try to create a tap cell in the current design that referenced the current design. This would create a cycle in the design hierarchy, which is not allowed.

**What Next**

Choose a different *reference* for the *insert_tap_cell* command.

---

## CHF-103

(Error) Library specified in -lib_cell was not found.

**Description**

The *insert_tap_cell* cannot find the library specified in the *-lib_cell* option.

**What Next**

Check and make sure that the specified library in the -lib_cell option exists and is spelled correctly.

Feedback

## CHF-104

(Error) Cell specified in -lib_cell was not found.

**Description**

The *insert_tap_cell* cannot find the cell specified in the *-lib_cell* option.

**What Next**

Check and make sure that the specified cell in the -lib_cell option exists and is spelled correctly.

## CHF-105

(Error) No '/' in -lib_cell option to seperate library and cell name.

**Description**

The *-lib_cell* option of the *insert_tap_cell* does not contain a '/' to seperate between the library and the cell.

**What Next**

Add '/' to the *-lib_cell* option to separate between the library and the cell in between the library and cell names.

## CHF-106

(Error) Net %s is not a %s net.

**Description**

The *-connect_power_name* and *-connect_ground_name* options of the *insert_tap_cell* command can only accept power and ground nets respectively.

**What Next**

Change the net specified by the option to a net that is a power or ground net.

## CHF-107

(Error) Failed to connect net %s to tap cell %s.

**Description**

The net specified to the either *-connect_power_name* and *-connect_ground_name* options of the *insert_tap_cell* command could not be connected to newly a created tap cell.

Feedback

**What Next**

Check the net specified to the option and make sure that it is valid and is a power or ground net.

---

## CHF-108

(Error) Failed to insert %s in block named %s.

**Description**

The command could not insert cells into a block.

**What Next**

Site rows are needed in the block to insert cells. If the block is a soft-macro, check and make sure that site rows have been pushed down from the top level.

---

## CHF-109

(Error) %s are not supported.

**Description**

The feature listed in the error message is not supported.

**What Next**

Remove the feature list in the error message.

---

## CHF-110

(Error) Block %s is read-only.

**Description**

The command cannot insert into the block because the block is read-only.

**What Next**

Change the block so that it is writable.

---

## CHF-111

(Error) No placement site with correct height found for cell %s.

Feedback

**Description**

The command could not find a placement site definition in the block that is compatible with the height of the cell that is to be inserted.

**What Next**

First, check and make sure you that cell you are trying to insert is the correct one. Then check to make sure that all the values including height are correctly set in the site definition for the cell you are trying to insert. Finally, if necessary create site rows with correct height for the cell that is to be inserted.

---

## CHF-112

(Error) Specified lib cells do not have the same site definition.

**Description**

The lib cells you specified do not have the same site definition. When doing insertion all library cells specified must have the same site definition.

**What Next**

Check and make sure you that cells you are trying to insert are the correct ones and the dimensions of these cells are compatible with each other.

---

## CHF-113

(Error) Voltage area %s is not associated with any power domain..

**Description**

In order for cells to be inserted into the correct hierarchy, non-default voltage areas must be associated with power domains.

**What Next**

Check your upf specifications and make sure non-default voltage areas are related to power domains.

---

## CHF-114

(Error) Tap distance is smaller than the width of a single cell placement site.

**Description**

The tap distance specified is smaller than the width of the cell placement site being used for insertion.

Feedback

**What Next**

Increase the specified tap distance so that it is larger than the width of a cell placement site.

---

## CHF-115

(Warning) Cannot place %s at location (%f, %f) because %s.

**Description**

The cell cannot be placed in the location due to the specified violation.

**What Next**

Check your library setup to make sure it is correct. For example if you have a cell that has an orientation that is not legal for the row it is placed and causing a violation. Make sure that the site that the cell is being created in allows symmetry on the x-axis.

---

## CHF-116

(Warning) Failed to fix violation for cell %s.

**Description**

The specified cell is in violation of a rule, but we failed to fix it by swapping equivalent cells in its place.

**What Next**

Make sure that correct substitutes are specified for this cell, or move it where it will not violate rules.

---

## CHF-117

(Error) Cell %s is in both %s and %s list.

**Description**

The specified cell is in two conflicting lists.

**What Next**

Remove cell from one of the lists.

---

## CHF-118

(Warning) Unable to fix max constraint length violation between cell %s and %s.

Feedback

**Description**

The command failed to resolve the violation between the two specified cells.

**What Next**

Consider moving or replacing some of the cells between the two.

---

## CHF-119

(error) Illegal fin type for cell %s in {{%s, %s} {%s, %s}}.

**Description**

This message indicates that the tool has detected a fin type violation.

**What Next**

Change the cell's LibCell according to the fin type rule.

---

## CHF-120

(error) Site master "%s" does not have Y-Symmetry but the design contains Y-mirrored site rows.

**Description**

This message indicates that the tool has detected that the site master being used does not have Y-Symmetry but the block that insertion is being performed in contains site rows that either have a MY or R180 orientation. This is a problem because there is no legal way that cells can inserted to meet the cell symmetry restrictions and the match the orientation of the row.

**What Next**

Either add Y-Symmetry to the site master or change the orientation of the rows from R180/MY to R0/MX.

---

## CHF-121

(Error) The height of library cell %s does not match the height of the other site definitions.

**Description**

The height of the specified library cell does not match the height of the other site definitions being used. This will happen for example if you specify cells that have different heights for different library cell options of create_boundary_cells.

Feedback

### What Next

First, check to see if the correct cells have been specified. Then check if all of the cells specified to the command are the same height. If it is correct then check the site definition of the specified cell to make sure they are all correct.

---

## CHF-122

(error) Line segment (%.4f, %.4f), (%.4f, %.4f) is smaller than the allowed minimum jog.

### Description

This message indicates that the tool has detected a line segment that is smaller than the allowed the minimum jog.

### What Next

Check the value for the minimum jog to ensure that it is correct. If it is correct modify your floorplan to extend the line segment specified in the error message so that it is longer than the minimum jog.

---

## CHF-123

(Warning) Overwriting value %s.

### Description

The tool is warning you that you are overwriting a value that you have already set.

### What Next

Please check the parameters in the command you just issued and make sure they are correct.

---

## CHF-124

(warning) Row (%.4f, %.4f, %.4f, %.4f) is not wide enough to accommodate non-abutted tap cells.

### Description

This message indicates that the tool has detected a row that is not wide enough to accommodate non-abutted tap cells.

Feedback

**What Next**

Before inserting tap cells, insert placement blockages in the rows that are not wide enough to accommodate non-abutted tap cells or run the command without the -no_abutment option.

---

## CHF-125

(warning) No 1x or 2x + 3x wide cells provided for top or bottom option.

**Description**

You receive this warning message because you have not specified either a cell that is equal in width to the unit site or a pair of cells that are twice and three times the width of the unit tile for the bottom and top boundary cell options.

**What Next**

Add cells to the bottom or top boundary cell list so that you mee the requirement of having a either 1x or a pair of 2x and 3x cells for both top and bottom boundary cells.

---

## CHF-126

(Error) The lower left corner of the boundary of library cell %s is not at (0,0).

**Description**

The lower left corner of the boundary of the specified library cell is not set to (0,0). Only library cells where the lower left corner of the boundary is set to (0,0) can be used with this command.

**What Next**

Go back to the LEF used to generate the library cell and set the lower left corner of the boundary to (0,0).

---

## CHF-127

(Warning) The design already has boundary cells of type %s.

**Description**

The design already has boundary cells of type %s.

**What Next**

Remove existing boundary cells and then re-run the command.

Feedback

## CHF-128

(warning) The design has advanced rules. Using create_stdcell_fillers is recommended over create_vtcell_fillers.

**Description**

This message indicates that the tool has detected that the design has advanced rules such as VT or CNOD.

**What Next**

Change your script to use create_stdcell_fillers instead of create_vtcell_fillers.

## CHF-129

(Error) Cannot terminate tap column with tap cap at location (%f, %f).

**Description**

The specified tap column cannot be terminated with a tap cap. This occurs when there is column consisting of one single tap cell that needs to be placed in a location that has a placement obstruction directly above and below it.

**What Next**

Change the floorplan so that it does not produce a column that consists of one single tap cell that has a placement obstruction directly above and below it.

## CHF-130

(warning) Skipping routing layer %s because routing direction is not set for that layer.

**Description**

This message indicates that the routing direction is not set on the given routing layer and that boundary routing blockages will not be created for that layer.

**What Next**

Set routing direction for the layer using the set_attribute command. For example, to set the routing direction for metal layer 3 to horizontal, issue the following command: set_attribute [get_layers M3] routing_direction horizontal

## CHF-131

(Error) Cannot find correct vt filler to fill gap at (%f, %f).

Feedback

**Description**

This error occurs the when the tool cannot find a correct vt filler cell to fill the gap at specified location.

**What Next**

Check the vt table to make sure that you have specified all the vt filler cells supplied by the library vendor for all the different vt types. Also check to make sure there are not gaps that are not less wide than the smallest filler vt filler cell.

---

## CHF-132

(Information) Inserted %d cell %s successfully in region %s.

**Description**

This message tells you how many cells were inserted into the region by the command.

**What Next**

Compare the number of inserted cells to what you anticipated.

---

## CHF-133

(Information) Dropped %d cell %s in region %s due to overlapping with blockages, macros, keepout regions and other existing cells.

**Description**

This message tells you how many cells were not inserted into the region due to blockages, macros, keepout regions and other existing cells by the command.

**What Next**

Compare the number of dropped cells to what you anticipated.

---

## CHF-134

(Information) Tap cells will be shifted to legal location due to %s.

**Description**

This message tells that tap cells may be shifted to accommodate certain rules.

Feedback

**What Next**

Check what options you specified to the command to make sure that you intended to turn those rules on. Make sure to include a tolerance between what you specify to the distance option and the actual tap rule DRC distance.

---

## CHF-135

(warning) The create_boundary_cells command will be deprecated and replaced with the compile_boundary_cells.

**Description**

Migrate to the compile/check_boundary_cells commands flow.

---

## CHF-136

(warning) Row (%.4f, %.4f, %.4f, %.4f) is not wide enough to accommodate %s.

**Description**

This message indicates that the tool has detected a row that is not wide enough to accommodate a tap cell insertion feature that requires shifting the location of the tap cells.

**What Next**

Before inserting tap cells, insert placement blockages in the rows that are not wide enough to accommodate shifting tap cells or turn-off the feature listed in the warning message.

---

## CHF-137

(warning) The chipfinishing.standard_cell_region_horizontal_shrink_factor and chipfinishing.standard_cell_region_vertical_shrink_factor app option will be deprecated and replaced with the derive_standard_cell_region_routing_guides command options: -standard_cell_region_vertical_shrink_factor and -standard_cell_region_horizontal_shrink_factor.

**Description**

The chipfinishing.standard_cell_region_horizontal_shrink_factor and chipfinishing.standard_cell_region_vertical_shrink_factor app option will be deprecated.

**What Next**

Change your script to replace the use of chipfinishing.standard_cell_region_horizontal_shrink_factor and chipfinishing.standard_cell_region_vertical_shrink_factor

Feedback

to use the -standard_cell_region_vertical_shrink_factor and -standard_cell_region_horizontal_shrink_factor options of the derive_standard_cell_region_routing_guides command.

---

## CHF-138

(Warning) Same cell specified for boundary cell (%s) as for boundary tap cell (%s)

**Description**

This warning occurs when you have specified the same cell for bottom or top boundary cell as you do for a boundary tap cell.

**What Next**

Modify your script so that you do not specify any cells for boundary tap cells.

---

## CHF-139

(Warning) Floorplan does not align correctly with double height boundary cell power rails at (%.4f, %.4f, %.4f, %.4f).

**Description**

This warning occurs when you are using double height boundary cells and the Y locations of placement blockages, macros and voltage area edges are not snapped to the correct row site row.

For example if you have double height cells where the middle power rail is a VDD rail the top of row of all the place-able row must have a row orientation of MX and the bottom row of all place-able rows must have a row orientation of R0. On the contrary, if the middle power rail is a GND rail the top of row of all the place-able row must have a row orientation of R0 and the bottom row of all place-able rows must have a row orientation of MX.

**What Next**

Modify the placement blockages, macros and voltage areas of the floorplan so that the top and bottom rows are of the correct orientation.

---

## CHF-140

(Warning) Not enough horizontal clearance at (%f, %f, %f, %f).

Feedback

**Description**

This warning occurs the when there is not enough horizontal clearance to insert boundary cells with the targets that where specified to the command. the tool cannot find a correct vt filler cell to fill the gap at specified location.

**What Next**

Modify the floorplan so that there is enough horizontal clearance in the area specified in the warning.

---

## CHF-141

(Warning) Not enough vertical clearance at (%f, %f, %f, %f).

**Description**

This warning occurs the when there is not enough vertical clearance to insert boundary cells with the targets that where specified to the command. the tool cannot find a correct vt filler cell to fill the gap at specified location.

**What Next**

Modify the floorplan so that there is enough vertical clearance in the area specified in the warning.

---

## CHF-142

(Information) Both core and voltages ares were specifed as boundary insertion targets, core area target will be ignored.

**Description**

This message tells you that you specified both core and voltages ares as targets to the boundary insertion command. If voltage areas are specified there is no need specify core area.

**What Next**

Update your script so that only voltage areas are specified as targets to boundary cell insertion.

---

## CHF-148

(Error) Library cell name %s is specified twice in the -multiple_tap_cell option.

Feedback

**Description**

This message lets you know that you specified the same library cell twice in the -multiple_tap_cell option.

**What Next**

Check over the library cells specified to the -multiple_tap_cell option remove one of them. If they library options have different parameters please take care to remove the one that has incorrect parameters.

---

## CHF-149

(Warning) Variants found for library cell %s, but variant awareness is turned off.

**Description**

This message lets you know that the library cell that you specified has variants, but variant awareness is not turned on. This gives unexpected results and might cause cells to be placed in locations where they are not legal due to variant rules.

**What Next**

Turn on the enable_variant_aware application option as follows:

set_app_option -name place.legalize.enable_variant_aware -value true

---

## CHF-150

(Information) Total %d blockages inserted successfully into %s.

**Description**

This message tells you how many blockages were inserted into the design by the command.

**What Next**

Compare the number of inserted blockages to what you anticipated.

---

## CHF-160

(Information) Total %d route guides inserted successfully into %s.

**Description**

This message tells you how many route guides were inserted into the design by the command.

Feedback

**What Next**

Compare the number of inserted route guides to what you anticipated.

---

## CHF-161

(Information) No areas without tap coverage found.

**Description**

This message tells you that the command found no place-able areas in the design that were missing tap coverage.

**What Next**

Tap insertion should now be complete and no further action in tap cell insertion is required.

---

## CHF-162

(Information) Found %d areas without tap cell coverage. Tap cell insertion will be performed in the areas using the specified pattern.

**Description**

This message tells you the number areas in the design that were missing tap coverage.

**What Next**

After insertion you should check the design to make sure that the final tap cell placement is what you anticipate.

---

## CHF-163

(Information) Found %d areas without tap cell coverage. The areas will be added to the error browser.

**Description**

This message tells you the number areas in the design that were missing tap coverage and that they have been added to the error browser.

**What Next**

After seeing this message you should open up the error browser and inspect and add tap cell coverage to the areas highlighted in the error browser.

Feedback

## CHF-164

(Information) Found %d areas with abutment violations.

**Description**

This message tells you the number areas in the design that have abutment violations.

**What Next**

After insertion you should check the design to make sure that the final tap cell placement is what you anticipate.

## CHF-165

(Error) Found DRC errors in check.

**Description**

This message tells you that DRC errors were found during checking.

**What Next**

Inspect the error browser and investigated the errors.

## CHF-166

(Warning) Tap cell insertion was executed without the -no_abutment options on a design that contains vertical abutment rules.

**Description**

This message tells you that you ran the tap cell insertion command without using vertical abutment options in a design that contains vertical abutment rules.

**What Next**

Consult with the design rules for tap cell insertion and add one more of the following no abutment options as as appropriate: -no_abutment, -no_abutment_cells, -no_abutment_horizontal_spacing and/or -no_abutment_corner_spacing.

## CHF-168

(Information) Tap cells with a VT that cannot abut boundary cells detected, no 0x mode will be turned on.

Feedback

**Description**

This message tells you that the command has detected tap cells that have a VT that cannot abut boundary cells. As a result of this the command turns on no 0x mode, which means that tap cells will not be placed at the beginning or end of place-able site rows.

**What Next**

Run check_legality after tap cell insertion to insure that there are no violations.

---

## CHF-169

(Warning) App option place.legalize.ignore_keepout_margins_against_filler is not supported in advanced legalizer filler flow, use -ignore_standard_cell_keepout_margins instead.

**Description**

You set the place.legalize.ignore_keepout_margins_against_filler app option to true.

**What Next**

Change your script so that instead of setting the place.legalize.ignore_keepout_margins_against_filler app option to true you specify the -ignore_standard_cell_keepout_margins option to the create_stdcell_fillers command.

---

## CHF-170

(Warning) Voltage area %s does not have hierarchy associated with it. Cells inserted in this voltage may be associated with DEFAULT_VA instead of the former voltage area.

**Description**

In order for cells to be inserted and associated into those voltage areas the voltage areas need to have a hierarchy. This warning lets you know if there is a voltage area in your design that do not have associated hierarchy.

**What Next**

Create a module for the hierarchy using create_module and then create a cell into that hierarchy using the create_cell command.

---

## CHF-171

(Error) Leakage vt order violation at %s. Cell %s can be replaced by lib cell %s's instance.

Feedback

**Description**

There is a leakage vt order violation at the reported location. Using the reported lib cell's instance to replace the reported cell can reduce the leakage power.

**What Next**

Fix the violation to reduce the leakage power.

---

## CHF-172

(Information) Attribute %s for library cell %s has been specified both on the command line and in PRF, the value specified on the command line will be used.

**Description**

This message tells you that the given attribute has been specified both on the command line and in PRF and that the value specified on the command line will be used.

**What Next**

Check whether you need to specify the attribute on the command line since it is already specified in PRF and that the values are correct.

---

## CHF-173

(Error) The placeable region {%s} is too %s that not larger than ('-x_offset' + '-x_offset') or ('-left_offset' + '-right_offset'), falied to derive objects in this area.

**Description**

The placeable area is derived according to the settings, if the settings is incorrect, the placeable area will be too narrow or short to place objects.

**What Next**

Please adjust the floorplan or change the command options' value.

---

## CHF-199

(warning) The usage of option -segment_parity in boundary cell insertion is not recommended for advanced technology process due to inefficient area usage. Recommend the floorplan checking and fixing flow using check_floorplan_rules and fix_floorplan_rules commands.

**Description**

This message suggests using the floorplan checking and fixing flow.

Feedback

**What Next**

Check floorplan rules.

---

## CHF-200

(Information) Starting %s insertion into %s using site master "%s".

**Description**

This message tells you that insertion has started and which site definition is being used for insertion.

**What Next**

Check the site definition to make sure it matches your expectation.

---

## CHF-201

(Information) Replaced cell %s with unconstrained cells.

**Description**

This message indicates that the specified constrained cell has been replaced with one or more unconstrained cells.

**What Next**

Check that the new cells match your expectation.

---

## CHF-210

(warning) The MIM capacitor cell whose bbox is {%s} is intersected with %s %s, the creation is skipped.

**Description**

The new created MIM capacitor cannot be intersected with these objects whose type is specified by command option "-no_overlap".

**What Next**

NA.

---

## CHF-250

(Information) Total %d %s successfully removed from %s.

Feedback

**Description**

This message tells you how many cells were removed from the design by the command.

**What Next**

Compare the number of removed cells to what you anticipated.

---

## CHF-300

(error) Different replacement rules cannot be run at the same time.

**Description**

This error message occurs when you specify different rule option sets in one replace_fillers_by_rules command. For example, you cannot run max vertical constraint rule (related to -max_constraint_length option) and abutment rulea(related to -replace_abutment option) in one command.

**What Next**

Run one type of replace_fillers_by_rules at a time. See man page for details.

---

## CHF-301

(error) options %s must be used together.

**Description**

You receive this error message because you didn't specify all the required options for this command.

**What Next**

Please check command man page for detail option usage.

---

## CHF-302

(error) Invalid syntax in -replace_abutment option.

**Description**

This error message occurs when replace_fillers_by_rules -replace_abutment option syntax incorrect. The correct syntax is -replace_abutment { {targetRef1 customRef1} {targetRef2 customRef2} ...}

**What Next**

Please check your option syntax.

Feedback

## CHF-303

(error) Unable to find ref cell %s.

**Description**

This error message occurs when command replace_fillers_by_rules cannot find the ref cell you specified

**What Next**

Please check your script and make sure the ref cell exists.

## CHF-304

(error) Invalid syntax in -tap_cells option.

**Description**

This error message occurs when replace_fillers_by_rules -tap_cells option syntax incorrect. If -left_tap/-right_tap/-both_tap options are used, only specify the tap ref cell to be swapped out in -tap_cells.

If -left_tap/-right_tap/-both_tap aren't used, list the tap cell to be swapped out first, followed by substitute tap cells. For example, -tap_cells {swap_out_tap, substitute_tap1, substitute_tap2, ...}

**What Next**

Please check your option syntax. See man page for more details.

## CHF-305

(error) Option %s must be specified.

**Description**

This error message occurs when indicated option isn't specified.

**What Next**

Please specify requested option. See man page for more details.

## CHF-306

(error) Invalid %s option usgae: %s.

Feedback

**Description**

This error message occurs of indicated option usage error

**What Next**

Please check your option syntax. See man page for more details.

---

## CHF-307

(error) Filler ref cell %s is specified twice

**Description**

This error message occurs when a filler ref cell is used in replace_fillers_by_rules -replace_lib_cells option twice.

**What Next**

Please check your command option usage. See man page for more details.

---

## CHF-308

(error) options %s cannot be used together.

**Description**

You receive this error message because you specified options that are mutually exclusive.

**What Next**

Please check command man page for detail option usage.

---

## CHF-309

(error) duplicate entry %s in -refill_table option.

**Description**

You receive this error message because you specified the indicated ref lib cell twice in -refill_table option.

**What Next**

Please check command man page for detail option usage.

---

## CHF-310

(error) Ref cell %s are specified as target ref cell and replacement ref cell.

Feedback

**Description**

You receive this error message because you specified the indicated ref lib cell as both the target ref cell and replacement ref cell .

**What Next**

Please check command man page for detail option usage.

---

## CHF-311

(error) Command does not support multi-height tap cell.

**Description**

You receive this error message because command does not support multi-height tap cell .

---

## CHF-312

(Warning) Cell %s has end to end orientation violation.

**Description**

You can get this warning when running the replace_fillers_by_rules command with the -check_only option, when the command detects a violation it prints this message.

**What Next**

Fix the violation either manually or be using the replace_fillers_by_rules command without the -check_only option.

---

## CHF-313

(Error) lib cell %s is specified in more than one option.

**Description**

You can get this error when running the replace_fillers_by_rules command with a lib cell specified in more than one option.

**What Next**

Check man page for correct option usage and correct the script.

---

## CHF-314

(Error) Specified filler cells have different heights.

Feedback

**Description**

You can get this error when running the replace_fillers_by_rules -rule small_filler_stacking command, and specifed fillers in -small_fillers and/or -replacement_fillers of different heights. This command only support fillers of same height and siteDef.

**What Next**

Check man page for correct option usage and correct the script.

---

## CHF-315

(Error) specified small filler %s cannot be greater than 2 site width.

**Description**

You can get this error when running the replace_fillers_by_rules -rule small_filler_stacking command, and specifed fillers in -small_fillers that are greater than 2 site width

**What Next**

Check man page for correct option usage and correct the script.

---

## CHF-316

(Error) specified replacement filler %s must be greater or equal to 3 site width.

**Description**

You can get this error when running the replace_fillers_by_rules -rule small_filler_stacking command, and specifed fillers in -replacement_fillers that are less than 3 site width

**What Next**

Check man page for correct option usage and correct the script.

---

## CHF-400

(warning) more than 2500 windows.

**Description**

You received this warning message because based on the specified window size, there will be more than 2500 windows

**What Next**

Check if you use the correct window size

Feedback

## CHF-401

(error) window size greater than core area's.

**Description**

You received this error message because specified window height or width is greater than the core area's, and that you didn't use option -include_small_windows.

**What Next**

Check if you use the correct window size or use option -include_small_windows

## CHF-402

(error) TCD reference cell is not of type macro cell.

**Description**

You received this error message because frontend TCD reference cell must be macro cell type.

**What Next**

Check your frontend TCD reference cell cell type

## CHF-403

(error) design does not have FinFet grid.

**Description**

You received this error message because you used -snap_to_fin_grid but design doesn't have fin grid.

**What Next**

Check your design or option usage.

## CHF-404

(error) backend TCD reference cell is not of type cover cell.

**Description**

You received this error message because backend TCD reference cell must be cover cell type.

Feedback

**What Next**

Check your backend TCD reference cell cell type

---

## CHF-405

(error) specified insertion bbox is outside die area.

**Description**

You received this error message because specified -bbox is outside die area

**What Next**

Check value specified for -bbox option.

---

## CHF-406

(error) incompatible values specified for -tcd_spacing and -stack_with_backend

**Description**

You received this error message because you specified -tcd_spacing for 2 backend tcd layers, but also specified them in -stack_with_backend that they are stackable

**What Next**

Check value specified for -tcd_spacing and -stack_with_backend option.

---

## CHF-407

(error) option %s must be greater than 0

**Description**

You received this error message because values for this option must be greater than 0

**What Next**

Check value specified for the option and man page for additional details.

---

## CHF-502

(error) ICOVL reference cell is not of type macro cell.

**Description**

You received this error message because ICOVL reference cell must be macro cell type.

Feedback

**What Next**

Check your icovl reference cell cell type

---

## CHF-503

(error) Unable to create placement blockage for icovl cell %s because placement blockage of same name already exists.

**Description**

You received this error message because tool tried to create placement blockage for named ICOVL cell but identically named placement blockage already exists. This maybe caused by creating and removing ICOVL cells without removing corresponding placement blockages.

**What Next**

Remove existing ICOVL placement blockages.

---

## CHF-510

(error) Lib cell %s has no vt layer or contains vt layer not in option -leakage_vt_order.

**Description**

You received this error message because tool failed to get vt layer of the lib cell or the vt layer tool got was not specified in the option -leakage_vt_order.

**What Next**

Remove the lib cell or add the vt layer of the lib cell in the option -leakage_vt_order.

---

## CHF-511

(error) specified fller cell %s has unit width %d, whcih is smaller than user defined smallest filler size of %d .

**Description**

You received this error message because you specified a filler cell with unit site width less than what is specified in app option place.rules.min_vt_filler_size.

**What Next**

Remove the offending filler cell from create_stdcell_fillers command or update app option place.rules.min_vt_filler_size setting.

Feedback

## CHF-601

(error) No layer density rule %s exists.

**Description**

You received this error message because tool there is no layer density rule of this name.

**What Next**

Check if you specified correct rule name or define the rule first.

## CHF-602

(warning) For window (%f, %f)-(%f, %f): Impossible to satisfy layer %s upper bound density requirement of %f. After replacing all filler cells with min density cells, the density does not go below %f.

**Description**

You received this error message because after replacing all filler cells with min density cells, it still exceeds max density limit.

**What Next**

Check if you specified correct density requirement or adjust cell placement in window.

## CHF-603

(warning) For window (%f, %f)-(%f, %f): Impossible to satisfy layer %s lower bound density requirement of %f. After replacing all filler cells with max density cells, the density does not exceed %f.

**Description**

You received this error message because after replacing all filler cells with max density cells, it is still below the min density limit.

**What Next**

Check if you specified correct density requirement or adjust cell placement in window.

## CHF-604

(error) Exceed limit of %d windows that are impossible to satisfy density bounds. Command execution terminated.

Feedback

**Description**

You received this error message because the number of windows that are impossible to satisfy density bounds exceeds the set limit. You can change the limit using option -max_dead_window.

**What Next**

Check density rule, cell placement, or adjust max impossible to fix window limit.

---

## CHF-605

(warning) Window (%f, %f)-(%f, %f) is ignored because it has no filler cells.

**Description**

You received this warning message because there is no filler in this window. Therefore no layer density fix can be performed.

---

## CHF-606

(warning) The boundary tap distance has been reduced by one site unit to %s to have an even site length because the -force_even_tile_rows option is used.

**Description**

If the -force_even_tile_rows option is set, then all boundary tap cells will be placed at an even distance location. If an odd tap distance is specified, the distance will be reduced by one site unit to make it even.

**What Next**

Please check boundary tap distance or -force_even_tile_rows option.

---

## CHF-607

(warning) The boundary tap distance has been reduced by one site unit to %s to have an even site length because the -segment_parity option is set as horizontal_even.

**Description**

If the -segment_parity option is set as horizontal_even, then all boundary tap cells will be placed at an even distance location. If an odd tap distance is specified, the distance will be reduced by one site unit to make it even.

**What Next**

Please check boundary tap distance or -segment_parity option.

Feedback

## CHF-608

(warning) The %s has been reduced by one site unit to an even-site %s because -force_even_sites is used.

**Description**

If the -force_even_sites option is specified, then all cells must be placed at even-site locations. If the X-coordinate location provided by the user is not at even-site location, the coordinate location will be rounded down to an even-site location. If the X distance provided by the user is not at even length (in unit of sites), the distance will be rounded down by one site width to an even length. If the X-coordinate location and/or distance provided by the user is already even, the values are accepted without further adjustments.

**What Next**

Please check -x_offset option or -x_pitch option.

## CHF-700

(error) No %s replacement availables.

**Description**

You received this error message because no valid replacement filler of specified type provided for command "replace_fillers_by_rules -replacement_rule half_row_adjacency".

**What Next**

please check that you provided correct replacement filler. See man page for details

## CHF-701

(error) MIMCap reference cell is not of type cover cell.

**Description**

You received this error message because MIMCap reference cell must be cover cell type.

**What Next**

Check your MIMCap reference cell's cell type

## CHF-702

(error) The stub can be specified only when the metal_preferred option is provided.

Feedback

**Description**

Add the metal_preferred option if you need use the stub option.

**What Next**

Check the specifications of your options.

---

## CHF-703

(error) Option -stub's %s is invalid. A valid range is: %s.

**Description**

An invalid value is found for the stub option.

**What Next**

Please check the values of the stub options and use values in the specified range.

---

## CHF-704

(warning) None of MIM capacitor cell is inserted because of the mismatch between PG nets and PG pins of MIM capacitor.

**Description**

VDD and VSS net in the specified boundary can’t cover the VDD and VSS pin of MIM capacitor together.

**What Next**

Please check the PG nets and PG pins of the MIM capacitor in specified layer.

---

## CHF-705

(error) total %d empty-space blocks are found in current design.

**Description**

This error message summarizes total number of empty-space blocks in current design.

**What Next**

Check if the existance of these empty-space blocks is proper. If yes, you can use suppress_message to ignore this error.

Feedback

## CHF-706

(error) Design %s has inconsistent tap distance defined in PRF.

**Description**

All designs should have same default tap distance defined in PRF. This error message indicates there's inconsistent setting.

**What Next**

Check all design and set same tap distance.

## CHF-707

(Warning) Unable to fill gap at {%s %s}.

**Description**

You received this warning message because cannot fill gap at {%s %s} because legal check fail.

**What Next**

Check filler cell can insert {%s %s} coordinate with legal rules.

## CHF-708

(Information) %s .

**Description**

This message tells you verbose information about creating MIM Capacitors.

**What Next**

Please check your information message.

## CHF-710

(Warning) Unable to insert %s filler for center cell %s.

**Description**

You received this warning message because tool cannot legally insert the left/right filler for indicated center cell .

Feedback

**What Next**

Check if design is legal before create_left_right_filler_cells.

---

## CHF-711

(Warning) There are no %s site rows in the design but site_name of lib cell %s is %s.

**Description**

Incorrect lib cell specified because its site def cannot be found in the site rows of current design.

**What Next**

Please specify correct lib cells.

---

## CHF-712

(Error) There is no frame view for lib cell design %s.

**Description**

The lib cell without frame view cannot be used in set_boundary_cell_rules.

**What Next**

Make sure that each lib cell has frame view.

---

## CHF-715

(warning) Unable to connect some pins of '%s' at location {%s} to PG net '%s'.

**Description**

NA.

**What Next**

NA.

---

# CHK

---

## CHK-001

(Error ) The option '%s' is not specified.

Feedback

**Description**

The Option is not specified.

**What Next**

Specify the option in the correct format. Please see the manpage of the command for the correct type of the option.

---

## CHK-002

(warning) The checkpoint action '%s' has a previous definition that will be overwritten.

**Description**

The specified action has a previously definition which will be overwritten.

**What Next**

Please verfiy if the overwriting of the action definition is intended.

---

## CHK-003

(Error) Cannot remove checkpoint action '%s'. No action with that name is defined.

**Description**

The specified action is not found in the checkpoint system. The chechpoint action cannot be removed

**What Next**

The specified named action object is not found in the checkpoint system. You can list the defined action names using "get_checkpoint_data -list_actions".

---

## CHK-004

(Error ) One of the options '%s' must be always be specified.

**Description**

The specified Options for the command are mutually exclusive but atleast one of them must be always be specified.

**What Next**

Please specify one of the specified options.

Feedback

## CHK-005

(warning) The nested checkpoint '%s' will be ignored.

**Description**

The checkpointing system ignores the nested checkpoint and only the outermost checkpoint is ignored.

**What Next**

Please verify the named checkpoint.

## CHK-006

(warning) Checkpoint name '%s' was previously used. Changing to unique name '%s'.

**Description**

The checkpoint name been specified has been defined previously. The checkpointing system will generate a new name for the specified checkpoint.

**What Next**

Please verify the named checkpoint.

## CHK-007

(warning) The checkpoint report '%s' has a previous definition that will be overwritten.

**Description**

The specified report has a previously definition which will be overwritten.

**What Next**

Please verfiy if the overwriting of the report definition is intended.

## CHK-008

(Error) Cannot remove checkpoint report '%s'. No report with that name is defined.

**Description**

The specified report is not found in the checkpoint system. The chechpoint report cannot be removed

Feedback

**What Next**

The specified named report object is not found in the checkpoint system. You can list the defined report names names using "get_checkpoint_data -list_reports".

---

## CHK-009

(information) Running action '%s' before checkpoint '%s'.

**Description**

The specified action is running before the given checkpoint is executed.

**What Next**

Please verfiy if the running of the action at the specified position is intended.

---

## CHK-010

(information) Running action '%s' after checkpoint '%s'.

**Description**

The specified action is running after the given checkpoint is executed.

**What Next**

Please verfiy if the running of the action at the specified position is intended.

---

## CHK-011

(information) Running action '%s' as a replacement for the original contents of checkpoint '%s'.

**Description**

The specified action is running as a replacement for the given checkpoint.

**What Next**

Please verfiy if the running of the action at the specified position is intended.

---

## CHK-012

(information) Running this sequence of reports before checkpoint '%s': '%s'.

**Description**

The specified reports is running before the given checkpoint is executed.

Feedback

**What Next**

Please verfiy if the running of the reports at the specified position are intended.

---

## CHK-013

(information) Running this sequence of reports after checkpoint '%s': '%s'.

**Description**

The specified reports is running after the given checkpoint is executed.

**What Next**

Please verfiy if the running of the reports at the specified position are intended.

---

## CHK-014

(warning) The command will not return checkpoint information because it is run outside of a checkpoint.

**Description**

The command "get_current_checkpoint" will not return checkpoint information because it is been run outside of checkpoint.

**What Next**

Please verify if the command "get_current_checkpoint" is intended to be run outside of checkpoint.

---

## CHK-015

(information) Checkpoint configuration file checkpoint.config.tcl is found in the run directory and will be sourced.

**Description**

Checkpoint configuration file "checkpoint.config.tcl" is found in the run directory and will be sourced.

**What Next**

Please verfiy if the configuration file is intended to be sourced.

---

## CHK-016

(warning) Checkpoint '%s' has not yet been executed.

Feedback

**Description**

The given Checkpoint has not yet been executed.

**What Next**

Please verfiy if a different checkpoint name is to be provided.

---

## CHK-017

(Error ) The action name '%s' has Special Characters that are not allowed.

**Description**

Special characters are not allowed in action name of checkpoint system. The special characters not allowed are 'space', 'carriage return', 'line break', '$', '', '[', ']', '{', '}', '(', ')', '#', ' ;', '\\', ' !'.

**What Next**

Please verify the action name provided.

---

## CHK-018

(Error ) The report name '%s' has Special Characters that are not allowed.

**Description**

Special characters are not allowed in report name of checkpoint system. The special characters not allowed are 'space', 'carriage return', 'line break', '$', '', '[', ']', '{', '}', '(', ')', '#', ' ;', '\\', ' !'.

**What Next**

Please verify the report name provided.

---

## CHK-019

(Error ) The checkpoint name '%s' has Special Characters that are not allowed.

**Description**

Special characters are not allowed in checkpoint name of checkpoint system. The special characters not allowed are 'space', 'carriage return', 'line break', '$', '', '[', ']', '{', '}', '(', ')', '#', ' ;', '\\', ' !'.

**What Next**

Please verify the checkpoint name provided.

Feedback

## CHK-020

(warning) Action '%s' has not yet been defined.

**Description**

The given Checkpoint action has not yet been defined.

**What Next**

Please verfiy if a different checkpoint action is to be provided.

## CHK-021

(warning) Report '%s' has not yet been defined.

**Description**

The given Checkpoint report has not yet been defined.

**What Next**

Please verfiy if a different checkpoint report is to be provided.

## CHK-022

(warning) Checkpoint system is disabled by 'set_checkpoint_options -active false'. eval_checkpoint will evaluate the enclosed Tcl commands but will not run any actions or reports.

**Description**

The checkpoint system is disabled. The command 'eval_checkpoint' will not run the '-before/-after' reports and '-before/-re[lace/-after' actions. The checkpoint will just evaluate the enclosed TCL commands.

**What Next**

Please verfiy if a the checkpoint system is to be enabled.

## CHK-023

(information) Starting 'eval_checkpoint %s ...'.

**Description**

The specified checkpoint and the associated actions and reports are preparing to get executed.

Feedback

**What Next**

Please verfiy if the running of the specified checkpoint is intended.

---

## CHK-024

(information) Ending 'eval_checkpoint %s ...'.

**Description**

The specified checkpoint and the associated actions and reports have been successfuly executed.

**What Next**

Please verfiy if the running of the specified checkpoint is intended.

---

## CHK-025

(Error) Checkpoint name '%s' does not exist.

**Description**

The specified checkpoint doesn't exists.

**What Next**

Please verfiy if the checkpoints that has been executed.

---

# CHUNB

---

## CHUNB-001

(Error) Library cell '%s' missing. '%s' and '%d' other cell instance(s) which reference this lib cell are unbound.

**Description**

This message appears when a leaf cell's reference is missing.

---

## CHUNB-002

(Error) Cell instance '%s' does not have any reference and is unbound.

**Description**

This message appears when a leaf cell is unbound.

Feedback

## CHUNB-003

(Error) Site definition '%s' is missing. '%s' and '%d' other site row(s) which reference this site definition are unbound.

**Description**

This message appears when a site row is unbound. Please check if the site definition is removed.

## CHUNB-004

(Error) Site row '%s' does not have any site definition and is unbound.

**Description**

This message appears when a site row is unbound.

## CHUNB-005

(Error) Site definition '%s' is missing. '%s' and '%d' other site array(s) which reference this site definiton are unbound.

**Description**

This message appears when a site array is unbound. Please check if the site definition is removed.

## CHUNB-006

(Error) Site array '%s' does not have any site definition and is unbound.

**Description**

This message appears when a site array is unbound.

## CHUNB-007

(Error) Via definition '%s' is missing. '%s'and '%d' other via(s) which reference this via definition are unbound.

**Description**

This message appears when a via is unbound. Please check if the via definition is removed.

Feedback

## CHUNB-008

(Error) Via '%s' does not have any via definition and is unbound.

**Description**

This message appears when a via is unbound.

## CHUNB-009

(Error) Shape '%s' has unbound layer '%s'.

**Description**

This message appears when a shape has unbound layer.

## CHUNB-010

(Error) Track '%s' has unbound layer '%s'.

**Description**

This message appears when a track has unbound layer.

## CHUNB-011

(Error) Layer '%s' is unbound layer.

**Description**

This message appears when a layer is unbound layer.

## CHUNB-012

(Error) Pin guide '%s' has unbound layer '%s'.

**Description**

This message appears when a Pin guide has unbound layer.

## CHUNB-013

(Error) Pin blockage '%s' has unbound layer '%s'.

**Description**

This message appears when a Pin blockage has unbound layer.

Feedback

### CHUNB-014

(Error) Routing guide '%s' has unbound layer '%s'.

**Description**

This message appears when a Routing guide has unbound layer.

### CHUNB-015

(Error) Routing corridor shape '%s' has unbound layer '%s'.

**Description**

This message appears when a Routing corridor shape has unbound layer.

### CHUNB-016

(Error) %s '%s' has unbound layer(%s) '%s'.

**Description**

This message appears when a Via defs has unbound layer.

## CL

### CL-001

(error) Cannot find current design and/or its hierarchy

**Description**

The tool cannot find any valid design and/or hierarchy. Please load a valid design.

**What Next**

Load a valid design.

### CL-002

(error) Clone count is less than 1.

**Description**

For clone_logic command, the value of "-clone_count" should NOT less than 1.

Feedback

**What Next**

Set an valid option value for clone count.

---

## CL-003

(error) Can only clone one driver cell at a time.

**Description**

The clone_logic command can only clone one driver cell at one time.

**What Next**

Set an valid option value for -driver_cell option.

---

## CL-004

(error) Driver cell must be leaf sequential cell.

**Description**

Must specify leaf sequential cell to option "-driver_cell".

**What Next**

Set an valid value for -driver_cell option.

---

## CL-005

(error) Can NOT clone don't touch cell %s.

**Description**

Don't touch cell can not be cloned or removed. User needs to double check the cell attributes.

**What Next**

Double check cell attribute.

---

## CL-006

(error) Can NOT clone fixed cell %s.

**Description**

Fixed cell can not be cloned or removed. User needs to double check the cell attributes.

Feedback

**What Next**

Double check cell attribute.

---

## CL-007

(error) Can NOT clone RP group cell %s.

**Description**

RP group cell can not be cloned or removed. User needs to double check the cell attributes and RP group.

**What Next**

Double check cell attribute and RP group.

---

## CL-008

(error) Can NOT clone bound cell %s.

**Description**

A cell in bound can not be cloned or removed. User needs to double check the cell attributes and bound.

**What Next**

Double check cell attribute and bound.

---

## CL-009

(error) Can NOT clone MV cell %s.

**Description**

MV cell (level-shifter, isolation cell) can not be cloned or removed.

**What Next**

Double check specified driver cell.

---

## CL-010

(error) Can NOT clone don't touch net %s.

**Description**

Don't touch net can not be cloned or removed.

Feedback

**What Next**

Double check net attribute

---

## CL-011

(error) Failed to cluster endpoints into %d clusters, invalid endpoints location or number.

**Description**

The command failed to cluster endpoints into several clusters.

**What Next**

Double check the value of option "-clone_count". Make sure the endpoint number is larger than clone cluster count, make sure endpoints are placed.

---

## CL-012

(error) Can not clone un-placed cell %s.

**Description**

Cell must be placed before clone_logic is performed. User needs to double check the placement result.

**What Next**

Double check cell placement result.

---

## CL-013

(error) Can not clone driver with combinational loop.

**Description**

The command can not clone logic with combinational loop, which means the driver can not be one of the endpoints.

**What Next**

User needs to double check the net-list logic.

---

## CL-014

(error) Can not clone cell %s within top level block.

Feedback

**Description**

The command can not clone cells inside top level block.

**What Next**

User needs to double check the net-list logic.

# CLE

## CLE-01

(information) Command line editor mode is set to %s successfully.

**Description**

This information message confirms that the command line editor mode is set to the mode you specified. Use command *set_cle_options* to set the line editing mode to either vi or emacs.

**What Next**

This is an information message only. No action is required.

## CLE-02

(error) Command line editor mode cannot be set to %s. Proceeding with %s mode.

**Description**

This error message occurs when you attempt to set the line editor mode to an invalid value. The value can be either set to *vi* or *emacs*. If you attempt to set the edit mode to an invalid value, then the tool uses either the existing edit mode, if the mode is set, or the default emacs mode.

**What Next**

Use the *set_cle_options* command to specify a valid mode.

## CLE-03

(warning) Command line editor is already in %s mode.

**Description**

This warning message occurs when you specify the same value for the command line editor mode that is currently in use by the editor.

Feedback

**What Next**

This is a warning message only. No action is required.

However, if the result is not what you intended, use the *set_cle_options* command to set the line editing mode to either vi or emacs.

---

## CLE-04

(warning) Variable sh_enable_line_editing can be set only in .synopsys_dc.setup file.

**Description**

This warning message occurs when you attempt to enable command line editing by setting the *sh_enable_line_editing* variable in the shell rather than in the .synopsys_dc.setup file.

**What Next**

This is a warning message only. No action is required.

However, you can enable command line editing by setting the *sh_enable_line_editing* variable to true in the .synopsys_dc.setup file.

Refer to the *Design Compiler Command-Line Interface Guide* for more information.

---

## CLE-05

(error) Command line editor is not enabled.

**Description**

This error message occurs when command line editing is not active.

**What Next**

Set the *sh_enable_line_editing* variable to true in the .synopsys_dc.setup file to enable command line editing.

Refer to the *Design Compiler Command-Line Interface Guide* for more information.

---

## CLE-06

(information) %s is currently in %s editing mode.

**Description**

This information message displays the current editing mode.

Feedback

**What Next**

This is only an informational message. No action is required.

However, you can use the *set_cle_options* command to set the line editing mode to either vi or emacs.

---

## CLE-07

(information) Terminal beep is %s.

**Description**

This information message displays the current terminal beep mode.

**What Next**

This is only an informational message. No action is required.

However, you can use the *set_cle_options* command to set the terminal beep to either on or off.

---

## CLE-08

(error) Terminal beep mode value can be either on or off.

**Description**

This message occurs when you attempt to set the line editor beep mode to an invalid value. The value can be either *on* or *off*. If you attempt to set the beep mode to an invalid value, then the tool uses the existing beep mode.

**What Next**

Use the *set_cle_options* command to specify a valid beep mode.

---

## CLE-09

(warning) -defaults option will override other options.

**Description**

-defaults option will override the other options of *set_cle_options* command.

**What Next**

This is only a warning message. No action is required.

Feedback

### CLE-10

(information) Term was not able to be set up using %s . Using "xterm" by default instead.

**Description**

This warning message occurs in certain OS when the term cannot be set up under its default term name.

## CLFR

### CLFR-001

(information) Read antenna property CLF file into '%s' library '%s'.

**Description**

This message reports the name of the library to accomodate CLF data.

**What Next**

No action required.

### CLFR-002

(error) Library '%s' is not a physical lib_cell library.

**Description**

The library specified for read CLF must be a physical lib_cell library.

**What Next**

Choose a physical lib_cell library to read CLF in.

### CLFR-003

(error) Invaild library name '%s' for option -library.

**Description**

There is no library with the name specified.

**What Next**

Please check the library name.

Feedback

## CLFR-004

(error) The library has no technology information.

**Description**

The library was created without a technology file. The library must have technology information to correctly read the CLF file.

**What Next**

Load a technology file into the library using the *read_tech_file* command.

## CLFR-005

(error) Cannot find CLF file '%s'.

**Description**

The file, specified in the read_clf_antenna_properties command, cannot be read.

**What Next**

Check the existence of the file in the search_path using the *which* command.

## CLFR-006

(error) Failed to read CLF file '%s'.

**Description**

reading CLF file failed.

**What Next**

Check CLF file syntax and content.

## CLFR-007

(error) Failed to find cell '%s' with '%s' view in lib '%s'.

**What Next**

Check the existence of the cell in the lib.

## CLFR-008

(error) Failed to find lib_pin '%s' in the lib_cell '%s'.

Feedback

**What Next**

Check the existence of the lib_pin in the lib_cell.

---

## CLFR-009

(error) '%s' at the line '%d' of file '%s'.

**What Next**

Check the syntax.

---

## CLFR-010

(error) Cannnot read CLF file to workspace library.

**Description**

The library specified for read CLF cannot be the workspace library.

**What Next**

Choose a library name other than the workspace name to read CLF in.

---

## CLFR-011

(error) Library name '%s' cannot be same as workspace name.

**Description**

The library name specified for read CLF cannot be the workspace name.

**What Next**

Choose a library name other than the workspace name to read CLF in.

---

## CLFR-012

(warning) Invalid hierarchy antenna properties specified on the layer "%s" for port "%s" of cell "%s".

**Description**

You got this message because the number of the hierarchy antenna property on the layer is not equal to 7. The syntax of scheme command "defineHierAntennaProp" is as follows. (defineHierAntennaProp "cellName" "portName" '( ("Metal1_layerName" m1_gate_size m1_mode1_area m1_mode2_ratio m1_mode3_area m1_mode4_area m1_mode5_ratio m1_mode6_area) )) These hierarchy antenna properties will be ignored.

Feedback

**What Next**

Check the number of the hierarchy antenna property specified on the layer.

---

## CLFR-013

(error) Layer '%s' does not exist in the library.

**Description**

You got this message because the indicated layer was not found in the library. All the antenna properties defined on this missing layer will be ignored.

**What Next**

Manually add the missing layer into the technology file, load the technology file, and then read the CLF file..

---

# CLFW

---

## CLFW-001

(warning) The layer information of the antenna property "%s" "%s" for port "%s" is missing.

**Description**

The antenna property will be ignored when the layer information is missing.

---

## CLFW-002

(error) The library "%s" does not contain any cell with "%s" view.

**Description**

write_clf_antenna_properties always dumps antenna properties from frame view.

**What Next**

Check whether there is any cell with frame view.

---

## CLFW-003

(error) The library has no technology information.

Feedback

### Description

The library was created without a technology file. The library must have technology information to correctly write the CLF file.

### What Next

Load a technology file into the library using the *read_tech_file* command.

# CLK

## CLK-0001

(warning) Clock clock has count sources on inout ports

### Description

The circuit behavior of an inout port can be unpredictable if it has a clock signal driving it. If the port is functioning as an output while the clock is driving, bus contention occurs. If the clock is a three-state condition, any registers in the fanout of the clock can lose state. If the inout port is operating only in input mode for this scenario, there is no risk. It is also possible that the clock is defined on the incorrect port, or the port is defined with the wrong direction.

### ONE POSSIBLE SCENARIO

Consider the scenario where a clock is defined on an inout port:

create_clock bidirClock -period 2

Since the port is bidirectional (or inout), and a clock has been defined on it, a CLK_0001 rule violation will be issued.

### What Next

Verify that the circuit is safe according to your design rules. Synopsys tools assume that the clock is valid. For the example scenario, you can verify the direction of the port with the get_attribute command:

get_attribute [get_port bidirClock] direction

### FIX SUGGESTION

There are several possibilities for resolving this rule violation. If the inout port is only operating in input mode for the scenario of interest, no change may be needed. If the port has the wrong direction, the Verilog module related to the port can be updated. Last, if the clock is defined on the incorrect port, it can be moved to the correct port for your design.

Feedback

For the example scenario, based on knowledge of the design, the bidirClock port only acts as an input port for the design in this mode, so no change is needed.

**See Also**

create_clock get_attribute

---

## CLK-0002

(Warning) Generated clock clock has count sources on input or inout ports.

**Description**

When creating a generated clock on an input or inout port, the generated clock will only derive its waveform characteristics from the master clock. Delay is derived from delay information at the port itself. Additionally, creating a generated clock to drive an inout port can cause unpredictable circuit behavior. If the port is functioning as an output while the clock is driving, bus contention occurs. If the clock is a three-state condition, any registers in the fanout of the clock can lose state. In post-layout conditions, a source latency for the generated clock cannot be calculated from the master clock. This may lead to inaccuracies in the timing checks related to the generated clock.

**ONE POSSIBLE SCENARIO**

Consider the scenario where a generated clock is defined on an input port: create_clock CLK1 -period 2 create_generated_clock -source CLK1 -name gen_clk [get_ports CLK2]

Since the generated clock was defined on input port CLK2, a CLK_0002 rule violation will be issued.

**What Next**

Verify that the circuit is safe according to your design rules. Synopsys tools assume that the generated clock is valid. For the example scenario, you can examine the generated clock definition by clicking on the name of the generated clock in the ‘Violation Details’. You can use the report_port command to verify the direction of the port specified in the "Violation Details":

rtl_shell> report_port [get_ports CLK2]

Pin Cap Wire Min Max Min Port Dir rise/fall rise/fall rise/fall rise/fall Attributes
---------- CLK2 in 0.00/0.00 0.00/0.00 0.00/0.00 0.00/00

The report shows that CLK2 is an input port, so the generated clock has been defined on an input port.

**FIX SUGGESTION**

Feedback

There are several possibilities for resolving this rule violation. If the waveform characteristics are the only thing required from the master clock, and the delay characteristics of the port are to be used for the generated clock, then no change may be needed.

If the port is an inout port and has the wrong direction, the Verilog module related to the port can be updated.

Last, if the generated clock is defined incorrectly on a port, it can be moved to the correct pin for your design. For the example scenario, based on knowledge of the design, the generated clock was incorrectly defined on the port and the constraint was changed to an internal pin of the design:

create_generated_clock –source CLK1 –name gen_clk [get_pins ff1/Q]

**See Also**

create_clock create_generated_clock report_port get_attribute

---

## CLK-0003

(Error) Generated clock clock is not expanded because it has no clock reaching its master source pin.

**Description**

The pin or port given for the -source option of this generated clock has no clock, therefore, no master clock can be determined for it. A generated clock without a master clock has no waveform, and it is not propagated forward to register clock pins. The portion of the circuit that should be clocked by this generated clock is untested, resulting in incomplete timing analysis on the design.

**ONE POSSIBLE SCENARIO**

This example scenario has a clock divider, div2. The constraints have a generated clock definition at the output, div2/Q, with the div2/CP clock pin, as the -source pin. No -master_clock option has been given. A CLK_0003 rule violation will be issued if no clock propagates to the div2/CP pin. (A CLK_0028 violation will be issued if there are multiple clocks at div2/CP.) In this example scenario, there is no clock at the div2/CP pin because of the set_disable_timing constraint at the U1/Z pin.

**What Next**

Determine why there is no clock at the -source pin or if an incorrect -source pin was specified in the create_generated_clock command. If the -source pin is correct, then the clock may be missing because:

The master clock has not been defined.

Feedback

The master clock is blocked from the -source pin by another constraint.

**FIX SUGGESTION**

Add the missing master clock, remove the constraints blocking the correct master clock, or move the -source pin to the correct location.

For the preceding example scenario, the set_disable_timing constraint can be removed by issuing the command:

remove_disable_timing u1/Z

Or the set_disable_timing command can be removed from the constraint file.

*Corresponding PrimeTime Error Message*

*Error Message: PTE-023*

*Severity:* Warning

*Description*

The generated clock '%s' has not been expanded. Create or activate its master clock.

**See Also**

create_generated_clock

---

## CLK-0004

(Warning) Mismatch between generated clock definitions at pin_or_port and potential master clocks.

**Description**

At the given pin or port location, there should be a generated clock (specified with the -add and -master_clock options) for each clock signal meeting the following requirements:

Present on the master sources

Propagating through source latency paths to this pin or port

The violation details section lists the master clocks with missing generated clock statements at the reported pin or port location.

This rule looks for potential masters as follows:

All the pins provided through the -source option of all generated clocks on the violated pin or port.

Any clock blocked at the violated pin or port by the generated clock definitions.

Feedback

Any register clock pin in the source latency paths of the existing generated clocks and in the fanout of the master clocks of those generated clocks.

Any generated clocks defined in the source latency path of the target generated clock with the same master clock. This portion of the rule check is controlled by the warn_on_generated_clocks_of_same_master rule property.

The register clock pins in the fanout of the given pin will be missing some of the clock waveforms that are physically possible for the circuit. This may result in a circuit that has not been completely verified and potentially create unbalanced clock trees during clock tree synthesis.

**ONE POSSIBLE SCENARIO**

Consider a clock divider, div2, with two clocks, CLK1 and CLK2 propagating to the clock pin of the clock divider. Only one generated clock is created on the output of the clock divider with CLK1 as its master clock. Since two clocks are actually propagating to this location (CLK1 and CLK2), a CLK_0004 rule violation will be issued for the div2/Q pin. The “Violation Details” section reports that potential CLK2 master clock exists at div2/CP, but it is not used when creating a generated clock at div2/Q.

**What Next**

Examine the "Violation Details" section to find which generated clocks exist at the violated pin or port.

**FIX SUGGESTION**

Add the missing generated clocks to the pin or port as shown here:

```
create_generated_clock DIV2/q -add \ -name gclk2 \ -source [get_port clk2] \
-master_clock clk2 \ -divide_by 2
```

**See Also**

create_generated_clock

---

## CLK-0005

(Info) Virtual clock clock has the same name as a design object.

**Description**

A virtual clock was defined with the same name as a port, pin, or net, and might not be what was intended. This kind of virtual clock, if intended to be an actual clock in the design, can lead to unconstrained paths in the design and incorrect constraints. Some constraints related to the virtual clock can be ignored and result in unrealistic timing violations.

Feedback

### ONE POSSIBLE SCENARIO

Consider a simple scenario where the clock is mistakenly defined as a virtual clock.

create_clock -name CLK1 -period 2 create_clock -name CLK2 -period 1 [get_ports CLK2] set_multicycle_path 2 -from [get_clocks CLK1] -to [get_clocks CLK2]

The ‘CLK1’ clock is a virtual clock that is not associated with any clock source port or pin. In this case, the following warning message is also issued:

Warning: Creating virtual clock named 'CLK1' with no sources. (UIC-021)

The design is unconstrained because there is no clock signal associated with the ‘CLK1’ port. In addition, the multicycle path exception from ‘CLK1’ to ‘CLK2’ is ignored because the ‘CLK1’ virtual clock is not associated with the ‘CLK1’ clock port.

### FIX SUGGESTION

Change the virtual clock to a non-virtual clock or change the virtual clock name such that the clock name differs from an existing port, pin or net name in the design.

In the example scenario, the virtual clock can be made into a non-virtual clock as follows:

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] set_multicycle_path 2 -from [get_clocks CLK1] -to [get_clocks CLK2]

Now the design is properly constrained and the multicycle path exception will be applied correctly.

### See Also

create_clock

---

## CLK-0006

(Warning) Clock clock source source has a logic constant or case value.

### Description

A clock source has been defined at a port or pin that has a constant value due to a logic constant or set_case_analysis constraint. The constant value will suppress the propagation of the clock waveform. A constant value at a clock source will deactivate the clock, and no timing analysis will be performed for the portion of design that is affected by the clock.

### ONE POSSIBLE SCENARIO

Consider a simple scenario involving a generated clock at a register output. The generated clock ‘GCLK1’ is defined on the output pin of a register, and this pin’s value is set to 0 by

Feedback

set_case_analysis. This constant suppresses the propagation of the generated clock and deactivates timing analysis of the downstream logic affected by ‘GCLK1’.

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 -source [get_ports CLK] -divide_by 2 [get_pins ff1/Q] set_case_analysis 0 [get_pins ff1/Q]

Because the generated clock is defined at a pin with a constant value, a CLK_0006 rule violation will be issued.

**What Next**

The violation message gives the name of the clock and the clock source pin. To further identify the root cause of the constant arriving at the source pin, use the report_case_details command. This command can show how logic constants and user case values propagate to the clock source pin.

For the example scenario, the command can be issued as follows:

rtl_shell> report_case_details -to [get_pins ff1/Q]

As can be seen in the following report excerpt, the clock source pin has a constant value of 0 due to a user-specified set_case_analysis.

Properties Value Pin/Port ---------- user case 0 ff1/Q

**FIX SUGGESTION**

If the intent is not to suppress the clock signal, remove the logic constant or the user-specified case value that caused the clock source pin to assume a constant value.

In the example scenario, this can be done by simply removing the set_case_analysis constraint:

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 -source [get_ports CLK] -divide_by 2 [get_pins ff1/Q] set_case_analysis 0 [get_pins ff1/Q]

This will allow generated clock ‘GCLK1’ to propagate.

**See Also**

create_generated_clock create_clock set_case_analysis report_case_details

---

## CLK-0007

(Error) Generated clock clock master source source has a logic constant or case value.

**Description**

The master source (a port or a pin) of the reported generated clock has a constant value due to logic or set_case_analysis constraint. The constant value will suppress the propagation of the generated clock waveform.

Feedback

Constant value at the master clock source will deactivate the generated clock and no timing analysis will be performed for the portion of design that is affected by the generated clock. This could result in an incompletely timed design.

**ONE POSSIBLE SCENARIO**

Consider a simple scenario involving two generated clocks. The first generated clock‘s (‘GCLK1’) source pin is defined at the output of a register whose value is set to 0 by set_case_analysis. The second generated clock (‘GCLK2’) has its master clock source pin defined at the output of the first register. This constant master clock source suppresses the clock propagation and de-activates the timing analysis of the downstream logic affected by the generated clock ‘GCLK2’.

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 -source [get_ports CLK] -divide_by 2 [get_pins ff1/Q] create_generated_clock -name GCLK2 -source [get_pins ff1/Q] -divide_by 1 [get_pins inv2/Z] set_case_analysis 0 [get_pins ff1/Q]

**What Next**

The violation message gives the name of the clock and its master clock source pin. To identify further the root cause of the constant arriving at the master clock source pin, use the report_case_details command. This command shows how logic constants and user case values propagate to the master clock source pin.

For the example scenario, the command can be issued as follows:

rtl_shell> report_case_details ff1/Q

As can be seen in the report excerpt below, the clock source pin has a constant value of 0 due to user case.

Properties Value Pin/Port ---------- user case 0 ff1/Q

To analyze how the constant value propagates to the source pin of the generated clock ‘GCLK2’, supply the generated clock source pin in the -to option of the report_case_details command:

rtl_shell> report_case_details -to inv2/Z

Properties Value Pin/Port ---------- from user case 0 inv2/Z

Case fanin report: Verbose Source Trace for pin/port inv2/Z: Path number: 1 Path Ref # Value Properties Pin/Port ---------- 0 F()=A' inv2/Z 1 inv2/A 1 F()=A' inv1/Z 0 inv1/A 0 user case ff1/Q

**FIX SUGGESTION**

If the intent is not to suppress the generated clock signal, remove the logic constant or the user case that caused the master clock source pin to assume a constant value.

Feedback

In the example scenario, this can be done by simply removing the set_case_analysis constraint:

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 -source [get_ports CLK] -divide_by 2 [get_pins ff1/Q] create_generated_clock -name GCLK2 -source [get_pins ff1/Q] -divide_by 1 [get_pins inv2/Z] #set_case_analysis 0 [get_pins ff1/Q]

**See Also**

create_generated_clock create_clock set_case_analysis report_case_details

---

## CLK-0008

(Warning) Generated clock clock has paths from the sources of master clock master_clock to generated clock sources with differing sequential depth.

**Description**

There are several possible latency paths reaching the generated clock. Not all the paths cross the same number of sequential elements and not all the paths may be needed for the latency calculation. The clock latency calculation may become too pessimistic. The generated clock may need to be modified to remove the pessimism. If this violation is not addressed, the timing analysis results may be too pessimistic since the timing analysis tool has to account for every path. This can lead to unnecessary increased effort in optimization and timing closure.

**ONE POSSIBLE SCENARIO**

Consider a scenario where there are two latency paths from the master clock to a generated clock. One path involves a sequential depth of one and the other path is combinational. In this example, the design intent is to propagate clock through the combinational path and use the sequential path as the signal pin of clock gating logic. However, clock latency calculation involves both latency paths and the “worst” path is chosen for timing analysis. It is likely that the sequential path is chosen for hold latency calculation because a sequential path delay tends to be larger than a combinational path delay. This may lead to undesirable hold violations associated with the generated clock.
*Figure 1: Two Latency Paths From Master Clock to Generated Clock*

create_clock -name sys_clk -period 4 [ get_ports CLK ] create_generated_clock -name gclk -divide_by 1 -source [get_ports CLK] [get_pins and1/Z]

**What Next**

The violation message gives the name of the generated clock and the Violation Details section provides the location where the differing sequential depth branches merge.

**FIX SUGGESTION**

Feedback

Different scenarios may require different approaches. The basic idea is to ensure that the latency path for the generated clock includes only the actual clock propagation path from the master clock to the generated clock. This may be done by using one of the following techniques:

moving the generated clock source

creating intermediate generated clocks

using the -stop_propagation option with the set_clock_sense command

using the -combinational option with the create_generated_clock command

For the example scenario, this can be done by changing the generated clock “gclk” to “combinational”. This means that the latency path for “gclk” will include only combinational paths where the master clock propagates to the generated clock and no paths involving sequential elements.

The modification can be done as follows:

create_clock -name sys_clk -period 4 [ get_ports CLK ] create_generated_clock -name gclk -combinational -source [get_ports CLK] [get_pins and1/A]

**See Also**

create_generated_clock create_clock set_clock_sense

---

## CLK-0009

(Error) Generated clock clock is not expanded because master clock master_clock does not reach its master source pin.

**Description**

The source pin of this generated clock does not belong to the clock network of the given generated clock’s master clock. The sense of the master clock at the -source pin is required to compute the waveform of a generated clock. No waveform will be created and, as a consequence, the generated clock cannot be propagated forward to register clock pins. The portion of the circuit that should be clocked by this generated clock is untested. This can result in potentially incorrect timing if the generated clock is supposed to be propagated to registers.

**ONE POSSIBLE SCENARIO**

In this example scenario, two clocks are propagating to some clock divider structure. In order to guarantee the proper timing analysis, generated clocks are created on the output of the clock dividers as seen in the following sample script.

Feedback

create_clock [get_port A] -name clk1 -period 2 create_clock [get_port B] -name clk2 -period 3 create_generated_clock -name gclk1 -divide_by 2 div2/Q \ -source [get_port B] -add -master_clock clk1 create_generated_clock -name gclk2 -divide_by 2 div2/Q \ -source [get_port A] -add -master_clock clk2

However, some mistakes were introduced in those constraints, resulting in CLK_0009 rule violations:

Generated clock 'gclk1' with 'clk1' as its master 'clk1' but refers to port B as its source. This is incorrect; the source should be port A.

Similarly, generated clocks 'gclk2' should refer to port B as its source pin rather than port A.

**What Next**

Check that the master_clock option is correct with respect to the source pin.

Check that the source pin is correct with respect to the master clock.

You can use the report_clock command to achieve this as demonstrated below.

rtl_shell> report_clock ****************************************** Report : clock Design : CLK_0009 Scenario: default Version: … Date : … ******************************************

Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Clock Period Waveform Attrs Sources ---------- clk1 2.00 {0 1} {A} clk2 3.00 {0 1.5} {B} gclk1 G {div2/Q} gclk2 G {div2/Q}

Generated Master Generated Master Waveform Clock Source Clock Modification ---------- gclk1 B div2/Q clk1 div(2) gclk2 A div2/Q clk2 div(2)

This reports shows the source discrepancy. Port “A” is the source of clock “clk1”, but port “B” is the source of generated “gclk1”.

If the master clock and the source pin seem correct, investigate why the master_clock doesn’t propagate to the source pin. Most likely, another constraint or a design structure is preventing proper clock sensitization:

The master clock could be blocked from the source pin by another constraint.

The master clock could be blocked by an unresolved cell in the clock network. When there appears to be no path and you expect one, an unresolved cell in the path, or a cell with an incomplete model is a possibility. Use the all_fanout command to look for where the path is disconnected.

rtl_shell> all_fanout -from [get_ports A] {"A", "b2/A", "b2/Z"}

**FIX SUGGESTION**

Feedback

Change the generated clock to correct the master_clock and -source pin/port or remove constraints that are blocking the master clock from the -source pin/port. For the example scenario above, fix the -source values:

create_clock [get_port A] -name clk1 -period 2 create_clock [get_port B] -name clk2 -period 3 create_generated_clock -name gclk1 -divide_by 2 div2/Q \ -source [get_port A] -add -master_clock clk1 create_generated_clock -name gclk2 -divide_by 2 div2/Q \ -source [get_port B] -add -master_clock clk2

*Corresponding PrimeTime Error Message*

*Error Message: PTE-023*

*Severity:* Warning

*Description*

The generated clock '%s' has not been expanded. Create or activate its master clock.

**See Also**

create_generated_clock report_clock

---

## CLK-0010

(Error) Generated clock clock is not expanded because its master clock master_clock is not expanded.

*Status:* Disabled by default

**Description**

A generated clock cannot be activated; the specified master_clock is not expanded. The portion of the circuit that should be clocked by this generated clock is unconstrained. This is likely to result in incorrect timing for the design.

**ONE POSSIBLE SCENARIO**

Consider the following scenario involving two cascading generated clocks. The second generated clock “d4” specifies the first generated clock “d2” as its master clock. However, no clock has been created at the port clk1, and thus the generated clock “d2” cannot be activated. This results in a CLK_0003 violation being flagged on “d2” and no waveform can be computed for generated clock “d2”. This CLK_0003 violation in turn creates a CLK_0010 violation for “d4” since a valid waveform would need to be present on “d2” to compute “d4”.

create_generated_clock -name d2 -divide_by 2 div2/Q -source div2/CP create_generated_clock -name d4 -divide_by 2 div4/Q \ -source div2/Q -master_clock d2 -add

Feedback

**What Next**

Investigate and fix the violation CLK_0003 or CLK_0009 related to the master clock. When this is done, the CLK_0010 rule violation should be addressed as a side effect.

**FIX SUGGESTION**

See the violation for the master clock. (CLK_0003 or CLK_0009). For the example scenario above, fix the *-source* values:

create_clock clk1 -period 2

*Corresponding PrimeTime Error Message*

*Error Message: PTE-023*

*Severity:* Warning

*Description*

The generated clock '%s' has not been expanded. Create or activate its master clock.

**See Also**

create_generated_clock report_clock CLK_0003 CLK_0009

---

## CLK-0011

(Error) Generated clock clock is not expanded because potential master clock master_clock is not expanded.

**Description**

A generated clock cannot be activated if only unexpanded master clocks drive the master source. Fixing the issue with the unexpanded master clocks resolves this violation.
This rule differs from the CLK_0010 rule because the -master_clock option for the create_generated_clock command was not used, therefore the unexpanded master clock appears as a potential master clock. The portion of the circuit clocked by this generated clock is unconstrained. No timing analysis will be performed for the portion of the circuit that is associated with this generated clock.

**ONE POSSIBLE SCENARIO**

Consider the following scenario involving two cascaded generated clocks. The generated clock d4 specifies the generated clock d2 as its master clock. The generated clock d2 cannot be activated because no clock has been created at the port clk1. This results in a CLK_0003 violation being issued for d2. A CLK_0011 rule violation will be issued for d4 because its definition does not contain the -master_clock option, and no waveform can be computed for it due to the error at d2.

Feedback

create_generated_clock -name d2 -divide_by 2 [get_pins div2/Q] \ -source [get_pins div2/CP] create_generated_clock -name d4 -divide_by 2 [get_pins div4/Q] \ -source [get_pins div4/CP]

**What Next**

Investigate the CLK_0003, CLK_0009, CLK_0010, or CLK_0011 rule violation related to the master clock.

**FIX SUGGESTION**

Fix the CLK_0003, CLK_0009, CLK_0010, or CLK_0011 rule violation related to the master clock. For the preceding example scenario, specify the *-source* values for the potential master clock:

create_clock [get ports clk1] -period 2

*Corresponding PrimeTime Error Message*

*Error Message: PTE-023*

*Severity:* Warning

*Description*

The generated clock '%s' has not been expanded. Create or activate its master clock.

**See Also**

---

## CLK-0012

(Warning) Generated clock clock has non-unate sense for master clock master_clock at its master source.

The waveform of a generated clock is dependent on the sense at its master source. When the sense is non-unate, only the positive sense of the master clock is used. If both clock senses need to be considered, create additional generated clocks to avoid incorrect or pessimistic timing analysis. The choice of clock sense can be made explicit by adding the set_clock_sense command at the non-unate location.

If this violation is not addressed, the resulting timing analysis may be incorrect or pessimistic depending on how the generated clock interacts with the master clock. Incorrect results may be obtained if the expected clock sense is negative but only the positive clock sense propagates. Incorrect clock sense may lead to a half cycle shift in clock waveforms. Pessimistic result may arise if there are interactions with the negative sense of the master clock and the positive sense of the generated clock. Pessimistic timing can lead to increased optimization and timing closure efforts.

Feedback

**ONE POSSIBLE SCENARIO**

Consider a scenario involving two generated clocks. The second generated clock *GCLK2* is essentially derived from the first generated clock *GCLK1*. The path from *GCLK1* source pin to G*CLK2* source pin involves a MUX selector pin to MUX output pin path.

Depending on the logic values at the inputs of the MUX, the clock sense may become positive or negative through the MUX. As a result, both positive and negative sense of *GCLK1* is available at the master source pin of *GCLK2* but only the positive sense will be used for the waveform and latency calculation of *GCLK1*. When timing results are analyzed at register ‘ff3/D’, the following cases are possible due to the interaction between *GCLK1* and *GCLK2:*

Launching Clock Sense (GCLK2) Capturing Clock Sense (GCLK1)

Case 1 Positive Negative

Case 2 Positive Positive

Case 3 Negative Negative

Case 4 Negative Positive

Due to the way *GCLK2* is defined, case 3 and case 4 will not be considered. As a result, an incorrect timing result may be obtained if a negative clock sense propagation is expected (case 3). As can be seen from the waveform diagram below, the positive sense waveform of *GCLK2* differs from the negative sense waveform by a half a cycle.

At the same time, a pessimistic timing may arise since case 1 may not be possible due to the mutually exclusive nature of the MUX: Z = A S’ + B S

A B Clock Sense at mux1/Z 0 0 Clock is inactive due to 0 0 1 Positive 1 0 Negative 1 1 Clock is inactive due to 1

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 [get_pins inv2/Z] \ -source [get_ports CLK] -combinational create_generated_clock -name GCLK2 [get_pins ff1/Q] \ -source [get_pins mux1/Z] -divide_by 2 set_propagated_clock [all_clocks]

**What Next**

The Violation Details section provides the names of the generated clock and the non-unate master clock as well as the master source pin. There are multiple ways to analyze the problem. One way is to use the report_clock command to view the clock waveform for *GCLK2* to see if the clock edges are correct. As can be seen from the report below, only the positive clock sense is propagated for *GCLK2*.

Clock Period Waveform Attrs Sources ---------- CLK 2.00 {0 1} p {CLK} GCLK1 2.00 {0 1} p, G {inv2/Z} GCLK2 4.00 {0 2} p, G {ff1/Q}

Feedback

Another way to analyze this problem is to use the clocks_with_sense attribute. This attribute provides, for each pin or port, information on clock and its sense for all its associated clocks. The clocks_with_sense attribute can be queried as follows:

rtl_shell> get_attribute [get_pins mux1/Z] clocks_with_sense { { "GCLK1" "negative" } { "GCLK1""positive" } } rtl_shell> get_attribute [get_pins ff2/CP] clocks_with_sense { { "GCLK2" "positive" } }

The attribute shows that there are both positive and negative senses of the master clock GCKL1 at the master source pin of GCLK2 but only the positive sense of GCLK2 propagates to register ‘ff2’.

**FIX SUGGESTION**

If both the positive clock sense and the negative clock sense need to be considered, create additional generated clocks to fix incorrect clock waveforms or remove unrealistic pessimism.

For the example scenario, this can be done as follows:

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1_POS [get_pins mux1/Z] \ -source [get_ports CLK] \ -combinational -add -master_clock CLK create_generated_clock -name GCLK1_NEG [get_pins mux1/Z] \ -source [get_ports CLK] \ -combinational -add -master_clock CLK -invert create_generated_clock -name GCLK2_POS [get_pins ff1/Q] \ -source [get_pins mux1/Z] \ -divide_by 2 -add -master_clock GCLK1_POS create_generated_clock -name GCLK2_NEG [get_pins ff1/Q] \ -source [get_pins mux1/Z] \ -divide_by 2 -add -master_clock GCLK1_NEG set_clock_groups -logically_exclusive -group {GCLK1_POS GCLK2_POS} \ -group {GCLK1_NEG GCLK2_NEG} set_propagated_clock [all_clocks]

Note that the positive sense and negative sense of both generated clocks are declared to be mutually exclusive.

If it is known that only one clock sense is possible, the pessimism can be reduced even further by using the set_clock_sense command. In the example scenario, if the input conditions A =1 and B = 0 can never happen, then the negative clock sense can be eliminated by using

set_clock_sense -positive mux1/Z

Then, the resulting timing analysis will not include any violations at register ‘ff3/D’ that are due to a launching clock associated with the negative sense of GCLK1 and a capturing clock with the negative sense of GCLK2.

## CLK-0013

(Error) Generated clock clock ignores multiple rising edges of master clock master_clock due to a user-defined duty cycle in the generated clock definition.

### Description

A generated clock specified with the -multiply_by option and a user-defined duty cycle, creates its waveform using the first rising edge and the period of the master clock. The master clock has multiple rising edges defined in its period, though the additional edges are ignored by this generated clock.

The generated clock waveform may be incorrect, especially for the falling edge, since this is defined by the create_generated_clock command using the -duty_cycle option. Timing analysis will be performed, but the results are based on an incorrect generated clock because the master clock has multiple rising edges.

### ONE POSSIBLE SCENARIO

Consider the two frequency divider clocks produced by phase lock loop (PLL) circuits. Both of the generated clocks *GCLK1* and *GCLK2* are defined using the -multiply_by 2 option with a master clock that has multiple rise and fall edges within a single period. *GCLK1* has an additional duty cycle constraint of 40%.

create_clock -name CLK -period 10 -waveform {2 4 6 8} \ [get_ports CLK] create_generated_clock -name GCLK1 -source [get_ports CLK] \ -multiply_by 2 -duty_cycle 40 [get_pins pll1/CLK_OUT] create_generated_clock -name GCLK2 -source [get_ports CLK] \ -multiply_by 2 [get_pins pll2/CLK_OUT]

The master clock CLK has multiple rising edges at time units 2 and 6. The generated clock, GCLK1, will only use the first rising edge to create its waveform due to the -duty_cycle option constraint in its specification. GCLK2 does not use the -duty_cycle option but is a -multiply_by 2 clock derived from the master clock CLK and has the same number of rising or falling edges.

### What Next

The “Violation Details” section provides the waveforms details for the generated clock and its master clock.

Master Clock Period: 10.0000 Waveform: {2.0000 4.0000 6.0000 8.0000} Generated Clock Period: 5.0000 Waveform: {1.0000 3.0000}

Check the master clock and the generated clock waveforms for correctness. The waveforms for clocks in the design can be obtained by using the report_clock command. For the example scenario, the command can be issued as follows for the clocks of interest:

rtl_shell> *report_clock [get_clocks {CLK GCLK1 GCLK2}]*

Feedback

Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Clock Period Waveform Attrs Sources ---------- CLK 10.00 {2 4 6 8} {CLK} GCLK1 5.00 {1 3} G {pll1/CLK_OUT} GCLK2 5.00 {1 2 3 4} G {pll2/CLK_OUT}

Generated Master Generated Master Waveform Clock Source Clock Modification ---------- GCLK1 CLK pll1/CLK_OUT CLK div(2) GCLK2 CLK pll2/CLK_OUT CLK div(2)

**FIX SUGGESTION**

If the generated clock waveform needs to be reshaped with the duty cycle option, consider changing the master clock waveform definition to have a single rising edge and a single falling edge. This will affect the shape of the master clock, and it may also affect the clock waveform of other generated clocks that use the same master clock. In the example scenario, this can be done by removing the last two edges from the master clock waveform:

create_clock -name CLK -period 10 -waveform {2 4} [get_ports CLK]

Alternatively, if the generated clock does not need a modified duty cycle, the -duty_cycle option can be removed from the generated clock definition.

**See Also**

create_generated_clock create_clock report_clock

## CLK-0014

(Info) Clock clock is created on a pin instead of a port.

**Description**

A clock has been defined on an internal a pin. Any clock defined on a pin will ignore incoming slews and latencies up to that pin which can impact timing accuracy. This rule will not be triggered if the pin has no incoming timing arcs.

The presence of a CLK_0014 rule violation is preceded by a UIC-019 message when reading the SDC constraints.

Ignoring incoming slews or latencies on clock paths may lead to optimistic timing results resulting in slower chip operation or even failure.

**ONE POSSIBLE SCENARIO**

Consider a simple scenario where the clock is defined at pin ‘inv2/Z’ that lies on the path from the clock port ‘CLK’ to the register. Since the clock source is at the inverter output pin ‘inv2/Z’, any clock slews or latencies from the port ‘CLK’ to the pin ‘inv2/Z’ will be ignored

Feedback

during clock latency calculation. This may lead to optimistic timing results on the flip-flop and might cause the chip to fail.

create_clock -name CLK1 -period 2 [get_pins inv2/Z]

**What Next**

The violation message gives the name of the clock and the Violation Details section provides the location of the clock source pin.

**FIX SUGGESTION**

There are two possible approaches to address this violation. One approach is to move the clock definition directly to the input port. In the example scenario, this can be done by:

create_clock -name CLK1 -period 2 [get_ports CLK]

Another approach is to create a generated clock as the output of the inverter ‘inv2’. A generated clock will automatically inherit the latency and slew data from its master clock. In the example scenario, this can be done by first creating a master clock at the port and then driving a generated clock at ‘inv2/Z’ from the master clock:

create_clock -name CLK1 -period 2 [get_ports CLK] create_generated_clock -name GCLK1 [get_pins inv2/Z] \ -combinational -source [get_ports CLK]

**See Also**

create_generated_clock create_clock

---

## CLK-0015

(Warning) Clock clock is created on a hierarchical pin.

**Description**

Defining a clock on a hierarchical pin breaks the net parasitics in a way that reduces the accuracy of latency calculation. Because a hierarchical pin does not have a set physical location, the latency calculation will be arbitrary. Creating clocks on hierarchical pins will result in potentially incorrect latency calculation and, as a consequence, incorrect timing analysis.

**ONE POSSIBLE SCENARIO**

The following clock definition shows that a clock source has been defined on a hierarchical pin.

create_clock -period 10 -name hier_clock b1/CLK

The physical location at which this hierarchical pin exists is arbitrary. In such a scenario CLK_0015 rule violation is given.

Feedback

### What Next

The all_fanin command can be used to find out which driving cell leaf pins correspond to this hierarchical pin. In the above example this command would be:

all_fanin -to b1/CLK -flat -pin_levels 1 {"b1/CLK", "CLK"}

### FIX SUGGESTION

Consider moving this clock definition to the driving leaf pins. The location of the cell leaf pin will now be known and the latency will be computed in an accurate fashion.

### See Also

create_clock all_fanin

---

## CLK-0016

(Error) Generated clock clock has no source latency path from its master clock master_clock.

### Description

There is no valid path from the source of the master clock to the source of the generated clock due to:

no topological path (possibly due to an unresolved reference or a black box)

disabled logic

the path is blocked by another clock source

a set_clock_sense-stop command in the path to the source of the generated clock

The "Violation Details" section provides reasons for the lack of a source latency path.

The generated clock will not be expanded, and registers clocked by the generated clock will not be constrained. Timing analysis will not occur for paths related to the registers, and the timing results will be incomplete for the design.

### ONE POSSIBLE SCENARIO

Consider the following scenario where the path from the master clock to the generated clock is blocked by a set_case_analysis command on the select pin of a MUX. The case analysis specified on the select pin of the MUX allows clock *CLK2* to propagate, but does not allow clock *CLK1* to propagate. The generated clock *GCLK* specifies clock *CLK1* as its master clock.

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] create_generated_clock -name GCLK -divide_by 2 \ -source [get_pins ff1/CP] -master_clock CLK1 \ -add [get_pins ff1/Q] set_case_analysis 1 [get_ports SEL]

Feedback

Since the case analysis on the select pin of the MUX propagates the clock *CLK2*, there is no latency path from *CLK1* to *GCLK*, and a *CLK_0016* rule violation will be issued.

**What Next**

Examine the "Violation Details" section for reasons the latency path is missing between the master clock source and the source of the generated clock.

If the reason reported is no topological path from the master clock to the generated clock, check if there are any unresolved references (black boxes) in the design. Black boxes are flagged with LNK-805 warning message of the form:

Warning: Unable to resolve reference to ‘BBOX’ in ‘top’. (LNK-805)

The reason for the missing clock latency path might be because it is blocked, disabled, or the clock is not propagating.

**FIX SUGGESTION**

If black boxes are blocking the clock paths, remove them by reading in additional library or design files. If the clock path is disabled/blocked, remove the disabling condition, or redefine the generated clock so that the path from the master clock to the generated clock is not disabled/blocked. For the example scenario, the set_case_analysis command can be removed:

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] create_generated_clock -name GCLK -divide_by 2 \ -source [get_pins ff1/CP] -master_clock CLK1 \ -add [get_pins ff1/Q] #set_case_analysis 1 [get_ports SEL]

Alternatively, the generated clock *GCLK* can be derived from clock *CLK2* instead of *CLK1*:

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] create_generated_clock -name GCLK -divide_by 2 \ -source [get_pins ff1/CP] -master_clock CLK2 \ -add [get_pins ff1/Q] set_case_analysis 1 [get_ports SEL]

*Corresponding PrimeTime Error Message*

*Error Message: PTE-075*

*Severity:* Warning

*Description*

Generated clock '%s' has no path to its master clock.

**See Also**

create_generated_clock create_clock report_disable_timing set_clock_sense

Feedback

## CLK-0017

(Error) The master source of generated clock clock is not in the fanin of the generated clock source pin.

### Description

The master source of the generated clock, as given by the -source option to the create_generated_clock command, is not in the fanin cone of the generated clock source pin. The generated clock will still propagate, but there will be issues with the latency of the generated clock. In addition, the sense of the master clock used to create the generated clock waveform may be affected. This rule differs from CLK_0016 in that a topological path from the master clock start point to the generated clock source pin exists and is not blocked or disabled. If the incorrect sense of master clock is used to create the generated clock waveform, the generated clock may have the wrong waveform propagated, and it will have zero clock latency. Zero clock latency may cause pessimistic timing results that may lead to increased optimization and timing closure effort. Incorrect generated clock waveforms will produce inaccurate timing results because the launching or capturing clock edges are wrong.

### ONE POSSIBLE SCENARIO

Consider a scenario involving multiple paths from the master clock source (start) point. The generated clock *GCLK1* is defined with the -source option set to the inverter output pin *inv1/Z*, even though the inverter *inv1* is not in the fanin cone of register *ff1*where the source pin of generated clock *GCK1* is specified. However, a topological path from the master clock start point *CLK* to the generated clock source pin *ff1/Q* does exist and is not blocked or disabled.

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 [get_pins ff1/Q] \ -divide_by 2 -source [get_pins inv1/Z] \ -master_clock CLK -add set_propagated_clock [all_clocks]

There are two problems with this scenario:

The resulting clock waveform is wrong. The generated clock waveform is neither a fully inverted nor a fully non-inverted divide-by-2 waveform of the original master clock waveform. As shown in the diagram below, the rising edge of the master clock is at time 0 and the falling edge at time 1. The rising edge of the generated clock will be at time 1 and the falling edge at time 3, instead of 0 and 2, or 2 and 4.

Zero source clock latency will be assumed for the generated clock so the clock network delay from ff1/D to ff1/Q will not be included in timing check at ff3/D. This will lead to pessimistic setup timing results at ff3/D.

For this scenario, the PrimeTime tool issues a *UITE-461* error message to alert you of this situation. However, not all violations of this rule causes a *UITE-461* error message in PrimeTime. *Figure 2: Master Clock and Generated Clock Waveforms*

Feedback

### What Next

Use the report_clock command to compare the master clock and generated clock waveforms to make sure that the generated clock waveforms are correct. For the example scenario, the command and its output are as follows:

rtl_shell> report_clock Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Clock Period Waveform Attrs Sources ---------- CLK 2.00 {0 1} p {CLK} GCLK1 4.00 {1 3} p, G {ff1/Q}

The report output shows that the generated clock has a rising edge at time 1 and a falling edge at time 3.

In addition, look for other violations related to the generated clock involving edge relations. In the example scenario, a violation of CLK_0020 will also be reported:

Generated clock GCLK1 has edge relationships with its master clock CLK that cannot be satisfied. Only paths with 'rise_triggered' sense exist from the master clock to source pin ff1/Q. A 'fall_triggered' sense is expected.

### FIX SUGGESTION ONE

Consider changing the *–source* pin or port of the generated clock so that it lies in the fanin cone of the generated clock source pin. In the example scenario, the -source option can be changed to *CLK* from *inv1/Z*.

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 [get_pins ff1/Q] \ -divide_by 2 -source [get_ports CLK] \ -master_clock CLK -add set_propagated_clock [all_clocks]

The generated clock waveform now has a rising edge at 0 and a falling edge at 2. See *GCLK1 (FIX1)* in the timing diagram.

### FIX SUGGESTION TWO

Alternatively, the generated clock can be inverted without changing the -source option. This will also remove the current and CLK_0020 violations in the example scenario.

create_clock -name CLK -period 2 [get_ports CLK] create_generated_clock -name GCLK1 [get_pins ff1/Q] \ -divide_by 2 -source [get_pins inv1/Z] \ -master_clock CLK -add -invert set_propagated_clock [all_clocks]

The generated clock waveform will have a rising edge at 2 and a falling edge at 4. See *GCLK1 (FIX2)* in the timing diagram.

Feedback

## CLK-0018

(Warning) Clock clock has non-unate logic in the clock network.

### Description

There is non-unate logic in the clock network. The locations where the clock network becomes non-unate are given in the details of this warning. Both the positive and negative sense of the clock will be propagated. If both clock senses are possible, but not simultaneously, consider creating generated clocks that are mutually exclusive to remove unrealistic pessimism. If only one clock sense can propagate, consider adding a set_clock_sense constraint to remove the pessimism. If this violation is not addressed, the resulting timing analysis may be pessimistic because both the positive sense and negative sense of the clock will be assumed to propagate simultaneously. In practice, only one clock sense may propagate, or both clock senses may propagate, but not simultaneously. Pessimistic timing results can lead to increased effort in optimization and timing closure.

### ONE POSSIBLE SCENARIO

Consider a scenario where a MUX has both a clock signal and an inverted clock signal as inputs. If the mode of operation of the circuit is not specified by setting a case analysis value on the select pin of the MUX, both the positive and negative sense of the clock CLK will be propagated.

create_clock -name CLK -period 2 [get_ports CLK]

Timing analysis assumes that both positive and negative clock senses can propagate simultaneously as shown in the following waveform diagram.

Timing violations will be reported at register ‘ff2/D’ that are due to a launching clock associated with the positive sense of ‘CLK’ and a capturing clock with the negative sense of ‘CLK’ and vice versa.

### What Next

The “Violation Details” section provides the name of the clock and the non-unate pins. There are several ways to analyze the root cause of the non-unateness.

Another way to analyze the root cause of non-unate clocks is to use the clocks_with_sense attribute. This attribute provides, for each pin or port, information on a clock and its sense for all clocks associated with the object. The clock_with_sense attribute can be queried as follows:

rtl_shell> get_attribute [get_pins mux1/A] clocks_with_sense \ get_attribute [get_pins mux1/A] clocks_with_sense \ { { "CLK" "positive" } }

rtl_shell> get_attribute [get_pins inv1/Z] clocks_with_sense \ get_attribute [get_pins inv1/Z] clocks_with_sense \ { { "CLK" "negative" } } rtl_shell> get_attribute [get_pins mux1/

Feedback

Z] clocks_with_sense \ get_attribute [get_pins mux1/Z] clocks_with_sense \ { { "GCLK" "negative" } { "GCLK" "positive" } }

**FIX SUGGESTION**

If the positive clock sense and the negative clock sense cannot propagate simultaneously, create two mutually exclusive generated clocks at the non-unate pins to remove the unrealistic pessimism. If only one clock sense can propagate, consider adding a set_clock_sense constraint to remove the pessimism, or a set_case_analysis constraint to propagate the desired sense of the clock for the mode of operation.

For the example scenario, case analysis can be specified on the MUX select pin to propagate the positive edge clock:

set_case_analysis 0 [get_pins mux1/S]

Now, only one sense of clock ‘CLK’ will arrive at the register clock pins ‘ff1/CP’ and ‘ff2/CP’.

*Corresponding PrimeTime Error Message*

*Error Message:PTE-070*

*Severity:* Warning

*Description*

## CLK-0019

(Warning) Design has both propagated and ideal non-virtual clocks.

**Description**

The design has some propagated clocks and some ideal clocks. For pre-layout analysis, ideal clocks are usually appropriate. For post-layout analysis, propagated clocks should be used. It is not common for some clocks to be pre-layout and some to be post-layout. Note that virtual clocks are ignored for this check and so are the clocks defined at output ports. Ideal clocks in post-layout analysis will lead to incorrect timing results because only specified clock latencies are considered. The clock latencies given with set_clock_latency may be larger or smaller than the actual latencies. Incorrect timing results may lead to slower chip operation or even failure. Propagated clocks in pre-layout analysis may add

Feedback

unintended pessimism or optimism to timing results because the clock network will not have been implemented with proper drive strength and skew.

**ONE POSSIBLE SCENARIO**

Consider a post-layout design where all the clocks need to be propagated. In the constraint file, there is a set_propagated_clock command that is applied to all the clocks.

create_clock -name CLK1 -period 10 [get_ports CLK1] create_clock -name CLK2 -period 20 [get_ports CLK2] set_propagated_clock [all_clocks] create_clock -name CLK3 -period 30 [get_ports CLK3]

However, the clock definition for ‘CLK3’ appears after the set_propagated_clock command, so ‘CLK3’ becomes ideal instead of propagated.

**What Next**

The "Violation Details" section provides a list of ideal clocks and a list of propagated clocks. Consider making either one of the clock lists empty by changing clocks from ideal to propagated or vice versa. Note that virtual clocks and clocks defined at output ports are not included in these lists.

**FIX SUGGESTION**

For post-layout analysis, declare the ideal clocks shown in the Violation Details section as propagated clocks. For the example scenario, this can be done by moving the set_propagated_clock command after the last clock definition as in:

create_clock -name CLK1 -period 10 [get_ports CLK1] create_clock -name CLK2 -period 20 [get_ports CLK2] create_clock -name CLK3 -period 30 [get_ports CLK3] set_propagated_clock [all_clocks]

For pre-layout analysis, consider changing the propagated clocks to ideal clocks to remove unintended pessimism. This can be done by removing set_propagated_clock commands.

**See Also**

create_generated_clock create_clock set_propagated_clock report_clock

---

## CLK-0020

(Error) Generated clock clock has edge relationships with its master clock master_clock that cannot be satisfied. Only paths with path_sensesense exist from the master clock to source pin source_pin. An expected_sensesense is expected.

Feedback

### Description

A generated clock definition implies certain relationships between the master clock source and the generated clock source. For example, a simple -divide_by 2 generated clock implies that a rising master clock edge can cause both a rising and falling generated clock edge (see the following figure). *Figure 1: Relation Between a Clock and its divide_by_2 Generated Clock*

A generated clock definition specifies how the master clock waveform, as it exists at the -source pin (from the create_generated_clock command), is altered.

If the *-source* pin given is one of the master clock sources, then the waveform modifier (-divide_by, -multiply_by, -edges, -combinational, -invert) specifies how the master clock waveform is modified to become the generated clock waveform.

If the *-source* pin is a clock network pin, the master clock waveform may be inverted at that pin. In the inverted case, that generated clock modifier specifies how the inverted master clock waveform is altered to become the generated clock waveform.

The CLK_0020 rule violation looks at the source latency paths of the generated clock and determines whether the specified relationship to its master exists. If the relationship cannot be proven, a CLK_0020 rule violation is triggered for that particular generated clock. In addition, a zero propagated latency is used for the edges of the generated clock where no source latency path is found.

This rule violation correlates to the PrimeTime message *UITE-461*.

The generated clock waveform might be incorrect, the needed source latency paths might be disabled for some reason, and the propagated latency might not be able to be computed. These problems can lead to incorrect or unexpected timing results.

### ONE POSSIBLE SCENARIO

Consider a scenario where an inverted clock reaches the input of a multiplexer. A generated clock (with a -combinational modifier) is added to the output of the MUX. The clock port (CLK) is defined as the -source pin of that generated clock, as shown here:

create_clock -name clk1 -period 2 [get_ports CLK] create_generated_clock -name g1 mux/Z -source [get_ports CLK] \ -combinational -master_clock clk1 -add

These constraints specify that the generated clock, g1, has the same waveform as its master clock, clk1. The tool expects that there is a positive unate path from the port CLK to the output of the mux. This means that a rising edge on CLK should produce a rising edge on g1 and a falling edge on CLK should produce a falling edge on g1. However,

Feedback

when constraint consistency does the clock analysis, it concludes that only negative unate paths exist. This will trigger a CLK_0020 rule violation as follows:

CLK_0020: Generated clock g1 has edge relationships with its master clock that cannot be satisfied. Only paths with negative sense exist from the master clock to source pin mux/Z. A positive sense is expected.

**What Next**

The relationship between the generated clock and its master clock can be seen using the report_clock command. In the preceding example, the report shows that the waveform of *g1* is the same as the waveform of the master clock, *clk1*.

rtl_shell> report_clock {clk1 g1}

****************************************** Report : clock Design : CLK_0020 Scenario: default Version: ... Date : ... ******************************************

Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Clock Period Waveform Attrs Sources
---------- clk1 2.00 {0 1} {CLK} g1 2.00 {0 1} G {mux/Z}

Generated Master Generated Master Waveform Clock Source Source Clock Modification
---------- g1 CLK mux/Z clk1 div(1)

**FIX SUGGESTION**

This violation usually indicates some errors specifying the generated clocks. You should alter the generated clock definition so the waveform matches the existing source latency paths.

In the preceding example, this can be done by either:

Adding the -invert option to the create_generated_clock command

create_generated_clock -name g1 mux/Z -source [get_ports CLK] \ -invert -combinational -master_clock clk1 -add

Changing the -source to a pin after the master clock is inverted

create_generated_clock -name g1 mux/Z -source [get_pins mux/A] \ -combinational -master_clock clk1 -add

The first corrected create_generated_clock command will lead to the following waveform as seen by the report_clock command. Note that the g1 waveform is inverted. The other generated clock statement will produce the same waveform.

rtl_shell> report_clock {clk1 g1}

Feedback

********** Report : clock Design : CLK_0020 Scenario: default Version: ... Date : ... **********

## CLK-0021

(Info) Clock clock is not used in this scenario.

**Description**

A clock defined in the constraints is not used in any scenario. A clock is classified as unused if all the following conditions are met:

no register clock pins receive the clock’s signal

no input or output delay is defined relative to the clock

no generated clock has the clock specified as its master clock

the clock does not propagate to an output/inout port

Unused clocks might be a symptom of an incorrectly or incompletely constrained design. This will also have a memory or runtime adverse effect in a static timing analysis tool since the clock still has to be accounted for.

Feedback

### ONE POSSIBLE SCENARIO

One possible scenario demonstrating this violation involves black boxes or unresolved references associated with a clock path. Such black boxes prevent the clock signal from propagating to register clock pins or output/inout ports and are flagged with LNK-805 warning message of the form:

Warning: Unable to resolve reference to 'BBOX' in 'top'. (LNK-805)

### FIX SUGGESTION

Check if there are any black boxes that are blocking the clock paths. It is a good idea to remove all the black boxes by reading in additional library or design files. A cell is considered a black box if a definition for the cell is not found in any of the Verilog or library technology files.

The clock might be blocked from all registers with case settings or other constraints. If it is correct in this scenario for the clock not to be used, the clocks can be safely removed as they do not affect the function of the design.

### See Also

create_generated_clock create_clock set_input_delay set_output_delay

## CLK-0023

(Warning) There are count clocks on source source with the same period and waveform.

### Description

More than one clock is defined on the same source, with identical periods and waveforms. This can result in increased runtime and memory usage. Consider combining the clocks unless they are needed for other constraint reasons such as clock latency pessimism removal. By default, this violation will be issued for generated clocks only if they have identical periods, waveforms and master clocks. If the *exclude_different_primary_masters* rule property is set to *false*, then generated clocks with identical periods and waveforms will be reported to have this violation even if their master clocks are different.

If this violation is not addressed, the timing analysis runtime and memory usage may increase without any reduction in clock latency pessimism. Failure to remove clock latency pessimism may lead to unrealistic setup or hold timing violations.

### ONE POSSIBLE SCENARIO A

Consider a scenario where there are two generated clocks with the same generated clock source but with different master clock source pins. The master clock source pin for ‘gclkA’ is specified at ‘mux1/A’, and the master source pin for ‘gclkB’ at ‘mux1/B’. However, for the purpose of clock latency calculation, the clock latency path begins from the point where

Feedback

the master clock originates, not where the master source pin is specified in the generated clock. Thus, generated clocks ‘gclkA’ and ‘gclkB’ have

identical clock periods

identical clock waveforms

identical master clocks

identical clock latency paths that start from the port ‘CLK’ and end at pin ‘mux2/A’

create_clock -name sysclk -period 4 [get_ports CLK] create_generated_clock -name gclkA -divide_by 1 \ -source [get_pins mux1/A] -master sysclk \ [get_pins mux2/A] -add create_generated_clock -name gclkB -divide_by 1 \ -source [get_pins mux1/B] -master sysclk \ [get_pins mux2/A] -add

**ONE POSSIBLE SCENARIO B**

Another possible scenario involves multiple clock MUXs controlled by the same select line. Since some clock latency paths are mutually exclusive, the pessimism in latency calculation can be removed by declaring some clocks as logically or physically exclusive. Consider two clock MUXs controlled by one common select line as follows:

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] create_generated_clock [get_pins mux1/Z] -name CLK1_SHORT \ -source [get_pins mux1/A] \ -divide_by 1 -add -master_clock [get_clocks CLK1] create_generated_clock [get_pins mux1/Z] -name CLK1_LONG \ -source [get_pins inv11/A] -divide_by 1 -add -master_clock [get_clocks CLK1] create_generated_clock [get_pins mux2/Z] -name CLK2_SHORT \ -source [get_pins mux2/A] -divide_by 1 -add -master_clock [get_clocks CLK2] create_generated_clock [get_pins mux2/Z] -name CLK2_LONG \ -source [get_pins inv21/A] -divide_by 1 -add -master_clock [get_clocks CLK2] set_propagated_clock [all_clocks] set_clock_groups -logically_exclusive \ -group {CLK1_SHORT CLK2_SHORT} \ -group {CLK1_LONG CLK2_LONG}

Two generated clocks are created at the output of each clock MUX. The long and short versions of each clock are declared as mutually exclusive by using set_clock_groups. However, both the long and the short versions of the generated clocks have identical periods, waveforms, master clocks and latencies because the paths from the master clock source pin to the generated clock source pin are identical. As a result CLK_0023 violation is issued and no pessimism in clock latency is removed despite an increase in runtime and memory usage.

**What Next**

The "Violation Detail" section provides the name of the clock that is being used as data as well as the clock source locations for the clock.

**FIX SUGGESTION**

Feedback

It is best to remove unnecessary generated clocks unless they are needed for purposes like removing pessimism in clock latency calculation. For example scenario A, the extra generated clock ‘gclkB’ can be removed without any impact on timing results.

For example scenario B, the duplicate generated clocks need to be changed to unique generated clocks to remove clock latency pessimism. This can be done by moving the generated clock source pins to the input pins of clock MUXs. This will create two unique generated clocks from each master clock such that the short (long) latency path traverses the path from the clock port to pin ‘A’ (‘B’) of the clock MUX. Now that correct latencies are associated with each generated clock, there will be fewer setup or hold violations to fix. The generated clock modification can be done as follows:

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] create_generated_clock [get_pins mux1/A] -name CLK1_SHORT \ -source [get_ports CLK1] \ -divide_by 1 -add -master_clock [get_clocks CLK1] create_generated_clock [get_pins mux1/B] -name CLK1_LONG \ -source [get_ports CLK1] -divide_by 1 \ -add -master_clock [get_clocks CLK1] create_generated_clock [get_pins mux2/A] -name CLK2_SHORT \ -source [get_ports CLK2] \ -divide_by 1 -add -master_clock [get_clocks CLK2] create_generated_clock [get_pins mux2/B] -name CLK2_LONG \ -source [get_ports CLK2] -divide_by 1 \ -add -master_clock [get_clocks CLK2] set_propagated_clock [all_clocks] set_clock_groups -logically_exclusive \ -group {CLK1_SHORT CLK2_SHORT} \ -group {CLK1_LONG CLK2_LONG}

Rule Property: exclude_different_primary_masters

By default, the exclude_different_primary_masters rule property is set to true. The rule property can be set to false as follows:

set_rule_property exclude_different_primary_masters false CLK_0023

If the rule property is set to *false*, more CLK_0023 violations will be reported because generated clocks with identical periods and waveforms will be reported to have this violation even if their master clocks are different.

---

## CLK-0024

(Warning) Register Clock pin pin has count clocks.

*Status:* Disabled by default

**Description**

This rule is disabled by default because it can give a large number of violations that the user may not be concerned about. It can be used to investigate further a PRF_0001 rule

Feedback

violation. The number of clocks allowed at a register clock pin without triggering a violation is set with the *max_clocks_per_register* property on this rule.

The PRF_0001 rule gives at most one violation. It gives the number of registers that exceed the *max_clocks_per_register* property of the PRF_0001 rule. The performance of many tools is negatively impacted by having many clocks propagating to a single clock pin.

There is a risk that the timing analysis will run slower and take more memory for a set of constraints with many clocks propagating to the same registers. There is also a risk that the design is not constrained for the functional modes as expected. The large number of clocks could also be due to an error in the case analysis settings for clock definitions in the design.

**ONE POSSIBLE SCENARIO**

You have a set of constraints that is meant to represent one functional mode for a design. It is expected that no register has more than one clock for this set of constraints. If any register has more than one clock, then for this example design there are other constraints missing that select the correct clock for this mode. To check the number of clocks reaching clock pin registers in the design, you would include the following commands in your run script:

enable_rule CLK_0024 set_rule_property max_clocks_per_register 1 CLK_0024

During check_constraints, a CLK_0024 violation will be issued if any clock pin has more than one clock.

**What Next**

The “Violation Details” section provides the names of the clocks at the register that has more than the maximum number of clocks.

**FIX SUGGESTION**

If you are using this rule to check that only one clock reaches each register, then you need to add additional case analysis values such that only one clock propagates through the design’s various clock selector logic. For the example scenario, the violation can be resolved by deciding to propagate only the positive sense clock CLK1. This can be achieved with the following command:

set_case_analysis 0 [get_ports SEL]

If you are using this rule to determine whether merging several functional modes has created a large number of registers with more than max_clocks_per_register, you might want to turn off this rule and just use the PRF_0001 rule.

*Rule Property: max_clocks_per_register*

Feedback

The default of the rule property, max_clocks_per_register, can be queried using the following command:

get_rule_property max_clocks_per_register CLK_0024

It can be set to a different value using the set_rule_property command:

set_rule_property max_clocks_per_register 10 CLK_0024

The number of violations reported by this rule is dependent on the setting of this property. If it is set to a large limit, then pins below that limit will not be reported as violations.

**See Also**

---

## CLK-0026

(Warning) Clock clock is used as data. One or more sources of the clock fans out to a register data pin or to a constrained primary output or inout port.

**Description**

The clock is used as data in the design. This can cause multiple problems during optimization, clock tree synthesis, and testing. Clock signals have a high fanout. When they are used as data this can cause large transition time violations in data paths which cannot be fixed by optimization tools. Also, if the data paths are not identified the clock tree synthesis runtime and quality can be adversely impacted. When the clock signals drive the data pin of registers, a race condition is created between the data pin and the clock pin of the registers. The race conditions may lead to the creation of poor test patterns or low test coverage. Clocks used as data may cause large transition time violations which cannot be fixed during optimization; this can increase runtime or degrade quality during clock tree synthesis. It can also result in poor test pattern generation or low test coverage for design testing.

**ONE POSSIBLE SCENARIO**

Consider a scenario where a clock signal drives register data pins and register clock pins. At register ‘ff2’ the clock signal ‘CLK’ appears as data at the data pin and as clock at the clock pin. *Figure 1: Clock Signal Driving Register Data Pins and Register Clock Pins*

create_clock -name CLK -period 1 [get_ports CLK] set_output_delay -clock CLK 0.5 [all_outputs]

**What Next**

The "Violation Details" section provides the name of the clock that is being used as data and the clock source locations.

Feedback

### FIX SUGGESTION

Check if the clock needs to be used as both data and clock. If possible, modify the design so the clock is not used as data. If the clock must be used as both clock and data, consider using clock isolation logic so the data paths and clock paths are separated. A simple clock isolation solution using a two-phase shifted clock divider is shown in the following figure:

### See Also

create_clock

---

## CLK-0027

(Error) At pin, there is a conflicting set_clock_sense for clock.

### Description

There is a set_clock_sense constraint at the given pin and the requested clock sense does not exist at the pin for the given clock. This may be due to a conflicting set_clock_sense constraint on a previous pin, or it may be because the only clock paths to that pin are not of the sense specified. The set_clock_sense constraint for the pin will be ignored because the requested clock sense does not exist. The timing analysis performed on the design will not use the specified clock sense. This could affect the timing results for the design.

### ONE POSSIBLE SCENARIO

Consider a scenario where a clock signal propagates from a select pin to an output pin of a MUX. The clock sense may become positive or negative through the MUX, based on the logic values at the inputs of the MUX.

Port SEL value Clock Sense at mux1/Z 0 Positive 1 Negative

create_clock -name CLK -period 2 [get_ports CLK] set_case_analysis 0 [get_ports SEL] set_clock_sense -negative mux1/Z

### What Next

The “Violation Details” section provides the name of the clock and the location of the set_clock_sense setting. It will also show the requested sense and the available sense of the clock.

### FIX SUGGESTION

Change the constraints so that the conflicting clock sense is resolved.

For the example scenario, it is not necessary to select the clock sense if the case value is used. The set_clock_sense command can be removed from the golden constraint file to resolve the violation.

Feedback

## CLK-0028

(Warning) The master clock for generated clock clock is ambiguous. There are multiple clocks on -source pin master_source.

### Description

The generated clock has been created without a -master_clock or -add options. The -source pin has more than one potential master clock leading to an ambiguous definition. Constraint consistency will, by default, pick the master clock with the least numbers of generated clocks as the primary master. If the potential master clocks tie for the number of levels, then the first created master clock will be chosen. Because the clock definition is ambiguous, there is a non negligible level of unknown associated with that clock definition. Not all tools in the flow may pick the same master clock and, even if they do, the constraints may be altered and the master clocks order changed in the constraint file changing the master clock for this generated clock. The waveform computed for this generated clock is not dependable and can potentially lead to incorrect timing analysis.

### ONE POSSIBLE SCENARIO

In the example below, a generated clock *CLK_gate* has been added at the output of a clock gating cell. The generated clock does not have a *-master_clock* specified, and the *-source* port has two clocks defined on it. This leads to an ambiguous clock definition. Constraint consistency will select the first clock created at the port, *CLK_SCAN* as the master clock of generated clock *CLK_gate*. This example also has an additional generated clock (properly specified) at the same location with the -master_clock and -add options.

create_clock -name CLK_SCAN -period 5 [get_port CLK] -add create_clock -name CLK_NORM -period 2.3 [get_port CLK] -add create_generated_clock -name CLK_gate -combinational \ -source [get_port CLK] ck_gate/Z create_generated_clock -name CLK_gate2 -combinational \ -source [get_port CLK] ck_gate/Z \ -master_clock CLK_NORM -add

### What Next

You can use the report_clock command to see the master clock and waveform for the generated clock.

For this example scenario, the command would be:

rtl_shell> report_clock

Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Feedback

Clock Period Waveform Attrs Sources
---------- CLK_NORM 2.30 {0 1.15} p {CLK} CLK_SCAN 5.00 {0 2.5} p {CLK} CLK_gate 5.00 {0 2.5} p, G {ck_gate/Z} CLK_gate2 2.30 {0 1.15} p, G {ck_gate/Z}

Generated Master Generated Master Waveform Clock Source Clock Modification
---------- CLK_gate CLK ck_gate/Z CLK_SCAN div(1), combinational CLK_gate2 CLK ck_gate/Z CLK_NORM div(1), combinational

**FIX SUGGESTION**

Remove the ambiguity when creating the generated clock by using the -master clock and -add options to the create_generated_clock. This will allow a correct and dependable computation of the clock waveforms.

For the preceding example scenario:

create_generated_clock -name CLK_gate -combinational \ -source [get_port CLK] ck_gate/Z \ -master_clock CLK_SCAN -add

*Corresponding PrimeTime Error Message*

*Error Message:PTE-004*

*Severity:* Warning

*Description*

The master clock for generated clock clock is ambiguous. There are multiple clocks on the -source pin master_source.

**See Also**

create_generated_clock report_clock

## CLK-0029

(Warning) The last edge shift value for generated clock clock is not equal to the first edge shift.

**Description**

The generated clock is specified with the -edges and -edge_shift options. The last edge specifies when the generated waveform repeats. Normally, the shift value for this last edge should be the same as the first shift value, resulting in a generated clock period equal to the difference between the last edge and the first edge. Specifying a different shift for the last edge may result in an edge relationship between the master clock and

Feedback

generated clock that changes from period to period. Clock generation circuitry is typically not designed to generate clocks of this type.

**ONE POSSIBLE SCENARIO**

Consider a scenario where a generated clock is created using edges and the timing of the edges is modified with the -edge_shift option. The last edge shift value is *1.1* time units and the first edge shift value is *0.2* time units in the generated clock definition:

create_clock -period 10 [get_ports CLK] create_generated_clock -source CLK ff1/Q -name genc \ -edges {1 1 3} -edge_shift {0.2 0.6 1.1}

Because the first and last edge shift values are different, the tool issues a CLK_0029 rule violation.

**What Next**

The violation message gives you the name of the generated clock that has different first and last edge shift values.

Examine the edge relationships between the clocks to verify whether or not the edge relationship between the master clock and generated clock remains the same between periods. For the example scenario, the first two periods of the master clock and generated clock are shown as follows:

For the first period, the time difference between the rising edge of the master clock and generated clock is 0.2 time units because (0.2 – 0 = 0.2). For the second period, the time difference between the rising edge of the master clock and generated clock is 1.1 time units because (11.1 – 10 = 1.1). The difference in the edge shift values causes the relationship between the rising and falling edges of the master clock and generated clock to change with each period of the clock.

**FIX SUGGESTION**

If the edge relationship between the master clock and generated clock remains the same between periods, the violation can be waived. If the edge relationship varies, consider modifying the *-edge_shift* specification so that the first and last edge shift values match.

**See Also**

create_generated_clock create_clock

---

## CLK-0031

(Info) The waveform for clock clock has more than two edges.

Feedback

### Description

Most waveforms have a single pair of rise and fall edges. Some tools do not support waveforms with four or more edges. There may be design tools that do not support clock definitions with more than two edges in their specification. All Galaxy tools support such a clock definition.

### ONE POSSIBLE SCENARIO

Consider a clock definition with more than one pair of rise and fall edges.

create_clock -period 10 CLK -waveform {0 1 3 4}

All Galaxy tools support more than two edges in the waveform specification. When a clock has more than two edges in its definition, the tool issues a CLK_0031 rule violation.

### What Next

Check to see if clock specifications of this type are supported by all of the design tools in your flow. If they are, this violation can be waived.

### See Also

create_clock

---

## CLK-0032

(Error) Non-combinational generated clock clock has a source identical to its master source object.

### Description

The reported generated clock has the same source as its master source. Since the generated clock is not combinational, this is an incorrect statement. The constraint describes a condition that is not physically possible in a real design. This will most likely result in incorrect timing analysis since the clock relationship is erroneous.

### ONE POSSIBLE SCENARIO

Consider a scenario where a generated clock is declared as divide-by-2 from its master source, also acting as its source pin:

create_generated_clock -name GCLK -source ff1/CP -divide_by 2 ff1/CP

### What Next

The “Violation Details” reports the pin acting as both the source and master source pin for the generated clock.

### FIX SUGGESTION

Feedback

There are two different approaches to solving this issue depending where the error was made in the generated clock definition:

You can declare the generated clock to have a combinational relationship with the master clock

You can move the master source pin such that the latency path satisfies the master/generated clock relationship

For example, in the preceding scenario, changing the generated clock declaration to the follow would solve the issue:

create_generated_clock -name GCLK -source ff1/CP -combinational

**See Also**

create_generated_clock

---

## CLK-0033

(Error) Clock clock has ideal latency during post-layout analysis.

*Status:* Disabled by default

**Description**

All clocks should be propagated during post-layout analysis. Virtual clocks and clocks defined on output ports are excluded from this check. Ideal clocks in post-layout analysis may lead to inaccurate timing results because clock latencies are not considered. This can lead to missed timing violations in the design.

**ONE POSSIBLE SCENARIO**

Consider a post-layout design where it is desired that all clocks should be propagated. In the constraint file, there is a set_propagated_clock command that is applied to all the clocks.

create_clock -name CLK1 -period 1 [get_ports CLK1] set_propagated_clock [all_clocks]
create_clock -name CLK2 -period 2 [get_ports CLK2]

However, the clock definition for *CLK2* appears after the set_propagated_clock command, so *CLK2* does not get propagated. As a result, a *CLK_0033* violation will be issued by the tool for *CLK2*.

**What Next**

The violation message will include the name of the clock that is not propagated. Virtual clocks and clocks defined on output ports are not included in this check.

Feedback

You can also obtain a report of the clocks in your design and whether they are propagated with the report_clock command. For the example scenario, the report can be obtained as follows:

rtl_shell> report_clock

****************************************** Report : clock Design : ... Scenario: ... Version: ... Date : ... ******************************************

Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Clock Period Waveform Attrs Sources ---------- CLK1 1.00 {0 0.5} p {CLK1} CLK2 2.00 {0 1} {CLK2}

The report shows that *CLK1* is a propagated clock, while *CLK2* is an ideal clock.

**FIX SUGGESTION**

For post-layout analysis, determine if the specified clock should be made propagated and include it in the collection of clocks to be propagated. For the example scenario, this can be done by moving the set_propagated_clock command in the constraint file so that it occurs after the last clock definition:

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] set_propagated_clock [all_clocks]

**See Also**

set_propagated_clock create_clock create_generated_clock report_clock

---

## CLK-0034

(Error) Clock clock has propagated latency during pre-layout analysis.

*Status:* Disabled by default

**Description**

All clocks should be ideal during pre-layout analysis. Virtual clocks and clocks defined on output ports are excluded from this check. Propagated clocks in pre-layout analysis will have their latency calculated with cell delays only, since no detailed parasitics are present in the design for interconnect delay. This may lead to inaccurate timing results.

**ONE POSSIBLE SCENARIO**

Consider a pre-layout design with two clocks, CLK1 and CLK2. In the constraint file, there is a set_propagated_clock command that is applied to clock *CLK2*.

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] set_propagated_clock [get_clocks CLK2]

Feedback

As a result, *CLK1* will be ideal, but *CLK2* is propagated. When this rule is enabled, a CLK_0034 violation will be issued for *CLK2* because it is propagated.

**What Next**

The violation message will include the name of the clock that is propagated. Virtual clocks and clocks defined on output ports are not included in this check.

You can also obtain a report of the clocks in your design and whether they are propagated with the report_clock command. For the example scenario, the report can be obtained as follows:

rtl_shell> report_clock

****************************************** Report : clock Design : ... Scenario: ... Version: ... Date : ... ******************************************

Attributes: p - Propagated clock G - Generated clock I - Inactive clock

Clock Period Waveform Attrs Sources ---------- CLK1 1.00 {0 0.5} {CLK1} CLK2 2.00 {0 1} p {CLK2}

The report shows that *CLK2* is a propagated clock, while *CLK1* is an ideal clock.

**FIX SUGGESTION**

For pre-layout analysis, consider removing the propagated clock declaration and replacing it with the set_clock_latency command. This command can be removed later when post-layout data is available for the design. For the example scenario, the set_propagated_clock command can be removed and replaced with a set_clock_latency command.

create_clock -name CLK1 -period 1 [get_ports CLK1] create_clock -name CLK2 -period 2 [get_ports CLK2] set_clock_latency 2.36[get_clocks CLK2]

**See Also**

set_propagated_clock remove_propagated_clock set_clock_latency create_clock create_generated_clock report_clock

---

## CLK-0035

(Warning) No clock-gating check inferred for the instance: cell clock pin: clk_pin enable pin: enable_pin lib cell: lib_cell clk name: clk_name.

**Description**

The enable pin specified converges with a clock network, but no clock gating check can be inferred. The library cell logic does not create a *high* or *low* clock gating check, and there

Feedback

is no set_clock_gating_check-high or -low or set_disable_clock_gating_check constraint at this location.

Constraint consistency can infer the clock gating check level (high or low) if the gate logic can be determined to be equivalent to logic AND or logic OR. Otherwise, the you need to specify the check level to enable clock gating checks on the cell. The clock gating checks will not be created because the clock gating check level cannot be inferred. Any timing violations related to the clock gating signal cannot be detected and will not be reported.

**ONE POSSIBLE SCENARIO**

Consider a scenario shown in the following figure, where a clock is created on the clock port *M1*, and a clock gating timing check cannot be inferred on the *MUX21H* cell since it does not have the logic AND or logic OR:

create_clock -period 5 [get_ports M1] -name m1

**What Next**

The violation message provides the name of the cell where a clock gating check cannot be inferred, along with the corresponding clock pin, enable pin, and library cell.

**FIX SUGGESTION**

To enable the clock gating check on this cell, use the set_clock_gating_check command with the -high or -low option to specify the check level information. If clock gating checks are not required, you can remove this violation by disabling the clock gating checks for this cell with the set_disable_clock_gating_check command.

**See Also**

set_clock_gating_check set_disable_clock_gating_check report_clock_gating_check

---

## CLK-0036

(Error) Generated clock clock (file:gclk_flr) has incorrect waveform inversion with its master clock master_clock(file: mclk_flr) that cannot be satisfied.

**Description**

There are edge triggered cells in the paths between the master clock and the generated clock that might involve waveform inversion. The specified clock waveform cannot be computed under the current conditions. It is likely that your generated clock definition has either:

a missing or an incorrect -invert option

a missing or an incorrect inverting -edges option

Feedback

This violation will not be issued for generated clocks that already have CLK_0020 or CLK_0008 violations.

If the generated clock definition incorrectly specifies waveform inversion, all timing paths affected by the generated clock can receive the wrong waveform. This can affect timing results of those paths and can negatively affect runtime and accuracy during timing optimization and timing closure. When performing this analysis, constraint consistency looks at inversions created with the -invert switch as well as inversions created by the -edges definitions.

**ONE POSSIBLE SCENARIO**

create_clock -period 10 -name clk1 [get_ports clk1] create_generated_clock -divide_by 2 -name clk2 \ -source [get_ports clk1] \ -master [get_clocks clk1] \ [get_pinsFGclock/Q] -add -invert

In the preceding example, the generated clock, clk2, is defined with a waveform inversion on the create_clock command. However, this doesn't match the connectivity in the actual design (the waveform should not be inverted). This results in constraint consistency issuing a CLK_0036 rule violation.

**What Next**

The Violation Details section shows whether the -invert option is missing or incorrectly specified. For the preceding example, it shows the following information:

Generated clock 'clk2' is specified with the -invert option but inversion is not expected.

Check the generated clock definition and the design and redefine the generated clock with the -invert option added or removed. In the example scenario previously described, the -invert option should be removed to match the clk2 waveform to the design.

**See Also**

report_clock CLK_0020 CLK_0008

---

## CLK-0037

(Warning) There are other clock sources in the clock latency path from the sources of the master clock master_clock to the source of generated clock clock.

*Status:* Enabled by default

**Description**

There are clock sources that launch clocks different from the current generated clock or the master of current generated clock in the paths between the master clock and the generated clock. You might want to redefine the generated clock in terms of the clocks that are present in these paths instead of the current master clock. When clock latency

Feedback

paths from a master clock source to a generated clock source contain pins which are the sources of other clocks, static timing tools might perform traversals involving both sequential logic and other clock sources, causing analysis complications (such as missing inferred clock gating checks) or increased runtime.

**ONE POSSIBLE SCENARIO**

Consider the clock generation structure described in the schematic below and the following clock definitions. The clock paths are highlighted in orange in the schematic:

create_clock -name master_clk -period 10 -waveform [list 0 5] [get_ports CLK]

create_generated_clock -add -name gclk1 -master master_clk -source [get_portsCLK] -divide_by 2 [get_pinsFF1/Q]

create_generated_clock -add -name gclk2 -master master_clk -source [get_ports CLK] -divide_by 4 [get_pinsFF2/Q]

In this example, both generated clocks gclk1 and gclk2 are specified with respect to the same master clock master_clk. However, the generated clock, gclk1, is created between the clocks master_clk and gclk2. As a consequence, gclk2 should be expressed in terms of gclk1 instead of in terms of master_clk. Constraint consistency issues a CLK_0037 violation whenever this situation is detected in the design.

**What Next**

The Violation Details section displays additional information related to the reported generated clock source latency. Most importantly, it identifies clock sources in the clock source latency path. In the preceding example, the violation details show the following message:

The following clock source pins occur in the source latency paths between the master clock (master_clk) and generated clock (gclk2):

* FF1/Qp

The Debugging Help section gives the command that can be used to further identify the cone of logic between the master clock and the reported generated clock source pin.

**FIX SUGGESTION**

The recommended practice is to define the generated clocks in the design with respect to the intermediate clock source present in the source latency paths instead of the current master clock. In the previous example, the constraints can be rewritten as follows:

create_clock -name master_clk -period 10 -waveform [list 0 5] [get_ports CLK]
create_generated_clock -add -name gclk1 -master master_clk -source [get_ports CLK] -divide_by 2 [get_pins FF1/Q] create_generated_clock -add -name gclk2 -master gclk1 -source [get_pins FF1/Q] -divide_by 2 [get_pins FF2/Q]

Feedback

**See Also**

report_clock CLK_0008

---

## CLK-0038

(Warning) Detects generated clocks with a sequential source network spanning block boundaries.

*Status:* Disabled by default

**Description**

The generated clock can be defined inside a block, whereas the source latency network of the generated clock could be crossing the block boundary where the generated clock is defined. This kind of scenario can lead to problems during the hierarchical analysis.

This rule uses the *set_hierarchical_config* command to define the blocks and the instances in the current design. This block information is used by this rule to identify the blocks that are of interest to the user.

set_hierarchical_config -block block_name -instances instances list

The source latency numbers for the generated clock might be different in the block-level analysis and the top-level analysis. This can lead to inaccurate results in hierarchical designs.

**What Next**

The Violation Details section displays additional information related to the reported generated clock source latency. Most importantly, it identifies clock sources, the master source, and the master clock for the reported generated clock.

**FIX SUGGESTION**

The recommended practice is to define generated clocks within the same block as the master clock.

**See Also**

check_constraints set_hierarchical_config

---

## CLK-0040

(Warning) Detects clock definition conflicts on the same net.

*Status:* Enabled by default

Feedback

### Description

This rules detects the clock definition conflicts on the same net. This is most useful when you have a hierarchical design, and a clock definition at the block level and another at the top level. When performing a flat analysis, the clocks might be defined with different definitions on the same net. This rule helps in identifying such problems. It is not physically possible to have different clock waveforms in the same net.

### What Next

The Violation details section displays additional details about the clocks with conflicting definitions. It shows all of the details, such as where the clock is defined, its master clock, and the SDC browser link. Most importantly, it lists all of the net segments in a hierarchical design that can lead to the conflict.

### FIX SUGGESTION

Different scenarios might require different approaches. The basic idea is to ensure that there are no conflicting clock definitions on the same hierarchical net segments.

check_constraints

---

## CLK-0042

(Error) The user-applied case analysis overlaps with clock propagation.

### Description

This violation occurs when clock propagation overlaps with user-applied case analysis. There is a risk that an unwanted case will stop the clock propagation and might lead to a missing path.

### ONE POSSIBLE SCENARIO

create_clock -name ck -period 10 -waveform {0 5} [get_ports ck] set_case_analysis [get_pins b0/z]

### What Next

Check if the case value is wanted. Remove the case value if it is an incorrect set.

### FIX SUGGESTION

Use the remove_case_analysis command on the port/pin to remove the case value.

### See Also

set_case_analysis remove_case_analysis

Feedback

## CLK-0043

(Warning) Creation of a clock clock blocks the propagation of clocks reaching to the specified point.

### Description

This violation is given when the creation of clock on a port/pin is blocking the propagation of clocks reaching until that point. The clock created on the propagating path of other clocks will lead to all the other clocks stop propagation. If this is unintended it might lead to incorrect clock definition across the design.

### ONE POSSIBLE SCENARIO

create_clock -name ck -period 10 -waveform {0 5} [get_ports ck] create_clock -name ck1 -period 20 -waveform {0 10} [get_pins b0/z]

In this scenario, clock ck1 is created on the path of clock ck. It should use create_generated_clock -master_clock ck -source [get_pins b0/a] -divided_by 2 -name ck1 to define the clock.

### What Next

Check if this is wanted and change the clock definition accordingly.

### FIX SUGGESTION

If the propagation of any blocked clock has to continue, then create a generated clock for all such clocks.

### See Also

create_clock create_generated_clock

# CMD

## CMD-001

(error) Cannot specify '%s' with '%s'.

### Description

The listed command options are exclusive. Only one of them can be specified.

### What Next

Look at the manpage for this command for more information on command options.

Feedback

## CMD-002

(error) Value for '%s' cannot be negative

**Description**

The value for this option must be greater than or equal to zero.

**What Next**

Enter the command again with a valid option value.

## CMD-003

(error) Cannot specify %s without %s.

**Description**

One command option requires another.

**What Next**

Refer to the manual page for this command for detailed information on valid options.

## CMD-004

(error) Must specify one of these options: %s.

**Description**

This command requires that one of the options in the list is specified.

**What Next**

Refer to the manual page for this command for detailed information on valid options.

## CMD-005

(error) unknown command '%s'

**Description**

The command is not recognized.

**What Next**

Look for a typographical error in the command. If it is correct, make sure that the program you are running supports the command, or you have the license to use the command.

Feedback

## CMD-006

(error) ambiguous command '%s' matched %d commands:\n \t(%s)

**Description**

The command does not have sufficient characters to distinguish it from other commands. The first three commands which match the abbreviation are listed. To see them all, use the help as follows: if the abbreviation is cmd, type 'help cmd*'. This lists all commands that begin with 'cmd'.

**What Next**

Type enough characters so the command is unambiguous.

## CMD-007

(error) Required argument '%s' was not found

**Description**

The listed argument to the command might not be omitted.

**What Next**

Supply the required argument.

## CMD-008

(error) value not specified for option '%s'

**Description**

The listed argument requires a value (that is, it is not a boolean option), and none were supplied.

**What Next**

Supply a value for the argument.

## CMD-009

(error) value '%s' for option '%s' not of type '%s'

**Description**

The value given for the listed argument is not the correct type. For example, if 'abc' is given for an integer option, this error occurs.

Feedback

**What Next**

Supply a compatible value for the argument.

---

## CMD-010

(error) unknown option '%s'

**Description**

The option is not recognized.

**What Next**

If this is not a simple mistake, retype the command with by the -help option. This lists all of the possible options.

---

## CMD-011

(error) ambiguous option '%s'

**Description**

The option does not have sufficient characters to distinguish it from other options.

**What Next**

Type enough characters so that the option is unambiguous.

---

## CMD-012

(error) extra positional option '%s'

**Description**

The command expects some positional arguments and has already received enough. It might also be the case that this was intended as a dash option and is misspelled.

**What Next**

Verify that the option given is not a misspelled dash option. If a list is provided directly instead of as a variable, ensure it is enclosed by curly braces or double quotation marks. Use -help with the command to verify which arguments are already given.

---

## CMD-013

(error) %s\n \tUse error_info for more info.

Feedback

**Description**

A script or complex command failed and there is a stack trace for the failure. The trace points out the source files and loops where the error occurred. The error_info command is used to display this stack.

**What Next**

Fix the error indicated by error_info.

---

## CMD-014

(error) Invalid %s value '%s' in list.

**Description**

A list argument is expected to be a common type (like integer or float) and one or more elements cannot be converted to that format.

**What Next**

Fix the offending list element.

---

## CMD-015

(error) could not open %s file

**Description**

A script or an output redirect file cannot be opened.

**What Next**

Verify that the file exists or that you have write access to the directory. Write access depends on the file type.

---

## CMD-016

(error) could not close %s file

**Description**

A script or an output redirect file cannot be closed.

---

## CMD-017

(warning) duplicate option '%s' ignored.

Feedback

**Description**

The given option is already issued. This command uses the first value of the option, and subsequent values are ignored.

**What Next**

Make sure this is the option you want to use. If so, decide which value you want and verify that you get the correct one.

---

## CMD-018

(warning) duplicate option '%s' overrides previous value.

**Description**

The given option has already been issued. This command uses the last value of the option, and previous values are ignored.

**What Next**

Make sure that this is the option you want to use. If so, decide which value you want and make sure that you get the correct one.

---

## CMD-019

(error) value '%s' for option '%s' not in range (%s).

**Description**

The value given for the listed argument is not in the allowable range. For example, if 4 is given for an integer option, which has a range of 1 to 3, this error occurs.

**What Next**

Supply a compatible value for the argument.

---

## CMD-020

(error) unknown OR extra positional option '%s'

**Description**

The dash option is not recognized. Further, all positional arguments have already been received. This is most likely a misspelled dash option.

Feedback

**What Next**

Check to see if the option is misspelled. Look at the entire command, as other options may have misled the interpreter.

---

## CMD-021

(warning) invoked %s outside of a loop

**Description**

The listed control command (break or continue) was used outside of the context of control structure (such as foreach, while, and so on).

**What Next**

Look for a loop that ends prematurely or for a misspelled control word.

---

## CMD-022

(warning) Can't create alias named '%s' - %s%s.

**Description**

An attempt was create an alias with an invalid name. Invalid names include those which match an existing command or procedure, and those which can be converted to a decimal, hexadecimal, or octal number.

**What Next**

Choose another name. Use 'help' and 'alias' (with no arguments) to see what names are in use.

---

## CMD-023

(error) Alias loop: %s

**Description**

You have aliases that refer to one another.

**What Next**

Use the alias command to look at the aliases listed in the diagnostic. Remove the loop and re-execute the command.

Feedback

## CMD-024

(error) can't %s "%s": %s

**Description**

You attempted an operation on a variable which failed. You may have tried to read a non-existent variable (set var). Or, you may have tried to unset a non-existent or application-owned variable. The text of the message will indicate which operation failed.

**What Next**

Verify that the variable exists with the printvar command. If it's not a user variable, you cannot remove (unset) it.

## CMD-025

(error) No manual entry for '%s'

**Description**

The topic for which you requested man pages does not exist.

**What Next**

Verify that the topic is spelled correctly.

## CMD-026

(error) %s required for the '%s' argument.

**Description**

The command is incomplete as entered. The specified argument requires a valid object or list of objects.

**What Next**

Enter the command with valid values for all arguments.

## CMD-027

(error) couldn't change working directory to '%s'

**Description**

The directory which you specified to the cd command is not valid.

Feedback

**What Next**

Verify that the directory is spelled correctly.

---

## CMD-028

(error) couldn't get working directory name

**Description**

The pwd command was unable to access the current directory. It is most likely the case that the directory which you are in no longer exists,

**What Next**

Use the cd command to get into an existing directory.

---

## CMD-029

(warning) no aliases matched '%s'

**Description**

You specified a pattern to the unalias command, and there are no aliases which match that pattern.

**What Next**

There is no adverse effect of this action. However, check the spelling of the arguments to unalias to ensure that you removed all of the aliases which you wanted to remove.

---

## CMD-030

(warning) File '%s' was not found in search path.

**Description**

The 'which' command evaluated an filename argument and the file was not found.

**What Next**

No adverse effect on the result of the command, but check spelling, etc.

---

## CMD-031

(error) value '%s' for option '%s' is not valid. Specify one of:\n \t%s

Feedback

**Description**

The value given for the listed argument is not one of the limited allowable strings. This messages lists all of the appropriate values.

**What Next**

Supply a compatible value for the argument.

---

## CMD-032

(warning) command '%s' requires some options.

**Description**

No options were given for the command, yet some are required.

**What Next**

Supply appropriate arguments.

---

## CMD-033

(error) cannot source the current log file.

**Description**

An attempt to source the log file of the currently running interpreter is not allowed. It would cause the tool to infinitely loop.

**What Next**

Copy the part of the log to be a source for another file, then source that file instead.

---

## CMD-035

(error) Value for %s cannot be larger than the %s value.

**Description**

Some commands work in pairs, specifying a maximum and minimum value. The minimum value should be less than the maximum value. For example, never specify a *min_capacitance* which is larger than the *max_capacitance* for the same design or port.

**What Next**

Remove the old value or use a different value.

Feedback

## CMD-036

(error) Value for list '%s' must have %s elements.

**Description**

The value given for the list argument does not have the correct number of elements. Some commands have list arguments which require either a specific number or an even number of elements. The message will indicate which it is.

**What Next**

Supply a correct number of elements in the list. If the list is provided directly instead of as a variable, ensure it is enclosed by curly races or double quotation marks.

## CMD-037

(error) value '%s' for option '%s' is invalid: must be %s.

**Description**

The value given for the listed argument is greater than or less than the allowable limit. For example, if 4 is given for an integer option, which is required to be less than or equal to 3, this error occurs.

**What Next**

Supply a compatible value for the argument.

## CMD-038

(information) The '%s' option for %s is unsupported.%s

**Description**

The option which you specified is not currently supported.

## CMD-039

(information) The '%s' variable is unsupported.%s

**Description**

The variable which you specified is not supported.

**What Next**

If a replacement variable is specified, use it instead of this one.

Feedback

## CMD-040

(information) No %s matched '%s'.

### Description

In command or variable search functions (help and printvar), you specified a pattern that did not match any variables or commands.

Note that printvar cannot find a specific array element; it can only find the entire array by name.

### What Next

Try using more wildcards (* or ?) in your search pattern.

## CMD-041

(information) Defining new variable '%s'.

### Description

This message is issued when a variable is set for the first time.

When combined with the *printvar* command, this message can be used to isolate spelling errors in system (application) variables. However, like many debugging features, this has significant CPU cost. Therefore, the feature should only be used interactively or when developing scripts.

This feature is enabled by setting the *sh_new_variable_message* variable to true. When combined with a true value for variables *sh_new_variable_message_in_script* or *sh_new_variable_message_in_proc*, this setting causes a warning message (CMD-042) to be issued, which indicates that the performance of scripts (or Tcl procedures) will be adversely affected. To enable the feature in Tcl procedures, set the *sh_new_variable_message_in_proc* variable to true. To enable the feature in Tcl scripts, set the *sh_new_variable_message_in_script* variable to true.

In the following example, the user has misspelled the variable *sh_continue_on_error* by making it plural. With this feature, debugging is simplified.

```
prompt> set sh_continue_on_errors true
Information: Defining new variable 'sh_continue_on_errors' (CMD-041)
true
prompt> printvar sh*
sh_arch               = "sparcOS5"
sh_continue_on_error = "false"
sh_continue_on_errors = "true"
sh_enable_page_mode  = "false"
sh_new_variable_message = "true"
```

Feedback

```
sh_new_variable_message_in_proc = "false"
sh_product_version   = ""
sh_source_uses_search_path = "false"
prompt> unset sh_continue_on_errors
prompt> set sh_continue_on_error true
true

Application variables are always defined, so if this message appears,
a new user-defined variable has been created.
```

### What Next

If attempting to set an application variable, use *printvar* with wildcards to get the correct spelling for the variable.

### See Also

- printvar
- sh_new_variable_message
- sh_new_variable_message_in_proc
- sh_new_variable_message_in_script
- CMD-042

---

## CMD-042

(warning) Enabled new variable message tracing -\n \tTcl scripting optimization disabled.

### Description

This message is issued when you enable new variable tracing for Tcl scripts or procedures. That occurs when you set the variable *sh_new_variable_message* to TRUE, and when you set the variables *sh_new_variable_message_in_proc* or *sh_new_variable_message_in_script* to TRUE. It warns you that the performance of the application will be negatively mpacted because this feature is costly in CPU time when enabled.

This feature is intended for debugging, and should only be used interactively or when developing scripts. It should not be used in a main flow.

### What Next

Set one or more of the variables to FALSE unless you are debugging a script.

Feedback

**See Also**

- sh_new_variable_message
- sh_new_variable_message_in_proc
- sh_new_variable_message_in_script

---

## CMD-050

(error) Unknown procedure '%s'.

**Description**

The procedure name argument to *define_proc_attributes* is not a procedure.

**What Next**

Verify that the argument is correct.

---

## CMD-051

(error) Procedure '%s' cannot be modified.

**Description**

The procedure that you passed to *define_proc_attributes* is a permanent procedure that cannot be modified.

**What Next**

The procedure might be part of the application, in which case it was correctly defined with *-permanent*. If it is not part of the application, it is possible that it was erroneously defined with *-permanent*.

---

## CMD-052

(error) Unknown command group '%s'

**Description**

The command group referenced does not exist. For example, using the *-command_group* option with the *define_proc_attributes* command, and passing in a non-existent command group will raise this error.

**What Next**

Verify that the correct command group name is being used.

Feedback

## CMD-053

(warning) The body of procedure '%s' is protected

**Description**

You attempted to examine the body of a procedure using *info body*. That procedure was protected by the writer so that it's body cannot be displayed.

**What Next**

No action required.

## CMD-060

(error) Syntax error in argument definition %d for proc '%s'.

**Description**

Using the *-define_args* option for *define_proc_attributes*, there is some kind of syntax error, for example, an improperly formatted list.

**What Next**

Use *error_info* to narrow the problem, then reenter the command.

## CMD-061

(error) Need at least 2 fields in argument definition %d for proc '%s'.

**Description**

Using the *-define_args* option for *define_proc_attributes*, an argument definition had insufficient arguments. At least 2 are required: the argument name and the option help text.

**What Next**

Reenter the argument definition with the correct number of fields.

## CMD-062

(error) Unknown %s '%s' in argument definition %d (%s) for proc '%s'.

**Description**

Using the *-define_args* option for *define_proc_attributes*, either a data type or attribute is invalid.

Feedback

The allowable data types are string, boolean, int, float, and list. The allowable attributes are required and optional.

**What Next**

Correct the invalid data and reenter the command.

---

## CMD-063

(error) Illegal name '%s' for Boolean argument definition %d for\n \t proc '%s': must begin with '-'.

**Description**

Using the *-define_args* option for *define_proc_attributes*, you attempted to create a Boolean argument with a name not preceded by a '-'. Boolean arguments require a leading '-'.

**What Next**

Correct the argument name and reenter the command.

---

## CMD-064

(warning) Value help ignored for Boolean option %s\n \tin argument definition %d for proc '%s'.

**Description**

Using the *-define_args* option for *define_proc_attributes*, you tried to add value help for a Boolean argument. Boolean arguments cannot have the value help.

**What Next**

Remove the value help field for boolean arguments and reenter the command.

---

## CMD-065

(error) Can't specify both 'optional' and 'required' in argument\n \tdefinition %d (%s) for procedure '%s'

**Description**

This message indicates an attempt to specify conflicting flag values as part of the definition of a procedure argument within the *define_proc_attributes* command.

**What Next**

Decide whether the argument is optional or required, and remove the opposite flag.

Feedback

## CMD-066

(error) Must specify a value for attribute 'values' when using '%s'\noption type as in option %d (%s) for procedure '%s'

### Description

This message is issued by the *define_proc_attributes* command when you attempt to define an argument whose value must be one of a set of pre-defined strings (the one_of_string data type), without specifying the set of valid strings.

### What Next

If the value type really needs to be one_of_string, pass the values in as a list within the attributes list (i.e. {values {a b c}}).

## CMD-067

(error) Invalid attribute specification for attribute '%s'\n \t(%s)\n \tin option %d (%s) for procedure '%s'

### Description

This message is issued by the *define_proc_attributes* command. It indicates an incorrect attempt at specifying an attribute for a procedure argument. The reason for the error is included in the message.

### What Next

Fix the syntax of the command and try again.

## CMD-068

(error) Could not find procedure '%s'. Arguments can't be parsed.

### Description

This message indicates an attempt to use the parse_proc_arguments command from within a procedure which has not been defined using define_proc_attributes.

### What Next

Define the procedure's arguments using define_proc_attributes and try again.

## CMD-069

(error) Could not set '%s(%s)' while parsing arguments in '%s'.

Feedback

### Description

This message indicates that the *parse_proc_arguments* command was not able to set the specified Tcl array variable to hold the value of a command option.

### What Next

This typically indicates that the variable was read-only. Use a different variable and try again.

---

## CMD-070

(error) %s can only be called from within a procedure

### Description

This message indicates an attempt to use the given command from the interpreter command line. Calls to this command are only supported from within a Tcl procedure.

### What Next

Create a procedure and call the command from within the scope of the procedure body.

---

## CMD-080

(warning) Command '%s' is disabled.

### Description

Although part of the application, the listed command is not currently enabled. The sh_disabled_is_error variable controls the severity of this message. When true, a Tcl error is issued for this command. When false, the command is a no-op.

### What Next

Look at the user documentation to determine how various commands are enabled and disabled.

### See Also

- sh_disabled_is_error

---

## CMD-081

(information) script '%s'\n \tstopped at line %d due to %s.

Feedback

### Description

The execution of a script was terminated. This message tells you which script stopped, the line number where it stopped, and why it stopped.

If the *sh_continue_on_error* variable is false (the default), any Tcl error, either syntax or semantic, stops the script. If *sh_continue_on_error* is false and the *sh_script_stop_severity* variable is W or E, messages of that severity or higher stop the script.

If the *sh_continue_on_error* variable is true, the *sh_script_stop_severity* variable is ignored and the script continues even if there are errors or warnings.

### What Next

Use the information in this message to identify and correct the source of errors and warnings. Then reexecute the script.

### See Also

- sh_continue_on_error
- sh_script_stop_severity

---

## CMD-082

(information) %s occurred at or before line %d in\n \tscript '%s'.

### Description

You receive this message if an error or warning occurs while a script is executing, and the variable *sh_source_emits_line_numbers* is set to E or W. A setting of E causes this message to be issued only if an error occurs, while for a setting of W, this message is issued for both warnings and errors. This message tells you the error or warning and the line and script in which it occurred.

The setting of the *sh_script_stop_severity* variable affects the output of the CMD-082 message. If *sh_script_stop_severity* is set to E, the script stops executing if an error occurs; for a setting of W, the script stops executing if a warning or error occurs. In both cases, message CMD-081 is issued, and takes precedence over CMD-082.

### What Next

Use the information in this message to identify and correct the source of errors and warnings. Then reexecute the script.

Feedback

### See Also

- sh_script_stop_severity
- sh_source_emits_line_numbers
- CMD-081

## CMD-085

(warning) Renaming %s %s cause %s commands which use it to fail.

### Description

You receive this message if you rename a command which is not a user-defined Tcl procedure. Renaming commands can be dangerous. Parts of the application are written in Tcl, and if you rename a command that the application is using, it is possible that those parts of the application will not function.

The only true use for *rename* is to wrap a command. For example:

```
shell> rename command1 command1_orig
shell>  \\
  proc command1 {args} {
    # ...
    eval command1_orig $args
    # ...
  }
```

If you use *rename* in this way, it is more likely that application will continue to function correctly. Still, use *rename* with extreme care and at your own risk.

### What Next

Consider using *alias*, Tcl procedures, or a private namespace before using *rename*.

### See Also

- rename

## CMD-086

(error) Could not find command '%s'.

### Description

This message indicates that the command name entered does not exist and therefore operation on associated command mode could not be performed.

Feedback

**What Next**

Check to make sure command name is typed correctly.

---

## CMD-087

(error) The command requires either a command name or a command mode name.

**Description**

This command requires either a command name or a command mode name to be specified.

**What Next**

Enter *set_current_command_mode* with the *-command* option flag followed by a command name or the *-mode* option flag followed by a command mode name. These options are mutually exclusive.

---

## CMD-088

(error) Could not find command mode '%s'.

**Description**

This message indicates that the command mode name entered does not exist and therefore could not be set as the current mode.

**What Next**

Check to make sure command mode name is typed correctly. *get_command_modes -all* lists all defined command mode names.

---

## CMD-089

(error) Initialization of command '%s' failed.

**Description**

This message indicates that a failure occurred during initialization and the specified command could not be evaluated.

---

## CMD-090

(error) Initialization of command mode '%s' failed.

Feedback

**Description**

This message indicates that a failure occurred during initialization of the command mode and the specified command mode could not be made current.

---

## CMD-100

(warning) Detected use of obsolete/unsupported feature. The following\n \twill not be available in a future release of the application:\n \t%s. Use %s instead

**Description**

You have used a feature which is no longer supported by the application, and the feature is planned to be removed at some future date. The supported method is given in the message.

**What Next**

Update your command usage as indicated.

---

## CMD-101

(error) Failed to set value of option %s for command %s.

**Description**

A run of a command such as set_command_option_value failed to set the default or current value of an option. The command option may not have been enabled for value-tracking or a conversion error may have occurred when attempting to set the option value.

**What Next**

It may be necessary to enable the option for value-tracking.

---

## CMD-102

(error) No such positional option %d for command %s.

**Description**

An attempt was made to find the positional option of the command at the given position. No such positional option was found. Either the given command has no positional options, or the given position is "out of range". Note that positional options are numbered 0, 1, 2, ... (N-1) where N is the number of postional options of the command.

**What Next**

Retry the operation using a positional option position that is "in range" for the command.

Feedback

## CMD-103

(error) A Severe error has occurred. \n \tTo ensure that the script does not continue, the value of sh_continue_on_error\n \thas been overridden to be false. Your script is being interrupted.\n \tTo see the Tcl call stack for the part of your script which generated\n \tthe Severe error use the error_info command.

### Description

A Severe error has occurred during a command execution. To ensure that the script does not continue, the value of sh_continue_on_error has been overridden to be false. Your script is being interrupted. To see the Tcl call stack for the part of your script which generated the Severe error use the error_info command.

### What Next

For details on the Severe error please look in your log file. You can also run man on the Severe error id to learn more about the error. Study the Severe error and try to fix the error in your script.

## CMD-104

(error) Variable '%s' is not an application variable. Using Tcl global variable.

### Description

The specified variable is not declared as an application variable (not returned by get_app_var -list). This message is only generated when the application variable sh_allow_tcl_with_set_app_var is true.

Please see the manpages for get_app_var and set_app_var for additional details.

### What Next

Make sure you are using the correct variable name.

## CMD-105

(warning) Option '%s' is deprecated, use '%s' instead.

### Description

This option is deprecated, you should use a different option for this command feature. The code has automatically used a compatible option setting, but in the future the old option may be removed, so you should update your scripts.

Feedback

**What Next**

Update your script to use the new option.

---

## CMD-106

(warning) Option '%s' for command '%s' is obsolete. See the command's man page for alternatives.

**Description**

This option is no longer supported, specifying it has no effect.

**What Next**

Update your script

---

## CMD-107

(error) Not enough values specified for option '%s', requires %d values found %d.

**Description**

The listed option requires that the specified number of values and not enough values were supplied.

**What Next**

Supply all the required values for the option.

---

## CMD-108

(warning) Command %s is obsolete. See the command's man page for alternatives.

**Description**

This command is obsolete. Calling it has no effect. Please see product documentation for alternatives.

**What Next**

Update your script as needed.

---

## CMD-109

(warning) Command %s is deprecated. See the command's man page for alternatives.

Feedback

**Description**

This command is deprecated. Please see product documentation for alternatives.

**What Next**

Update your script as needed.

---

## CMD-110

(warning) Option '%s' for command '%s' is deprecated. See the command's man page for alternatives.

**Description**

This option is deprecated, you should use a different option for this command feature.

**What Next**

Update your script to use the new option.

---

## CMD-111

(error) The write operation failed: %s.

**Description**

The write operation failed for the reason shown.

---

## CMD-112

(error) duplicate option '%s'

**Description**

Duplicate options are disallowed for this command option.

**What Next**

Provide a single entry for this option.

---

## CMD-113

(error) problem running user derived attribute command for %s attribute %s:\n \t%s

**Description**

Duplicate options are disallowed for this command option.

Feedback

**What Next**

Provide a single entry for this option.

---

## CMD-114

(severe) Command raised a C++ exception:\n %s

**Description**

A command raised a C++ exception. This is a tool bug and should be reported to Synopsys. This script will terminate execution and you may try to conintue by saving or attempting some other operation. Other issues are likely.

**What Next**

Report the issue to Synopsys.

---

## CMD-999

(severe) A Severe error has occurred during testing.

**Description**

A Severe error has occurred during testing. This should never happen in production.

---

# CMP

---

## CMP-009

(Warning) The custom clock mapping is found to be incomplete.

**Description**

The option is provided for custom clock mapping. However, it is found that the clock mapping is incomplete.

**What Next**

No action is needed if this is intentional. Otherwise, update the script for custom clock mapping.

---

## CMP-010

(Error) Conflicting clock mapping detected at '%s'; previous mapping for this clock defined at '%s'.

Feedback

**Description**

Conflicting entries are found in the custom clock mapping for the given clock. It is likely that you need to redefine a clock as a multi-source clock instead of as two different clocks.

**What Next**

Custom clock mapping for this clock will be discarded. Check your clocks and the mapping scripts.

---

## CMP-011

(waring) Duplicated clock mapping detected at '%s'; previous mapping for this clock defined at '%s'.

**Description**

Duplicate entries are found for same clock in the custom clock mapping for the given clock.

**What Next**

Consider removing the duplicated entry in the script.

---

# CNL

---

## CNL-0001

(Warning) Inconsistent clock network latency values on object_type object.

**Description**

The clock network latency values are inconsistent. Each min value should be smaller than the corresponding max value. By definition, min/max values are used for minimum/maximum operating conditions. It is inconsistent with the intent of having the different analysis modes to have the max clock network latency to be less than the min clock network latency. This could lead to incorrect delay calculation and analysis.

**ONE POSSIBLE SCENARIO**

Consider a scenario where the clock network latency is set on a clock *CLK* as follows:

set_clock_latency -rise -min 11 [get_clock CLK] set_clock_latency -fall -min 2 [get_clock CLK] set_clock_latency -rise -max 3 [get_clock CLK] set_clock_latency -fall -max 4 [get_clock CLK]

Feedback

The *-rise -min* value is larger than the *-rise-max* value which is inconsistent. It should be the smallest value. For this situation, the tool will issue a CNL_0001 rule violation.

**What Next**

The “Violation Details” section of the rule violation shows a table for the source latency values defined at the object. For the scenario described previously, the table reported is shown as follows:

*Min Max*

*Rise* 11.0000 2.0000

*Fall* 3.0000 4.0000

You can also view the related constraint definitions in the Constraint Browser by clicking on the links in the “Network latency specified at:” section of the “Violation Details.”

**FIX SUGGESTION**

Changing the constraints to have consistent min/max clock network latency values will fix this violation. For the example scenario, changing the -rise -min value to be less than the -rise -max value will fix the violation.

set_clock_latency -rise -min 1 [get_clock CLK]

---

## CNL-0002

(Warning) Input/output delays are defined relative to clock clock. This clock has incomplete network latency values required for those external delays even though its source ports/pins have more complete network latencies defined on them.

**Description**

Since the network latency values for the clock are incomplete, no network latency will be applied for paths with from/to points which have input or output delay relative to this clock. The network latency set on the clock sources is not applied on these paths. This could result in incorrect timing analysis. Network latency should be applied to the clock object.

Clock network latency values applied on a clock source pin or port will not be used when delays need to be calculated on paths that have ports with external delay settings on them.

Only latency values applied on clock objects are used for path delay calculations, and if these are not specified or are incomplete, zero values are assumed. This could affect both setup and hold timing calculations if it is assumed that the clock network latency values specified on the clock source pin/port will be used instead.

**ONE POSSIBLE SCENARIO**

Feedback

Consider a scenario, where a clock is defined on an input port:

create_clock -period 10 [get_ports CLK]

Clock network latencies are defined on both the clock object and the clock source port.

set_clock_latency -min 3 [get_clock CLK] set_clock_latency 4 [get_ports CLK]

An input delay is specified for a port relative to this clock:

set_input_delay 5 -clock CLK -add_delay [get_ports INPUT]

The input delay set on the INPUT port has been defined with respect to clock CLK, but since no network latency is defined on the clock object for the max condition, the clock network latency for maximum delay calculations will be zero. The network latency of 4 applied on the CLK port object will not be used. For this situation, a CNL_0002 rule violation is issued to warn the user that the clock network latency applied on the port object will not be used for clocks specified in external delay definitions.

The “Violation Details” section shows a table for the network latency values: one for the clock and one for its sources. For the scenario described above, the tables reported in the “Violation Details” section would be:

Network Latency Values on the Clock

*Min Max*

*Rise* 3.0000 --

*Fall* 3.0000 --

Network Latency Values on Source ‘CLK’

*Min Max*

*Rise* 4.0000 4.0000

*Fall* 4.0000 4.0000

You can also view the related constraint definitions in the Constraint Browser by clicking on the link in the “Network latency specified at:” section associated with each table in the “Violation Details.”

**FIX SUGGESTION**

Modify the constraints so that a complete set of clock network latency values is specified. For the example scenario, adding network latency for the clock object max condition as follows will fix the violation:

set_clock_latency -max 4 [get_clock CLK]

Feedback

If an incomplete network latency definition is the desired analysis for the from/to ports having external delays with respect to this clock, then no fix is required.

---

## CNL-0003

(Warning) Clock network latency is specified on object_type object, but that object is not in any clock network.

**Description**

Clock network latency should only be specified on clocks, pins, or ports in a clock network.

The clock network latency specified for an object that is not in a clock network will be ignored. This could affect both setup and hold timing of the design.

**What Next**

The “Violation Details” section provides a link with the file name and line number to the clock network latency specification.

This violation can be caused by a pin or port that may be part of a clock network, but another constraint is blocking the clock. Use the *potential_clocks* attribute to check if the pin or port could be in a clock network, but was blocked by the set_case_analysis or set_disable_timing command specification or some other constraint.

For the example scenario, the value of the potential_clocks attribute is as follows:

rtl_shell> get_attribute [get_pins inv/Z] potential_clocks {"clk"}

If the object is not in a potential clock network, then there may be an error in specifying the pin, or there is a missing clock definition. An error in the pin specification could be caused if the wrong pin is specified, or if a wildcard is used in the set_clock_latency command, and it returns more pins than expected.

**FIX SUGGESTION**

If the pin or port is in a potential clock network, check if the blockage is correct for this scenario. If it is correct, the violation can be waived or the set_clock_latency command can be altered to remove the object associated with the violation.

If the pin or port is not part of a clock network, the latency specification should be moved to other pins or ports that are part of the clock network so that it is not ignored.

---

## CNL-0004

(Warning) Clock network latency is specified on object_type object with respect to clock clock, but that object is not in the clock's network.

Feedback

### Description

Clock network latency should only be specified on pins or ports which are part of the specified clock network.

The clock network latency specified for an object that is not in a clock's network will be ignored. This could affect both setup and hold timing of the design.

### ONE POSSIBLE SCENARIO

Consider the scenario below where a design contains two clocks. The clock network latency specification is specified on pin *ff1/CP* with respect to clock *clk2* instead of *clk1*. Since the *ff1/CP* pin is not in the *clk2* network, this clock network latency specification is ignored, and the tool will issue a CNL_0004 rule violation.

create_clock -period 10 [get_clocks clk1] create_clock -period 10 [get_clocks clk2] set_clock_latency 1.3 [get_pins ff1/CP] -clock clk2

### What Next

The "Violation Details" section provides a link with the file name and line number to the clock network latency specification.

This violation can be due to an incorrect clock that is specified with the *set_clock_latency* command. Query the clocks attribute on the pin or port to determine which clocks reach the pin or port. If a different set of clocks reaches this pin or port than the one specified in the constraint, then check to see if one of those clocks should be defined in the clock network latency command.

For the example scenario, the clocks attribute can be queried as follows:

rtl_shell> get_attribute [get_pins ff1/CP] clocks {"clk1"}

If the contents of the clocks attribute are not the expected ones, then the clock of interest could potentially be blocked from reaching the pin or port. The potential_clocks attribute associated with the object will help determine which clocks could reach the pin or port. For the example scenario, the attribute can be queried as follows:

rtl_shell> get_attribute [get_pins ff1/CP] potential_clocks Warning: Attribute 'potential_clocks' does not exist on pin 'ff1/CP' (ATTR-3)

For the example scenario, the clock clk1 arrives at the ff1/CP pin, but there are no other potential clocks for that pin. Further debug can be completed as described below to identify if there are other potential clocks that exist on the object or if the expected clock is not in the clocks or potential_clocks attributes query. Resolution of the violation is discussed in the "Fix Suggestion" section below.

### FIX SUGGESTION

Feedback

Check to see if the clock name in the -clock option of the network latency is correctly specified. In the example scenario, the network latency needs to be specified relative to the clock clk1.

set_clock_latency 1.3 [get_pins ff1/CP] -clock clk1

If the pin or port is in a potential clock network, see whether the blockage is correct for this scenario. If it is correct, the violation can be waived, or the set_clock_latency command can be altered to remove the object associated with the violation.

---

## CNL-0005

(Warning) All register clock pins in the fanout of pin have no clock latency for clock clock.

**Description**

During pre-layout analysis, all clocks should have an ideal clock network latency.

In pre-layout designs, path delays are not finalized. The propagated clock network latency may not reflect the real latency from the placement, clock-tree synthesis, and routing stages. Missing a realistic latency at the register clock pins may lead to inaccurate timing results.

**ONE POSSIBLE SCENARIO**

Consider the scenario shown in Figure 1, where clock signals reach the register clock pin U2/CP.

If the following constraints are applied,

create_clock -period 10 [get_clocks clk1] create_clock -period 5 [get_clocks clk2] set_clock_latency -clock clk1 2.0 [get_pins U1/Z]

no clock network latency is defined at the register clock pin with respect to the clock clk2. This results in a CNL_0005 rule violation indicating that no clock latency has been defined for the fanout of port clk2.

**What Next**

The violation message reports the name of the clock and the pin where the ideal clock network latency can be set. In addition, the More Info section of the message lists up to 20 register clock pins affected by the missing clock network latency.

**FIX SUGGESTION**

Specify a realistic clock network latency value at the given pin or at the fanout of the pin with respect to the reported clock. For the scenario above, specify the clock network latency at the output of the multiplexer:

set_clock_latency -clock clk2 1.2 [get_pins U1/Z]

Feedback

# CORR

## CORR-001

(information) The reference %s version used for correlation check is '%s'.

**Description**

This information message advises you to use compatible image version for correlation checker.

# CSL

## CSL-0001

(Warning) Inconsistent source latency values on object_type object.

**Description**

The source latency values defined on the reported object are inconsistent. In order to correctly specify the latency on this object, each “early” value should be smaller than its corresponding “late” value and each “min” value should be smaller than its corresponding “max” value. By definition early/late and min/max values are used for minimum/maximum operating conditions. Having the late/max values being less than the early/min does not allow for proper analysis of the different operating corners of the design. If left as is, this could lead to incorrect delay calculation and analysis.

**ONE POSSIBLE SCENARIO**

Consider a scenario where the clock source latency is set on a clock port ‘CLK’ as follows:

set_clock_latency -source -early -rise -min 11 CLK set_clock_latency -source -early -fall -min 2 CLK set_clock_latency -source -early -rise -max 3 CLK set_clock_latency -source -early -fall -max 4 CLK

set_clock_latency -source -late -rise -min 6 CLK set_clock_latency -source -late -fall -min 7 CLK set_clock_latency -source -late -rise -max 8 CLK set_clock_latency -source -late -fall -max 9 CLK

The -early -min -rise value is larger than the other rise values. This is most likely not the expected behavior for this design and should be investigated. The combination of -early and -min should probably have the smallest latency here.

Constraint consistency will flag a CSL_0001 rule violation to bring the problem to your attention.

**What Next**

The Violation Detail section displays a table containing the various source latency values defined on the reported object. In the above scenario, this is what that table would look like:

*EARLY LATE*

*Min Rise* 11.0000 6.0000

Feedback

*Min Fall* 2.0000 7.0000

*Max Rise* 3.0000 8.0000

*Max Fall* 4.0000 9.0000

The various places in your SDC file where those values are defined are also reported in this section. One can easily find out from the table where the inconsistency is and then use the SDC hyperlinks to navigate to the exact SDC command where the latency is defined.

**FIX SUGGESTION**

Using realistic and consistent data for min/max and early/late latency values will address this problem.

In the preceding example scenario, changing the *-early -rise -min* value to be less than the other set of rise values would fix the problem.

set_clock_latency -source -early -rise -min 1 CLK

---

## CSL-0002

(Warning) Input or output delays are defined relative to clock clock. This clock has incomplete source latency values required for those external delays even though its source ports or pins have more complete source latencies defined on them.

**Description**

Some input and output delays are relative to a clock with incompletely specified source latency. Because of this, paths starting or ending at ports relative to this clock will not have source latency either. The source latency data specified on the clock source (for example the port where a clock is specified) will not be carried over to those paths. This could create incorrect timing results during static timing analysis.

Only latency values applied on clock objects are used for path delay calculations and if these are not specified or are incompletely specified, zero delay values are assumed. The clock source latency values applied on a clock source pin/port will not be used when delays need to be calculated on paths which have ports with external delay settings on them.

This could lead to optimistic delay calculations if the user assumed that the clock source (pin or port) latency values will be used in place of the clock object latency values.

**ONE POSSIBLE SCENARIO**

Consider the following scenario where a clock is defined on an input port

create_clock –period 10 CLK

Feedback

Clock source latencies are defined on both the clock object and the clock source port.

set_clock_latency –source –min 3 [get_clock CLK] set_clock_latency –source 4 [get_port CLK]

An input delay is specified to a port relative to this clock:

set_input_delay 4 –clock CLK –add IN

The input delay set on the *IN* port has been defined with respect to clock *CLK*, but since no source latency is defined on the clock object for the max condition, the clock source latency for maximum delay calculations will be zero. The source latency applied on the port object CLK (with a value of 4) will not be used in place of the clock object source latency here.

Constraint consistency will flag a CSL_0002 violation in this case to notify you that incomplete or missing latency values on a clock object could be problematic.

**What Next**

The “Violation Detail” section displays a table containing the source latency values both for the clock and its sources. In the preceding scenario, the table would look like this:

Source Latency Values on the Clock

*EARLY LATE*

*Min Rise* 3.0000 3.0000

*Min Fall* 3.0000 3.0000

*Max Rise* -- --

*Max Fall* -- --

Source Latency Values on Source ‘CLK’

*EARLY LATE*

*Min Rise* 4.0000 4.0000

*Min Fall* 4.0000 4.0000

*Max Rise* 4.0000 4.0000

*Max Fall* 4.0000 4.0000

**FIX SUGGESTION**

It is recommended that clock latency be completely defined. This would help STA tools computing accurate timing reports.

Feedback

In the example scenario presented above, one easy fix would be to add a -max latency value on the clock object as seen below:

set_clock_latency -source –max 4 [get_clock CLK]

SH "SEE ALSO" set_clock_latency set_input_delay set_output_delay

---

## CSL-0003

(Warning) Clock source latency is specified on object_type object, but that object is not a clock source.

**DSECRIPTION**

Source latency should only be specified on clocks or on clock source pins or ports.

Even though the set_clock_latency command itself does not allow latency values to be set on a non clock source pin or port, if a clock is removed or redefined to a new location, its latency values still persist at the outdated clock source pin or port. This is usually not the designer’s intention when moving clocks.

When a clock is redefined to another clock source in the design, the clock latency values set on its original clock source (pin or port) do not get copied over to the new source location. The clock source latency is ignored and has no value.

This is a situation which frequently arises when as a result of merging different constraint scripts together.

**ONE POSSIBLE SCENARIO**

Consider the following scenario where you move a clock from source port CLK to source port CL. In the original clock definition, a source latency value is specified for the clock.

create_clock -period 10 -name clk1 [get_port CLK] set_clock_latency -source -max 3 [get_port CLK]

One can report the current clocks and latency values specified in the design using the report_clock and report_clock-skew commands. Here are the current values:

rtl_shell> report_clocks

Clock Period Waveform Attrs Sources
---------- clk1 10.00 {0 5} {CLK}

You can see in the report above that the clock “clk1” is defined on port “CLK”.

rtl_shell> report_clocks -skew

Min Condition Source Latency Max Condition Source Latency
---------- Object

Feedback

Early_r Early_f Late_r Late_f Early_r Early_f Late_r Late_f Rel_clk
---------- CLK 3.00 3.00 3.00 3.00 - - - - --

You can see from the report above that clock source latency values exist on port “CLK”, which is also the source of clock “clk1”. Now if one moves the clock “clk1” definition to a different port, using the command below, the clock latency data will not be moved along.

create_clock -period 10 -name clk1 [get_port CL]

rtl_shell> report_clock

Clock Period Waveform Attrs Sources ---------- clk1 10.00 {0 5} {CL}

The source of clock “clk1” has been move from port “CLK” to pot “CL”.

rtl_shell> report_clock -skew

Min Condition Source Latency Max Condition Source Latency
---
Object Early_r Early_f Late_r Late_f Early_r Early_f Late_r Late_f Rel_clk
---------- CLK 3.00 3.00 3.00 3.00 - - - - --

From the preceding report, however, the clock latency is still specified on port “CLK”. No new latency values are available on port “CL”.

**What Next**

The designer should examine the script and make sure the clock redefinition was intentional. If this is the case, any latency specification should also be manually transferred to the new clock source and the old latency values should be removed.

**FIX SUGGESTION**

Remove unnecessary latency values and reapply the old values to the new clock source.

In the preceding example scenario, adding the source latency at port ‘CL’ addresses the problem.

set_clock_latency -source -max 3 [get_clock CL]

In order to remove the violation, the unnecessary clock source latency value (which was specified on port CLK) should be removed. For the example scenario the command would look like this:

remove_clock_latency -source [get_port CLK]

Feedback

## CSL-0004

(Warning) Generated clock clock master clock master_clock is not propagated and has zero or incomplete source latency values.

### Description

The reported clock's master is not propagated. It is expected that realistic source latency values be provided to represent the delay to the clock source. Constraint consistency could not find those latency values. Since no source latency values are specified, timing analysis tools will assume a zero delay value. This might result in incorrect timing analysis.

### ONE POSSIBLE SCENARIO

Consider a scenario where a generated clock gen_clock is defined with respect to a master_clock.

create_clock -period 10 master_clock create_generated_clock -name gen_clock \ -source master_clock gen/Q -divide_by 2

If the master_clock is defined as ideal and not propagated, the generated clock *gen_clock* will have zero source latency values. Constraint consistency flags a CSL_0004 in such a case to warn you that there are potentially missing latency data on those clocks.

### What Next

The "Violation Details" section reports whether the clock latency values are undefined, have a value of zero, or are incomplete.

### FIX SUGGESTION

There are two different possible ways to address this issue depending on the situation. For the example scenario described above, here are the two different approaches to solve this problem:

The master clock was supposed to be propagated but somehow the command was never issued. In this case, propagating the clock will address the issue and the generated clock will inherit the proper latency values.

set_propagated_clock master_clock

The master clock is ideal. In this case, some realistic latency values should be provided in order to ensure correct timing analysis.

set_clock_latency -source 3 [get_clock gen_clock]

Feedback

## CSL-0005

(Warning) Generated clock clock has source latency values less than that of master clock master_clock when the clock edge relationships are considered.

### Description

The source latency of a generated clock is automatically computed when all the various clocks in the design are propagated. When you specify the source latency values for the generated clock, those values should be larger than the source latency of the corresponding master clock. The latency is created by taking into account the edge relationship between the master and the generated clocks.

A generated clock source is further away from the master clock source and therefore has more latency than its master clock. Specifying smaller source latency values than the master clock leads to overly optimistic results.

### ONE POSSIBLE SCENARIO

Consider a scenario where a generated clock ‘gen_clock’ is defined with respect to a master_clock. The generated clock has a divide_by 2 relationship with respect to its master without sense inversion.

create_clock -period 10 -name master_clock create_generated_clock -name gen_clock -source master_clock gen/Q -divide_by 2

Clock source latencies are manually defined as follows for both the master clock and its related generated clock:

set_clock_latency -source -rise 4 [get_clocks master_clock] set_clock_latency -source -fall 1 [get_clocks master_clock] set_clock_latency -source -rise 2 [get_clocks gen_clock] set_clock_latency -source -fall 2 [get_clocks gen_clock]

When looking at the edge relationship between the master clock and its related generated clock, as shown in the following figure, you can see the rising edges of the master clock triggers both the rising and the falling edges of the generated clock.

As consequence, on the generated clock side, the latency (for both rise and fall) should be at least as large as the “rising edge” latency of the master (four in the preceding figure). If the latency values for the generated clock are less, a CSL_0005 violation is issued.

### What Next

The “Violation Details” section reports the various latency data in a table for both the master and the generated clocks.

Master Clock Source Latency

*EARLY LATE*

Feedback

*Min Rise* 4.0000 4.0000

*Min Fall* 1.0000 1.0000

*Max Rise* 4.0000 4.0000

*Max Fall* 1.0000 1.0000

Generate Clock Source Latency

*EARLY LATE*

*Min Rise* 2.0000 2.0000

*Min Fall* 2.0000 2.0000

*Max Rise* 2.0000 2.0000

*Max Fall* 2.0000 2.0000

**FIX SUGGESTION**

To achieve the correct source latency for the generated clock the edge relationships between both the master and the generated clocks should be considered.

In the preceding example, the source latency computation for the generated clock is at least four units (the master clock latency) for both the rise and fall data. In general, the source latency computation of the generated clock is the total of the master clock source latency and any latency between the master clock and the generated clock source; this includes all gates within the path. As an example, the following value would solve the CSL_0005 rule violation:

set_clock_latency -source -rise 5 [get_clock gen_clock] set_clock_latency -source -fall 5 [get_clock gen_clock]

---

## CSL-0006

(Warning) Clock source latency is specified on object_type object with respect to clock clock, but that object is not in the clock's network.

**Description**

The source latency specification is incorrect, the port or pin reported using in the set_clock_latency command is not part of the clock network specified through the -clock option.

If the referenced object is a valid clock source, the CSL_0006 rule verifies that the source latency is specified on an object belonging to the clock network of -clock.

For constraint consistency, the set_clock_latency command generates a UIC-002 error message if the referenced object is not a proper clock source.

Feedback

Since the object where the source latency is specified does not belong to the related clock network, the source latency value will be ignored. This could result in incorrect clock network delay calculations and overly optimistic results.

**ONE POSSIBLE SCENARIO**

Consider a scenario shown in Figure 1, with two different clock networks CLK1 and CLK2. Each of those clock networks originates respectively from ports PORT_CLK1 and PORT_CLK2.

create_clock -period 10 [get_ports PORT_CLK1] -name CLK1 create_clock -period 10 [get_ports PORT_CLK2] -name CLK2 set_clock_latency 2 -source [get_ports PORT_CLK1] -clock CLK2

The set_clock_latency command specifies the source latency for clock network CLK2 at port CLK1. Since CLK1 is not in the clock network CLK2, this latency will be ignored. A CSL_0006 violation is issued as a warning.

**What Next**

The “Violation Details” section reports the file name and the line number where the set_clock_latency command was issued.

**FIX SUGGESTION**

The source latency specification needs to be revised so the clock and its relative clock source match.

In the preceding scenario, if the requirement is to set the clock latency on the port PORT_CLK1 with respect to the clock CLK1, the revised specification would be:

set_clock_latency -source 5 [get_ports PORT_CLK1] -clock CLK1

---

## CSL-0007

(Warning) Source latency defined on pin/port pin_port will overwrite the clock source latency for clock clock.

**Description**

The clock source latency should be specified on either the clock or the clock definition point, but not both at one time. Doing so results in overwriting the clock source latency of the clock and could create incorrect timing results during static timing analysis.

Since the source latency value is changed, it can potentially lead to unexpected and incorrect analysis results, if ignored.

**ONE POSSIBLE SCENARIO**

Feedback

Consider the following scenario where a clock is defined on an input port:

create_clock -name clk1 -period 10 -waveform { 0 5 } [get_ports {clkp}]

A clock source latency is defined on the clock object:

set_clock_latency -source -min 55 -dynamic 11 [get_clocks {clk1}]

set_clock_latency -source -max 55 -dynamic 11 [get_clocks {clk1}]

A clock source latency is also defined on the clock definition point of clk1:

set_clock_latency -source -clock clk1 1000 [get_ports clkp] -early

set_clock_latency -source -clock clk1 2000 [get_ports clkp] -late

This clock source latency on the clkp port will overwrite the source latency of clk1. PrimeTime constraint consistency flags a CSL_0007 in such a case to warn the designer that the source latency of the clock object has been changed so that any unexpected results can be avoided.

**What Next**

The “Violation Details” section displays the clock for which the source latency has been overwritten, along with the clock definition.

**FIX SUGGESTION**

You should check the source latencies applied on the clock definition point and remove the incorrect ones.

In the example scenario presented previously, one easy fix is to remove the source latency applied on the port clkp as follows:

remove_clock_latency -source -clock clk1 [get_ports {clkp}]

# CSTR

## CSTR-001

(warning) The %s analysis mode is not supported; using on_chip_variation\nanalysis mode instead.

**Description**

The bc_wc or single analysis modes are not supported in this tool.

Feedback

**What Next**

Ensure your scripts are written using modes and corners appropriate for on-chip-variation analysis.

---

## CSTR-002

(error) Mode '%s' already exists.

**Description**

The mode has already been created. Each mode must have a unique name.

**What Next**

Use a different name for each mode.

---

## CSTR-003

(warning) The -clock option cannot be specified for clock '%s'. Ignoring option for this clock.

**Description**

This option exists to specify clock objects to be associated with the network latency that is placed on pin/port objects. So providing this option with clock already in the object_list is irrelevant and the execution of the command proceeds as if -clock was not given.

**What Next**

Check if the -clock option is redundant or incorrect.

---

## CSTR-004

(error) '%s' and '%s' are already defined as '%s' not allowing paths.

**Description**

You receive this error message because the -allow_paths defined by asynchronous clock groups is conflict with false path set by either the asynchronous, physically exclusive or logically exclusive clock groups for the same clock pair.

**What Next**

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

Feedback

**See Also**

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-005

(error) '%s' and '%s' are already defined as -allow_paths in asynchronous clock groups.

**Description**

You receive this error message because the clock pair is already defined as asynchronous clock relationships which allow paths between these two clocks.

**What Next**

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

**See Also**

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-006

(warning) '%s' %s existing false paths.

**Description**

The set_clock_groups command won't analyze the paths between exclusive and asynchronous clocks. Previous manually defined false paths between these exclusive and asynchronous clocks will be removed by set_clock_groups during remove_clock_groups command.

**See Also**

- set_clock_groups
- remove_clock_groups

Feedback

- report_exceptions
- set_false_path

## CSTR-007

(Information) From and to clocks are exclusive or asynchronous clocks.

**Description**

The set_clock_groups command won't analyze the paths between exclusive and asynchronous clocks. Therefore, the set_false_path between these exclusive or asynchronous clocks is a redundant command.

**What Next**

Use the remove_clock_groups command to remove existing clock groups. Use the report_exceptions command to see the existing false paths.

**See Also**

- reset_path
- remove_clock_groups
- report_exceptions
- set_false_path

## CSTR-008

(warning) Attempting to remove a clock gating check that was not previously set.

**Description**

Removal of clock gating check on an object is valid only if a clock gating check was set before on that object.

**What Next**

This command will be ignored. Please check the spelling of the object for the *remove_clock_gating_check* command.

## CSTR-009

(error) Cannot remove internal path group '%s'.

Feedback

**Description**

You cannot use *remove_path_group* to remove internal path groups (such as the default group).

**What Next**

Reenter the command without the internal path group name.

---

## CSTR-010

(warning) Path group '%s' has no paths; it will not affect optimization.

**Description**

The *group_path* command can be used to create or modify path groups. You can use *group_path -name clock -weight 5* to change the weight of an existing group. This warning is to let you know when you have created a path group that has no paths. This path group will not affect optimization unless paths are added to it by additional *group_path* commands.

**What Next**

You should use *group_path -name clock -to clock* if you wish to include all paths to object "clock" in the path group. Use *report_path_group* to see the path groups that are currently defined.

---

## CSTR-011

(warning) The '%s' command is not supported in this program. The command will be ignored.

**Description**

The command is not supported in this program. The command will be ignored.

**What Next**

Check if the program version is correct.

---

## CSTR-012

(Error) Cannot specify -clock_path or -data_path with objects other than clocks.

**Description**

The command options, -clock_path and -data_path, are provided only for clock objects. These option are not allowed with other object types.

Feedback

**What Next**

Check if the objects passed to the command are clock objects.

---

## CSTR-013

(warning) Removed %s '%s' had a constraint. The constraint is no longer applied.

**Description**

The given database object was removed, but it had a constraint that referred to it. The constraint for the object has now been removed.

**What Next**

If your object was subsequently replaced, you may want to consider reapplying your constraint.

If many constraints were removed and your constraints were from an sdc or tcl file, you can reapply all of constraints by using: "reset_design" followed by resourcing your constraints.

---

## CSTR-014

(error) Cell '%s' has no %s port named '%s'. Pin '%s' cannot be set the same.

**Description**

In order to set the the budget for to pins to be the same, those pins must have the same direction and must be pins of the same hierarchical cell in the netlist. The port you named cannot be found on the cell you have named.

**What Next**

Perhaps the port is the wrong direction, or perhaps you used the full hierarchical pin name instead of the simple port name. The syntax is:

set_budget_pin_options -same_as_pin IN[0] U1/U2/U3/IN[*]

---

## CSTR-015

(error) Corner '%s' already exists.

**Description**

The corner has already been created. Each corner must have a unique name.

Feedback

**What Next**

Use a different name for each corner.

---

## CSTR-016

(error) Scenario '%s' already exists.

**Description**

The scenario has already been created. Each scenario must have a unique name.

**What Next**

Use a different name for each scenario. Note that scenarios without a user-given name are auto-named, and it is possible for a user-given name to be the same as the auto-generated name of a different scenario.

---

## CSTR-017

(information) Full design constraints for the block %s need to be read when changed from a more abstracted view to a less abstracted view.

**Description**

When switching from a more abstracted view to a less abstracted view, timing constraints are not automatically filled in for the core of the block. Only constraints which cross the boundary are guaranteed to be preserved. For example, if you initially had a abstract view, the abstract holds no constraints for the core of a block. When you switch to a design view, it will be necessary to fill in constraints for the core.

**What Next**

Reread your block constraints from a previouly saved SDC file.

---

## CSTR-018

(information) The set_clock_balance_points constraint on block output port %s is not promoted.

**Description**

The 'promote_constraints -cts' command will not promote set_clock_balance_points constraints on output block ports. Such constraints are usually used to allow block-level CTS in the presence of clock outputs. They should not be necessary at the toplevel.

Feedback

**What Next**

If the promotion of the constraint is really required, it needs to be re-applied manually while the toplevel design is current.

---

## CSTR-019

(warning) Removed %s '%s' is the last one of one path exception's -from/-through/-to set. Removing it will cause the whole path exception being dropped.

**Description**

The given database object is removed, but it is the last object in one path exception's -from/-through/-to set, so removing this object will cause the whole path exception being dropped. The path exception including set_min/max_delay, set_false_path, set_multicycle_path, set_path_margin, and group_path.

**What Next**

If your object is subsequently replaced, you may want to re-apply your constraint.

If many constraints are removed and the constraints are from an sdc or tcl file, you can re-apply all of constraints by using "reset_design", followed by sourcing the constraints.

---

## CSTR-020

(information) '%u' cells set to '%s'.

**Description**

The given number of cells have had their size_only or dont_touch status set or cleared.

---

## CSTR-021

(warning) set_load on nets is not supported.

**Description**

For script compatibility the *set_load* command will accept nets, but the command will have no effect.

---

## CSTR-022

(warning) The -library option of set_driving_cell is not supported.

Feedback

### Description

The *-library* option of the *set_driving_cell* command is not supported. Driving_cell references will be resolved using the same *ref_libs* mechanism used for linking the design. The library name given by the *-library* option will be stored and written out by *report_port*, *write_script*, and *write_sdc*, but it will have no other effect on the tool operation.

### See Also

- set_driving_cell
- report_port

---

## CSTR-025

(error) There is already a scenario for mode %s and corner %s.

### Description

A scenario already exists for this mode and corner. There can be only one scenario for any mode-corner pair.

### What Next

Identify the existing scenario for this mode and corner, and either use it, or delete it and re-create a new one.

---

## CSTR-026

(warning) Scenario %s has no analysis types to activate.

### Description

The set_scenario_status command has been given the "-active true" option, which is meant to enable the actual setup, hold, power, and DRC analysis settings. However, none of these settings are turned on, and thus the "-active true" option will have no immediate effect.

### What Next

Turn on some of the actual analysis settings, with the -setup, -hold, etc. options.

---

## CSTR-027

(warning) Scenario %s is inactive, so the specified analysis will not actually be performed.

Feedback

**Description**

The set_scenario_status command has turned on one of the setup, hold, power, or DRC analysis settings. However, the scenario is not marked as active, and thus no analysis will be done for it.

**What Next**

Make the scenario active with the "-active true" option.

---

## CSTR-028

(warning) Constraint on clock was not %s for following scenario(s): %s

**Description**

The command was passed list of scenarios or modes but no clock object specified for the one or more scenarios. This warning is generated if a scenario, default or specified using -modes/-scenarios options, has no clock objects specified. This can happend if a clock object from mode1 is specified with no other clocks in set_max_capacitance/ set_max_transition and remove_max_transition/remove_max_capacitance commands and passed with scenarios of mode1 and mode2. The warning will report all scenarios of mode2 for which constraint was not set.

For example, consider 2 scenarios s1 and s2 with modes m1 and m2 and corners c1 and c2, respectively. Following will generate this warning message for scenario s2 because no clock object from mode m2 was specified.

all_scenarios

{s1 s2}

current_scenario s1 // <-- current_mode is m1

set_max_transition 1 [get_clocks *] -scenarios [all_scenarios]

*get_clocks* will return clocks from mode m1 only and there is no constraint set in scenario s2 for any clock from mode m2.

**What Next**

Make sure the scenarios specified are related to the modes of the clock objects passed.

---

## CSTR-029

(warning) %s -comment has newline and/or '#' and is replaced by ' '.

Feedback

### Description

The specified constraint command -comment line has either newline and/or '#' which is illegal and is replaced by white space ' '.

### What Next

The illegal characters is replaced automatically by white spaces ' '

---

## CSTR-030

(error) Operating condition of name %s not found in any library.

### Description

The given operating condition does not exist in any reference library.

### What Next

Use the *report_lib* command with each reference library to determine the correct operating condition name.

### See Also

- report_lib

---

## CSTR-031

(error) Found multiple versions of the %s operating condition in the %s reference library.

### Description

The specified reference library contains multiple versions of the specified operating condition. This can happen when a reference library is built from multiple logic libraries, and two or more of them have an operating condition with the same name.

### What Next

Use the *-lib* option to specify one of the logic libraries that was used to build the reference library. Use the *report_lib* command to understand what operating conditions the reference library contains.

### See Also

- report_lib

Feedback

## CSTR-032

(error) Multiple versions of operating condition %s found among the design's reference libraries.

### Description

Multiple versions of the given operating condition exist among the reference libraries of the design.

### What Next

Use the *-lib* option to specify a particular library or a particular .db file that was used to build the libraries. Use the *report_lib* command with the reference libraries to understand what operating conditions they contain.

### See Also

- report_lib

## CSTR-033

(error) %s is not the name of any library, and does not match any .db file used to build any library.

### Description

The given name does not identify any reference library, and it also does not identify any .db file used to build any library.

### What Next

Use the *get_libs* command to determine which reference libraries are loaded. Use the *report_lib* command to determine which .db files were used to build each reference library.

### See Also

- get_libs
- report_lib

## CSTR-034

(warning) Multiple references to .db library %s found among the design's reference libraries.

Feedback

### Description

The given .db library has apparently been used to build more than one of the design's reference libraries, and multiple copies of its operating conditions have been found.

### What Next

Use the *report_lib* command on all reference libraries to understand what .db files they were built from, and what operating conditions they contain.

### See Also

- report_lib

---

## CSTR-035

(error) Cannot specify -db with objects other than lib_pins.

### Description

The option,-db, is used to specify .db library or file name for lib_pin objects. This error is generated when it is used with objects other than lib_pins.

### What Next

Check the object list and remove objects that are not lib_pins.

### See Also

- set_max_transition
- set_max_capacitance
- set_min_capacitance
- report_lib

---

## CSTR-036

(error) Specified .db library %s not found for the lib_pin.

### Description

The given .db library was not found in library pane for the lib_pin.

### What Next

Use the *report_lib* command on reference libraries to understand what .db files were used.

Feedback

### See Also

- report_lib
- set_max_transition
- set_max_capacitance

---

## CSTR-037

(error) The .db library name %s matches multiple libraries. Please specify unique .db library name.

### Description

The given .db library name doesn't specify a unique .db library file name. The command expects a unique .db name. If multiple .db libraries have same local names then use full path name of the .db file.

### What Next

Use the *report_lib* command on relevent reference libraries to understand what .db files they were built from and what pvt and pane they contribute to.

### See Also

- report_lib
- set_max_transition
- set_max_capacitance
- set_min_capacitance

---

## CSTR-038

(information) Automatically promoting voltage %.2f for supply net '%s' in corner %s from the block constraints of '%s'.

### Description

The given supply net corresponds to a voltage region that is isolated from the top level. And there is no set_voltage command in the top-level constraints that assigns a voltage for the region.

The same net was assigned a voltage in the block-level constraints. That value will be used for top-level timing and optimization.

Feedback

### What Next

If you wish to use a different voltage value, you should assign the voltage directly in the top-level constraints.

### See Also

- set_voltage

---

## CSTR-039

(warning) Process label %s is not used by the reference library %s.

### Description

The given process label is not used by the given library, so specifying it will have no effect.

### What Next

Use the *report_lib* command with the reference library to determine which process labels it uses.

### See Also

- report_lib

---

## CSTR-040

(warning) Process label %s is not used by any reference library.

### Description

The given process label is not used by any library, so specifying it will have no effect.

### What Next

Use the *report_lib* command with the design's reference libraries to determine which process labels they use.

### See Also

- report_lib

---

## CSTR-041

(error) Process labels may not contain embedded whitespace.

Feedback

### Description

The given process label contains embedded whitespace, which is not allowed.

### What Next

Use the *report_lib* command with the design's reference libraries to determine which process labels they use.

### See Also

- set_process_label

---

## CSTR-042

(error) %s may not contain embedded whitespace.

### Description

The given identifier contains embedded whitespace, which is not allowed.

### What Next

Ensure that identifiers such as object names are a single word, without any embedded spaces, tabs, or newlines.

---

## CSTR-050

(warning) Cannot set %s on hierarchical pin, '%s'.

### Description

THis warning message is generated when a hierarchial pin is passed to set_max_transition or set_max_capacitance commands. The commands support constraints only on leaf pins. Hierarchical pins are ignored with this warning. This usually happens when a collection of pins, with a mix of leaf and hierarchical pins, is passed to the commands.

### What Next

User can just ignore the warning message or filter out all the hierarchical pins from the collection passed to the comamand for clean log file.

### See Also

- set_max_transition
- set_max_capacitance

Feedback

## CSTR-051

(Error) Can't find valid HyperScale context data under given path: %s

**Description**

The HyperScale context data can't be found in the path given -to *read_hyperscale_context*, with *-path* option.

With a HyperScale directory generated by PrimeTime, you can specify the top directory, or TOP/CONTEXT, or TOP/CONTEXT/BLOCK_NAME, or TOP/CONTEXT/BLOCK_NAME/HyperScale_Default.

**What Next**

Make sure the given path for HyperScale context is correct.

## CSTR-052

(Information) The mode '%s' has been loaded with other scenarios, skipping the mode data loading for scenario '%s'.

**Description**

The HyperScale context has already been loaded for the mode, with some other scenarios. In MCMM with HyperScale, we expect the HyperScale contexts have exact same mode related data for the scenarios of the same mode. So the mode data is loaded only once for the first HyperScale scenario context of that mode, and loading is skipped for following scenarios.

**What Next**

No action needed.

## CSTR-053

(Warning) In mode '%s', HyperScale clock '%s' can't be found in block level SDC.

**Description**

When HyperScale timing context is generated, the clock name used in the timing context will be the top level clock name, which could be different from the name used in the block level implementation (usually constraints generated by budgeting tool).

**What Next**

To correct this, before *update_timing*, use *set_clock_map* to provide a name mapping between top and block level clocks, so tool can resolve the clock names correctly.

Feedback

## CSTR-054

(Warning) In mode %s, clock (%s)'s properties are different in different HyperScale timing contexts for the same mode.

**Description**

The HyperScale timing contexts carries mode specific information like clock definitions. When multiple scenarios of the same mode have HyperScale timing context loaded with *read_hyperscale_context*, we expect the mode related information from those timing contexts to be consistent.

**What Next**

To correct this, make sure when the scenario timing contexts is generated in PrimeTime, they are actually using constraints from same mode.

## CSTR-055

(Information) HyperScale context exists for scenario '%s', will be overwritten.

**Description**

The given scenario already has HyperScale context loaded. This *read_hyperscale_context* will overwrite existing context.

**What Next**

No action needed.

## CSTR-056

(Warning) ignore *set_dont_override* on the virtual clock: '%s'.

**Description**

The virtual clock is not modeled in HyperScale. We can't apply option *setDontOverride* on virtual clocks.

**What Next**

No action needed.

## CSTR-057

(Warning) In mode %s, clock (%s)'s properties are different from those captured in HyperScale timing contexts.

Feedback

### Description

The HyperScale timing contexts carries mode specific information like clock definitions. There is mismatch between the SDC clock definition and HyperScale timing context.

### What Next

To correct this, make sure when the scenario timing contexts is generated in PrimeTime, they are actually using constraints from same mode. You can also modify SDC clock definition to make them consistent.

### See Also

- create_clock
- create_generated_clock

---

## CSTR-058

(Information) No HyperScale context exists for scenario %s.

### Description

The given scenario doesn't have HyperScale context loaded so nothing is removed with this *remove_hyperscale_context*.

HyperScale context can be loaded with *read_hyperscale_context*.

### What Next

No action needed.

---

## CSTR-059

(Warning) '%s' has inconsistent mode data in scenario '%s'.

### Description

In MCMM HyperScale, it's expected that the HyperScale contexts for different scenarios should have exact the same mode specific information, like clock, exception, disable timing, case value, etc.

The warning message indicate that for the mentioned pin or clock, inconsistent mode data is detected in the mentioned scenario, compared with the scenario of the same mode which is previously loaded.

Feedback

**What Next**

Check HyperScale contexts for the scenarios of the same mode, make sure they have same mode-specific settings.

---

## CSTR-060

(Information) In mode '%s', HyperScale clock '%s' is mapped to block level SDC clock '%s', based on '%s'.

**Description**

When HyperScale timing context is generated, the clock used in the timing context will be the top level clock, it's mapped to block level SDC clock during block level timing analysis, either based on *set_clock_map* or auto matching based on clock properties like period, waveform, source pins, propagated status, etc.

**What Next**

This is informative, no actions needed.

---

## CSTR-061

(Information) HyperScale data for mode '%s' is cleared after set_clock_map.

**Description**

The clock mapping between HyperScale top-level clock and SDC block-level clock will change the clock resolution in HyperScale data loading, so the loaded HyperScale data is cleared and needs to be reloaded.

**What Next**

No action needed.

---

## CSTR-062

(Warning) In mode '%s', HyperScale exception is dropped because it's invalid in block level.

**Description**

If the objects (clock or netlist objects) referred by the HyperScale exception captured in top-level are missing, exceptions could become invalid and will be dropped.

Feedback

**What Next**

Ensure that the netlist and constraints are consistent between HyperScale generation and block level, especially clock definition. *set_clock_map* would be needed to resolve missing matching clock objects.

---

## CSTR-063

(Error) Can't find top-level clock named '%s' in loaded HyperScale context for mode '%s'.

**Description**

The given top-level clock name in *set_clock_map* can't be found in the HyperScale context.

**What Next**

Make sure the name is correctly specified.

---

## CSTR-064

(Information) In mode '%s', SDC clock '%s' is mapped to top level HyperScale clock '%s', based on '%s'.

**Description**

When HyperScale timing context is generated, the clock used in the timing context will be the top level clock, it's mapped to block level SDC clock during block level timing analysis, either based on *set_clock_map* or auto matching based on clock properties like period, waveform, source pins, propagated status, etc.

**What Next**

This is informative, no actions needed.

---

## CSTR-065

(Error) Ignore user set clock mapping for clock '%s' in mode '%s', because the top level clock '%s' doesn't exist in context.

**Description**

This message is issued when HyperScale context is loaded, so that the user set clock mapping can be checked to see whether the clocks exist in the context. If not, the clock map setting for that clcok will be ignored.

Feedback

### What Next

Check the clock name used in *set_clock_map -parent_clock parent_clock_name*, make sure the clock does exist in the context.

---

## CSTR-066

(warning) No corresponding clock for top-level clock '%s' in mode '%s' with period %s and waveform %s.

### Description

In HyperScale analysis, clocks from block level have to be mapped to clocks defined at top level in order to properly interpret the timing data and constraints. If this mapping fails for any clock, the warning is issued.

### What Next

To see the details of failed clock mapping, please use *report_clock -map*. To specify correct clock mapping, use *set_clock_map*.

### See Also

- report_clock

---

## CSTR-068

(Information) HyperScale data for %s '%s' is cleared.

### Description

When HyperScale related settings are changed, the loaded HyperScale data is cleared, next timing update will reload those data if needed.

### What Next

No action needed.

---

## CSTR-069

(Warning) %s context data at port '%s' for pin '%s' because it is missing or not on the same net.

### Description

This message is issued during context override at the HyperScale block level analysis, where there is a netlist mismatch found on the port net between current block design and

Feedback

HyperScale top level context data. A best-effort context override will be applied to the related port.

**What Next**

No action required. To ensure accurate context override, please use consistent block and top netlist.

---

## CSTR-070

(Warning) The pin '%s' is no longer connected to port '%s'. Its context value will be applied to pin '%s' instead.

**Description**

At block, ECO fixing (such as buffer insertion and removal) on I/O ports can sometimes cause the pin that context was initially captured on to no longer exist. In this case, the context value will be applied on the new load pin of the port as informed in the warning message.

**What Next**

Check whether the netlist change is intended.

---

## CSTR-071

(Warning) Ignore context data at port '%s' because it's missing.

**Description**

This message is issued during context override at the HyperScale block level analysis, where there is a netlist mismatch found on the port net between current block design and HyperScale top level context data. The context data is ignored because the port can't be found.

**What Next**

No action required. To ensure accurate context override, please use consistent block and top netlist.

---

## CSTR-072

(Warning) Netlist object (pin/port) '%s' referred in HyperScale context is not in the design.

**Description**

The given object was in the design at the time the HyperScale context was captured, but the object is gone now. The constraint refering to the object will be dropped.

Feedback

If the object is no longer important, then your constraints are OK.

**What Next**

If needed, regenerate the HyperScale context with consistent netlist.

---

## CSTR-081

(warning) Missing or unusable driving_cell '%s'.

**Description**

The specified library cell could not be found, or is not suitable for use as a driving_cell. This may happen if no library in the ref_lib list contains the cell, if the specified output or input pins do not exist, if no pins were specified and the cell has multiple output pins, or if no suitable cell arcs exist to provide the drive capability.

**What Next**

If the driving cell requires a library that has not been loaded and included in the ref_lib list, the ref_lib list should be changed with *set_ref_libs* to include that library. Otherwise, check the command options for errors in cell name or pin names.

---

## CSTR-100

(warning) Propagated clock %s is written as ideal and source %s as propagated causing another clock %s to become propagated in scripts.

**Description**

This warning is generated by write_sdc and write_script for formats that cannot support io path latency for propagated clocks. In such cases, propagated clocks are written out as ideal and their sources as propagated.

To generate timing comparable script for io paths, the clock sources are generated as propgated and the clocks are generated as ideal. But, when a propagated clock source is also a source for another ideal clock then the tools can not be compared without first changing the ideal clock to propagated.

**What Next**

The generated script can be used to compare timing for clocks only after the reported ideal clock is converted to propagated in this tool.

Alternatively, convert all the clocks from the reported source to propagated or all the clocks to ideal and re-generate the scripts.

Feedback

## CSTR-101

(warning) Ideal clock %s has zero network latency but non-zero io path latency.

**Description**

This warning is generated by write_sdc and write_script when the tool generates network latency for io paths only. In general, network latency is same as io path network latency for ideal clocks but remove_propagated_clock on a propagted clock can change a clock to ideal with zero network latency and non-zero io path latency. To generate timing comparable script for io paths, the clock or the sources should be changed to propgated.

**What Next**

The generated script can be used to compare timing only after the reported ideal clock is converted to propagated or the clock sources made propagated in this tool. For other tools, the clock sources should be made propagated.

Alternatively, convert the reported clock or the clock sources to propagated in this tool and generate the scripts again. If the intent is to use the clock as ideal then set network latency for the clock using set_clock_latency command and re-generate the scripts.

## CSTR-102

(Error) Failed to create physical context, '%s.'

**Description**

Command failed to create design physical context. Check if the object already exist or incomplete command arguments specified.

**What Next**

If you want to modify the existing physical context then remove and recreate.

## CSTR-103

(Error) Can't find physical context, '%s.'

**Description**

Command failed because no pysical context was found by name in the design. Use report command to find existing design physical contexts.

**What Next**

Correct physical context name or use different command option.

Feedback

## CSTR-104

(Error) Physical context '%s' exists for process label '%s.'

### Description

This error is generated when trying to create multiple physical contexts for a process label. Only one physical context is allowed for a process label in the design and a valid physical context already exists for the process label.

### What Next

Create physical context for different label or remove existing physical context first.

## CSTR-105

(warning): Constraint loading found unsupported physical context format, '%c' and skipped.

### Description

Constraint loading has skipped unsupported format found in the current version. Valid formats are: M - physical contexts and G - physical context groups

### What Next

Use the correct version of the tool or recreate data. Ignore if physical context are not needed.

### See Also

- open_block

## CSTR-106

(Error): Physical context group could not be set. Reason: %s.

### Description

Physical context group was not set becauase of one of the following reasons. Reason:

1. Physical context overlap: One or more physical contexts are already used by another group in the corner. 2. Less than two in a group: Specified less than two valid physical contexts in a group specified. Minimum of two contexts are required.

### What Next

Fix the issue by removing overlap or specify minimum of two contexts.

Feedback

**See Also**

- open_block

---

## CSTR-108

(Warning): Physical context group(s) removed for corner %s.\n %s

**Description**

Physical context group(s) removed for the corner becauase of one or more of the physical contexts were removed by remove_physical_context command.

**What Next**

Set process physical context groups for the corner again using remaining or new physical contexts.

---

## CSTR-400

(error) Loading of constraint configuration failed.

**Description**

An error occured while reading information about the saved design constraints. It is possible that the database is corrupted and the constraints are now incorrect.

**What Next**

You should consider clearing your constraints with reset_design, and then reloading the constraints from your original tcl or sdc file.

---

## CSTR-401

(error) Hierarchy instance '%s' was in the netlist when constraints were saved, and is not in the netlist now.

**Description**

The configuration of the netlist included the given instance when the design was saved. The configuration has changed now -- most likely because design linking failed. Old constraints that refered to the missing instance will be dropped.

**What Next**

If your subblock is no longer needed, then your constraints are still OK for the netlist that still remains. You will need to take action to restore the dropped constraints if the missing hierarchy is ever restored.

Feedback

If the missing hierarchy should not be missing, then a more serious problem has occured. You should fix the hierarchy and reload the constraints.

---

## CSTR-402

(error) Errors have occurred during constraint loading.

**Description**

There is a mismatch between the constraints on the disk and the configuration of the netlist in memory. So it is likely that the constraints on disk are not complete.

**What Next**

You can use "load_constraints -force" to ignore this error and read the constraints as they are. Or you can try "load_constraints -promote" to try to fill in missing top-level constraints with saved constraints from the lower level blocks.

---

## CSTR-403

(warning) For hierarchy instance '%s', constraints were stored for design '%s:%s', but the current design is '%s:%s'.

**Description**

This warning occurs when you design configuration has change since the time that the design was last saved.

**What Next**

If this message was unexpected, you should check your ref_lib specifications to see if they are correct.

---

## CSTR-404

(warning) Hierarchy instance '%s' was added to the netlist since constraints were saved.

**Description**

The saved constraints for this design do not cover the given new instance hierarchy.

**What Next**

You should consider adding constraints for the new hierarchy.

Feedback

## CSTR-405

(warning) Hierarchy instance '%s' changed from view '%s' to view '%s' since constraints were saved.

**Description**

The saved constraints for this design might not cover the given new hierarchy view.

**What Next**

You should consider adding constraints for the new hierarchy.

## CSTR-406

(warning) Hierarchy instance '%s' changed from view 'design' to view '%s'.

**Description**

The new hierarchy instance has fewer objects than the original. Your constraints are still OK for the objects that remain, but the constraints that pointed to the missing instances will now be dropped.

**What Next**

You will need to take action to restore the dropped constraints if the missing hierarchy is ever restored. The constraints can be reapplied from the top.

## CSTR-407

(warning) Constrained %s '%s' is not in the design.

**Description**

The given object was in the design at the time the constraints were saved, but the object is gone now. The constraint refering to the object will be dropped.

If the object is no longer important, then your constraints are OK.

**What Next**

If the constraint refering to the object was important, you can apply new constraints.

## CSTR-408

(warning) Constraint promotion for instance '%s' cannot be performed because top-level %s '%s' is not mapped to a block %s.

Feedback

**Description**

Before you can promote constraints from a lower level block, you must provide a mapping between block and top constraints. The given object is not mapped.

**What Next**

Use set_block_to_top_map to set the mapping.

---

## CSTR-409

(warning) Constraint promotion for instance '%s' cannot be performed because %d block-level clock(s) are not mapped to a top-level clock in mode '%s'.

**Description**

Before you can promote constraints from a lower level block, you must provide a mapping between block and top constraints. The given clock is not mapped.

**What Next**

Use set_block_to_top_map to set the mapping. Use report_block_to_top_map to see which clocks need to be mapped.

---

## CSTR-410

(information) Promoting constraints for instance '%s'.

**Description**

Constraints are being promoted from the lower-level instance to the top-level design. This promotion may have been triggered automatically when the configuration of your design hierarchy changed, and constraints needed to be filled in.

---

## CSTR-411

(Error) Promoting constraints for instance '%s' failed.

**Description**

An error occured while promoting constraints from the lower-level instance to the top-level design. The constraints have not been promoted or are only partially promoted.

**What Next**

Check the error messages that preceded this one for more details. One common reason for promotion to fail is that the modes, clocks and/or corners of the block could not be mapped to their counterparts at the top level.

Feedback

## CSTR-412

(Error) %s '%s' is not an independently linkable, hierarchical block.

**Description**

This operation can only be done on hierarchical instances, where the instance or reference points to a block in a seperate design. If the instance is not hierarchical, or the instance is only logical hierarchy within a single design, this operation cannot be performed.

**What Next**

You could consider using commit_block to break out this hierarchy into another design. That is to say -- you could make a new physical hierarchy.

If the instance should already point to a hierachical block, then double check to make sure that your design has successfully linked. Perhaps a reference lib is missing.

## CSTR-413

(Information) No map information for %s '%s'.

**Description**

No hierarchy mapping information has been recorded for the given object. The block clocks must be mapped before constraint promotion can be done.

**What Next**

You can set map information with the set_block_to_top_map command.

## CSTR-414

(warning) Block currently has no constraints defined. Assuming block and top clock names are the same.

**Description**

It is possible that clocks defined in your blocks have names that do not match connected top-level clock names. For example, a top level clock named "SYS_CLK" may be connected to a block-level clock named "CLK". The *write_budget* command understands that names may not match, and will automatically derive the mapping between top-level and block-level clocks. This allows *write_budget* to generate the proper constraints for the block.

In order for write_budget to properly map clock names, it is necessary for constraints to already be loaded for your block. Since your block currently has no defined constraints,

Feedback

name mapping cannot be performed. Write_budget will assume that your block-level and top-level clock names match. If this is a bad assumption, then the constraints generated by write_budget will be incorrect.

**What Next**

Load your regular block constraints and call write_budget again. This will avoid this warning message, and ensure that clock names are properly mapped between block and top.

---

## CSTR-415

(Warning) %s '%s' is not an independently linkable, hierarchical block. Timing constraints may be incorrect.

**Description**

The change_abstract command attempts to preserve timing constraints which are applied to a hierarchical block views such as "design" and "abstract". When you switch between these two views, constraints at the boundaries of the blocks will be properly maintained.

You have switched from a non-hierarchical block to a hierarchical "abstract" or "design" view. The constraints that were applied to your original non-hierarchical view are probably not suitable for the new hierarchical view that you have inserted. So your timing constraints are now probably incorrect.

**What Next**

You probably need to reread your design constraints from your original top-level SDC before timing reports can be reliable.

---

## CSTR-416

(Error) You cannot specify a clock edge without a clock.

**Description**

When constraining with a clock edge, you must specify a clock or clock group. For example, *::rise and *::fall are not supported.

**What Next**

If you want to specify a clock edge, please also specify a specific clock or clock group.

---

## CSTR-417

(Error) You may not specify clock groups based on generated clock '%s'.

Feedback

**Description**

You have specified a clock group like my_gclock+. Clock groups can only be specifed on non-generate clocks. The group will implicitly include all generated clocks that transitively depend on the regular clock.

**What Next**

If you want to specify a clock edge, please also specify a non-generated clock.

---

## CSTR-418

(Error) Clock groups cannot be specified for specific blocks or clock pins.

**Description**

You have supplied a clock group specification similar to clk+:block or clk+:block:rise. This is not supported. You may only use clock groups in cases where no block or pin is specified. The following specifications are acceptable:

clk+ clk+::rise clk+::fall.

**What Next**

Please use clock groups without blocks or pins.

---

## CSTR-419

(Error) value %s for option '%s' is invalid: must be '%s'.

**Description**

Multi-Input Switching (MIS) coefficients can only be applied to combinational cell with more than 2 input pins, while the given lib cell is either a sequential one or with less than 2 input pins. You can use lib cell's attribute 'is_combinational == true' to filter the sequential lib cells.

**What Next**

Supply a compatible value for the argument.

---

## CSTR-420

(error) Found invalid objects during constraint loading.

**Description**

There is a mismatch between the constraints on the disk and the configuration of the netlist in memory. Some netlist objects may have been deleted and updated constraints

Feedback

is not saved to disk. The error line and column(s) numbers printed refer to the constraint saved on disk. The constraint command with missing objects skipped is printed.

**What Next**

You can compare the constraint command printed to the original and locate what is missing. In the case missing or no arc, please check design linking errors. You can also consult CSTR-402.

---

## CSTR-430

(information) Promoting clock_data for instance '%s'.

**Description**

Clock data is being promoted from the lower-level instance to the top-level design.

---

## CSTR-431

(Error) Promoting clock_data for instance '%s' failed.

**Description**

An error occured while promoting clock-data from the lower-level instance to the top-level design. The data has not been promoted or is only partially promoted.

**What Next**

Check the error messages that preceded this one for more details.

---

## CSTR-435

(warning) For instance '%s', %d block-level clock(s) are not mapped to a top-level clock in mode '%s'.

**Description**

In order to promote clock balance points from a lower level block through promote_clock_data command, you must provide a mapping between block and top constraints. The given clock is not mapped. Since clocks are not mapped, command will only promote clock-independent balance points.

**What Next**

Use set_block_to_top_map to set the mapping. Use report_block_to_top_map to see which clocks need to be mapped.

Feedback

### See Also

- promote_clock_data
- set_block_to_top_map

---

## CSTR-438

(warning) Clock Mapping Failed. Promoting clock independent balance points (if any) for instance '%s'.

### Description

While promoting clock balance points from a lower level block through promote_clock_data command, clock mapping has failed between block and top. Since clocks are not mapped, command will only promote clock-independent balance points.

### What Next

In order to promote clock balance points also, use set_block_to_top_map to set the mapping. Use report_block_to_top_map to see which clocks need to be mapped.

### See Also

- promote_clock_data
- set_block_to_top_map

---

## CSTR-439

(Warning) In mode '%s' case value conflict at pin '%s'. Block value of '%s' will be used.

### Description

A case value is different from the value given to set_case_analysis at this pin for this mode. The case value set at Top will be ignored and the value set at Block will be used.

### What Next

Check that your constraint files are meant to be used for this mode.

---

## CSTR-440

(information) Applied size_only to '%s' but %s permitted.

Feedback

**Description**

User size_only restriction is applied to the specified cell but constant or unloaded cell gobbling, or constant propagation through the cell is permitted.

---

## CSTR-441

(warning) For instance '%s', based on connectivity and IO delay block-level virtual clock(s) are mapped to a top-level clock in mode '%s'. User to verify.

**Description**

The IO delays associated with the virtual clocks are used to map the block level virtual clocks.

**What Next**

Use set_block_to_top_map to set the mapping. If user is aware of which clocks need to be mapped.

---

## CSTR-442

(Information) In auto POCV scaling, voltage settings in OCVM tables of lib cell are ignored.

**Description**

When application option *time.ocvm_auto_pocv_scaling* is turned on and object_type is lib cell in POCV side file, the voltage settings are ignored. The exact matching and scaling for coefficient and distance derate are performed based on the panes specified in the object_spec.

**What Next**

This is informative, no actions needed.

---

## CSTR-443

(warning) Dropping clock_groups '%s' during promotion because one of the group has only virtual clocks which are either unmapped or driving the ports in the mode '%s'.

**Description**

You receive this warning message because one of the clock groups has only virtual clocks which are driving the ports.

Feedback

### What Next

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

### See Also

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-444

(warning) %s and %s in clock group %s will trigger clock exclusivity outside the block in the mode '%s'.

### Description

You receive this warning message because the clock pair will trigger clock-exclusivity outside the block.

### What Next

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

### See Also

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-445

(warning) exclusivity between %s and %s has been established in clock group %s due to promotion in the mode '%s'.

### Description

You receive this warning message because exclusivity between the clock pair has been established due to promotion.

Feedback

### What Next

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

### See Also

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-446

(warning) %s Top has clock group between user-mapped clocks %s and %s but block does not have a corresponding clock group in the mode '%s'.

### Description

You receive this warning message because the user-mapped clock pair has clock group at the top, whereas block does not have a corresponding clock group.

### What Next

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

### See Also

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-447

(warning) %s Conflicting clock group type between clocks: %s, %s and their master/top level clocks in the mode '%s'.

### Description

You receive this warning message because the clock pair has a conflicting clock group type with respect to their master/top level clocks.

Feedback

### What Next

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

### See Also

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-448

(error) %s Same clock group exists with a different clock group type in the mode '%s'.

### Description

You receive this error message because the exactly same clock group exists with a different clock group type.

### What Next

Use the report_clock with -groups option to check what clock groups have been set. To remove the existing clock groups, use the remove_clock_groups command.

### See Also

- set_clock_groups
- remove_clock_groups
- report_clock

---

## CSTR-449

(Information) In mode %s, dropping %s latency for block clock %s because it is mapped to existing top clock %s.

### Description

During promote_constraints the source latency set on block clock is dropped if its mapped to existing top clock as it will be over ridding the actual top clock latency.

Feedback

## CSTR-450

(Information) In mode %s, dropping %s latency for block clock %s because it is mapped to existing top clock %s.

**Description**

During promote_constraints the network latency set on block clock is dropped if its mapped to existing top clock as it will be over ridding the actual top clock latency.

## CSTR-451

(Information) In mode %s, promoting clock uncertainty from block clock %s to %s even though its master clock also has uncertainty.

**Description**

During promote_constraints uncertainity set on block clock is promoted if the mapped top clock is a generated clock.

## CSTR-452

(Information) In mode %s, dropping clock uncertainty from block clock %s because it is mapped to existing top clock %s.

**Description**

During promote_constraints the uncertainity set on block clock is dropped if it is mapped to the existing top clock to avoid the top clock uncertainity being overridden.

## CSTR-453

(warning) Overwriting top level derates of cell %s with block level derates in the corner '%s'.

**Description**

You receive this warning message because top level derates of the cell is overwritten with block level derates.

**What Next**

Use report_timing and report_timing_derate to check what derates have been set. To reset derate factors, use the reset_timing_derate command.

Feedback

**See Also**

- report_timing
- report_timing_derate
- reset_timing_derate

---

## CSTR-454

(warning) Skipping promotion of block level derates of lib cell %s in the corner '%s'.

**Description**

You receive this warning message because block level derates of the lib cell is skipped during promotion.

**What Next**

Use report_timing and report_timing_derate to check what derates have been set. To reset derate factors, use the reset_timing_derate command.

**See Also**

- report_timing
- report_timing_derate
- reset_timing_derate

---

## CSTR-455

(Information) In mode %s, dropping input/output delays specified on port %s, as it is estimated in the absence of top.

**Description**

During promote_constraints we promote the block level constraints to top, while we drop the input/output delays set on ports.

---

## CSTR-456

(Information) In mode %s, dropping clock transition for block clock %s because master clock %s is propagated.

Feedback

**Description**

During promote_constraints if master clock is propagated for a mode then clock transition for block clock is dropped for that particular mode.

**What Next**

Stop Master Clock Propagation to the top for a mode to avoid dropping of block clock transition for that mode during constraints promotion.

---

## CSTR-457

(Information) In mode %s, dropping source latency for block clock %s because master clock %s is propagated.

**Description**

In promote_constraints we are dropping source latency along with dynamic latency, as after promotion there is no need to estimate the source latency if the master clock is propagated from top.

---

## CSTR-458

(Warning) In mode %s dropping set_clock_gating_check on %s. The object should not be hierarchical-cell.

**Description**

During promote_constraints if the instance is a hierarchical cell then set_clock_gating_check is dropped for that mode.

**What Next**

Use report_clock_gating to check what clock gatings have been set. To set clock gating check, use the set_clock_gating_check command.

**See Also**

- report_clock_gating
- set_clock_gating_check

---

## CSTR-459

(warning) Dropping set_latency_adjustment_options during promotion because block clock '%s' is a virtual clock which is driving a port in the mode '%s'.

Feedback

### Description

You receive this warning message because the clock referred in the *-clock_to_update* option in *set_latency_adjustment_options* is a virtual clock and driving a port in the block.

### See Also

- set_latency_adjustment_options

---

## CSTR-460

(warning) Dropping group_path '%s' during promotion because one of the group has only virtual clocks which are driving the ports in the mode '%s'.

### Description

You receive this warning message because one of the path groups mapped to top has only virtual clocks which are driving the ports.

### What Next

Use the report_path_groups to check what path groups have been set. To remove the existing clock groups, use the remove_path_groups command.

---

## CSTR-461

(Information) In mode %s, dropping clock uncertainty from block clock %s because it is an unmapped clock.

### Description

During promote_constraints the uncertainity set on a block clock which is unmapped is dropped as the block clock itself is dropped.

---

## CSTR-462

(Information) In mode %s, dropping %s latency for block clock %s because it is an unmapped clock.

### Description

During promote_constraints the source or the network latency set on a block clock which is unmapped is dropped as the block clock itself is dropped.

Feedback

## CSTR-463

(Information) In scenario %s, dropping %s %s for block clock %s because it is an unused clock.

### Description

During promote_constraints, the max_transition / max_capacitance set on a block clock which is unused is dropped as the block clock itself is dropped.

### What Next

To remove the existing max_transition, use the remove_max_transition command. To remove the existing max_capacitance, use the remove_max_capacitance command.

## CSTR-464

(warning) '%s' exception is different between the block clock '%s' and the top clock '%s' in the mode '%s'.

### Description

You receive this warning message because one of the exceptions is different between the top clock and the block clock. Multiple contrasting exceptions are being promoted for the same clock.

### What Next

Use the command report_exceptions to check what exceptions have been specified.

## CSTR-465

(Warning) In mode '%s', removed %s clock from '%s' design during promote_constraints, since this clock is mapped by the user which is defined on the internal pin of the promoted block.

### Description

During promote_constraints, the top clock cannot be mapped with a block clock, when it is created on an internal pin[a level deeper inside the block].

### What Next

Define the top clock on an hierarchial pin or on the top design and then map with right clock using set_block_to_top_map. Also see report_clocks, promote_constraints, set_block_to_top_map.

Feedback

## CSTR-466

(Information) Dropping clock latency during promotion for block clock '%s' because it is a virtual clock which is driving a port in the mode '%s'.

**Description**

You receive this message because the block clock has delays set on port and promoting this shall affect the mapped existing top clock latency.

## CSTR-467

(Information) Dropping clock uncertainity during promotion for block clock '%s' because it is a virtual clock which is driving a port in the mode '%s'.

**Description**

You receive this message because the block clock here has delays set on port and promoting this shall affect the mapped existing top clock uncertainity.

## CSTR-468

(warning) The '%s' exception at '%s', exists on top and hence dropping in the mode '%s'.

**Description**

You receive this warning message because one of the exceptions already exists on top. One of the reasons could be that during split_constraints if the exception is set from top pin to a block pin then while splitting the exception is moved to block interface.

**What Next**

Use the command report_exceptions to check what exceptions have been specified.

## CSTR-469

(error) Exception is not set because no through objects could be found .

**Description**

The object list of the exception path is empty at the from, to, or through position. This might happen if the specified object in the command line is a net that does not have any global driver or is a cell with no output pins .

**What Next**

Verify that this is the intended behavior.

Feedback

## CSTR-470

(warning) Clock path max transition constraints for output pins for clock '%s' are skipped as not supported for sdc and script with pt/dc format.

**Description**

Clock path max transition constraints for output pins of clocks are not supported for sdc and scripts for format other than icc/fc.

**What Next**

If want to set maximum transition on clock output pins for these formats set it on specific lib pins .

## CSTR-471

(Warning) -'%s' option for set_sense -type clock command is not written out with write_sdc as read_sdc does not this option for this command.

**Description**

New version of sdc will support this option for this command.

**What Next**

Checkout other options for this command.

# CTP

## CTP-001

(warning) No phase delay could be computed for anchor point %s

**Description**

During anchor point creation, a pin or port was deemed a candidate for becoming an anchor point. However, no phase delay could be computed for this point. The likely reason is that the clock tree is not or not fully implemented, so that no reasonable delays could be computed.

**What Next**

Check the logfile for messages pertaining to clock tree synthesis, to see what problems were reported.

Feedback

## CTP-002

(error) Pin/port %s has the wrong direction.

**Description**

The specified pin or port has the wrong direction.

**What Next**

Specify a pin or port of the correct direction.

## CTP-003

(error) No physical design data.

**Description**

There was no physical design data. Most likely this is due to the design flow not yet ready for clock trunk planning.

**What Next**

Perform floorplanning first.

## CTP-004

(error) Core area is not defined.

**Description**

The design core area is not defined.

**What Next**

This is a general setup issue. Check that the flow has been run succesfully so far, in particular check if floorplanning has been performed.

## CTP-005

(information) For mode %s, port %s: %s

**Description**

Clock trunk planning has derived a temporary set_driving_cell constraint for the given mode and port.

Feedback

**What Next**

This message is informational only. If the given set_driving_cell constrain is not desired, an explicit one can be given using the CTS set_block_constraint file.

---

## CTP-006

(information) Pushed-down cell %s has been removed after being used to guide pin placement.

**Description**

During push_down_clock_trunks, guide buffers are pushed down, then used to guide pin placmeent, and finally removed. This message is to inform the user of the last step.

**What Next**

No action required. This message is informational only.

---

## CTP-007

(error) No valid libcells with CTS purpose found for cell %s in block %s.

**Description**

During clock trunk planning, an attempt was made to push down clock cells into a block. However, there are no valid libcells with CTS purpose configured for the block.

**What Next**

Either configure some libcells with CTS purpose for the block or close the block for feedthrough.

---

## CTP-008

(error) No %s libcells found for cell %s in block %s.

**Description**

During clock trunk planning, an attempt was made to push down clock cells into a block. However, there are no valid libcells with the correctl polarity (biffer/inverter) with CTS purpose configured for the block.

**What Next**

Configure some buffer or inverter libcells with CTS purpose for the block.

Feedback

## CTP-009

(error) Cannot replace existing repeater %s in block %s.

**Description**

The existing cell could not be replaced because it appears not to be a repeater, even though its libcell indicates it is.

**What Next**

This may indicate a library setup issue. Please check the libcell. We expect a repeater to have a single input and a single putput.

## CTP-010

(error) Attempt to make %s a clock tuning point, which is not the input pin of a buffer.

**Description**

Clock tuning points can only be placed at the input pin of a buffer.

**What Next**

You can first insert a buffer at the desired place in the netlist, then mark its input as a clock tuning point.

## CTP-011

(information) CTP constraints %s are set for block %s.

**Description**

constraints set by the command set_ctp_constraints.

**What Next**

This message is informational only. It prints constraints set by the command set_ctp_constraints.

## CTP-012

(Error) Problem found in offset value. %s.

**Description**

Problem found in offset value provided with set_ctp_constraints command. Ignoring these values.

Feedback

**What Next**

Check the offset values and apply set_ctp_constraints again with correct offset value.

---

## CTP-013

(Error) Length of the side %u of Block %s is less than offset %u provided. Ignoring the CTP constraints for the block %s.

**Description**

Problem found in offset value provided with set_ctp_constraints command. Ignoring these values.

**What Next**

Check the offset values and apply set_ctp_constraints again with correct offset value.

---

## CTP-014

(Error) Valid edges are not found for %s based on applied CTP constraints. Ignoring CTP constraints set on this block.

**Description**

Problem found in CTP constraints set by the user. Ignoring these values.

**What Next**

Check the CTP constraints and apply set_ctp_constraints again with correct value.

---

## CTP-015

(Information) CTP pin constraints will happen based on following constraints.

**Description**

This is an information message to print CTP pin constraints".

**What Next**

Check for other CTP messages.

---

## CTP-038

(error) Number of endpoints too large: actual number is %d , limit is %d.

Feedback

**Description**

The number of endpoints which have been automatically identified for clock trunk planning is too large.

**What Next**

The recommended approach is to define endpoints manually using set_clock_trunk_end_point. Alternatively, the limit can be increased by using app_option "plan.clock_trunk.endpoint_limit".

---

## CTP-039

(error) Different supply nets on %s and %s.

**Description**

Two sinks that were to be buffered together have a different supply net.

**What Next**

Consider removing one of the sinks from the set of sinks to be buffered.

---

## CTP-040

(error) Sink %s is not a physical pin or port.

**Description**

The sink is not a physical pin or port. A logical pin or port cannot be buffered.

**What Next**

Please specify only physical sinks.

---

## CTP-041

(error) Pin/port %s is unconnected.

**Description**

A sink to be buffered was unconnected, so there is no net to buffer.

**What Next**

Please specify only connected pins or ports.

Feedback

## CTP-042

(error) Sinks are deriven by multiple physical nets: %s and %s

**Description**

The sinks are driven by multiple physical nets, so they cannot be buffered by a single buffer.

**What Next**

Please specify only sinks attached to a single physical net.

## CTP-043

(error) Sinks are in different physical hierarchies.

**Description**

The sinks are in different physical hierarchies. This command can only buffer sinks in the same physical hierarchy.

**What Next**

Please specify sinks in the same physical hierarchy.

## CTP-044

(error) Multiple-driven nets are not supported: %s and %s

**Description**

The net to be buffered is multiple-driven. This is not supported.

**What Next**

If a buffer is really desired here it should probably be inserted at the Verilog level.

## CTP-045

(error) Net %s to be buffered has no driver.

**Description**

The net to be buffered has no driver. This may indicate a problem in the netlist.

**What Next**

Check the netlist if an undriven clock net is really intended.

Feedback

## CTP-046

(error) No buffer libcell found.

**Description**

No buffer could be inserted since the library contains no buffer libcell. This is probably a library setup error.

**What Next**

Check if the standard cell library is complete.

## CTP-047

(error) No sinks were specified.

**Description**

No sinks were specified, while at least a single sink is required in order to put a buffer in front of it.

**What Next**

Please specify at least one sink.

## CTP-048

(error) No physical net to buffer found.

**Description**

A physical net to buffer could not be found.

**What Next**

Please check if all specified sinks are driven by a single physical net.

## CTP-049

(error) No logical hierarchy can be found to place the buffer in.

**Description**

No logical hierarchy can be found to place the buffer in. This may indicate a software bug.

**What Next**

Please contact Synopsys with this problem.

Feedback

## CTP-050

(error) No buffer could be inserted.

**Description**

No buffer could be inserted. This may indicate a software bug.

**What Next**

Please contact Synopsys with this problem.

## CTP-051

(error) Expected a single input and a single output pin on the buffer.

**Description**

A library cell which purports to be a buffer was found which does not have a single input and a single output pin. This may indicate a library setup problem.

**What Next**

Please check your standard cell library.

## CTP-052

(error) Could not hook up new buffer to %s.

**Description**

The new buffer could not be properly connected. This may indicate a software bug.

**What Next**

Please contact Synopsys with this problem.

## CTP-053

(error) No physical design data available.

**Description**

No physical design data is available. Probably the state of the flow is too early to perform clock trunk planning.

**What Next**

Proceed further in the flow before attempting clock trunk planning.

Feedback

## CTP-054

(error) No allowed buffers found for clock %s and supply %s. Cannot perform timing estimation.

**Description**

No buffers could be found that may be used to buffer the clock under consideration. This may indicate a library setup problem.

**What Next**

Check your library setup that there are some buffers which can be used to buffer the clock tree.

## CTP-055

(error) No technology library could be found.

**Description**

No technology library could be found. This may indicate a library setup problem.

**What Next**

Check your library setup.

## CTP-056

(error) Cannot obtain any allowed routing layers for clock tree synthesis.

**Description**

The tool cannot obtain any allowed routing layers for clock tree synthesis. This may indicate a setup problem.

**What Next**

Check that there are some layers which may be used by clock tree synthesis.

## CTP-057

(error) No unit length delay found for nets powered by supply net %s.

**Description**

No unit-length delay could be estimated.

Feedback

**What Next**

Pleas check earlier warnings for a setup problem.

---

## CTP-058

(error) Cannot create timer.

**Description**

The timer could not be created.

**What Next**

Please try report_timing and check the problems it reports.

---

## CTP-059

(error) Unexpected problem with path group creation.

**Description**

There was an unexpected problem with path group creation. This may indicate a software bug.

**What Next**

Please contact Synopsys with this problem.

---

## CTP-060

(error) Syntax error in driving cell specification. %s.

**Description**

The format of driving cell specified through app_option "plan.clock_trunk.default_driving_cell" is wrong.

**What Next**

Please refer to the man page for app_option "plan.clock_trunk.default_driving_cell".

---

## CTP-061

(information) For mode %s: %s

Feedback

**Description**

Driving cell specification applicable to a given port for a given mode and specified either through app_option plan.clock_trunk.default_driving_cell or automatically chosen by the tool for Clock trunk planning.

**What Next**

This message is informational only. This is applicable in case set_driving_cell constraint is missing in CTS_CONSTRAINT file for a given mode.

---

## CTP-062

(error) Incorrect value %s specified for option '-sort_by' of report_clock_trunk_qor.

**Description**

Option '-sort_by' of report_clock_trunk_qor can only accept either "wns" or "wns_ocv" as sorting criteria.

**What Next**

Specify correct sorting criteria (either "wns" or "wns_ocv") with option '-sort_by' before running report_clock_trunk_qor.

---

## CTP-063

(information) Block clock pin %s is not placed.

**Description**

It is recommended to place block clock pins before running CTP.

**What Next**

Place clock pins for all blocks before running CTP.

---

## CTP-064

(warning) CTS_CONSTRAINT file specification for block %s is missing from set_constraint_mapping_file.

**Description**

CTP does not consider clock tree constraints for a particular block if its CTS_CONSTRAINT file specification is missing from set_constraint_mapping_file.

Feedback

**What Next**

Specify the CTS_CONSTRAINT file for all blocks before running CTP.

---

## CTP-065

(warning) CTS_CONSTRAINT file %s specified in set_constraint_mapping_file for block %s is empty.

**Description**

CTS_CONSTRAINT file specified in set_constraint_mapping_file should not be empty.

**What Next**

Specify the CTS_CONSTRAINT file for all blocks before running CTP.

---

## CTP-066

(warning) Latency estimation cannot be done at pin %s for clock %s.

**Description**

This may be because no path exists between clock source and pin. Look for GRF-014 messages in the logfile which is one of the potential causes of this issue.

**What Next**

Ensure that a valid path exists between clock source and the pin. Eliminate the reason for GRF-014 message in logfile if it exists.

---

## CTP-100

(Warning) Unable to determine side constraint %s. Command will proceed with pin placement.

**Description**

During topological constraint file generation, CTP engine was unable to find a valid side constraint.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-101

(Error) Loop detected %s for pin '%s' for clock source pin '%s'.

Feedback

**Description**

Loop detected in the topology for the said pin.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-105

(Error) Loop detected in the topology tree%s.

**Description**

The topology tree generated by CTP has a loop.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-107

(Error) Unable to determine the location for pin '%s' for clock source pin '%s'.

**Description**

CTP was unable to find proper location for the said pin.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-108

(Warning) Placement for port '%s' is not valid. This port will be ignored during CTP.

**Description**

CTP engine will ignore output ports if it is not placed.

**What Next**

Check the non-placed output ports present in the design.

---

## CTP-109

(Error) Pin constraint writer detected an issue for pin '%s'. Pin placement will be skipped.

Feedback

**Description**

CTP was unable to find or create the said pin.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-110

(Error) Logical loop detected. Output pin '%s' is driving input pin '%s' of the same physical hierarchy instance '%s'.

**Description**

There is a logical loop as detailed in the message. These type of logical loops are not supported.

**What Next**

Modify the design to remove such logical loops.

---

## CTP-121

(Error) Consistency checks failed for clock source pin '%s'. Pin placement will be skipped for this.

**Description**

CTP ran into consistency issue for the said clock source pin. Subsequent pin placement step will be skipped for this clock net.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-125

(information) None of the clocks could be mapped to block-level clocks for block '%s'.

**Description**

No block level clocks of the specfied block could be mapped to any top level clocks. Command will proceed for all the clocks in that block.

**What Next**

Check the clock mapping for the blocks.

Feedback

## CTP-126

(warning) None of the specified clocks could be mapped to block-level clocks for block '%s'.

**Description**

None of the block level clocks of the specfied block could be mapped to any of the specified top level clocks. Command will skip this block.

**What Next**

Check the clock mapping for the blocks.

## CTP-151

(Warning) detected %s pin %s on the read-only block %s, %s.

**Description**

During tree generation, CTP engine will ignore pins beyond first pin of read only block.

**What Next**

Check the read only blocks present in the design.

## CTP-152

(Warning) The port %s is not driving any load. This port will ignored.

**Description**

During tree construction, CTP engine will ignore ports if it is not driving any load.

**What Next**

Check the ports with no load present in the design.

## CTP-153

(Error) Not able to create a Feedthrough pin/port %s on read-only block %s.

**Description**

During Feedthrough pin/port construction, CTP will not create any Feedthrough pin/port on a read only block.

Feedback

**What Next**

Check the connection to find out why feedthrough pin/port is required on a read only block.

---

## CTP-180

(Error) Topology constraint file '%s' is missing.

**Description**

The topological constraint file was could not be found.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-181

(Error) Topology constraint file '%s' is empty.

**Description**

The topological constraint file was found to be empty.

**What Next**

Check the log file for CTP related related warning/error messages leading upto this point.

---

## CTP-200

(information) Setting app option '%s' to '%s' for CTP %s flow.

**Description**

Tool has detected that app option 'top_level.optimize_subblocks' and/or 'cts.common.enable_subblock_optimization' has not been set to proper value for the specified flow. Command will set the app options internally to proper values for the specfied flow.

**What Next**

Check the intention of using present values of the app options 'top_level.optimize_subblocks' and/or 'cts.common.enable_subblock_optimization'.

---

## CTP-201

(Warning) Ignoring '%s' argument for CTP %s flow.

Feedback

**Description**

The arguments '-from' and '-to' for command 'synthesize_clock_trunks' is applicable only in case of clock trunk planning in THO mode. Command will ignore these arguments in any other mode.

**What Next**

Check the intention of using the '-from' and '-to' arguments.

---

## CTP-202

(Error) All the sub-blocks are found to be readonly. Command will not proceed.

**Description**

Tool detected that all the sub-blocks are readonly. Command will not proceed further.

**What Next**

Check the setup. Check for other CTP messages leading up to this point.

---

## CTP-203

(Warning) Found editable abstract instance ‘%s’ without optimization context. Command will treat it as readonly.

**Description**

Tool detected the said block instance as linked with abstract without optimization context. However it has been marked as editable. Command is treating it as readonly.

**What Next**

Check the setup. Either mark the said block instance as non-editable or run "synthesize_clock_trunk_setup_hier_context -init" to setup the instances.

---

## CTP-204

(Warning) Found editable abstract instance '%s'. But abstract editing is not enabled. Command will treat it as readonly.

**Description**

Tool detected that abstract editing is not enabled for command "synthesize_clock_trunks". But there are some sub-blocks linked with abstracts that have been marked as editable. Command is treating it as readonly.

Feedback

**What Next**

Check the setup. Either abstract editing needs to be enabled or blocks linked with abstract need to set as non editable.

---

## CTP-205

(Information) Block instance '%s' will be treated as %s.

**Description**

This is an information message specifying editability of blocks for command "synthesize_clock_trunks".

**What Next**

Check for other CTP messages.

---

## CTP-206

(Waring) Setup issue detected while checking for sub-block editability. The checks will be skipped.

**Description**

Tool detected setup issue while performing the editability checks on sub-blocks. The checks will not be performed.

**What Next**

Check the setup. Check for other CTP messages leading up to this point.

---

## CTP-207

(Information) The MPH flag is true, Tool will ignore app option "plan.clock_trunk.write_separate_files".

**Description**

This is an information message specifying Tool will ignore the app option "plan.clock_trunk.write_separate_files" as MPH flag is set.

**What Next**

Check the MPH flag. Check for other CTP messages leading up to this point.

Feedback

## CTP-208

(Information) %s

**Description**

This is an information message.

**What Next**

This is an information message.

## CTP-209

(Error) Incrmental CTP can not run on MPH design.

**Description**

Incrmental CTP can not run on MPH design.

**What Next**

Check the design and run full CTP instead of Incremental CTP.

## CTP-210

(Error) Detect no full CTP has been run before. To run Incrmental CTP previous full CTP has to be run.

**Description**

To run Incrmental CTP previous full CTP has to be run.

**What Next**

To run Incrmental CTP previous full CTP has to be run.

## CTP-307

(Error) CTP sanity check has failed. Run check_design_for_clock_trunk_planning -clock command for detailed errors.

**Description**

This message indicates that the sanity checks have failed at top level. The issues may cause the CTP flow to be incorrect or fail at some point. It is recommended to correct the reported errors before proceeding with the CTP flow. Run check_design_for_clock_trunk_planning -clock <clocks> command to see detailed errors.

Feedback

### What Next

Run check_design_for_clock_trunk_planning -clock command to see detailed errors. If app-option top_level.continue_flow_on_check_hier_design_errors is set to true, command will continue even if sanity checks fail and CTP-308 error message will be given.

### See Also

- check_design_for_clock_trunk_planning
- top_level.continue_flow_on_check_hier_design_errors

---

## CTP-308

(Error) CTP sanity check has failed but the command will continue. Run check_design_for_clock_trunk_planning -clock command for details.

### Description

This message is issued because the sanity checks have failed at top level and the app-option top_level.continue_flow_on_check_hier_design_errors is set to true. The issues may cause the CTP flow to be incorrect or fail at some point. It is recommended to correct the reported errors before proceeding with the CTP flow. Run check_design_for_clock_trunk_planning -clock <clocks> command to see detailed errors.

### What Next

Run check_design_for_clock_trunk_planning -clock command to see detailed errors.

### See Also

- check_design_for_clock_trunk_planning
- top_level.continue_flow_on_check_hier_design_errors

---

## CTP-400

(Error) Load site %s is not reachable, will be ignored.

### Description

During CTP if a load is not reachable this error will be issued.

### What Next

Check if the any of user constraints or the arrangement of block/hardmacro/readonly-blocks is making this load unreachable.

Feedback

### CTP-401

(Error) With given MIB-set, clock trunk is not possible. Loads: %s.

**Description**

During CTP if among MIBs, an agreeable placement of pin can not be found, this error is issued.

**What Next**

Check if the any of user constraints or the arrangement of block/hardmacro/readonly-blocks is making MIB-set unreachable with agrreable placement of pin.

## CTS

### CTS-001

(Warning) '%s' pin/port not a clock source, ignored.

**Description**

The pin/port specified is not a source of a clock, and is thus ignoered.

### CTS-002

(Warning) There are active CTS scenarios with no clock definition.

**Description**

There are timing scenarios enabled for CTS that do not have any clock definitions. CTS will work on any active scenario that is enabled for setup or hold fixing with the set_scenario_status command.

**What Next**

Ensure that all of the active CTS scenarios have at least one clock defined. Control the CTS scenarios by using the *set_scenario_status* command. New clocks are defined using the SDC commands create_clock and create_generated_clock.

### CTS-003

(Warning) Skipping source pin '%s' of clock '%s' (mode '%s') because there is no valid clock net for CTS to work on.

Feedback

**Description**

When a clock is defined on an input pin or internal pin of a clock gate, CTS will iterate through all the output pins of the clock gate to find root clock nets. This message indicates that no output net of the clock gate is found.

**What Next**

Please check the clock definition. CTS will exclude this clock source pin because there is no net to work on.

---

## CTS-004

(Warning) There are generated clocks that cannot be reached by their master clock.

**Description**

A generated clock is logically derived from its master clock, as specified in the create_generated_clock constraint. For a master clock to derive a generated clock, it should be possible to trace a path from the master clock to the generated clock root pin in the netlist. This message indicates that CTS failed to find such a path. As a result, CTS will not balance the generated clock with the master clock. The generated clock will be balanced independently.

**What Next**

Examine your netlist and timing constraints to understand why the generated clock could not be reached by the master clock. You can proceed with CTS despite this issue, but the generated clock will not be balanced with the master clock. To balance them together, the netlist or timing constraints must be modified so that the master clock propagates to the generated clock's root pin.

---

## CTS-005

(Warning) Generated clocks defined on bidirectional pins

**Description**

A generated clock definition is present on a bidirectional pin. The timer may have problems correctly handling this constraint, which can affect CTS balancing of this generated clock domain, or of the generated clock with its master clock.

**What Next**

Use remove_generated_clock to remove the existing generated clock definition. Then use create_generated_clock to redefine the clock on another pin that is not bidirectional.

Feedback

**See Also**

- create_generated_clock
- remove_generated_clock

---

## CTS-006

(Warning) Balancing conflicts exist between different clocks

**Description**

The partially overlapping clock structure shared by two clocks makes it impossible to balance their delays to produce low clock skew. The structure contains common sinks for both clocks, but it also has at least one pin that is a sink for only one of the clocks, but is an intermediate pin in the clock tree for the other clock.

The most common reason for this is a situation where a generated clock is defined on the output of a divider flop for a particular master clock, but there are multiple clocks propagating to the divider flop clock pin. As a result, the flop is a divider for one master clock, and the tree continues to downstream sinks. For the other master clock, the divider flop is instead a sink.

**What Next**

Check the clock structure, and modify the timing constraints to avoid a situation where one clock arrives at a sink but the other clock continues through it. If the structure is defined as intended and cannot be modified, then understand that the clocks cannot be balanced. Instead, consider modifying the interclock delay balancing constraints with the create_clock_balance_group command, so that these two master clocks are not balanced together.

---

## CTS-007

(Warning) Failed to specify any clock buffers or inverters for CTS

**Description**

CTS requires at least one buffer or inverter library cell to build the clock trees.

**What Next**

Use 'set_lib_cell_purpose -include cts $lib_cell_list', where $lib_cell_list includes at least one buffer or inverter lib_cell.

**See Also**

- set_lib_cell_purpose

Feedback

## CTS-008

(Warning) Clock reference cells have dont_touch or dont_use

**DESCRIPTION"**

If a lib_cell has a dont_touch or dont_use attribute, then its instances in the design cannot be modified. This also prevents CTS from inserting new instances of that lib_cell, or resizing instantiations of that cell. This message indicates that one or more clock references are dont_touch or dont_use.

**What Next**

Modify the available clock references by using 'set_lib_cell_purpose -include cts $lib_cell_list', where $lib_cell_list includes at least one lib_cell that is not dont_touch. Alternately, 'set_dont_touch $lib_cell false' can be used to clear dont_touch attributes on clock references in the library.

**See Also**

- set_lib_cell_purpose
- set_dont_touch
- get_attribute

## CTS-009

(Warning) Cell instances in the clock tree have multiple conditional delay arcs between the same pins

**Description**

This message indicates that a CTS reference cell has more than one timing arc.

**What Next**

Please check the CTS reference settings.

**See Also**

- set_lib_cell_purpose

## CTS-010

(Information) Source pin '%s' of clock '%s' has a clock tree balance point defined on it.

Feedback

### Description

The source pin of this clock is defined as clock tree balance point. CTS will fix design constraints on this clock tree, but will not try to balance its sinks.

### What Next

Check the clock to see if it is what you expect.

### ALSO SEE

`set_clock_tree_balance_point (2), remove_clock_tree_balance_point (2)`

---

## CTS-011

(Information) Source pin '%s' of clock '%s' has ExplicitIgnore pin defined on it.

### Description

The source pin of a clock is defined as an ExplicitIgnore pin.

---

## CTS-012

(Warning) Nets in the clock network have a dont_touch constraint

### Description

Nets in the clock network have been marked with a dont_touch attribute. dont_touch on a net prevents sizing, optimization, and replacement of all attached cells. It also prevents buffering on the net. dont_touch can limit CTS optimization, which can cause worse latency, skew, or area in the clock network.

### What Next

Examine the reported nets to ensure that the dont_touch attributes have been applied with good reason. In particular, dont_touch on high-fanout or other large nets can cause latency problems after CTS, as that large net will not be buffered. dont_touch attributes can be removed with the set_dont_touch, set_dont_touch_network, or mark_clock_tree commands. set_dont_touch is normally used for setting and clearing dont_touch on individual nets or cell instances. set_dont_touch_network is used to apply dont_touch to an entire fanout from a clock or pin. Note that set_dont_touch_network will not trace from a master clock through to a generated clock. mark_clock_tree can be used also to apply or clear dont_touch. Unlike set_dont_touch_network, mark_clock_tree will trace through generated clocks.

Feedback

**See Also**

- set_dont_touch
- set_dont_touch_network

---

## CTS-013

(Warning) Cells in the clock network have a dont_touch constraint

**Description**

Cells in the clock network have been marked with a dont_touch attribute. dont_touch on a cell prevents sizing, optimization, and replacement during CTS. dont_touch can limit CTS optimization, which can cause worse latency, skew, or area in the clock network.

**What Next**

Examine the reported cells to ensure that the dont_touch attributes have been applied with good reason. dont_touch attributes can be removed with the set_dont_touch, set_dont_touch_network, or mark_clock_tree commands. set_dont_touch is normally used for setting and clearing dont_touch on individual nets or cell instances. set_dont_touch_network is used to apply dont_touch to an entire fanout from a clock or pin. Note that set_dont_touch_network will not trace from a master clock through to a generated clock. mark_clock_tree can be used also to apply or clear dont_touch. Unlike set_dont_touch_network, mark_clock_tree will trace through generated clocks.

**See Also**

- set_dont_touch
- set_dont_touch_network

---

## CTS-014

(Warning) There is a balance conflict at pin '%s' (corner '%s') : %s %s.

**Description**

This message indicates that balance point(stop, float) values are conflict in different mode.

**What Next**

Check the balance point settings. Make sure they are consistent across different mode.

---

## CTS-015

(Warning) set_max_delay or set_min_delay constraints are defined in the clock network

Feedback

### Description

This message indicates that there is max/min delay set on clock. CTS will ignore this constraint.

### What Next

Check the max/min delay settings.

### See Also

- set_max_delay
- set_min_delay

---

## CTS-016

(Warning) There is Max_delay or Min_delay set on pin '%s'.

### Description

This message indicates that there is max/min delay set on a clock pin. CTS will ignore this constraint.

### What Next

Check the max/min delay settings.

### See Also

- set_max_delay
- set_min_delay

---

## CTS-017

(Warning) clock gate '%s' is dont touch.

---

## CTS-018

(Warning) clock net '%s' is dont touch.

---

## CTS-019

(Warning) Clocks propagate to output ports

Feedback

### Description

One or more clocks in the design propagate to output ports. This is allowable, and could be due to a feedthrough clock in a block, or clocks generated inside a block that need to propagate to the top-level. Default CTS behavior is dependent on the constraints on the output port.

If the output port is a valid timing endpoint, due to a set_output_delay, set_max_delay, set_min_delay, or set_data_check constraint to that output port, then the port is considered a data endpoint. It will not be balanced as a clock sink, and any nets in the clock tree fanning out only to data pins will not be synthesized by CTS.

If the output port is unconstrained, it will be treated as an ignore pin and will not be balanced. A DRC clean clock tree will still be built to this port.

If the user explicitly puts a stop pin or float pin constraint on this port using set_clock_balance_points, then it will be treated as a sink, and will be balanced appropriately during CTS.

### What Next

Check each port that is reported, and see how it will be handled based on the constraints on that port. It may be treated as a data sink, a clock ignore point, or a clock balance point. If the port is not constrained to be handled as expected, then modify the constraints on the port. set_output_delay can force the port to be a data endpoint. set_clock_balance_points can be used to set it as a balance point. set_clock_ignore_points can be used to set it as an ignore point.

### See Also

- set_clock_balance_points
- set_output_delay
- set_max_delay
- set_min_delay
- set_data_check

---

## CTS-020

(Warning) Corner '%s' has different RC value for early and late. early: %f %f %f %f and late: %f %f %f %f

### Description

The message indicates that there are different TLU+ for early and late for the same corner.

Feedback

## CTS-021

(Warning) -max and -min are set differently at input port '%s' of clock '%s'. max: %f, %f; min: %f, %f.

### Description

The message indicates that there are different -max and -min settings on clock input ports.

### What Next

Check the -max and -min settings in set_input_transition.

### See Also

- set_input_transition

## CTS-022

(Error) clock '%s' is a generated clock. This command does not take a generated clock as input.

### Description

This command does not take a generated clock as input.

### What Next

Check the master clock of the specified generated clock, and use it as input.

## CTS-023

(Error) No clock routing rule matched specified pattern.

### Description

The pattern which you specified did not match any clock routing rule.

### What Next

Check the pattern to see if it is what you expected.

### See Also

- set_clock_routing_rules

Feedback

## CTS-024

(Warning) Skip the balance group '%s' because its mode '%s' has no associated scenario with setup or hold actviated.

### Description

The clocks of the clock balance group are in the mode which has no associated scenario with setup or hold activated. Therefore, the program skips to balance this group.

### What Next

Check the clock balance group and scenario status to see if it is what you expected.

### See Also

- report_clock_balance_groups

## CTS-025

(Warning) Gate '%s' is not sizable.

### Description

The gate may have dont_touch attribute, or may be in a read only block, thus sizing was not performed.

## CTS-026

(Error) The '-objects' list mixes clocks and skew groups.

### Description

To prevent confusion the object list has to be all clocks or all skew groups. If you want to balance a skew group with a clock which has no skew group defined on it, you can specify the default skew group of this clock. The name of the default skew group is 'default_<clock name>', for example, the default skew group of clock 'clk1' is 'default_clk1'.

### What Next

Check clocks and skew groups to see if it is what you expected.

### See Also

- create_clock_balance_group

Feedback

## CTS-027

(Error) Clock '%s' is in both -offset_from and -offset_to clock list.

### Description

The clock which you specified is in the lists of both -offset_from and -offset_to options. This caused a conflicting settings.

### What Next

Check the clock to see if it is what you expected.

### See Also

- create_clock_balance_group

## CTS-028

(Warning) Skipped delay insertion on driver pin '%s' because its net cannot be buffered. CTS also failed to find its downstream nets to buffer without degrading the balance of this sub-tree.

### Description

CTS failed to insert a delay buffer here. This net may have dont_touch attribute or may be in a read only block.

### What Next

Check the clock to see if it is what you expected.

## CTS-029

(Warning) Replace net '%s' with '%s' in clock routing rule.

### Description

CTS automatically replaces the user specified net with the net connecting the driver pin in the net based clock routing rule, because a hierarchical net may be lost after buffer insertion.

### What Next

Check the result to see if it is what you expect.

### ALSO SEE

set_clock_routing_rules (2)

Feedback

## CTS-030

(Error) Clock '%s' exists in the other clock balance group '%s'. To combine a clock into an existing group, remove the existing group and create a new group.

### Description

The clock which you specified already exists in the other clock balance group. Since a clock cannot be found in multiple groups, you need to consolidate the new group and existing groups. If you intend to combine a new clock into an existing group, remove the existing group and re-create a new group which includes the new clock and the other clocks in the existing group.

### What Next

Consolidate the group which you specified and existing groups to make a new one.

### See Also

- create_clock_balance_group

## CTS-031

(Error) The minimum layer constraint is either equal to the maximum layer constraint, or on a higher layer than the maximum layer constraint.

### Description

The minimum layer constraint has to be on a lower layer than the maximum layer constrait. Please redefine the min/max layer constraint.

## CTS-032

(Warning) There are fixed routing shapes on the net '%s', so the dont_touch flag is set on this net to prevent buffering.

### Description

Since the net has fixed routing shapes, the clock synthesis tool will prevent buffering on this net.

### What Next

Check the result to see if it is what you expect.

Feedback

## CTS-033

(Warning) Both logical nets '%s' and '%s' have been set with net based routing rules, but they correspond to the same physical net. Therefore, the setting on the latter net is ignored and removed.

### Description

These two logical nets correspond to the same physical net, so the setting on one net will be honored and the other will be ignored.

### What Next

Check the result to see if it is what you expect.

### ALSO SEE

set_clock_routing_rules (2)

## CTS-034

(Warning) The specicified reference cell '%s' for isolate port '%s' either has dont_touch flag or does not have the cts purpose, so this setting will not be honored.

### Description

The specified reference cell either has dont_touch flag or does not have the cts purpose. The clock synthesis tool will ignore this setting and choose a cts purpose reference.

### What Next

If you still prefer this reference cell to isolate a clock port, please use *set_lib_cell_purpose* command to add cts purpose for the reference cell. If this cell has dont_touch flag, you need to remove the flag.

### ALSO SEE

```
set_isolate_ports (2)
set_lib_cell_purpose (2)
set_dont_touch (2)
```

## CTS-035

(Warning) The internal clock tree structure is inconsistent on net '%s'.

Feedback

**Description**

The clock tree synthesis tool finds unexpected connections on this net. This problem is usually caused by the preserved hierarchical ports or dont_touch flag on some segments of this net. This internal problem may damage the clock skew and DRC.

**What Next**

This is just a warning message. It is better to remove constraints on its hierarchical pins and dont_touch on the net.

**ALSO SEE**

---

## CTS-036

(Warning) No clock was specified or found in all active scenarios.

**Description**

CTS will work on any active scenario with setup or hold timing analysis enabled. There was no clock in those scenarios.

**What Next**

Check clock and analysis settings in all scenarios. Modify the scenarios settings by *set_scenario_status* command.

---

## CTS-037

(info) CTS QoR %s: GlobalSkew = %s; ID = %s;%s%s NetsWithDRC = %d; %s; ClockBufCount = %d; ClockBufArea = %s; ClockCellArea = %s; ClockWireLen = %s; Clock = %s; Mode = %s; Corner = %s; ClockRoot = %s.

**Description**

Clock Qor information.

---

## CTS-038

(Warning) No clock routing rule is specified.

**Description**

There is no clock routing rule used in the clock tree synthesis.

**What Next**

Check the result to see if it is what you expect.

Feedback

**ALSO SEE**

set_clock_routing_rules (2)

---

## CTS-039

(info) Clock '%s' mode '%s' root '%s' is removed from skew and latency optimization.

**Description**

This message indicates that a clock is removed from skew and latency optimization, because optimization engine finds out that it is identical with another clock. For the clocks that are identical, optimization engine will pick only one of them to process. The optimization of the remaining clocks is implicit.

---

## CTS-040

(info) Balance point auto scaling set on term '%s' clock '%s' corner '%s' early rise %s early fall %s late rise %s late fall %s.

**Description**

This message indicates that a balance point is set by CTS automatically. CTS will detect missing balance points that are necessary for clock balancing purpose and set them according to the user balance point settings.

**ALSO SEE**

```
set_clock_balance_points (2)
report_clock_balance_points (2)
```

---

## CTS-041

(Warning) Gate '%s' is not sizable because of %s dont_touch.

**Description**

The gate has dont_touch attribute, thus sizing was not performed.

---

## CTS-042

(Warning) Gate '%s' is not sizable because of dont_touch_network on %s.

**Description**

The gate has dont_touch_network attribute, thus sizing was not performed.

Feedback

## CTS-043

(Warning) Gate '%s' is not sizable because of fixed placement.

**Description**

The gate is fixed placement, thus sizing was not performed.

## CTS-044

(Warning) Gate '%s' is not sizable because of read-only physical block.

**Description**

The gate is inside a read-only physical block, thus sizing was not performed.

## CTS-045

(Warning) Gate '%s' is not sizable because of its lib_cell specified by users.

**Description**

The lib_cell of the gate was specified by users, thus sizing was not performed.

## CTS-046

(Warning) Net %s has pin %s with invalid location: ignored.

**Description**

Load pin on the net doesnt't have valid location and would not be buffered.

## CTS-047

(Error) Driver %s is not placed. buffering will not happen for this net.

**Description**

Driver pin of the net is not placed. Net would be skipped for buffering.

## CTS-048

(Warning) clock '%s' is a virtual clock. This command does not take a virtual clock as input.

**Description**

This command does not accept a virtual clock, so it has been ignored.

Feedback

## CTS-049

(Error) Failed to disconnect pin '%s' from net '%s' in routing update.

**Description**

The interactive router failed to disconnect a pin from its net.

**What Next**

Please check the pin in the reference library. The most common situation is this pin does not have a physical shape in the reference library.

## CTS-050

(Error) Failed to disconnect pins from net '%s' in routing update.

**Description**

The interactive router failed to disconnect pins from its net.

**What Next**

Please check pins on this net. The most common situation is that some pins do not have a physical shape in the reference library.

## CTS-051

(Warning) clock '%s' has been set. This command will overwrite its settings.

**Description**

This command will overwrite the clock settings.

## CTS-052

(Warning) The specified lib cell '%s' either has dont_touch attribute or no cts purpose, so this setting will not be honored.

**Description**

The specified lib cell either has dont_touch attribute or no cts purpose. This will prevent clock tree synthesis tools to use it.

Feedback

**What Next**

If you would like to use this lib cell for clock tree synthesis, please apply *set_lib_cell_purpose* command to add cts purpose, and *set_dont_touch* command to clear dont_touch attribute.

**ALSO SEE**

```
set_lib_cell_purpose (2)
set_dont_touch (2)
```

---

## CTS-053

(Warning) The net '%s' will not be buffered because it is a pad net.

**Description**

This net is a pad net, so it will not be buffered.

---

## CTS-054

(Warning) The net '%s' will not be buffered because it is in dont_touch_network.

**Description**

This net is in dont_touch_network, so it will not be buffered.

---

## CTS-055

(Warning) The net '%s' will not be buffered because it is a dont_touch net.

**Description**

This net is a dont_touch net, so it will not be buffered.

---

## CTS-056

(Warning) The net '%s' will not be buffered because it is in a read only block.

**Description**

This net is in a read only block, so it will not be buffered.

---

## CTS-057

(Warning) The net '%s' will not be buffered because it connects a special cell.

Feedback

### Description

This net connects a special cell, such as port isolate buffer, so it will not be buffered.

---

## CTS-058

(Warning) The net '%s' has user's specified %s routing rule, so it will not be overwritten by CTS.

### Description

In clock synthesis stage, CTS will apply clock routing rules on all clock nets. Here clock routing rules are the rules specified by the *set_clock_routing_rules* command. However, this process will not overwrite existed rules already set on nets by *set_routing_rule* command. Since this net has a routing rule already, it will not be overwritten by CTS.

### What Next

If this behavior does not meet user's need, user can clear routing rules before clock tree synthesis.

### See Also

- set_routing_rule
- set_clock_routing_rules

---

## CTS-059

(Warning) There is no clock tree balance point on user specified primary corner '%s', but this settings are shown on other corners.

### Description

In the gate by gate clock tree synthesis stage CTS will choose a primary corner and balance all loads based on this corner, so it is better to have all balance points on this corner. Now the user specified primary corner does not have any setting, but the other corner has. This inconsistency will affect the result of clock synthesis.

### What Next

Please check the primary corner and balance point settings.

### See Also

- cts.compile.primary_corner

Feedback

## CTS-060

(Warning) No layer constraint is specified in this set_clock_routing_rules command.

### Description

Since no '-max_routing_layer' or '-min_routing_layer' option is specified, the clock synthesis tool will use all routing layers available in the design for net type specified in this *set_clock_routing_rules* command.

### What Next

If you do not want the tool to use all routing layers for specified net type, set desired routing layers with min_routing_layer and max_routing_layer options.

### ALSO SEE

```
set_clock_routing_rules(2)
remove_clock_routing_rules(2)
```

## CTS-061

(Error) Clock %s has zero period.

### Description

Since the synthesize_clock_tree depends on the clock period for optimizing clock trees, a zero-period clock may cause unpredictable result.

### What Next

Check the clock definition and make sure the clock's period is not zero

### ALSO SEE

```
create_clock(2)
report_clocks(2)
```

## CTS-062

(Warning) Exception '%s' is applied on %s '%s' %s.

### Description

Port / Net may have restrictions applied to it. The type of the restriction is reported, as well as name of the port / net.It will also print the reason of the exception.

Feedback

## CTS-063

(Warning) The set_clock_routing_rules has incomplete min/max_routing_layer constraints.

### Description

The user only set min_routing_layer or max_routing_layer, but not both min_routing_layer and max_routing_layer. In a lot of cases, QoR result of synthesize_clock_tree with/ without complete min_max_routing_layer can be significantly different. If both min/max routing layers are desired, please make sure to provide both the -min_routing_layer and -max_routing_layer options. Even if users use two set_clock_routing_rules commands to set the min_routing_layer and max_routing_layer seperately, we still recommend users to set them in the same set_clock_routing_rules commands to avoid confusion.

## CTS-064

(Error) Skip to work on clock_balance_group '%s' because it is impossible to balance its members together.

### Description

The program skips this balance group because some members in this group cannot be balanced with others.

### What Next

Please check each member in this group, and find the ones which cannot be balanced with others. Then remove this balance group and create a new one without those bad members.

### See Also

- create_clock_balance_group
- remove_clock_balance_groups

## CTS-065

(Warning) trying to balance a very large downstream delay of '%f' at driver '%s' is restricted to balance only upto '%f'.

### Description

The downstream of this driver pin has load with very large and possiblly unreasonable delay that is needed to be balanced against other loads with much smaller delay. This will result in a large number of buffers being inserted. CTS will only balance it to a pre-defined upper limit to prevent excessive large latency and buffer count/area.

Feedback

### What Next

Please check the balancing requirements of this driver's load pins, and make sure that this is what user want. Usually it is due to some really large drc violation downstream, unreasonally large balance point, etc.

### See Also

- set_clock_balance_points

---

## CTS-066

(Warning) The net '%s' will not be buffered because it has multiple drivers.

### Description

This net has multiple drivers, so it will not be buffered.

---

## CTS-067

(Error) Failed to initialize clocks.

### Description

The program fails to initialize clocks, so it will not continue.

### What Next

Here are the main reasons to fail clock initialization. 1. There is no available buffer/inverter lib cell. CTS will use those lib cells with "cts" purpose and no "dont_touch" flag. Please check the reference lib cell settings. 2. Failed to characterize corners in the designs.

### See Also

- set_lib_cell_purpose
- set_dont_touch

---

## CTS-068

(Warning) MV violation on pin $$s on clock $$s. The connected inst and net will not be considered for buffering and optimization.

### Description

A design object was found to be in violation of MV rules at the start of clock tree synthesis, and will not be buffered or optimized.

Feedback

### What Next

Check for MV violations using check_mv_design before starting clock tree synthesis.

### See Also

- check_mv_design

---

## CTS-069

(Error) No available %s in the clock reference list. The app_option setting 'cts.compile.repeater_selection %s' will be ignored.

### Description

User provided repeater_selection setting does not match with the clock reference list.

### What Next

Modify the clock reference list to include repeaters of the specified type.

---

## CTS-070

(Information) Multi-threaded CTO is disabled for VR mode, when minimum-pulse-width optimization is enabled, or when wire_em is enabled.

### Description

When global routing (GR) is available and enabled in the flow, GR-based multi-threaded CTO will be used; otherwise single-threaded optimization will occur with virtual routing (VR). If cts.optimize.minimum_pulse_width or cts.optimize.wire_em_aware is enabled (both default false), multi-threaded CTO will also be disabled due to compatibility and will fall back to single-threaded CTO.

### What Next

If GR is available in the flow but disabled by app option, cts.optimize.minimum_pulse_width is enabled, or cts.optimize.wire_em_aware is enabled, please review your settings.

---

## CTS-071

(Warning) There is a huge DRC transition violation on the net driven by %s, which is on longest path of clock %s. This is causing very large clock latency. The clock tree optimization is disabled to prevent from unnecessary delay insertion to match this very large clock latency.

Feedback

**Description**

Some large drc violations (especially large transition violations) might be present at the CTO skew/latency optimization step. There are several possible reasons, like some kind of user dont-touch settings, or simply the gate-by-gate build clock tree step wont be able to fix all the drc. When this happens, the clock latency can be a very large value since large transition values often have large stage delays and these nets with often appear on the longest path. In this case, if CTO skew/latency optimization proceed with normal balancing, it will have to add huge amount of delay buffers and often cause very large runtime. This is not necessary, user need to check either the constraint of the nets with large drc, or check if there is anything wrong in the gate-by-gate step.

**What Next**

Check user constraints on the terms, or check the gate-by-gate step on the terms/net pointed out.

---

## CTS-072

(Warning) There is a very large arc delay between term %s and term %s for clock %s on corner %s

**Description**

Some very large delay is on the longest path and take majority of the longest path, at a certain mode/corner. This often means either there is a very large drc violation or a lib arc being used for that scenario itself has very large delay. The clock will be ignored for clock tree optimization to prevent unnecessary balancing.

**What Next**

Check user constraints on the terms/arcs, or check the gate-by-gate step on the terms/net pointed out.

---

## CTS-080

(Warning) Exception '%s' is applied %d times %s.

**Description**

Buffer tree has restrictions applied to it. The type of the restriction is reported, as well as number of the occurences of that restriction for this clock tree net.

---

## CTS-101

(Information) %s will work on the following scenarios.

Feedback

**Description**

Lists the scenarios that command will work on.

---

## CTS-102

(Information) %s will work on the following clocks.

**Description**

Lists the clocks that command will work on.

---

## CTS-103

(Information) '%s' is identified as primary corner for initial clock tree building.

**Description**

The *synthesize_clock_trees* command will pick a primary corner in the initial clock tree building stage. By default the worst delay corner will be selected as primary corner.

---

## CTS-104

(Information) The run time for %s is %s, cpu time is %s.

**Description**

Prints the run time information for a step.

---

## CTS-105

(Information) All clock objects will be converted from ideal to propagated clock during CTS.

**Description**

CTS will change the clocks in active scenarios to be propagated.

**See Also**

- set_propagated_clock

---

## CTS-106

(Information) Relocated the clock cell '%s' from %s to %s.

Feedback

**Description**

This clock cell is relocated by CTS to improve the clock latency.

---

## CTS-107

(Information) %s will work on all clocks in active scenarios, including %d master clocks and %d generated clocks.

**Description**

Print the number of clocks for command to work on.

---

## CTS-108

(Information) There are %d skew groups in the mode '%s'.

**Description**

Print the number of skew groups in the specified mode for CTS to work on.

---

## CTS-109

(Information) Clock %s had a previously specified reference setting, which will be overwritten.

**Description**

Specified clock had a previously specified reference setting, which will be overwritten with latest setting.

**ALSO SEE**

`set_clock_tree_reference_subset (2)`

---

## CTS-110

(Information) %d references enabled for CTS.

**Description**

Prints the count of refrences enabled for LEQ cell using command derive_clock_cell_references.

---

## CTS-111

(Information) %d references are already enabled for CTS.

Feedback

**Description**

Prints the count of refrences which are already enabled for LEQ cell using command derive_clock_cell_references

---

## CTS-112

(Information) %d LEQ cells found but not enabled due to user set exclude purpose.

**Description**

Prints the count of LEQ cell refrences which are not enabled as user has set exclude purpose of lib cell using command derive_clock_cell_references.

---

## CTS-113

(Information) %d LEQ cells found but not enabled due to dont_touch on lib_cell.

**Description**

Prints the count of LEQ cell refrences which are not enabled due to dont_touch attribute using command derive_clock_cell_references.

---

## CTS-114

(Information) %d LEQ cells found but not enabled due to dont_use on lib_cell.

**Description**

Prints the count of LEQ cell refrences which are not enabled due to dont_use attribute using command derive_clock_cell_references.

---

## CTS-115

(Warning) Failed to legalize cell '%s'.

**Description**

CTS cannot to legalize this cell. The failure could be caused by various reasons, such as congested floorplan, blockages, or large clock cell spacing rules.

**What Next**

Check the floorplan for high utilization or blockages. If a clock cell spacing rule is specified, try to remove or modify this rule.

Feedback

## CTS-116

(Warning) Mode '%s' is not active. set_clock_tree_options -copy_exception_across_modes will be ignored.

**Description**

The "-from_mode" and "-to_mode" modes specified in the "set_clock_tree_options -copy_exception_across_modes" command are required to be active. Otherwise, there will be no exception copying and this option is ignored.

**What Next**

Make sure that the scenarios of the "-from_mode" and "-to_mode" are active before invoking synthesize_clock_trees.

## CTS-117

(Error) There is no active scenario with setup or hold timing analysis enabled.

**Description**

CTS will work on an active scenario with setup or hold timing analysis enabled. Since CTS does not find such a scenario, it will not do anything.

**What Next**

Check the analysis settings in all scenarios. Modify the scenarios settings by *set_scenario_status* command.

## CTS-118

(Error) The core area of this design is invalid.

**Description**

Since the core area of the design is invalid, it is not suitable to run clock synthesis.

**What Next**

Check design and fix the block.

## CTS-119

(Error) The current design has been routed, so it is not appropriate to run this command.

Feedback

**Description**

This command works on a pre-routed design. It exits because this design has been routed.

**What Next**

Check the design and the flow.

---

## CTS-120

(Warning) The balance_point phase delay values '%s' set on mode '%s' and at pin '%s' is too large and will be removed.

**Description**

The phase delay value of the balance_point (considered for balancing) is much more than the tool's internal upperLimit (currently set as 20ns). This may cause synthesize_clock_tree to either hang or have bad results. The balance_point exception will be removed.

**What Next**

Make sure that the balance point phase delay values are correctly set to a reasonable value.

---

## CTS-121

(Information) Firewall ICG %s sized to %s.

**Description**

This information shows the firewall ICG has been sized for power in gate-by-gate synthesis stage.

---

## CTS-122

(Information) %d firewall ICGs are found in the design, %d of them have been sized.

**Description**

This information prints the summary of firewall ICG sizing for power in gate-by-gate synthesis stage.

---

## CTS-123

(Warning) Skipped buffering for net %s as buffer models are not available in all domains.

Feedback

**Description**

Net cannot be buffered if buffer models are not available for the net in all voltage domains.

---

## CTS-124

(info) Total %d ICGs are not considered in merging for reasons: don't touch - %d; fixed - %d; other reasons - %d.

**Description**

This information prints the summary of ICGs not considered for merging because of restrictions.

---

## CTS-125

(info) %s: reason - %s

**Description**

This information prints the detailed restrictions of an ICG not considered for merging.

---

## CTS-126

(info) Total %d ICGs are unique in the design.

**Description**

This information prints the summary of unique ICGs for merging in design.

---

## CTS-127

(info) %s: reason - unique

**Description**

This information prints unique ICG for merging in design.

---

## CTS-128

(info) Information: Transitive-fanout-based Root NDR feature is turned ON.

**Description**

This information notifies user that the transitive-fanout-based Root NDR feature is on. User has set_clock_tree_options -root_ndr_fanout_limit set to a positive integer value.

Feedback

## CTS-129

(info) Information: There are %d pre-existing gates having transitive fanout greater than user-defined -root_ndr_fanout_limit %d

**Description**

This information notifies user that with transitive-fanout-based Root NDR feature on, the statistics of the pre-existing gates with transitive fanout greater than user-defined threshold.

## CTS-130

(Information) Clock {%s} with %d user-defined skew group%s has a target latency applied to its default skew group. The latenc%s of the user skew group%s may be altered to achieve the target on the default skew group.

**Description**

This is a notice that, when a target latency is applied to a clock with user skew group(s), the latencies of the user skew groups may not necessarily be preserved if the default skew group needs to be delayed to achieve the target latency.

## CTS-131

(Information) Clock {%s} with %d user-defined skew group%s has a target latency applied to its default skew group. The latenc%s of the user skew group%s will be preserved, but more buffers may need to be added and global skew may not be preserved in achieving the target latency.

**Description**

This is a notice that, when a target latency is applied to a clock with user skew group(s) and the user has requested the user skew group latencies to be preserved, more buffer chains may need to be added to achieve the target latency on the default skew group without affecting the user skew groups. As this may result in parallel buffer chains downstream from the clock root, the global skew may not be preserved during target delay insertion.

## CTS-132

(Information) To achieve the target latency on the default skew group of clock {%s} while preserving the latencies of user skew groups, %d parallel repeater chains will be inserted.

Feedback

**Description**

This is an informational message quantifying the effect of preserving the user skew group latencies of the clock in order to meet the target latency on the default skew group.

---

## CTS-133

(Warning) Skew group {%s} contains %ld non-boundary sink%s. The target latency constraint on this skew group will be ignored.

**Description**

A boundary skew group must only contain boundary sinks for the target latency constraint to be effective.

**What Next**

Check the skew group definition and remove the non-boundary sinks as listed in the report.

---

## CTS-134

(Warning) Unable to characterize library cell '%s' in corner '%s'. Please check your CTS reference cells.

**Description**

An unexpected or out-of-range value in the library cell definition has caused a calculation error while characterizing the delay model.

**What Next**

Check the definition of library cells used for CTS purpose.

---

## CTS-135

(Warning) A guide buffer of type '%s' could not be inserted on the net driven by '%s'.

**Description**

CTS inserts guide buffers for various reasons in order to separate a subtree of the clock network for the purpose of clock tree synthesis and optimization. No such guide buffer could be inserted on any of the hierarchies of this net, and the resulting lack of separation may have unintended consequences for clock tree synthesis and/or optimization.

**What Next**

Check the bufferability of this net.

Feedback

## CTS-136

(Warning) A guide buffer of type '%s' could not be inserted in front of %ld of %ld load(s) on the net driven by '%s'.

### Description

CTS inserts guide buffers for various reasons in order to separate a subtree of the clock network for the purpose of clock tree synthesis and optimization. No such guide buffer could be inserted on any of the hierarchies of this net, and the resulting lack of separation may have unintended consequences for clock tree synthesis and/or optimization.

### What Next

Check the bufferability of this net.

## CTS-137

(Warning) Delay insertion on driver pin '%s' skipped as the estimated number of repeater levels required to achieve the target delay exceeds the threshold.

### Description

CTS attempted to insert a chain of repeaters on this driver pin to achieve a certain target delay for skew reduction, but achieving such a target delay may result in long runtime and/or high power and area use.

### What Next

If it is expected to have to insert such a large number of repeaters to reduce skew within the clock tree, this checking may be disabled with *set_app_options -list {cts.common.unlimit_delay_insertion_stages true}*.

### See Also

- cts.common.unlimit_delay_insertion_stages

## CTS-138

(Warning) No buffer is inserted after root '%s' in %s.

### Description

CTS could not add buffers to balance the clock tree at this root with other clocks in the same balance group or roots within a multi-source clock.

Feedback

### What Next

Check constraints, available reference cells, and physical layout on the root net.

---

## CTS-139

(Information) CTO is relaxing latency of clock/skewgroups '%s' to benefit skew of clocks/skewgroups '%s'.

### Description

CTO is entering a mode of relaxing the latency of some clocks in order to benefit skew of some other clocks. This happens when the shortest path of the clocks to benefit skew are overlapping with longest/near-longest path of the clocks at least partially, and when there are no other places on the shortest path of the skew-benefit clocks to insert delay except the common path which share with the longest path of the clocks to relax latency.

### What Next

Please check the clock structure, especially those settings that is preventing delay insertion on shortest path of the skew-benefit clocks. If the settings are correct/expected, the relax of latency is expected.

---

## CTS-140

(Warning) The user-set target skew '%f' for clock '%s' is too tight (< '%f' of latency) and may cause too much latency degradation for the victim clock when advanced-skew-balance is trying to improve skew toward target skew.

### Description

CTO is entering advanced-skew-balance mode (a mode of relaxing the latency of some clocks in order to benefit skew of some other clocks). The target skew is being used to achieve better skew with the latency of some other clock increase tolerated. But the user-set target skew is too tight comparing to a certian percentage of its latency. Since CTO will try to improve skew towards user target skew, it may increase the other victim clock's latency by too much.

### What Next

Please check the target skew setting for the clock, keep in mind that working on skew too hard will increase latency of another clock.

Feedback

## CTS-141

(Information) Latency Bottleneck Path for clock '%s' and skew group '%s' in mode '%s' for clock root '%s':

**Description**

Reports the latency critical path for every clock and skew group in each mode for the primary corner.

## CTS-142

(Warning) To achieve the target latency for %s, %ld parallel repeater chains will be inserted.

**Description**

This warning message shows multiple parallel repeater chains will be added to cover the specific skew group without affecting the other sinks. It may heavily increase the repeater count.

**What Next**

Redefine the skew group or refine the clock tree structure to make all the sinks of that skew group in a separate branch.

## CTS-200

(Error) An unexpected error has occurred during CTS. Please report this information to Synopsys.

**Description**

An unexpected error has occurred during CTS.

**What Next**

The results of this command following this error may be unexpected. Please report this information to Synopsys.

## CTS-500

(error) Ignoring option set name '%s' as it hasn't been defined for '%s'.

Feedback

**Description**

The specified option set name has either not been defined or is not defined for the current application. Use the command 'set_multisource_clock_subtree_options' to define a set of options for subtree synthesis.

---

## CTS-501

(error) No option set exists for '%s'. Please use the '%s' command to define a set of options.

**Description**

The executed command requires that at least one option set with driver objects has been defined using the specified command.

---

## CTS-502

(info) option '%s' is ignored when option '%s' is specified.

**Description**

The printed options should not be used together. This is not an error but the first mentioned option is not considered by the command.

---

## CTS-503

(error) Net '%s' has no driver.

**Description**

The specified net cannot be used to determine a clock subtree driver. No port with direction 'in' or cell output pin is connected to the specified net.

---

## CTS-504

(error) Only driver pins are allowed. Pin '%s' is ignored.

**Description**

The specified cell pin is not of direction 'out'. Only output pins are allowed as driver objects.

---

## CTS-505

(error) Only driver ports are allowed. Port '%s' is ignored.

Feedback

**Description**

The specified port is not of direction 'in'. Only input ports are allowed as driver objects.

---

## CTS-506

(error) The -max_total_wire_delay option requires the -corners option.

**Description**

A corner or a list of corners is required in case the option -max_total_wire_delay is applied. The maximum total wire delay of a clock path from driver object to a sink can only be specified per corner.

---

## CTS-507

(error) Maximum total wire delay must be larger than 0.

**Description**

The maximum total wire delay is a delay value constraint that has to be positive.

---

## CTS-508

(error) The -corners option requires the -max_total_wire_delay option.

**Description**

A corner specification is only required if the -max_total_wire_delay option has been specified. The total maximum wire delay requires a corner.

---

## CTS-509

(error) '%s' is not a valid group name.

**Description**

The specified group name has not been defined using the 'set_multisource_clock_subtree_options' command.

---

## CTS-510

(warning) Clock '%s' not found in group '%s'.

Feedback

**Description**

The specified clock was not defined in the specified group using the 'set_multisource_clock_subtree_options' command.

---

## CTS-511

(warning) No maximum total wire delay defined for corner '%s' in group '%s'.

**Description**

There was no total maximum wire delay defined for the specified corner using the 'set_multisource_clock_subtree_options' command.

---

## CTS-512

(warning) No drivers defined for group '%s'.%s

**Description**

There are no driver objects specified using the 'set_multisource_clock_subtree_options' command for the specified group.

---

## CTS-513

(error) Wrong order of flow steps of options -from and -to.

**Description**

The flow step as specified by option -from has to be equal to or comes before the flow step as specified by option -to. The flow step order is: merge, optimize, route_clock.

---

## CTS-514

(warning) Couldn't create a unique %s name with prefix '%s' and suffix '%s'.

**Description**

The tool was unable to create a database object of the specified type with the given prefix and suffix settings. A reason could be that too many objects of the given type had to be created.

---

## CTS-515

(warning) %s Couldn't delete cell '%s'.

Feedback

**Description**

The tool was unable to delete a cell. Please check attributes on the cell or the hierarchy the cell belongs to.

---

## CTS-516

(warning) Failed to disconnect pin '%s'.

**Description**

The tool was unable to disconnect a cell pin from its net.. Please check attributes on the cell or the net the pin is connected to.

---

## CTS-517

(warning) Clock '%s' in mode '%s' is not valid in any timed scenario. The clock is skipped.

**Description**

There is no active timed scenario (hold or setup) that refers to the mode of the clock. As a consequence, no timing infromation for the clock is available.

**What Next**

Create and/or activate a scenario with the mode of the clock.

---

## CTS-518

(warning) No clock found for driver '%s'. This driver is skipped.

**Description**

A driver object was defined for a group using the 'set_multisource_clock_subtree_options' command which is not part of a clock path, i.e. no clock is arriving at that object. The driver object is ignored by synthesis.

---

## CTS-519

(warning) No driver for sink '%s'.

**Description**

While traversing a clock subtree to prepare synthesis, a clock sink was reached which is not reachable from a driver object.

Feedback

## CTS-520

(warning) Cannot resize lib cell '%s' because no context-valid lib cells are available.

**Description**

No library cell class nor a logically equivalent library cell was found for sizing.

## CTS-521

(error) The option set name '%s' is already used by %s.

**Description**

Subtree synthesis and tap assignment cannot use the same option set name.

**What Next**

Please use the -name option and select a different name.

## CTS-522

(warning) Failed to resize cell '%s' from '%s' to '%s'.

**Description**

The tool was unable to change the library cell of the specified cell to the specified library cell. Please check attributes on the given objects that might prevent resizing.

## CTS-523

(error) Pin '%s' is part of subtree '%s' but a driver of a subtree as well.

**Description**

A driver object that has been specified by the 'set_multisource_clock_subtree_options' command is in the fanout of another driver object. A nesting of clock subtrees is not allowed.

## CTS-524

(info) Selecting clock '%s' in scenario '%s' for driver '%s'.

**Description**

The specified clock arrives at the specified driver object. Constraints for that clock in the indicated scenario will be used to synthesize the subtree starting at the driver object.

Feedback

## CTS-525

(info) A maximum total wire delay of %s has been defined for this driver.

**Description**

A maximum total wire delay has been specified for a clock subtree using the 'set_multisource_clock_subtree_options' command.

## CTS-526

(info) %s '%s' is not splittable since %s.

**Description**

The object with the given path name cannot be split. This message prints the reason for it.

## CTS-527

(info) Found clock cell '%s' without a sub-tree behind it. Will treat this cell as a sink of the tree.

**Description**

A non-sequential cell in the clock subtree has no fanout. The cell is treated as a sink during subtree synthesis.

## CTS-528

(info) Resized %d cells to a different library cell.

**Description**

To prepare the synthesis of clock subtrees all non-sink clock cells are resized to a certain drive strength.

## CTS-529

(warning) Cannot move cell '%s' to (%s).

**Description**

The tool failed to place a clock cell to the desired location. Reasons could be cell congestion or blockages.

Feedback

## CTS-530

(warning) Large displacement of %s while moving cell '%s'. Placed location: {%s} target location: {%s}.

**Description**

The tool failed to move a clock cell to the desired location. Reasons could be cell congestion or blockages.

## CTS-531

(error) Couldn't connect pin '%s' of a splitted cell.

**Description**

The tool failed to connect a new cell pin. Please check attributes on the cell and the corresponding hierarchy levels.

## CTS-532

(error) No tree found for node '%s'.

**Description**

While splitting clock cells to assign them to preroute structures, the tool was unable to find a matching subtree for a given node. This indicates a synthesis problem.

## CTS-533

(warning) Total wire delay violation on path through cell '%s' which cannot be split. Total wire delay: %s.

**Description**

A maximum total wire delay violation was detected on a clock path through the specified cell. However, the cell could not be split to reduce the total wire delay.

## CTS-534

(warning) Latency violation at cell '%s' which cannot be split to fix the violation. Latency %s.

Feedback

**Description**

A latency violation was detected on the specified cell. However, the cell could not be split to reduce the latency.

---

## CTS-535

(warning) Failed to split cell '%s'. This might degrade QoR.

**Description**

The tool was unable to split the specified cell. A reason could be that cells in the direct fanout are placed at identical locations.

---

## CTS-536

(warning) DRC violation at output '%s' which cannot be split. Max trans: %s max cap: %s fanout: %d.

**Description**

A DRC violation (max transition, max capacitance, or max fanout) was detected on the specified cell output. However, the cell could not be split to reduce or fix the violation.

---

## CTS-537

(warning) Failed to move sink '%s' to nearest cluster at (%s).

**Description**

The tool was unable to reassign a clock sink to a different driver pin. This might degrade QoR.

---

## CTS-538

(warning) Failed to delete a dangling tree node at output '%s' because it still has still loads.

**Description**

The tool was unable to remove a cell which is supposed to not drive any sinks anymore. The connected pins are printed out.

---

## CTS-539

(warning) Unable to connect loads to output '%s'.

Feedback

**Description**

The tool was unable to reconnect clock cell inputs to the specified output. The input pins are printed out.

---

## CTS-540

(info) %s violation detected at cell '%s' (latency: %s, wire RC: %s).

**Description**

The tool has detected a violation on a cell which will be split.

---

## CTS-541

(info) Created new cell '%s' with a fanout of %d. tran: %g latency: %g.

**Description**

The tool has created a new cell by splitting.

---

## CTS-542

(info) Created new cell '%s' with a fanout of %d.

**Description**

The tool has created a new cell by splitting.

---

## CTS-543

(info) Preroute splitting created new cell '%s' with a fanout of %d.

**Description**

The tool has created a new cell by splitting for preroute shapes.

---

## CTS-544

(warning) Cannot extract preroutes: no net connected to driver '%s'.

**Description**

No net preroute shapes could be extracted as the clock subtree driver has no net connected to it.

Feedback

## CTS-545

(warning) Cannot extract preroutes: no physical net attached to net '%s'.

**Description**

No net preroute shapes could be extracted as the net connected to the clock subtree driver has no physical information.

## CTS-546

(error) Could not identify any multi-source subtree drivers.

**Description**

The 'synthesize_multisource_clock_subtrees' command could not find any groups to synthesize. Please use the 'set_multisource_clock_subtree_options' command to define a group.

## CTS-547

(error) Failed to mark clock trees.

**Description**

The clock tree marking step failed.

## CTS-548

(error) Failed to legalize placement.

**Description**

The final legalization step failed.

## CTS-549

(error) Failed to route clock nets.

**Description**

The final detail routing of the clock nets failed.

## CTS-550

(info) Successfully %s.

Feedback

**Description**

The given step finished successfully after synthesizing the clock trees.

---

## CTS-551

(warning) Merge: Failed to move first-level cell '%s' from root '%s' to root '%s'.

**Description**

The command 'synthesize_multisource_clock_subtrees' was unable to reconnect a first-level clock cell to a closer driver object.

---

## CTS-552

(warning) Cannot rename cell '%s' while merging to '%s'.

**Description**

The command 'synthesize_multisource_clock_subtrees' could not change the cell name of a merged cell according to the merge naming rule using prefix, suffix, and name concatenation.

---

## CTS-553

(info) Merge: Moved first-level cell '%s' from root '%s' to root '%s'.

**Description**

The command 'synthesize_multisource_clock_subtrees' reconnected a first-level clock cell to a closer driver object.

---

## CTS-554

(error) Check failed after %s.

**Description**

This message indicates a severe problem. The synthesis might have created a netlist which is not equivalent with the original netlist. Check previous warning and error messages for failures.

---

## CTS-555

(error) Failed to create subtree '%s'.

Feedback

**Description**

The command 'synthesize_multisource_clock_subtrees' was unable to create a tree representation of the given driver object.

---

## CTS-556

(error) Splitting %s failed for subtree '%s'.

**Description**

The command 'synthesize_multisource_clock_subtrees' was unable to perform the described task for the subtree of the given driver object. Please check for earlier error and warning messages or enable verbose output.

---

## CTS-557

(error) Snapping of first-level cells failed.

**Description**

The command 'synthesize_multisource_clock_subtrees' was unable to snap the first-level clock cells close to the preroutes of the subtree driver.

---

## CTS-558

(error) Switching clocks to propagated mode of the trees failed.

**Description**

The command 'synthesize_multisource_clock_subtrees' was unable to switch the relevant clocks to propagated mode. This might result in wrong timing results in the clock tree.

---

## CTS-559

(warning) Failed to snap first level cell '%s' to %s.

**Description**

The command 'synthesize_multisource_clock_subtrees' was unable place the specified cell close to a preroute shape. Reasons might be cell congestion or placement blockages.

---

## CTS-560

(warning) Preconditioning of the clock trees failed.

Feedback

**Description**

Some setup steps failed while executing the command 'synthesize_multisource_clock_subtrees'. Please check earlier warning or error messages or enable verbose output.

---

## CTS-561

(warning) Clock subtrees of clock '%s' at root pin '%s' have no considered sinks. Optimization will be skipped.

**Description**

The clock subtrees of the clock do not have considered sinks. This means that there are no sinks, or that none of the sinks is considered for balancing. As a consequence no latency nor skew optimization will be performend.

**What Next**

Check the netlist to see whether any sinks are connected to the mentioned root pin. Check the 'set_clock_balance_point -consider_for_balance false' constraints to make sure that not all sinks are ignored for balancing.

---

## CTS-562

(warning) Adding multiple clocks to a group '%s' is not recommended. This might degrade QoR or lead to other problems during synthesis. For example, constraints referring to these clocks are not adapted when moving first-level clock cells from a clock source of one clock to a clock source of a different clock.

**Description**

It is recommended that you use multiple groups if you want to synthesize a set of clocks. Each group can have several clock sources of the same clock.

---

## CTS-563

(error) Design %s has no technology data.

**Description**

There is no technology data associated with the design.

---

## CTS-564

(error) Design %s has no physical data.

Feedback

**Description**

There is no floorplan defined for the design.

---

## CTS-565

(error) Design %s has invalid global-route cells.

**Description**

The design is not yet setup properly for running global routing.

---

## CTS-566

(error) Detected reconvergence in the clock tree at pin '%s'. This is not supported.

**Description**

There is a reconvergent clock structure at the reported pin. This command does not support subtrees with such clock structures.

---

## CTS-567

(error) There are design constraints that refer to hierarchical clock pin '%s'. This is not supported.

**Description**

There are design constraints that refer to the reported hierarchical pin. This command does not support subtrees with such hierarchical pins.

---

## CTS-568

(error) Multiple clocks used for drivers in group '%s'. Please restrict the number of clocks to one when defining the group with 'set_multisource_clock_subtree_options'.

**Description**

The tool was unable to select a single clock for all subtree drivers of the specified group. It is recommended that you use multiple groups if you want to synthesize a set of clocks. Each group can have several clock sources of the same clock.

---

## CTS-569

(info) Optimization %s %d cell%s to %s.

Feedback

**Description**

This message summarizes netlist changes for subtree optimization.

---

## CTS-570

(error) Sink alignment failed.

**Description**

This message indicates that the sink alignment step failed. Check previous warning and error messages.

---

## CTS-571

(warning) Routing failed for net '%s': %s.

**Description**

This message explains why the given net cannot be routed.

---

## CTS-572

(error) No options have been defined for the specified clock%s.

**Description**

The -clocks option specifies clocks for which no option set has been defined.

---

## CTS-573

(info) Using target latency %s for clock '%s' at corner '%s'.

**Description**

A target latency value has been specified using the set_clock_tree_options command for the given clock.

---

## CTS-574

(info) Skew mode enabled. Using an estimated target latency %s for clock '%s' at corner '%s'.

Feedback

**Description**

No target latency value has been specified using the set_clock_tree_options command for the given clock. The synthesis command will use an estimated target latency to perform clock cell splitting.

---

## CTS-575

(info) Skew mode is enabled for all clocks.

**Description**

A target latency value has not been specified using the set_clock_tree_options command for all the clocks. The synthesis command will use an estimated target latency to perform clock cell splitting. You can increase the verbosity to see the estimated target latency per clock driver.

---

## CTS-576

(Error) Port '%s' is unplaced. This command requires a placed design.

**Description**

This command requires that the ports driving the clock subtrees, are placed.

**What Next**

Check that the reported port has terminals.

---

## CTS-577

(Error) Cell '%s' is unplaced. This command requires a placed design.

**Description**

This command requires that the cells connected to the clock subtrees, are placed.

**What Next**

Check the placement status of the reported cell.

---

## CTS-578

(warning) %s arrive at the driver '%s'. The cell of that driver is skipped.

Feedback

**Description**

The user has restricted the command to a set of clocks. However, none of the specified clocks propagate through the specified driver. The driver object is ignored by synthesis.

---

## CTS-579

(warning) The clock '%s' of group '%s' doesn't arrive at the driver '%s'. The cell of that driver is skipped.

**Description**

The user has specified a clock of a synthesis group. However, that specified clock doesn't propagate through the specified driver. The driver object is ignored by synthesis.

---

## CTS-580

(error) No groups specified. Please use the 'set_multisource_clock_subtree_options' command to define at least one group.

**Description**

The executed command requires that at least one group has been defined using the 'set_multisource_clock_subtree_options' command.

---

## CTS-581

(warning) %s {%s} is outside of track area.

**Description**

The requested strap shape cannot be created because there are no routing tracks at the strap location.

**What Next**

No routing tracks could be identified at or near the requested location that satisfy the -margins setting. Make sure that there are routing tracks in the requested layer at the requested location.

---

## CTS-582

(info) Created %d %s (shifted %d tracks%s).

Feedback

**Description**

Straps were created. The message contains information about the number of straps, the shift with respect to the requested location and about the shielding of the straps.

**What Next**

No action is required. This is an informative message.

---

## CTS-583

(info) Found %d %s shielding shapes for biasing.

**Description**

Informative message about the number of shielding shapes that were found for biasing the straps.

---

## CTS-584

(warning) Cannot create %s side of ring.

**Description**

The indicated side of the ring cannot be created.

**What Next**

Check for blockages at the location where the ring should be created.

---

## CTS-585

(error) No spine shapes found%s.

**Description**

The tools was unable to detect spine shapes that can be used for stripe connection to the net.

**What Next**

Make sure that there are spine shapes to connect the stripes to.

---

## CTS-586

(info) Spine {%s} of net %s has influence area {%s}.

Feedback

**Description**

Reports the influence area of a detected spine. Stripes in that area will be connected to this spine.

---

## CTS-587

(info) Created ring with bounding box {%s}.

**Description**

Reports the bounding box of the created ring around the mesh.

---

## CTS-588

(error) Could not create ring shapes.

**Description**

The ring around the mesh could not be created.

**What Next**

Check for blockages at the locations where the ring should be created.

---

## CTS-589

(warning) Could not create the %s-ends part.

**Description**

The ends part as requested by the -create_ends option could not be implemented.

**What Next**

Check for blockages at the locations where the ends should be created.

---

## CTS-590

(warning) No %s grid defined.

**Description**

No grid definition for the named direction was specified. As a consequence, no regular stripes in that direction will be created.

Feedback

**What Next**

If this is the intention, no action is required. Otherwise, please specify a grid using -grid {start stop step}

---

## CTS-591

(warning) Margin is set to 0 for %s straps. Grid point should be exactly on routing tracks.

**Description**

When the margin is 0, straps will only be created if the specified grids are exactly on routing tracks.

**What Next**

Specify a non-zero margin using the -margin option to allow snapping of the grids to routing tracks.

---

## CTS-592

(warning) Skipped creation of %s strap {%s} because it is not inside the boundary.

**Description**

The strap was not created because it is outside the area for strap creation. The area for strap creation is the core area of the block. If an explicit boundary was specified using the *-boundary* option, then the intersection of that boundary and the core area is considered as the area for strap creation.

**What Next**

Enlarge the boundary or change the strap grid definition.

---

## CTS-593

(warning) Could not create %s strap {%s} because %s.

**Description**

The strap was not created. There can be multiple reasons. 1. The strap would cause a design rule violation (spacing, overlap, ..) with existing shapes. 2. The strap would overlap with user specified keepouts (using the -keepouts option). 3. The strap does not connect to shapes in the orthogonal direction because it does not overlap with any of those orthogonal shapes, or it is impossible to connect to the orthogonal shape with a via.

Feedback

**What Next**

Inspect the layout for other shapes in the same layer that may cause DRCs. Check the position of keepouts and see whether the requested strap would overlap with a keepout region. If the -allow_splitting option was set to false, you don't allow partial straps to be created. In that case, straps that do not span the full width or height of the bounding box will be skipped. Use the -allow_floating option if you do not require straps to connect to shapes in the orthogonal layer. Use app option cts.common.verbose to increase the verbosity such that more information about the exact cause of the problem is printed.

---

## CTS-594

(info) Requested creation of %d %s stripes.

**Description**

Reports the requested number of stripes in the named direction based on the grid definition.

---

## CTS-595

(warning) %d %s grid lines were skipped because %s.

**Description**

Reports the reason why straps at certain grid lines were not created.

**What Next**

Increase the value of cts.multisource.verbose to increase the verbosity level of the command.

---

## CTS-596

(info) Created %d %s straps on %d grid lines.

**Description**

Reports the number of straps that were created in the named direction. It also reports how many grid lines are addressed by these straps.

---

## CTS-597

(info) Created %d end-straps on %d grid lines.

Feedback

**Description**

Informative message on the number of end straps (induced by the -create_ends options) that were created.

---

## CTS-598

(info) For influence area {%s} the specified length is too large for the specified backoff value.

**Description**

Both -length and -backoff values were specified. The length could not be realized without violating the backoff value. The backoff is respected, and the length was decreased.

**What Next**

In general, this is not a problem. Both -length and -backoff define the final length of the stripes and the length will be adjusted if the backoff value is violated.

---

## CTS-599

(warning) Physical net for %s was not found. This net is skipped.

**Description**

During clearing of straps, the named physical net could not be found.

---

## CTS-600

(info) Removed %d shapes from net %s.

**Description**

During clearing of straps, the number of shapes that is removed from the named net is reported.

---

## CTS-601

(info) Creating ring.

**Description**

Informative message that ring creation has started.

Feedback

## CTS-602

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the create_clock_straps command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of create_clock_straps for more information about argument syntax and semantics.

## CTS-603

(error) Could not create straps.

**Description**

The command failed because no straps were created.

**What Next**

Earlier errors should indicate what the cause of the failure is. Please scroll up in the log to check for earlier errors.

## CTS-604

(info) %s layer %s will be used in non-prefered direction.

**Description**

For the named layer, straps in the non-prefered direction will be created. This should only happen if the user has requested this.

**What Next**

No further action required. This is just an informative messages.

## CTS-605

(info) No -boundary specified. Using core area {%s}.

**Description**

The user did not specify a -boundary for strap creation. As a consequence, straps will be created for the full core area of the block.

Feedback

**What Next**

No further action required. This is just an informative messages.

---

## CTS-606

(info) Using double spacing (%s) for backoff.

**Description**

The user did not specify a -backoff for strap creation. By default, double width-dependent minimum spacing is used as a separation of stripes that are connected to different spines.

**What Next**

See the manual page of create_clock_straps for the semantics of -backoff.

---

## CTS-607

(info) Found %s net for shielding: %s.

**Description**

The named power or ground net was identified as a net that can be used for shielding of the created straps.

**What Next**

No further action required. This is just an informative messages.

---

## CTS-608

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the create_clock_drivers command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of create_clock_drivers for more information about argument syntax and semantics.

---

## CTS-609

(warning) Failed cell placement prevents further splitting of that cell and its clones.

Feedback

**Description**

The tool failed to place a clock cell to the desired location. No additional splitting will happen to that cell and its clones.

**What Next**

Check for limited area in voltage areas or move bounds. Placement blockages might also cause over-utilization.

---

## CTS-610

(warning) The option '%s' is deprecated and will be removed in future. Please use option '%s' instead.

**Description**

The given option is deprecated. Please use the replacement option as given in this message.

---

## CTS-611

(error) Multi-output clock cell '%s' detected. This is only supported if at most one output is connected to a net.

**Description**

Cells with multiple connected outputs are currently not supported by the executed command. Only one of the outputs is allowed to be connected to a net.

**What Next**

If multiple output pins are connected to nets but only one of them has loads, then remove the net without any loads.

---

## CTS-612

(warning) Some cells are not allowed to be %s. Reasons are:

**Description**

The listed constraints prevent the command from merging or splitting some cells.

**What Next**

Set the application option cts.multisource.verbose to 8 to get list of cells with a reason why it cannot be split or merged with CTS-613 messages. Check whether the constraints are intended and remove them to enable cell merging and splitting.

Feedback

## CTS-613

(warning) Cell '%s' is not %s since the cell %s.

### Description

The message provides an indication of why a cell cannot be split or merge. Following are the reasons that prevent clock cell splitting and merging:

```
1. Cell has physical_status: locked, legalize_only, or fixed
2. Cell has user_size_only or dont_touch
3. Constraints on path between its driver and the loads of this cell:
    a. A don't-touch net between driver and a load
    b. Path crosses a physical hierarchy
    c. Path crosses a power domain boundary and port punching on it is
 not allowed
    d. A logical read-only hierarchy (like a black box)
    e. A hierarchy with frozen ports: Either due to set_freeze_ports or
 due to
       timing constraints on the hierarchical pin
```

### What Next

Please check net don't touch settings or constraints on the logical and physical hierarchies.

## CTS-614

(error) The %s '%s' is ignored as it is already defined as a driver object for %s.

### Description

The given pin or port has already been specified as a driver object for a different purpose.

### What Next

Either correct the pin or port name or remove ther option setting that revers to this driver object.

## CTS-615

(Error) Net %s cannot be routed by route_clock_straps, because %s.

### Description

The route_clock_straps command can only be used to route clock nets with clock straps. The given net does not satisfy one of these criteria, as explained in the message.

Feedback

## CTS-616

(Error) The %s routing step failed.

**Description**

The given routing step of the route_clock_straps command failed for one or more of the given nets. See output earlier in the log for more details.

## CTS-617

(Error) %s routing cannot route net %s, because %s.

**Description**

Routing for given topology cannot be done, for the reason explained in the message.

## CTS-618

(warning) Large legalization distance %s for cell %s. It was moved from preferred location {%s} to legalized location {%s}.

**Description**

The cell was moved over a large distance during legalization. No -max_displacement option was given, so the cell was inserted at the legalized location. This may point to high utilization, or blocked area near the preferred location.

**What Next**

Check the floorplan for high utilization or blockages. Consider to specify a -max_displacement to avoid that cells get inserted far away from the preferred location.

## CTS-619

(warning) Option -convert_ideal_latencies is deprecated. It will not be supported in future releases. Please use derive_clock_balance_points for ideal latency conversion.

**Description**

The automatic conversion of ideal latencies to set_clock_balance_points constraints is not supported as an option anymore. There is a separate command *derive_clock_balance_points* that is doing this conversion. Use the *-reference_latency 0.0* option to get the same behavior as -convert_ideal_latencies.

**What Next**

Adapt your script to change

Feedback

```
synthesize_multisource_clock_subtrees -convert_ideal_latencies
```

to

```
derive_clock_balance_points -reference_latency 0.0
    synthesize_multisource_clock_subtrees
```

## CTS-620

(warning) Below lib cells will not be used because these lib cells %s%s:

**Description**

The specified lib cells will not be used during clock driver insertion for the reason as mentioned in the message.

**What Next**

Check whether the mentioned reason is expected. If not, use commands set_lib_cell_purpose, set_dont_touch or set_dont_use to change the lib cell attributes as required. If the reason is expected, you may consider to not pass the offending lib cells to the create_clock_drivers command. That will avoid the message.

## CTS-621

(error) Below lib cells are not buffers%s:

**Description**

The specified lib cells can not be used during clock driver insertion because these are not buffer lib cells.

**What Next**

The create_clock_drivers command only accepts buffers as lib cells. If other cells need to be inserted, you need to insert a template cell in the netlist and use the -template option to indicate that this template cell should be cloned.

## CTS-622

(error) A mix of buffers and inverters is specified in the -lib_cells option%s.

**Description**

The polarity of all cells in the list of lib_cells should be the same.

**What Next**

Remove either the inverters or the buffers from the list of lib_cells.

Feedback

## CTS-623

(error) No usable lib cells found, aborting clock driver insertion%s.

**Description**

None of the specified lib_cells can be used by create_clock_drivers. The reasons why certain lib_cells could not be used were listed in earlier messages.

**What Next**

Make sure to specify at least one lib_cell that can be used for clock driver insertion.

## CTS-624

(error) %s Both -template and -lib_cells defined%s. This is not supported.

**Description**

For each level, the create_clock_drivers command can either insert buffers/inverters, or clone an existing template cell to create the drivers. It cannot do both.

## CTS-625

(error) Pin '%s' is not connected to the proper net. This pin is skipped.

**Description**

All load pins should be connected to the same physical net. The mentioned pin is connected to a different physical net than the others.

**What Next**

Make sure that all specified load pins are connected to the same physcial net.

## CTS-626

(error) Net driver pin/port could not be identified%s.

**Description**

The net of the specified load pins does not have a driver. The create_clock_drivers command requires that the net of the load pins is driven.

**What Next**

Make sure that a driver of the load pins exists in the netlist.

Feedback

## CTS-627

(error) Driver of net '%s' is a port. This is not supported with -template%s.

**Description**

The -template option instructs the create_clock_drivers command to clone the existing driver cell of the load net. If the load net is driven by a port, there is no template cell that can be cloned.

**What Next**

Make sure that the load net is driven by a lib_cell when using -template.

## CTS-628

(error) Load net '%s' is multi-driven. This is not supported with -template%s.

**Description**

The -template option instructs the create_clock_drivers command to clone the existing driver cell of the load net. If there are multiple driving cells, the driver cannot be identified.

**What Next**

Make sure that the load net is driven by a single lib_cell when using -template.

## CTS-629

(Warning) Restricting the %s value to %s, to ensure proper comb routing.

**Description**

The given fishbone (sub-)span is restricted to the value reported in the message, to avoid that in the resulting fishbone routing, the distance from the pins to the fishbone topology exceeds the maximum comb routing distance.

## CTS-630

(Warning) Ignoring stripe {{%.3f %.3f} {%.3f %.3f}} on layer %s because it does not follow the preferred routing direction.

**Description**

The stripe shape indicated in the message is ignored by fishbone routing, because it does not follow the preferred routing direction of the layer. Comb routing can still connect to the stripe.

Feedback

## CTS-631

(Error) Option %s can only be used with a fishbone topology.

**Description**

The given option of the route_clock_straps command only applies to the fishbone topology and cannot be used with -topology comb.

## CTS-632

(Warning) Failed to route a fishbone finger to the following pins: %s. These pins will still get connected to a clock stripe by comb routing.

**Description**

The route_clock_straps command failed to route a fishbone finger to the reported pins. These pins will still be connected to the nearest clock stripe by comb routing, but that can require a longer comb route.

## CTS-633

(Warning) Found: %d dont-touch net%s, %d power-domain boundary pin%s, %d physical hierarchy pin%s, and %d frozen hierarchy pin%s limiting clock cell merge and split.

**Description**

In case there is a dont-touch net, a power domain boundary, a physical hierarchy pin, or a frozen hierarchy pin between a driver and its fanout, then the driver cell cannot be split or merged together with an equivalent cell. You can set the application option cts.multisource.verbose to 8 to see a full list of pins that are affected by these settings.

**What Next**

Check that any reported don't touch net or frozen pin is required. If not, clear the corresponding setting and rerun the command.

## CTS-634

(Error) Detected cyclic dependency while calculating the level of cell '%s'.

**Description**

Before performing splitting to fix DRC violations, all cells get a level assigned. Cells with highest level (counted from the driver object) are split first. Levelizing cells requires that there are no cycles in the clock path. This message indicates that a cycle has been found around the given cell.

Feedback

**What Next**

If the cycle is inside the enable logic paths, then try to use a lower tracing level number.

---

## CTS-635

(error)MV aware global clock tree construction is not possible, because %s.

**Description**

The analysis of the problem instances showed that global clock tree construction is not possible due to limitations in the supported configurations. Either change the location of the global tree sinks, or modify the area where to place the clock drivers.

---

## CTS-636

(error)MV analysis indicates that below required buffering configuration does not lead to valid supply information.

**Description**

During the global clock tree construction a required buffering configuration was encountered for which the multi voltage infrastrcuture indicated that no valid setup could be found.

**What Next**

To find more details use command *check_bufferability* and pass the shown configuration. If possible correct the setup and re-run the command.

---

## CTS-637

(error) Stop processing because no valid buffering solution was found for net '%s'.

**Description**

The command *synthesize_multisource_global_clock_trees* evalutes several solutions to buffer a given net. Many restrictions, foremost multi-volatge related ones, are limiting or excluding possible solutions.

**What Next**

To find more details use command *check_bufferability* for the failing net. If possible correct the setup and re-run the command.

Feedback

## CTS-638

(warning) Dropping %s rail %s '%s' because %s.

**Description**

The command *synthesize_multisource_global_clock_trees* expects that either all user specified repeaters are of version single or dual rail, or for each repeater type there is a pair of single and dual rail version specified which are from their repective electrical behavior (input capacitance, internal deay and load dependend delay) exchangable. This is necessary to obtain a balanced global tree. Please note that the pairing is based on the specified order of library cells passed with option *-lib_cells* of command *synthesize_multisource_global_clock_trees*.

**What Next**

Check the set of library cells passed with option *-lib_cells* into command *synthesize_multisource_global_clock_trees* and adopt it if necessary to match the above specified requirements.

## CTS-639

(error) Stop processing because no buffering solution was found at level '%d'.

**Description**

The command *synthesize_multisource_global_clock_trees* evalutes several solutions to buffer a given net. Many restrictions, foremost multi-volatge related ones, are limiting or excluding possible solutions.

**What Next**

To find more details, see warning *CTS-640*. If possible choose different lib-cells and re-run the command.

## CTS-640

(warning) There was no meaningful pairing of single/dual rail buffers to drive.

**Description**

Not able to find a pair of single/dual rail buffers to drive a meaningful distance.

## CTS-641

(Information) Selecting via ladder %s for pin %s.

Feedback

### Description

The command *synthesize_multisource_global_clock_trees* applies suitable via ladder constraints on output and input pins of inserted buffers considering user input as well as library constraints.

---

## CTS-642

(Error) The timer anchor driver '%s' of the driver object '%s' is not on the clock network of clock '%s'.

### Description

In the MSCTS flow, a mesh net can be modeled by defining annotated delay and transition values for all mesh drivers along with the mesh net and mesh loads. For a multi-driven net the timer disables all but one mesh driver internally, the driver with timing arc retained is termed as anchor driver. Ensure there are no user defined disabled timing arcs for the mesh drivers and let tool derive the same since a mismatch can result in a case where no clock reaches the subtree driver object.

### What Next

Check with the 'report_disable_timing' command whether the input to output arc of the timer anchor is enbled.

---

## CTS-643

(Warning) Could not place cell %s at location (%f, %f) due to existing pre-routes. Removing the temporary placement blockages for the remaining flow and trying to place the cell again. This could lead to high run time at routing stage and could also leave some nets unrouted in the worst case.

### Description

Metal shapes in preferred routing layers are converted to placement blockages before placing the cells. However, if it is not possible to place one or more cells with the existing blockages, the placement blockages are removed and the cells are placed. This is equivalent to the behaviour of app option cts.multisource.enable_pin_accessibility_for_global_clock_trees being set to false. This could lead to high run time at routing stage and could also leave some nets unrouted if the pins of some of the cells are inaccessible due to pre-routes.

---

## CTS-644

(Error) No active scenario with setup or hold enabled found for clock '%s' in mode '%s' for option set '%s'.

Feedback

**Description**

Each option set for MSCTS has a clock defined for a given mode. It is required that a scenario exists with that mode which is active and has either setup or hold analysis defined. This message indicates that no such scenario is found for the named option set.

**What Next**

Check with the 'report_multisource_clock_subtree_options' respectively the 'report_multisource_clock_tap_options' command whether the specified clock is defined for the right mode. Use the 'report_scenarios' command to check that the desired scenario is active and activated for stup or hold analysis.

---

## CTS-645

(info) Reconvergence detected for clock '%s' at pin '%s' through input pins %s.

**Description**

Multiple paths of a clock are reconverging through different input pins of clock cell.

---

## CTS-646

(info) Clocks %s overlap at pin '%s' through input pins %s.

**Description**

Paths of different clocks are overlapping through different input pins of a clock cell.

---

## CTS-650

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the synthesize_multisource_global_clock_trees command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of synthesize_multisource_global_clock_trees for more information about argument syntax and semantics.

---

## CTS-651

(error) Skipping library cell '%s' because it is neither a buffer nor an inverter.

Feedback

**Description**

The specified library cell has to be of type buffer or inverter.

**What Next**

Check the option '-repeaters' and remove all library cells which are neither buffer nor inverter.

---

## CTS-652

(error) Skipping repeater '%s' because flag 'dont_touch' is set to true.

**Description**

The specified library cell of type repeater is marked 'dont_touch' and hence is not allowed to be used.

**What Next**

If the repeater has to be used use command 'set_dont_touch' to overwrite the flag. Otherwise check the option '-repeaters' and remove all library cells with mark 'dont_touch'.

---

## CTS-653

(error) Skipping library cell '%s' because it does not belong to a reference library of the current design.

**Description**

The specified library cell belongs to a library which has not been used for linking the current design.

**What Next**

Check the option '-repeaters' and remove all library cells which are not belonging to the list of linked libraries.

---

## CTS-654

(error) No legal repeater remain from option '-repeaters'.

**Description**

The checking of all library cells specified with option '-repeaters' end in an empty list of usable repeaters.

Feedback

**What Next**

Check the option '-repeaters' and specify a list of library cells which are legal repeaters.

---

## CTS-655

(error) No physical net found for net '%s' which should be synthesized.

**Description**

No physical net information has been found for given logical net.

**What Next**

Check the consistency of the database.

---

## CTS-656

(error) No %s routing layer specified for net '%s'.

**Description**

For each net to be synthesized and/or routed a min and max routing layer must be found to guide the router where to implement the physical layout of the net.

**What Next**

Use command 'set_routing_rule' or 'set_clock_routing_rules' to explicitly defined a lowest or highest routing layer to be used for that net.

---

## CTS-657

(error) The min/max layer specification for net '%s' ' does not include a %s routing layer.

**Description**

The specified min/max routing layers for the given net have to cover a horizontal and a vertical routing layer.

**What Next**

Check the specification of command 'set_routing_rule' and/or 'set_clock-routing_rules' for that net. If neither is given, check if the highest two routing layers of the technolgy are orthogonal to each other.

Feedback

## CTS-658

(error) The min/max layer specification for net '%s' has to form an adjacent set of horizontal/vertical routing layers."

**Description**

The sepcified min/max routing layer pair for the given net has to be an adjacent layer pair.

**What Next**

Check the specification of command 'set_routing_rule' and/or 'set_clock-routing_rules' for that net.

## CTS-659

(info) Using routing H/V layer pair '%s'/'%s' for net '%s'.

**Description**

Reports the used horizontal an vertical routing layer for the given net.

## CTS-660

(error) Stop processing because the set of loads of net '%s' are not distributed on a regular and uniform grid.

**Description**

The command 'synthesize_multisource_global_clock_trees' assumes that the loads for which a global tree should be synthesized are distributed in a regular and uniform grid.

**What Next**

Inspect the location of the loads of the net and adjust them such that they are distributed in a uniform and regular grid.

## CTS-661

(info) Using the following DRC values for net '%s' :%s

**Description**

Reports the design rules constraints used during synthesize of the given net.

Feedback

## CTS-662

(info) Using routing H/V layer pair '%s'/'%s' for all the nets in logica level %d.

**Description**

Reports the horizontal an vertical routing layer used for the routing of all nets at the given logical level counted from the specified roots.

## CTS-663

(error) The processing of the route-only flow stopped because %s%s%s.

**Description**

The input data for the route-only flow does not match the required specification.

**What Next**

Check and correct the database and re-run the command.

## CTS-664

(error) The pre-processing of the clock data failed.

**Description**

Some setup in the general clock data is invalid.

**What Next**

Check the logfile for other warnings and errors.

## CTS-665

(error) Stop processing of command '%s' because %s.

**Description**

The input data for the command '%s' does not match the required specification.

**What Next**

Check and correct the database and re-run the command.

## CTS-666

(error) Cannot split template cell '%s' because the cell %s%s.

Feedback

**Description**

The command was unable to split (clone) the existing template cell as requested by the -template option because of the mentioned reason.

**What Next**

Remove the reason that prevents the template cell from being split.

---

## CTS-667

(warning) Cannot insert driver '%s' at location {%s} because %s.

**Description**

The command was unable to insert a driver at the specified location because of the reason mentioned in the message.

**What Next**

Investigate whether the mentioned reason is valid and whether the dropping of the driver is acceptable.

---

## CTS-668

(error) No drivers were inserted%s because MV violations would be created.

**Description**

No drivers were inserted, because a multi-voltage legal solution could not be found.

**What Next**

Set the application option cts.common.verbose to 1 (or higher) to see more information about the reason(s).

---

## CTS-669

(error) No drivers could be inserted in power domain '%s'.

**Description**

The command was unable to insert any drivers in the mentioned power domain, while drivers are required in that power domain.

**What Next**

Investigate the reason why the drivers could not be inserted. Earlier messages in the log may help in finding the reason(s).

Feedback

## CTS-670

(error) Cannot identify driver of net '%s'.

**Description**

The named net has no driver.

**What Next**

Check the netlist.

## CTS-671

(error) Cannot set output net name to '%s'.

**Description**

You specified a specific net name for the shorted output net of the drivers. The command was unable to set the name of the net to the specified string.

## CTS-672

(warning) Shorted output net has been renamed from '%s' to '%s' to avoid a name conflict.

**Description**

You specified a specific net name for the shorted output net of the drivers. This name is already present in the netlist, and a suffix has been added to avoid a name conflict.

## CTS-673

(warning) Clock '%s' in mode '%s' is skipped because %s.

**Description**

The named clock is not considered for balance point derivation because of the mentioned reason.

## CTS-674

(warning) Skipped balance point '%s' because clock '%s' is not used as a clock by the timer.

Feedback

### Description

The named balance point is not affected because the clock at the balance point is not used as a clock by the timer. The propagation of the set_clock_latency constraints is only done for the part of the clock network that fans out to pins that need a clock for timing analysis.

### What Next

Check that the delay value of the balance point is in line with the set_clock_latency constraints because derive_clock_balance_points will not affect this (manual) delay value.

---

## CTS-675

(info) Cell statistics%s after %s of driver object set '%s': clock cell count: %d (ICGs %d) clock cell area: %s (ICGs %s).

### Description

This message prints the number of non-sink clock cells and their area after each step during tap assignment.

---

## CTS-676

(warning) The -allow_buffering option will not be respected for the tree rooted at '%s' because there are still high-fanout drivers in the tree (maximum fanout is %d).

### Description

The *-allow_buffering* option of the *set_multisource_clock_subtree_options* command allows for buffer insertion during skew optimization of structural multisource clock sub-trees. These skew buffers will be used to slow down fast clock paths. In order to do effective skew optimization, the clock tree should have been constructed by splitting existing cells in the netlist. This splitting should break up high fanout nets into smaller fanout nets to eliminate DRC (transition) violations. When the command detects high fanout nets during the optimization step, it will turn off skew-buffer insertion because the timing of high fanout nets is not reliable and skew optimization would be ineffective.

### What Next

When this message occurs, there is a setup problem. Make sure that there are enough cells in the netlist such that splitting can resolve DRC issues. Check the value of the maximum allowed transitions (set_max_transition) and make sure the value is tight enough. Make sure that no dont_touch, size_only or other reason prevents the existing cells from being split.

Feedback

## CTS-677

(error) No driver cells were inserted%s. Buffers at all other levels are being removed.

**Description**

No driver cells were inserted. This is an error situation. Earlier messages indicate the reason why driver cells could not be inserted. For the command to complete successfuly, at each level, at least one driver should be inserted.

**What Next**

Correct the configuration such that, at each level, at least one driver is inserted.

## CTS-678

(info) Multisource Global Clock Tree Metrics: Skew = %s; ID = %s; NetsWithDRC = %s; Worst Trans/Cap violation = %s/%s; ClockBufArea = %s; Clock = %s; Mode = %s; Corner = %s; GlobalTreeRoot = %s.

**Description**

Multisource global clock tree Qor information.

## CTS-679

(error) Pin '%s' is not on the clock network%s.

**Description**

The specified pin is not on the clock network. This pin is either the driver pin or a load pin of a net that is addessed by create_clock_drivers. The create_clock_drivers command can only operate on objects that are on the clock network.

**What Next**

Make sure all clock definitions are correct.

## CTS-680

(error) The area spanned by the leaves of net '%s' is too small to be handled by global clock tree synthesis.

**Description**

The specified problem instance is too small to be handled by the global clock tree synthesis command.

Feedback

**What Next**

Either spread the sinks over a larger area, or use smaller repeater and thinner wiring.

---

## CTS-681

(error) No load terminals could be identified.

**Description**

Either the specified net of the -loads option does not have any load pins, or the set of load pins as specified by the -loads option is empty.

**What Next**

Check the specified net for load pins.

---

## CTS-682

(error) No drivers were inserted%s because port punching is not allowed at power domain crossing hierarchies.

**Description**

No drivers were inserted, because ports would need to be punched at power domain crossing hierarchies. This is not allowed. An example situation is a power domain with multiple existing entry ports. In that case, the command cannot make a choice on what driver to connect to what entry port. Since it is not allowed to create a dedicated entry port per driver, or attach all drivers to a single entry port, we do not insert any drivers at all and we consider this an error situation.

**What Next**

Set the application option cts.common.verbose to 1 (or higher) to see more information about the reason(s).

---

## CTS-683

(warning) QoR report disabled for clock %s in mode %s at root %s because it is in ideal mode.

**Description**

QoR report is only possible if clock is in propagted mode.

**What Next**

Set clock into propagted mode and re-run the command.

Feedback

## CTS-684

(error) Different clocks arrive at multi-source drivers '%s' and '%s'.

**Description**

Since the command may move clock structures from one multi-source driver to another, it is required that the clocks at each driver pin/port are identical.

## CTS-685

(error) None of the repeaters are able to drive just a sink of net '%s' without creating DRC violations.

**Description**

All repeaters passed with command option -lib_cells to command synthesize_multisource_global_clock_trees are not able to drive just one sink of the net to synthesize without creating DRC violations.

**What Next**

Relax the max capacitance and/or max transition time limits for the net or clock and re-run the command.

## CTS-686

(warning) Since command option %s is set, command option %s is ignored.

**Description**

The two options are orthognal to each other.

## CTS-687

(Error) Timing characterization failed for lib_cell %s.

**Description**

The timing behavior of the reported lib_cell cannot be characterized, while this lib_cell is available for clock synthesis

**What Next**

Review the delay calculation for the lib_cell to check whether there is any missing data that causes this issue. If delay calculation cannot be performed, exclude cts from the purpose of the lib_cell to indicate that the lib_cell is not available for clock synthesis.

Feedback

## CTS-688

(Error) Both a horizontal and a vertical routing layer are required when sub-finger routing is enabled.

**Description**

When using the -fishbone_sub_span and -fishbone_layers options of the route_clock_straps command together, it is required that both horizontal and vertical routing layers are specified.

## CTS-689

(Warning) Skipping cell '%s' marked as global tree buffer because library cell '%s' is not identified as a repeater.

**Description**

It is expected that every cell in the design marked as a global tree repeater cell is instantiated from a library cell which can be identfied as a buffer or inverter.

## CTS-690

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the remove_multisource_global_clock_trees command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of remove_multisource_global_clock_trees for more information about argument syntax and semantics.

## CTS-691

(info) %s %d cells are marked as global tree repeaters out of which %d are matching the prefix '%s'. In total %d repetears are removed (%d %s, %d %s).

## CTS-692

(error) %s%s%s%s%s

Feedback

**Description**

There is an error in the argument list of the remove_clock_drivers command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of remove_clock_drivers for more information about argument syntax and semantics.

---

## CTS-693

(error) %s.

**Description**

There is an error in the expected input for command remove_clock_drivers. The additional information should be self explanatory.

**What Next**

Correct the input and re-run the command.

---

## CTS-694

(warning) %s.

**Description**

There is an inconsistency in the input for command remove_clock_drivers. The additional information should be self explanatory.

**What Next**

Although the command finished consider to repair the input and re-run the command.

---

## CTS-695

(info) %s

**Description**

Information about the result of calling command remove_clock_drivers.

---

## CTS-696

(info) %s

Feedback

### Description

General information about the initialization, setup and processing of MS-CTS commands.

---

## CTS-697

(error) Placement of %s '%s' failed, because no legal location was found (target = (%f, %f)).

### Description

This typically happens if the library cells specified to command *synthesize_multisource_global_clock_trees* with option *-lib_cells* are larger than the space remaining after converting the metal shapes in the prefered routing layers into placement blockages.

### What Next

To solve the issue either user smaller library cells, or disable the app option cts.multisource.enable_pin_accessibility_for_global_clock_trees.

---

## CTS-698

(error) MV aware global clock tree construction failed, because %s.

### Description

Instantiation of a cell in a multi-voltage setup for multi-source global clock tree construction failed. There are several types of reasons why such a failure happen.

If the message reads "*none of the provided library cells is valid for voltage area*" the multivoltage setup requires a type of repeater (dual or single rail) for a given location and hence voltage area which is not listed in the set of library cells passed with the command option *-lib_cells*.

If the reasons reads "*none of the specified driver locations belong to the power domain*" all locations where clock drivers should be placed belong to a voltage area, and hence power domain, which are different to the one of the provided template cell. Since the template cell cannot be moved into a different power domain without loosing its original power domain information the command *remove_clock_drivers* is not able to re-create the original state. Such a change is not allowed. As a consequence it is required that the user has to specify at least one clock driver location which falls into the voltage area of the template cell.

### What Next

Based on the explanation above either check the library cells listed in the command option *-lib_cells or adopt the targeted driver locations such that at least on of them fall into the voltage area of the template cell, then re-run the command.*

Feedback

## CTS-699

(error)MV aware global clock tree construction is not possible, because %s.

**Description**

The analysis of the problem instances showed that global clock tree construction is not possible without port punching on power domain boundaries. This could be resolved by enabling the app option *opt.common.allow_physical_feedthrough*.

**What Next**

Set the app option *opt.common.allow_physical_feedthrough* to true and re-run the command.

## CTS-700

(error) Tap assignment requires that option -num_taps is used on option set '%s' and matches the number of driver objects.

**Description**

In the current version of the tool tap assignment requires that the number of requested tap drivers matches the number of pins and ports given by option -driver_objects.

## CTS-701

(error) The number of tap drivers does not match the number of specified taps using option -num_taps on option set '%s'.

**Description**

In the current version of the tool tap assignment requires that the number of requested tap drivers matches the number of pins and ports given by option -driver_objects.

## CTS-702

(warning) Warning: The tap drivers should get explicitly defined on option set '%s'.

**Description**

In the current version of the tool tap assignment requires that the option -driver_objects specifies all tap drivers. The implicit definition of tap drivers by considering the clock sources will be disabled in future.

**What Next**

Make sure that the option -driver_objects specifies all tap driver pins or ports.

Feedback

## CTS-704

(warning) The -clock option will become a required option in future releases. Please specify a clock using the -clock option.

**Description**

Previous versions of the tool didn't require the -clock option. The clock specification has become a requirement now to resolve any ambiguity.

## CTS-705

(warning) The strategy cannot be set using this command. The option -strategy is deprecated and will be removed in future releases.

**Description**

Previous versions of the tool allowed the specification of a strategy for a group. This has changed as separate commands for structural synthesis and tap assignment (regular clock tree synthesis) have been introduced.

## CTS-706

(error) Sink group '%s' already exists.

**Description**

A sink group with the given name already exists.

**What Next**

Either remove the existing sink group using the 'remove_multisource_clock_sink_groups' command or specify a different sink group name using the -name option.

## CTS-707

(error) Sink group '%s' doesn't exist.

**Description**

A sink group with the given name doesn't exist.

**What Next**

Use the 'report_multisource_clock_sink_groups' command to list the existing sink groups.

Feedback

## CTS-708

(info) Removed %d sink group%s.

**Description**

Successfully removed the given amount of sink groups.

## CTS-709

(info) No sink groups defined.

**Description**

There have been no sink groups using the 'create_multisource_clock_sink_group' command created.

## CTS-710

(warning) No valid clock sinks specified.

**Description**

There were no valid clock sinks specified using the -sinks option.

## CTS-711

(info) Fanout of tap driver '%s' of option set '%s' with %d endpoint%s will get distributed.

**Description**

This message indicates how man clock tree sinks have been identified for tap assignment for the given option set and its tap drivers.

## CTS-712

(error) Couldn't find input of tap cell '%s' that is on the clock path of clock '%s'.

**Description**

None of the input pins of the tap driver cell is on the clock network of the specified clock.

**What Next**

Check the netlist and the timing constraints to make sure that a clock input pin can be detected.

Feedback

## CTS-713

(warning) No tap cell found for option set '%s' whose fanout can be distributed.

**Description**

After the merging operation none of the tap cells of the given option set had a clock network connected to it.

**What Next**

Make sure that at least one tap driver drives a clock tree with clock sinks for the given clock of the option set.

## CTS-714

(warning) Reducing the number of subtrees to %d for option set '%s'.

**Description**

The given number of tap drivers as given by option -num_taps cannot be synthesized. Check for earlier warnings why some tap drivers could not be used.

**What Next**

Check the defined tap drivers of the option set. Verify that they can be reached by the given clock.

## CTS-715

(error) Tap assignment requires that all tap driver cells have a fixed location. Cell '%s' is not marked as fixed.

**Description**

The given tap driver doesn't have a fixed placement location as currently required by tap assignment..

**What Next**

Make sure to use the 'set_placement_status' command to mark the tap cells as fixed.

## CTS-716

(warning) Tap driver '%s' has multiple exclusive sink groups assigned.

Feedback

**Description**

The specified tap driver has multiple sink groups assigned which are of type exclusive. This means that an exclusive assignment is not possible.

**What Next**

Use the 'report_multisource_clock_sink_groups' command to check the definition of the existing sink groups.

---

## CTS-717

(info) Tap driver '%s' has the sink group '%s' assigned.

**Description**

The specified tap driver has the specified sink group assigned using the 'create_multisource_clock_sink_group' command.

---

## CTS-718

(warning) Additional sinks are added to exclusive sink group driver '%s' because the pin '%s' is not splittable%s. Enable message CTS-725 to see them all.

**Description**

An exclusive sink assignment as defined for the given sink group is not possible due to constraints put on the clock tree. Exclusive sink assignment requires that clock cells can be split to achieve the assignment goal. In this case the specified pin and its entire fanout has to be assigned to the tap driver due to the reason given in the message.

**What Next**

Check any constraints like size-only, dont-touch, or frozen ports whether splitting can be enabled for the given pin. Also balance point definitions in front of sink-group sinks might cause this warning.

---

## CTS-719

(warning) Pin '%s' of sink group '%s' is not reachable from any of the existing driver objects. This sink is not assigned to any tap driver.

**Description**

Not all of the sinks of the given sink group can be assigned to the tap driver of that group. The clock might not reach the given sink.

Feedback

**What Next**

Check the netlist and the clock related constraints that might prevent a path from the tap driver to the sink.

---

## CTS-720

(warning) Cannot use %d tap%s as only %d pin%s to connect to %s available.

**Description**

The netlist doesn't offer as much splitting opportunities as there are tap drivers defined. Constraints might restrict the amount of splitting.

**What Next**

Check the netlist and the constraints that might prevent splitting.

---

## CTS-721

(info) Removing %d option set%s.

**Description**

The given number of option sets for tap assignment are removed.

---

## CTS-722

(warning) Non-propagated upstream clock '%s' detected.

**Description**

There is a non-propagated clock in the upstream clock network.

**What Next**

Switch the upstream clocks to propagated mode. See the documentation of message CTS-723 for more information.

---

## CTS-723

(warning) Detected ideal clock(s) in the upstream clock network. Global skew balancing accross the multisource subtrees will be skipped.

**Description**

Some part of the upstream clock network, i.e. the part of the clock network between the clock source and the multisource drivers, is still in ideal clock mode. Typically this means

Feedback

that a (master) clock in the upstream clock network was not switched to propagated mode using the set_propagated_clock command. As long as parts of the upstream clock network are ideal, it makes no sense to balance the subtrees because the upstream delays are unknown. Subtree balancing could even be counter productive in that case.

**What Next**

Switch the upstream clocks to propagated mode. If you want to model certain delays and/or transitions, please use set_annotated_delay and set_annotated transition.

---

## CTS-724

(error) Tap driver '%s' has a multi-voltage violation on its connected net.

**Description**

Tap assignment requires that the tap drivers are MV clean.

**What Next**

Please resolve the MV violation first before executing tap assignment.

---

## CTS-725

(warning) Additional sink '%s' added to exclusive sink group driver '%s'.

**Description**

This message reports all clock sinks that get added to an exclusive sink group tap driver but which are not part of that sink group. Reasons are constraints put on the clock tree. Exclusive sink assignment requires that clock cells can be split to achieve the assignment goal. In this case the specified pin and its entire fanout has to be assigned to the tap driver due to the reason given in the message.

**What Next**

Check any constraints like size-only, dont-touch, or frozen ports whether splitting can be enabled for the given pin. Also balance point definitions in front of sink-group sinks might cause this warning.

---

## CTS-726

(error) Tap cell '%s' doesn't have a valid library cell class.

**Description**

Tap assignment requires equivalent lib cell class for all tap cells. The lib-cells need to have the same function_id attribute value. If this attribute is not set, the tool will consider the

Feedback

user_function_class lib-cell attribute. In case this attribute is also not set, then the tap cells need to have the same lib-cells to be considered equivalent.

**What Next**

Please check the library cell type of the tap drivers. Make sure that either the function_id or the user_function_class attributes do match.

---

## CTS-727

(error) Tap cells '%s' and '%s' don't have the same library cell class.

**Description**

Tap assignment requires equivalent lib cell class for all tap cells.

**What Next**

Please check the lib cell subset attribute 'subset_name' and the library cell type of the two tap cells.

---

## CTS-728

(Error) Conflict detected. User mode %s has been included in another different scale_across_modes group already.

**Description**

The user specifed mode has been grouped with other modes in another existing group before, which is either from a previous command in the same session or from the database. The existing group will be kept and user input is being ignored.

**What Next**

Check the existing scale_across_modes settings and either remove the existing settings of scale_across_modes, or discard the current attempt of change.

---

## CTS-729

(Error) Regular multi-source clock group '%s' does not have any loads connected to the drivers.

**Description**

A regular multi-source clock group was defined using the set_multisource_clock_tap_options command. The drivers of this group, however, do not drive any load pins. This is an error.

Feedback

**What Next**

Check the loading of the driver objects of the multi-source clock group as configured by set_multisource_clock_tap_options.

---

## CTS-730

(info) Removed %d %s strap(s) because these do not connect to shapes in the orthogonal direction and floating shapes are not allowed.

**Description**

When floating shapes are not allowed, all straps that do not connect to shapes in the orthogonal direction are removed.

---

## CTS-731

(error) All %s straps were removed because these do not connect to shapes in the orthogonal direction and floating shapes are not allowed.

**Description**

When floating shapes are not allowed, all shapes that do not connect to shapes in the orthogonal direction are removed. In this case, no shapes in the given direction are remaining, and that is flagged as an error.

**What Next**

If you do allow floating shapes, please use option *-allow_floating true*.

---

## CTS-732

(Warning) Hierarchical pin '%s' is ignored. Only leaf input pins or ports are accepted.

**Description**

The -loads option of the split_clock_cells command accepts a list of collections of leaf cell pins and ports. Hierarchical pins are not allowed.

---

## CTS-733

(Warning) The collection of option '-loads' at position %d is empty.

**Description**

The -loads option of the split_clock_cells command accepts a list of non-empty collections of leaf cell pins and ports.

Feedback

## CTS-734

(Error) No valid pins nor ports have been specified for option '-loads'.

**Description**

The -loads option of the split_clock_cells command accepts a list of non-empty collections of leaf cell pins and ports.

## CTS-735

(Error) Load '%s' is driven by port '%s' which cannot be cloned.

**Description**

All pins or ports that are specified with option -loads of the split_clock_cells command have to by driven by a leaf cell which can be split. Ports as drivers are not allowed.

## CTS-736

(Error) Load '%s' is not connected to a driver pin.

**Description**

All pins or ports that are specified with option -loads of the split_clock_cells command have to by driven by a leaf cell which can be split.

## CTS-737

(Error) Load '%s' is driven by '%s' which is different than the driver of other loads in the collections. Skip splitting for the collection with '%s'.

**Description**

Loads that are connected to different drivers have been specified in same collection to option -loads of the split_clock_cells command.

**What Next**

Make sure that all load pins and ports specified in a collection are driven by the same pin.

## CTS-738

(Warning) Expecting list of pins or ports for option '%s'.

Feedback

**Description**

The -loads option of the split_clock_cells command accepts a list of collections of leaf cell pins and ports.

---

## CTS-739

(information) %d connected components were removed because these do not connect to the connected component %s.

**Description**

When the -keep_connected_component option is set, shapes of connected components that are not selected to be kept are removed.

**What Next**

Check whether the connected component that survives is the intended one.

---

## CTS-740

(Error) Driver object '%s' of option set '%s' overlaps with other driver objects.

**Description**

The bounding box of a driver object cell or port is overlapping with one of the other driver objects of the same multisource option setting. This typically indicates a setup problem.

**What Next**

Make sure that all driver objects are legally placed with repsect to each other.

---

## CTS-741

(Warning) Sink pin '%s' cannot be assigned to closest tap driver '%s' due to MV considerations.

**Description**

The specified sink pin needs to be driven by a tap driver which is further way than the closest tap driver as the closest tap driver is not allowed to drive the first-level cell of that sink.

---

## CTS-742

(Error) No first-level pin found that can be connected to the tap driver '%s'.

Feedback

**Description**

The specified tap driver doesn't have any first-level pin that can be connected to it.

---

## CTS-743

(info) %s

**Description**

The tool has reordered an ICG with a buffer.

---

## CTS-744

(Error) Logic level balancing constraints not meeting for the subtree driver '%s'.

**Description**

The logic level balancing step failed because no possible configuration/buffer combinations found fit for meeting the constraints.

The reason could be one of the following : - Don't touch applied on net which prevents buffer cells to be inserted. - No valid buffer cell found for insertion. - No matching buffer cell found for the matching hierarchy for power domain. - Target level settings are too strict to satisfy.

**What Next**

Please review the log file for probable cause like buffer not available, don't touch net etc.

---

## CTS-745

(warning) ICG '%s' is not reordered because %s.

**Description**

The message provides an indication of why an ICG cannot be reordered. Following are the reasons that prevent ICG reordering with the buffer:

```
1. ICG cannot be reordered in case the ICG and the buffer driving it:
    a. Are marked as dont_touch
    b. Are marked fixed
    c. A don't-touch net between ICG and buffer
    d. Have an MV violation
    e. Are in different voltage areas
```

Feedback

**What Next**

Please Check whether the constraints are intended and remove them to enable ICG reordering.

---

## CTS-746

(Warning) No buffers available to buffer the net '%s' for logic level balancing.

**Description**

The logic level balancing step couldn't insert buffers on the specified net possibly because (a) no buffer cells available in the design or (b) no matching buffer found for the corresponding hierarchy of net. If buffer cells exists but not available for this particular net or hierarchy then it will be automatically tried on other nets and solution will be found.

---

## CTS-747

(Warning) '%s' net is don't touch net, cannot be buffered for logic level balancing.

**Description**

The logic level balancing step couldn't insert buffer on the specified net because the net is marked as don't touch. It will now try other nets for buffering in order to meet the level balancing constraints. If a solution is possible then it will be tried by inserting some extra buffer cells on other un-constrained nets.

---

## CTS-748

(Warning) The level balancing setting of group '%s' is smaller than the existing number of levels(%d). Only balancing subtrees with a level below %d for balancing the subtree levels.

**Description**

The target level constraint set with "set_multisource_clock_subtree_options" or "set_multisource_clock_subtree_constraints" command is too strict and can't be honoured.

**What Next**

Please reivew the target level constraint set with "set_multisource_clock_subtree_options" or "set_multisource_clock_subtree_constraints"

Feedback

## CTS-749

(info) No buffer found driving only a single ICG as immediate load, hence no ICG re-ordering performed pre DRC Fixing stage.

**Description**

During ICG re-ordering if no buffer found driving only a single ICG as immediate load then pre DRC fixing stage,ICG re-ordering will not be performed.

## CTS-750

(info) MSCTS QoR %s : GlobalSkew = %s; ID=%s; Median Latency=%s; Std.dev Latency=%s; Deviation from Target Latency=%s; MaxSubtreeLevels=%s; NetsWithDRC = %d; Worst Trans/Cap violation = %s/%s; ClockCellCout=%s; ClockCellArea =%s; ClockBufArea = %s; Clock = %s; Mode = %s; Corner = %s;

**Description**

Multi Source Clock Qor information.

## CTS-751

(Warning) Subtree synthesis is leaving %d first-level net%s as ideal after optimization.

**Description**

Multisource structural subtree synthesis is marking nets connected to the driver objects as timing ideal during the first phases of optimization if these nets have preroutes that are considered for snapping the first-level clock cells. If the app option 'cts.multisource.subtree_routing_mode' is set to 'none', i.e. virtual routing is used for parastics estimation, then these nets will stay in ideal mode after the optimization finishes. Multi-driven nets will always stay in ideal mode as their timing should be modeled by transition and delay annotations using 'analyze_subcircuit'.

**What Next**

Consider setting the app option 'cts.multisource.subtree_routing_mode' to 'global' or 'fishbone' to get more accurate parasitics and timing estimations during optimization.

## CTS-752

(warning) DRC violation at driver object '%s' which might not get fixed by subsequent splitting or sizing operations. Max trans: %s (limit: %s) max cap: %s (limit: %s) fanout: %d (limit: %d).

Feedback

**Description**

A DRC violation (max transition, max capacitance, or max fanout) was detected on the specified driver object which is most likely not fixable by subsequent optimization steps.This can be due to one of the following reasons:

1. DRC or latency constraints are too tight. Tight constraints might result in too many first-level cells that were created during the DRC splitting phase or the initial load of the driver object was already too high.
2. If the net driven by subtree driver is root net or mesh net then it has not been modeled correctly with set_annotated_delay and set_annotated_transition.
3. Other design issues. Example: no-placeable area close to pre-route shapes on the net driven by subtree driver for snapping.

QoR is not guaranteed with a large DRC violation on the subtree driver or its loads.

**What Next**

Please check the root cause of DRC on subtree driver and resolve the same:

1. Ensure DRC constraints for max-fanout, max-cap, and max-transition are reasonable.
2. If the net driven by a subtree driver is a root or mesh net with high fanout and capacitance, then model the net with set_annotated_delay and set_annotated_transition for command to see reasonable transition and delay in the clock tree.
3. Ensure pre-route shapes on nets driven by subtree drivers are reasonable and cells can be snapped under them without creating DRCs.

---

## CTS-753

(Error) Partial Stage Constraints Definition Found : '%s'.

**Description**

S-MSCTS require complete stage constraint definition to work in Structural Mode.

Following constraints must be defined to work in Structural Mode. - Min & Max Cell Delay for all the cells used in the clock tree. - For cells with subset_name attribture defined; use command : set_multisource_clock_subtree_constraints -subset_names - For cells without subset_name attribture defined; use command : set_multisource_clock_subtree_constraints -undefined_subset_name - Max RC Delay for all the cell levels used in the clock tree. - use command : set_multisource_clock_subtree_constraints -net_level 2 -max_rc_delay 10

Feedback

The reason for this error could be one of the following :

**What Next**

Report existing constratins with report_multisource_clock_subtree_constraints Please review the clock subtree for missing constriants on the cells or nets.

---

## CTS-754

(info) Running in Structural Mode; since valid stage constraints are set.

**Description**

This message indicates that the S-MSCTS is running in "Structural Mode" which is primarily used to control min/max cell delay and stage RC delay.

---

## CTS-755

(info) Stage Constraint Violators : %s : Max Cell Delay Violators = %s(%s), Min Cell Delay Violators = %s(%s), RC Delay Violators = %s(%s), Clock = %s; Mode = %s; Corner = %s; ClockRoot = %s.

**Description**

Multi Source Clock Stage Constraints Violator information.

---

## CTS-756

(info) Running multisource tap assignment.

**Description**

This message indicates that the multisource tap assignment is running.

---

## CTS-757

(info) Running multisource incremental tap assignment.

**Description**

This message indicates that the multisource tap assignment is running with incremental mode.

---

## CTS-758

(Warning) Could not find legal location for the context instance %s

Feedback

**Description**

This message indicates that unable to find legal location while adding buffer during clustering.

---

## CTS-759

(Warning) No %s routing layer specified for net '%s'.

**Description**

Min-max layer constraints must be specified for clock net to enable correct routing topology.

**What Next**

Use command ‘set_clock_routing_rule’ to define the correct NDR rule along with min-max routing layers to be used for routing.

---

## CTS-760

(Warning) The MSCTS clock tree input '%s' doesn't have an annotated transition time.

**Description**

This message indicates that the given input to MSCTS doesn't have any transition time annotation given. This might lead to sub-optimal timing QoR due to pessimistic transition times.

**What Next**

Please use the 'set_annotated_transition' command to annotate reasonable treansition times in the scenario applied by MSCTS.

---

## CTS-761

(Warning) The MSCTS clock tree input '%s' doesn't have a valid transition time even though some annotations on this input exist.

**Description**

This message indicates that the given input to MSCTS doesn't have a valid transition time annotation given. This might lead to sub-optimal timing QoR due to pessimistic transition times.

Feedback

**What Next**

Please use the 'set_annotated_transition' command to annotate reasonable treansition times in the scenario applied by MSCTS.

---

## CTS-762

(Warning) The MSCTS clock tree input '%s' has a max transition violation. Annotated transition time: %s limit: %s.

**Description**

This message indicates that the given input to MSCTS has a transition time annotation which is violating a given max transition constraint. This might lead to sub-optimal timing QoR due to pessimistic transition times.

**What Next**

Either reduce the transition time annotation or relax the constraint, if appropriate.

---

## CTS-763

(Warning) The MSCTS clock tree input '%s' doesn't have a valid transition constraint defined.

**Description**

This message indicates there is no max transition constraint that applies to the given MSCTS input. Hence, the tool cannot check whether the annotated transition time on this input is reasonable.

**What Next**

Pleae check whether a set_max_transition for the entire design or this input would be required.

---

## CTS-764

(info) Ignoring %s for all subtree driver objects due to app option 'cts.multisource.ignore_drc_on_subtree_driver'.

**Description**

This message indicates that some DRC constraints (max capacitance and/or max-fanout) are ignored on the driver objects due to the user defined app option setting.

Feedback

## CTS-765

(Warning):Sizing pre-exsiting cell %s with reference module %s.

### Description

Sizing pre-exsiting cell whose reference is not in CTS purpose list with references from CTS reference list during synthesize_clock_trees command.

## CTS-766

(Error) No valid clock cells to split.

### Description

The message shows that none of the cells provided for splitting are valid cells. Following are the reasons that prevent clock cell splitting and merging:

```
1. Cell has physical_status: locked, legalize_only, or fixed
2. Cell has user_size_only or dont_touch
3. Constraints on path between its driver and the loads of this cell:
    a. A don't-touch net between driver and a load
    b. Path crosses a physical hierarchy
    c. Path crosses a power domain boundary and port punching on it is
 not allowed
    d. A logical read-only hierarchy (like a black box)
    e. A hierarchy with frozen ports: Either due to set_freeze_ports or
 due to
       timing constraints on the hierarchical pin
```

### What Next

Please check net don't touch settings or constraints on the logical and physical hierarchies.

## CTS-767

(warning) H-Tree NDR rule '%s' with layers %s-%s, specified using set_regular_multisource_clock_tree_options is ignored because a net specific NDR rule '%s' with layers %s-%s already exists on clock net '%s'.

### Description

The H-Tree NDR rule specified using the option -htree_routing_rule could not be applied to H-Tree nets because a net specific NDR rule already exists on the clock net.

Feedback

**What Next**

Remove the net specific NDR rules already existing on the clock net to apply the H-Tree NDR rule.

---

## CTS-768

(Error) Command synthesize_regular_multisource_clock_trees is not supported for Multiple Physical Hierachy Designs.

**Description**

H-tree creation is not supported in Multiple Physical Hierarchy Designs.

**What Next**

Turn off the app option 'cts.multisource.enable_mlph_flow' and re-run to ignore the physical hierachy blocks.

---

## CTS-769

(Information) relaxing user dont_touch/size_only limit on cell '%s' for splitting.

**Description**

The message provides an information that the cell is considered for splitting during tap assignment relaxing the user_dont_touch/user_size_only constraints. This is since the cell is specified with set_multisource_clock_tap_options -relax_split_restrictions_for_cells.

---

## CTS-770

(warning) Latency target to intermediate pin %s(%s) is higher than the latency target to %s(%s) in its fanout; hence ignoring the target to intermediate pin.

**Description**

Reports the conflict between the intrmediate latency set by user at the non-sink pin and the target latency(with balance point offset) at the sink pin.

---

## CTS-771

(warning) Cannot merge %s (delay_offset: %s) and %s (delay_offset: %s) due to different delay_offsets.

Feedback

**Description**

Merging of cells is not allowed if the pins of 2 merging instances have different intermediate latency offset.

---

## CTS-772

(info)Found %d intermediate pins with latency targets for group %s and will be honored by subtree synthesis.

**Description**

Intrmediate latency constraints are found and will be hounered by the subtree synthesis.

---

## CTS-773

(error) '%s' is not a valid driver. It will be ignored.

**Description**

The specified driver object is not valid. Below are valid driver objects - input port - output pin - net driven by an output pin

**What Next**

Correct the error in the argument list. See the manpage of set_multisource_clock_tap_options or set_multisource_clock_subtree_options for more details of valid driver_objects.

---

## CTS-774

(error) %s required at location (%f, %f) in voltage area '%s'.

---

## CTS-775

(warning) '%s'

**Description**

The buffer could not be inserted at a location suitable to build H-Tree. Hence it is being relocated to nearest valid location which could have a QoR impact.

**What Next**

Review the floorplan constraints at the ideal location and ensure that there are no placement blockages, unsuitable voltage areas at that location.

Feedback

## CTS-776

(warning) Logical net looping encountered during traversal of net: '%s'. Ignoring this net for backward traversal.

**Description**

Tool encountered a case of looping while backward traversion on the gvien net. The net may not be intended for the clocks. If such a net is found then some of the MSCTS netlist operations like merging, splitting may not work.

**What Next**

Review the net and fix the loop structure.

## CTS-777

(warning)Template cell %s has not been used and will be deleted.

**Description**

The specified template cell could not be used during buffer insertion as there are no locations falling in the template cell hierarchy. Hence the template cell would be deleted.

**What Next**

Check why no locations have been specified for buffer insertion in the template cell hierarchy. If you do not want the cell to be deleted, remove if from the create_clock_drivers command input.

## CTS-778

(info) Running initial multisource subtree synthesis.

**Description**

This message indicates that initial multisource subtree synthesis is running.

## CTS-779

(info) Running multisource subtree synthesis for optimization.

**Description**

This message indicates that the multisource subtree synthesis is running for latency based optimization.

Feedback

## CTS-780

(warning) Skipping driver '%s' as its net is multi-driven.

**Description**

This warning message indicates that we have a multi-driven net from the given driver, so ignoring this tap driver from tap assignment.

## CTS-781

(info) Running multisource subtree synthesis for preprocess and merge.

**Description**

This message indicates that the multisource subtree synthesis preprocess and merge is running.

## CTS-782

(info) Skipping SMSCTS %s step as optimization has already been done.

**Description**

This message indicates that final_place SMSCTS steps will be skipped as subtree optimizations has already been done.

## CTS-783

(Warning) Found more than %d percent (%d) of clock nets are detail-routed, which is unexpected before starting S-MSCTS refine.

**Description**

S-MSCTS refine is not expected to see detail-routed clock-nets. This may lead to inconsistencies of timing number after refine due to DR <-> GR correlation.

## CTS-784

(Warning) Found stripe shapes in both horizontal and vertical directions on output nets of driver objects, this is not supported. Ensure stripe shapes in any one direction only on all driver objects for subtree synthesis.

Feedback

### Description

Currently S-MSCTS supports either horizontal or vertical shape preroutes for subtree driver output net. Having both dir preroute is not a recommended flow for now.

---

## CTS-785

(warning) %s is unsplit because it %s.

### Description

The message provides an indication of why a cell cannot be split. Following are the reasons that prevent clock cell splitting:

```
1. Cell has physical_status: locked, legalize_only, or fixed
2. Cell has user_size_only or dont_touch
3. Constraints on path between its driver and the loads of this cell:
    a. A don't-touch net between driver and a load
    b. Path crosses a physical hierarchy
    c. Path crosses a power domain boundary and port punching on it is
 not allowed
    d. A logical read-only hierarchy (like a black box)
    e. A hierarchy with frozen ports: Either due to set_freeze_ports or
 due to
       timing constraints on the hierarchical pin
```

### What Next

Please check net don't touch settings or constraints on the logical and physical hierarchies.

---

## CTS-786

(warning) Pin %s is not a boundary sink and will be ignored from the boundary skew group %s.

### Description

The message provides an indication of a pin will be ignored from the boundary skew group since it's not a real boundary sink.

### What Next

Update the setting and remove the pin from the boundary skew group.

---

## CTS-787

(Information) Driver pin %s will not be splitted since it is on reconvergent path.

Feedback

### Description

The message shows the information that pins on reconvergent clock path will not be splitted.

---

## CTS-788

(Error) %s is unsplit because it %s.

### Description

The message provides an indication of why a cell cannot be split. Following are the reasons that prevent clock cell splitting:

```
1. Cell has physical_status: locked, legalize_only, or fixed
2. Cell has user_size_only or dont_touch
3. Constraints on path between its driver and the loads of this cell:
    a. A don't-touch net between driver and a load
    b. Path crosses a physical hierarchy
    c. Path crosses a power domain boundary and port punching on it is
 not allowed
    d. A logical read-only hierarchy (like a black box)
    e. A hierarchy with frozen ports: Either due to set_freeze_ports or
 due to
       timing constraints on the hierarchical pin
```

### What Next

Please check net don't touch settings or constraints on the logical and physical hierarchies.

---

## CTS-789

(Error) Secondary cost attribute %s is not defined for following lib cells: %s. Define user secondary cost annotation for these lib cells.

### Description

An error to be produced by SMSCTS when there are cells of a given lib cell class with missing user secondary cost annotations. For example: Consider lib cell class ‘ABC’ which contains lib cells “D1/D2/D4/D6/D8/…” etc..

If one of the lib cell i.e. ‘D2’ in the lib cell class ‘ABC’ doesn’t have user secondary cost defined (but at least one other cell in the same lib cell class does) then produce an error and stop command execution.

### What Next

Check the missing user secondary annotation for given lib cell class.

Feedback

## CTS-790

(info) MSCTS Power QoR %s : InputPinCap = %s; Internal Power = %s; Switching Power = %s; Total Dynamic Power = %s; Clock = %s; Mode = %s; Corner = %s;

**Description**

Multi Source Clock Power Qor information.

## CTS-791

(warning) Found instance %s with 'placed' status. Manually modified clock cells must be legalized and marked as 'application_fixed' before next clock step.

**Description**

Route step expects the cell status as 'application_fixed'. For manually modified clock cells, they must be legalized and marked as 'application_fixed' to avoid any legalization issues lat later step during subtree synthesis.

## CTS-800

(Warning) '%s' is not a clock net, ignored.

**Description**

The net specified is not a clock net, and is thus ignored.

## CTS-801

(Warning) Net %s cannot be routed by route_fishbone, because %s.

**Description**

The fishbone command can only be used to route clock nets appropriate status. The given net does not satisfy one of these criteria, as explained in the message.

## CTS-802

(Error) No valid net to route.

**Description**

The net(s) specified are not valid for fishbone routing.

Feedback

## CTS-803

(Warning) Could not legalize net %s.

**Description**

Wire or Via shapes on the net could not be legalized.

## CTS-804

(Warning) Net %s, cannot legally route %s sub strap at %.3f, estimated length %.3f (%s to %s).

**Description**

Sub straps could not be routed successfully due to legalization problem which could be due to DRC not being clean. This could be due to routing blockages, availability of vias etc.

## CTS-805

(Information) Net %s, routed %s sub strap at %.3f, estimated length %.3f (%s to %s).

**Description**

A sub strap was routed successfully at given location.

## CTS-806

(info) Driver '%s' corresponding to specified location {%s} will not drive any loads.

**Description**

Clock drivers at specified location will be left dangling and will not connect to any loads.

## CTS-900

(Warning) Clock routing rules are outside of allowable layers

**Description**

Routing rules for nets are defined by using the *create_routing_rule* command, and then applied to clock nets by using the *set_routing_rule* or *set_clock_routing_rules* command. The *set_routing_rule* and *set_clock_routing_rules* commands have *-min_routing_layer* and *-max_routing_layer* options to restrict nets with that routing rule to those routing layers. There is also a global minimum and maximum routing layer for the design, which is set

Feedback

by the *-min_routing_layer* and *-max_routing_layer* options of the *set_ignored_layers command.*

This warning is issued when a routing rule defined on a clock net uses layers outside of the allowable range for the design. For such cases, it is not possible to route on all layers specified in the net routing rule. This can lead to different RC delay characteristics than expected on that clock net, or could contribute to routing congestion on certain layers.

**What Next**

No change is needed if it is acceptable to route on a more limited set of layers than what was specified with the *set_routing_rule* or *set_clock_routing_rules* command. Otherwise, modify the routing layer ranges specified by the *set_routing_rule*, *set_clock_routing_rules*, or *set_ignored_layers* commands to resolve the routing layer conflict.

**See Also**

- create_routing_rule
- set_ignored_layers
- set_routing_rule
- set_clock_routing_rules

---

## CTS-901

(Warning) Clock nets have MV violations

**Description**

Clock nets should be free of MV violations before started CTS. This check reports cases where clock nets already have MV violations.

**What Next**

Use check_mv_design to further investigation the reasons for the MV violation. Depending on the violation, it may be necessary to modify the UPF constraints, insert special cells like level shifters or isolation cells, or take other corrective action.

**See Also**

- check_mv_design

---

## CTS-902

(Warning) No AON (always-on) buffers or inverters available for CTS

Feedback

### Description

Always-on cells are often required on MV designs, typically when a signal needs to remain active in a voltage domain that can be shut-down. This check indicates that none of the specified clock buffer or inverter references can be used as an always-on cell.

### What Next

Use 'set_lib_cell_purpose -include cts $lib_cell_list', where $lib_cell_list includes at least one always-on buffer or inverter

### See Also

- set_lib_cell_purpose

---

## CTS-903

(Warning) Cells instantiated in the clock network are not in the clock reference list

### Description

CTS can only size to lib_cells that are specified in the clock reference list, constrained using 'set_lib_cell_purpose -include cts $lib_cell_list'. This message indicates that some cells instantiated in the clock network have reference lib_cells that are not in the clock reference list. If there are logically equivalent lib_cells in the reference list, then these instances can still be resized to those logically equivalent lib_cells, if necessary. There is no guarantee that the cell will be resized, and once resized it cannot be sized back to the original lib_cell that was not in the reference list.

If there are no logically equivalent cells in the reference list, then this cell will not be resized by CTS, and a CTS-904 message will also be issued by check_clock_trees, indicating that no logically equivalent cells are available.

### What Next

No action is necessary if the behavior described above is okay. If resizing of the cell is desired, ensure that logically equivalent lib_cells are available using the 'set_lib_cell_purpose -include cts $lib_cell_list' command. Note that there is no guarantee that the cell will be resized, and so it may remain in the clock network with its original reference cell which was not supplied in the clock reference list. If you want to guarantee that this reference cell does not exist in the clock network after CTS completes, then you must manually associate it to a new lib_cell using the change_link command before running CTS.

Feedback

**See Also**

- set_lib_cell_purpose
- change_link

---

## CTS-904

(Warning) Some clock reference cells have no LEQ cell specified for resizing

**Description**

CTS cannot resize a cell in the clock network unless there are logically equivalent lib_cells specified in the clock reference list. This message indicates that there are cells instantiated in the clock network that have no logically equivalent lib_cells in the reference list, so no sizing can be done.

**What Next**

If the cell does not need to be sized, or has optimization constraints like dont_touch that prevent sizing, then no action is necessary. Otherwise, use 'set_lib_cell_purpose -include cts $lib_cell_list', where $lib_cell_list includes logically equivalent lib_cells to the ones reported by this check. This will ensure that the cell can be resized during CTS.

**See Also**

- set_lib_cell_purpose

---

## CTS-905

(Warning) There are clocks with no sinks

**Description**

Normally a clock is expected to propagate to a set of sinks for clock construction and balancing. Alternately, a clock may not propagate directly to any sinks, but rather is only used to generate other clocks. This check flags cases that violate this rule.

For the purposes of this check, a sink can either be a standard clock sink like a flip-flop or macro clock input, or it can be a clock balance point defined by the set_clock_balance_points command. For example, if a clock propagates to 100 sinks but all were set as ignore points, those would still be considered sinks for this check, even though report_clock_qor would not report them as sinks. Also, if a clock has no sinks but does generate another clock, it will not be flagged by this check.

Feedback

### What Next

Typically a clock should always arrive at sinks, or generate another clock. Clocks flagged by this check normally are prevented from arriving at their sinks by a timing constraint, like set_case_analysis blocking clock propagation through a mux or ICG, or set_disable_timing preventing clock propagation through a timing arc. Check the netlist to ensure that the clock should arrive at some sinks. If it does, then check the timing constraints to see what constraint could be preventing propagation of this clock through its network. The reporting commands report_case_analysis and report_disable_timing can assist in debugging these timing constraints.

### See Also

- create_clock
- create_generated_clock
- set_case_analysis
- set_disable_timing
- set_clock_balance_points
- report_case_analysis
- report_disable_timing

---

## CTS-906

(Warning) There are sinks with no clock

### Description

Clock sinks exist in the design that do not receive a clock signal. As a result, CTS will not be able to build a clock tree to these sinks.

For the purposes of this check, a sink can either be a standard clock sink like a flip-flop or macro clock input, or it can be a clock balance point defined by the set_clock_balance_points command. For example, if a clock propagates to 100 sinks but all were set as ignore points, those would still be considered sinks for this check, even though report_clock_qor would not report them as sinks.

### What Next

Typically a sink should always receive a clock. When it doesn't, it's likely caused by a timing constraint blocking clock propagation, or by an incorrectly specified set_clock_balance_points constraint.

Feedback

Timing constraints like set_case_analysis and set_disable_timing can block clock propagation through a timing arc. You can use report_case_analyis and report_disable_timing to help debug whether either of these constraints are causing a clock to be blocked from propagating to its sinks.

If a set_clock_balance_points constraint is set on a pin in the datapath, then a clock would not propagate to that balance point. This could also trigger this check.

**See Also**

- set_case_analysis
- set_disable_timing
- set_clock_balance_points
- report_case_analysis
- report_disable_timing

---

## CTS-907

(Warning) There are disabled timing arcs in the clock network

**Description**

This message indicates that there are timing arcs in the clock network that have been disabled. The clock cannot propagate through a disabled arc, which can affect which sinks a clock can propagate to, and as a result this has an impact on clock construction and balancing.

Typically a disabled timing arc would come from either an explicit set_disable_timing constraint, or indirectly from set_case_analysis propagating a constant value to a cell in the clock network. For example, an ICG enable pin may have case analysis that disables the clock from propagating through the ICG.

**What Next**

Check the set_disable_timing and set_case_analysis constraints in your design. Clear any of these constraints that are preventing clocks from correctly propagating through the clock tree. The commands report_disable_timing and report_case_analysis can help in debugging these issues.

**See Also**

- set_case_analysis
- set_disable_timing

Feedback

- report_case_analysis
- report_disable_timing

## CTS-908

(Warning) Large phase delay in abstracted sub-blocks

**Description**

Phase delay indicates the downstream skew from a paricular node in the clock tree. For the case of an abstract model like an ILM or ETM, it's possible that there is large phase delay at the clock pin, even when that pin is a leaf-level sink of the clock tree. This message indicates that a large phase delay is present on some hierarchical cells. This can hurt skew balancing, since CTS cannot modify the contents of that sub-block, it can do nothing to reduce that large phase delay.

**What Next**

Reexamine your abstracted sub-block and determine why it has large phase delay. It may be expected due to actual skew inside the block. If there is large skew in the sub-block, it should be addressed during implementation of that sub-block.

To ignore the large phase delay on the sub-block, use set_clock_balance_points to force new downstream delay values on that block's clock pin.

**See Also**

- create_abstract
- set_clock_balance_points

## CTS-909

(Warning) set_load constraints detected in the clock tree

**Description**

set_load constraints are used to force a capacitive load value on a port or net in the design. Typically, set_load constraints should only be used for output ports. A set_load constraint on an input clock port or a clock net will force a load value onto that net, even as it is being synthesized. This can cause convergence problems where inserting repeaters does not reduce the load of the net. It can also lead to unfixable max_cap violations in the clock tree. This check looks for any set_load constraints set on a clock input port or a clock net. It will ignore set_load constraints on output ports attached to the clock network.

Feedback

### What Next

Examine the nets or ports reported by this check, and verify that the set_load constraint should have been applied. Typically these constraints should only be used during place-and-route on output ports, but in some cases they may be used to override dirty library data, like incorrect pin load values.

Pay special attention to set_load constraints that exceed the max_cap constraint being applied on the clock net. These will cause unfixable cap DRCs on the clock network.

### See Also

- set_load

---

## CTS-910

(Warning) Balance point constraints are defined downstream of another balance point or ignore point constraint

### Description

set_clock_balance_points is used to set balance points in the clock tree to direct clock skew balancing. set_clock_ignore_points is used to define pins in the clock tree that should be ignored for skew balancing. Any of these constraints, when applied at an intermediate node of the clock tree, cause the downstream clock tree to be ignored for balancing purposes (a DRC clean clock tree is still built downstream). As a result of this behavior, if a balance point constraint is applied downstream of another balance point or ignore point constraint, it will have no effect on CTS.

This message indicates that some clock balance point constraints will be ignored due to upstream balance point or ignore point constraints.

### What Next

This behavior may not be a problem, but it is reported to make the user aware that some constraints will be ignored. If the downstream balance point must be honored, then the upstream balance or ignore point constraint should be removed. Balance point constraints can be removed using remove_clock_balance_points. Ignore point constraints can be removed using remove_clock_ignore_points.

### See Also

- set_clock_balance_points
- remove_clock_balance_points
- report_clock_balance_points

Feedback

## CTS-911

(Warning) Clock pins downstream of a balance point or ignore point have been added to a skew group

### Description

When a balance point is defined with the *set_clock_balance_points* command, any downstream sinks or balance points are not balanced. Likewise, when an ignore point is defined with the *set_clock_balance_points -consider_for_balancing false* command, any downstream sinks or balance points are not balanced. Balancing stops at the first encountered balance point or ignore point, and the entire downstream clock tree is synthesized DRC-free but not balanced.

This message detects the situation where a pin added to a skew group by the *create_clock_skew_group* command is downstream of a balance point. In this case, even though the pin is added to a skew group, it is not balanced.

### What Next

If the pin that was added to a skew group should be skew balanced, reconsider the balance point or ignore point definition upstream. You can clear it by using the *remove_clock_balance_points* command.

If the pin that was added to a skew group does not need to be balanced, no change in constraints is required. A DRC-free clock tree will be built to that pin downstream of the balance point or ignore point.

### See Also

- set_clock_balance_points
- remove_clock_balance_points
- report_clock_balance_points
- create_clock_skew_group

## CTS-912

(Warning) set_load constraints on output clock ports exceed the max capacitance limit

### Description

set_load is used to explicitly constrain a capacitive load value on a port or net. This check looks for set_load constraints on output clock ports, and reports cases where the set_load constraint exceeds the capacitance limit on the clock port. In these cases, an unfixable DRC violation will exist on the clock port.

Feedback

### What Next

Either the set_load constraint or the capacitance limits should be changed on the port. Capacitance limits can come from the .lib or .db description of the reference cell, or from the set_max_capacitance SDC constraint. CTS honors both capacitance limits.

### See Also

- set_load
- set_max_capacitance

---

## CTS-913

(Warning) Explicit ignore points have been added to a skew group, and will not be balanced

### Description

set_clock_ignore_points is used to define pins in the clock tree that should be ignored for skew balancing. create_clock_skew_group is used to add clock pins into a separate skew group from the default skew group for that clock. This message reports clock pins that are defined as explicit ignore points but also have been added to a skew group. In this case, one constraint indicates to not balance the pin, and the other constraint indicates that the pin should be balanced as part of a user defined skew group. Ignore point constraints take precedence over skew group constraints, so these pins will not be balanced.

### What Next

Check the pins that are reported and consider whether the pin should be balanced as part of the skew group or not. If it should be balanced, then the ignore point constraint should be cleared with remove_clock_ignore_points.

### See Also

- create_clock_skew_group

---

## CTS-914

(Warning) set_input_transition on clock ports exceeds the max transition limit

### Description

set_input_transition is used to constrain a transition time on an input port. This check looks for set_input_transition constraints on clock input ports, and reports cases where the constraint exceeds the max transition limit on the clock port. In these cases, an unfixable DRC violation will exist.

Feedback

### What Next

Either the set_input_transition constraint or the max transition limits should be changed on the port. Transition limits can come from the .lib or .db description of reference cells, or from the set_max_transition SDC constraint. CTS honors both transition limits.

### See Also

- set_input_transition
- set_max_transition

---

## CTS-915

(Warning) Excessively small max capacitance constraints in the clock network

### Description

Max capacitance constraints have been detected on the clock network that are small enough to adversely affect clock QOR. Excessive buffering triggered by the max cap constraints could hurt clock area, latency, or both. The max capacitance constraints could be coming from the .lib / .db description of the clock tree reference cells, or could be coming from set_max_capacitance constraints applied on ports, clocks, or the design.

### What Next

Examine the max capacitance constraints reported by this command and relax them if possible. Otherwise, the constraints will be honored as they are, and CTS QOR can be affected.

### See Also

- set_max_capacitance

---

## CTS-916

(Warning) Excessively small max transition constraints in the clock network

### Description

Max transition constraints have been detected on the clock network that are small enough to adversely affect clock QOR. Excessive buffering triggered by the max trans constraints could hurt clock area, latency, or both. The max transition constraints could be coming from the .lib / .db description of the clock tree reference cells, or could be coming from set_max_transition constraints applied on ports, clocks, or the design.

Feedback

### What Next

Examine the max transition constraints reported by this command and relax them if possible. Otherwise, the constraints will be honored as they are, and CTS QOR can be affected.

### See Also

- set_max_transition

---

## CTS-917

(Warning) Implicit ignore points have been added to a skew group, and will be balanced

### Description

Implicit ignore points are constraints automatically derived by CTS and propagated in the clock tree. Certain pins in the clock tree are not balanced, including explicit ignore pins constrained by the set_clock_ignore_points command, as well as data pins attached to the clock network (such as flip-flop D pins). Implicit ignore constraints are propagated up the clock tree from these ignore pins, so that the whole clock fanout leading only to ignore pins is implicitly ignored. This check reports the case that the user has constrained an implicit ignore pin to be part of a skew group for balancing in that group. A skew group constraint has higher precedence than an implicit ignore constraint, so the pin will be skew balanced as part of the skew group.

### What Next

Normally implicit ignore constraints only propagate through the parts of the clock network that are not expected to be balanced, because no downstream pin needs to be balanced. As such, it is unexpected that an implicit ignore should be balanced as part of a skew group, which is the reason for this check. You can use report_clock_qor -type structure, or the Abstract Clock Graph feature in the GUI, to investigate and debug the propagation of implicit ignore constraints in the clock network.

If the implicit ignore point constraints are expected and the pin should be balanced as part of the skew group, then no further action is required. If after investigation you determine the pin should not be balanced at all, then redefine the skew group using the create_clock_skew_group command to exclude this pin. If the pin is not expected to be implicit ignore but should be balanced as part of the skew group, no action may be necessary. The pin will be balanced in the skew group. But, you can remove downstream explicit ignore constraints that may be causing the implicit ignore propagation, using the remove_clock_ignore_points command. Note that this command can be used only to remove explicit ignore constraints, not implicit ignores, which are automatically derived and propagated.

Feedback

## CTS-918

(Warning) Voltage area blocked for buffering.

**Description**

Volatage area are blocked for buffering through app option "opt.common.blocked_vas". CTS will not abe able to add buffer in the blocked VAS. This is just a warning message for user for reporting the blocked VAS

**What Next**

To remove the blocked VAS, reset the value of app option "opt.common.blocked_vas" to empty string.

---

## CTS-919

(Error) Core area of block %s is unbound.

**Description**

The core area is unbound. This is possibly due to removed or invalid site def information.

**What Next**

Recreate the block information with valid site def information and re-run the command.

---

## CTS-920

(Warning) There are %d instances connected to routes in the design. No optimization will be performed on the routed nets and instances connected to them.

**Description**

CTO THO flow currently works in VR mode only. If there are global or detail routed nets at the top level or block level, no optimization will be run on them

**What Next**

Delete the global and detail routes and run again.

Feedback

## CTS-921

(Information) Design is being run in THO mode. Global router is being turned off, all timing computations will happen in virtual route mode.

**Description**

synthesize_clock_trees will use virtual router in THO mode. Global router will be disabled internally. No additional app options or setting need to be provided for doing this.

## CTS-922

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the set_regular_multisource_clock_tree_options command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of set_regular_multisource_clock_tree_options for more information about argument syntax and semantics.

## CTS-923

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the synthesize_regular_multisource_clock_trees command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of synthesize_regular_multisource_clock_trees for more information about argument syntax and semantics.

## CTS-924

(warning) Below lib cells will not be used because these lib cells %s%s:

**Description**

The specified lib cells will not be used during clock driver insertion for the reason as mentioned in the message.

Feedback

**What Next**

Check whether the mentioned reason is expected. If not, use commands set_lib_cell_purpose, set_dont_touch or set_dont_use to change the lib cell attributes as required. If the reason is expected, you may consider to not pass the offending lib cells to the set_regular_multisource_clock_tree_options command. That will avoid the message.

---

## CTS-925

(error) Below lib cells are not buffers%s:

**Description**

The specified lib cells can not be used during clock driver insertion because these are not buffer lib cells.

**What Next**

The set_regular_multisource_clock_tree_options command only accepts buffers as tap lib cells. If other cells need to be inserted, you need to insert a template cell in the netlist and use the -tap_template_cells option to indicate that this template cell should be cloned.

---

## CTS-926

(error) Redhawk cannot be initialized for voltage drop optimization:

**Description**

Voltage drop option is turned on but Redhawk data is not available.

**What Next**

Please make sure Redhawk resistance calculation is run before invoking clock_opt with voltage drop option turned on.

---

## CTS-927

(info) Voltage drop aware optimization is turned on:

**Description**

Grid resistance based voltage drop aware option is turned on in clock_opt.

---

## CTS-928

(information) No option set exists for '%s'. Please use the '%s' command to define a set of options.

Feedback

**Description**

The executed command requires that at least one option set with driver objects has been defined using the specified command.

---

## CTS-929

(Warning) Layers` '%s' of clock strap do not match the top layer of via-ladder '%s'. Via-ladders would not be inserted.

**Description**

The via ladder would not be inserted if layers of clock strap do not match the top layer of via-ladder.

---

## CTS-930

(Warning) Skipping RC delay calculations because of missing RC Tree for net '%s'. Continuing.

**Description**

The RC delay calculations are being skipped because of missing RC Tree for the net. The reasons could be failed routing or failed extraction of the net.

---

## CTS-931

(Information) H tree checking for the set of tap drivers failed due to tap locations.

**Description**

In auto tap synthesis for H tree topology, tap drivers are under feasibilty check for H tree implementation. This message tells the tap drivers as a set failed the checking due to their locations. If none of the tap drivers are inserted in the end, please check the floor plan and may need to give boundary to guide the tap synthesis.

---

## CTS-932

(Information) H tree checking in tap driver insertion failed for the set of tap drivers due to some reasons other than tap locations.

**Description**

In auto tap synthesis for H tree topology, tap drivers are under feasibilty check for H tree implementation. This message tells the tap drivers as a set failed the checking for the reasons other than the tap locations.

Feedback

## CTS-934

(info) Dynamic voltage drop ccd is turned on:

**Description**

Dynamic voltage drop ccd is turned on in ccd.

## CTS-935

(error) Redhawk cannot be initialized for ccd dynamic voltage drop optimization:

**Description**

Voltage drop option is turned on but Redhawk multi grid data is not available.

**What Next**

Please make sure Redhawk dynamic voltage calculation is run before invoking ccd with voltage drop option turned on.

## CTS-936

(Warning) Skipping RC delay calculations because of net '%s' is global routed. Continuing.

**Description**

The RC delay calculations are being skipped because the design is global routed and not detailed routed. If the design is global routed, the calculations are not accurate because the design is not DRC clean

## CTS-938

Warning: NDR spacing '%f' is greater than %s grid step size '%f'. Some straps may be skipped.

**Description**

In presence of defined ndr, some straps may be skipped when the ndr spacing value is higher.

## CTS-939

(warning) %s%s%s%s%s

Feedback

**Description**

This is a warning message for the synthesize_multisource_global_clock_trees command. The additional information should be self explanatory.

**What Next**

Check the warning and correct if needed. See the manpage of synthesize_multisource_global_clock_trees for more information about argument syntax and semantics.

---

## CTS-940

(error) %s%s%s%s%s

**Description**

There is an error in the argument list of the set_multisource_global_clock_tree_options command. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. See the manpage of set_multisource_global_clock_tree_options for more information about argument syntax and semantics.

---

## CTS-941

(info) Removed %d group%s.

**Description**

Successfully removed the given amount of groups.

---

## CTS-942

(info) No groups defined.

**Description**

There have been no groups created using the 'set_multisource_global_clock_tree_options' command.

---

## CTS-944

(error)Global clock tree synthesis failed in spine construction, because %s.

Feedback

**Description**

Global clock tree spine construction is not possible due to reasons as given.

---

## CTS-945

Warning: No via-ladder inserted with top layer matching clock strap layers '%s', hence skipping zroute connection.

**Description**

No via-ladder inserted with top layer matching clock strap layers M8/M9, hence skipping further zroute connectioni.

---

## CTS-946

Warning: Excluding '%s' from the non-exclusive bounds.

**Description**

CTS/CTO does not support non-exclusive hier move bounds. If non-exclusive hier move bound is found during buffer insertion in that hier, than CTS/CTO will ignore the bound constraint

---

## CTS-947

(Error) No delay arc between '%s' and '%s.'

**Description**

There is no cell arc between the specified two pins.

**What Next**

Specify the input pin and output pin of the same cell.

---

## CTS-948

(Error) No delay arc between '%s' and '%s.'

**Description**

There is no delay arc between the specified two pins.

**What Next**

Specify the driver and sink of the same net.

Feedback

## CTS-949

(Information) Tap synthesis inserted single level of inverter, subsequent global clock tree building step (htree_synthesis) will correct the polarity.

**Description**

Given -invert and inverter as lib_cells from create_clock_drivers, or given inverter lib cells for taps and H tree from auto tap sunthesis, tap drivers will be inverting the logic and H tree will invert again to make polarity correct.

## CTS-950

(Information) Htree synthesis adding odd number of inverter levels to accommodate single inverter level from tap synthesis and address the clock tree polarity.

**Description**

Given -invert and inverter as lib_cells from synthesize_multisource-global_clock_trees or given inverter lib cells for taps and H tree from auto tap sunthesis, tap drivers will be inverting the logic and H tree will invert again to make polarity correct.

## CTS-951

(Warning) Htree synthesis is not under invert mode but taps are inverted. Poloarity of the clock tree maybe wrong.

**Description**

When taps are inverting the logic, H tree is expected to invert the logic again to make polarity correct. Use -invert and inverter as lib_cells when calling synthesize_multisource-global_clock_trees.

## CTS-952

(error) %s.

**Description**

The basic sanity checks of HTree are failing as specified.

## CTS-953

(Warning) %s

Feedback

### Description

This indicates a warning scenario in H-tree building flow.

---

## CTS-954

(info) Clock cell relocation is restricted to cells without data connection because app option cts.compile.enable_cell_relocation is set to "auto" and clock gate latency aware placement is enabled.

### Description

Since the timing-driven placer has placed the clock gates with consideration of clock latency, it is advised not to relocate the clock gates during CTS to improve clock metrics. Moving the clock gate cells may disturb clock gate enable path timing that was optimized by the placer. The *auto* value of cts.compile.enable_cell_relocation imposes this recommendation

Clock gate latency aware placement is enabled by setting place.coarse.clock_gate_latency_aware to "true", or by setting place.coarse.clock_gate_latency_aware to "auto" and enabling clock gate latency estimation at the flow level by seting one of app option place_opt|refine_opt|compile.flow.estimate_clock_gate_latency to "true". To have a consistent flow, it is recommended to set the *.flow.estimate_clock_gate_latency app options for all used mega commands to the same value.

### What Next

If you want clock gates to be relocated anyway, you can set app option cts.compile.enable_cell_relocation to *all*.

### See Also

- cts.compile.enable_cell_relocation
- place.coarse.clock_gate_latency_aware
- place_opt.flow.estimate_clock_gate_latency

---

## CTS-955

(warning) App option cts.compile.enable_cell_relocation is not set to "auto" while clock gate latency aware placement is enabled. Consider to set it to "auto".

### Description

Since the timing-driven placer has placed the clock gates with consideration of clock latency, it is advised not to relocate the clock gates during CTS to improve clock metrics.

Feedback

Setting cts.compile.enable_cell_relocation to e.g. "all" or "leaf_only" will make CTS move clock gates that are connected to signal nets and that may disturb the clock gate enable path timing. It is recommended to set cts.compile.enable_cell_relocation to "auto" when clock gate latency aware placement is enabled.

Clock gate latency aware placement is enabled by setting place.coarse.clock_gate_latency_aware to "true", or by setting place.coarse.clock_gate_latency_aware to "auto" and enabling clock gate latency estimation at the flow level by setting one of app options place_opt|refine_opt|compile.flow.estimate_clock_gate_latency to "true". To have a consistent flow, it is recommended to set the *.flow.estimate_clock_gate_latency app options for all used mega commands to the same value.

**What Next**

Consider to set cts.compile.enable_cell_relocation to "auto".

**See Also**

- cts.compile.enable_cell_relocation
- place.coarse.clock_gate_latency_aware
- place_opt.flow.estimate_clock_gate_latency

---

## CTS-956

(warning) Please use -largest / -smallest / -all switches with -show_verbose_paths / -show_paths to report the clock paths.

**Description**

-largest / -smallest / -all switches have to add with -show_verbose_paths / -show_paths to report the clock paths.

**What Next**

Add -largest / -smallest / -all switches to report the clock paths.

---

## CTS-957

(Warning) Clock drivers will not be snapped as %s.

**Description**

Clock driver could not be snapped due to the reason specified.

Feedback

**What Next**

Review the message and correct the setup.

---

## CTS-958

(warning) Cannot snap driver '%s' at location {%s} because %s.

**Description**

The command was unable to snap a clock driver at the specified location because of the reason mentioned in the message.

**What Next**

Investigate whether the mentioned reason is valid and whether the dropping of the driver is acceptable.

---

## CTS-959

(warning) Could not get phase delay of pin '%s'

**Description**

The phase delay of the pin was not found.

---

## CTS-960

(error) There are no repeater lib cell references opened for CTS.

**Description**

There are no repeater lib cell references opened for CTS. Command cannot proceed.

**What Next**

Correct the error and rerun the command.

---

## CTS-961

(error) None of the repeater lib cell references opened for CTS are usable.

**Description**

The is no repeater lib cell references opened for CTS. Command cannot proceed

**What Next**

Correct the error and rerun the command.

Feedback

## CTS-962

(warning) "%s"

**Description**

Lib cells are unusable as per the provided reason.

**What Next**

Check if not using those lib-cells are intentional.

## CTS-963

(warning) "%s constraint is set to %f which is too tight".

**Description**

Constraints are too tight. Tight constraints might result in unexpected long runtime.

**What Next**

Ensure DRC constraints for max-transition, max-cap, max-net-length, max-fanout are reasonable.

## CTS-964

(Information) Successfully relocated %d leaf ICGs out of %d total leaf ICGs for dynamic power improvement.

**Description**

This message indicates how many leaf ICGs are successfully relocated out of total leaf ICGs.

## CTS-965

(Information) Total %d leaf ICGs are not relocated for reasons: fixed - %d, legalize_only - %d, Zero_input_toggle_rate - %d, Toggle_Ratio - %d, Wirelength_Check - %d, Other_Reason - %d

**Description**

This message indicates how many leaf ICGs are not relocated and provides a reason wise break up.

Feedback

## CTS-966

(Information) %s

**Description**

This message indicates ICG gate name which is not relocated during Activity Driven Clock Gate Relocation and print the corresponding reason.

## CTS-967

(Error) %s is sink for generated clock %s but pass through for master clock.

**Description**

A master clocks tree's non sink pin is a sink pin for the generated clock. This can cause issues with skew balancing on endpoints beyond this pin.

**What Next**

Check generated clock definitions.

## CTS-968

(Error) Corner %s has no valid parasitic.

**Description**

Could not find valid parasitic corner, usually because constraint corner has no parasitic tech setup. RC extraction can not be performed.

**What Next**

Check constraint corner's parasitic tech setup in run script. Run report_parasitic_parameters to make sure all corners are correctly set.

## CTS-969

(Warning) All leaf ICGs have 0 input toggle rate. Please verify if power scenarios are activated.

**Description**

Since all leaf ICGs have 0 toggle rate on input net, no ICG will be moved. Please check if power scenarios are enabled .

Feedback

## CTS-970

(Information) Successfully moved %d ICGs (including %d reparented) out of %d total candidate ICGs for dynamic power improvement.

**Description**

This message indicates how many ICGs are successfully moved (including reparented) out of total candidate ICGs.

## CTS-971

(error) The net '%s' has a %s structure. Disconnecting the net '%s' from the hierarchical term %s so that CTS can still buffer the net.

**Description**

This error message will triggered when there is a reconvergent path or a cycle on hier net.

**What Next**

One of the hier pin will be disconnected from the net such that CTS can still buffer the net.

## CTS-972

(error) Subtree synthesis failed to get reference cell for %d output ports

**Description**

Tool failed to get a reference cell based on the number of output loads.

**What Next**

Please check the script to make sure complete set of splitter library cells are available for CTS usage.

## CTS-973

(info) The value of option cts.compile.enable_cell_relocation has been overridden to "leaf_only" to support latency-driven placement.

**Description**

If option place.coarse.latency_driven_placement is true, placement will attempt to move clock gating cells to improve clock latency. To prevent clock gate relocation from altering the locations of these cells, clock gate relocation will be done in leaf_only mode. Only leaf-level clock gates will be moved by clock gate relocation. This overrides option cts.compile.enable_cell_relocation.

Feedback

Latency-driven placement happens at the place_opt flow stage. Clock gate relocation happens at the clock_opt flow stage.

**What Next**

To use clock gate relocation mode other than "leaf_only", it is necessary to disable latency-driven placement. Set option place.coarse.latency_driven placement to false during place_opt and clock_opt flow stages. Clock latency may degrade as a consequence of this.

**See Also**

- cts.compile.enable_cell_relocation

---

## CTS-974

(warning) Mode '%s' doesn't have any valid clock in any timed scenario. The mode is skipped.

**Description**

The clock definition and constraints are not set properly for all the modes. Hence, no clock information is available for the mode.

**What Next**

Set clock constraints on all the modes.

---

## CTS-975

(info) Fanout %s from clock gate %s is moved to clock gate %s

**What Next**

None

---

## CTS-976

(info) Clock gate %s is removed

**What Next**

None

---

## CTS-977

(info) Clock gate %s is renamed to %s

Feedback

**What Next**

None

---

## CTS-978

(info) Clock gate %s is cloned from clock gate %s

**What Next**

None

---

## CTS-979

(info) %d fanout(s) from clock gate %s are moved to clock gate %s

**What Next**

None

---

## CTS-980

Warning: Clock net ‘%s’ routed with user net length constraint of ‘%f’ has DRC violation. (tran/cap cost : $trancost/$capcost)

**Description**

This clock net has length limit constraint. To meet contraint, routed wire length may have been impacted. The constraint value can be adjusted to fix violation

**What Next**

adjust constraint value

---

## CTS-981

(info) Annotating zero clock path delay till subtree driver '%s'.

**Description**

This message indicates we are annotating zero delay till subtree driver.

---

## CTS-982

(info) Removing internally annotated clock path delay till subtree drivers.

Feedback

**Description**

This message indicates we are removing annotated clock path delay till subtree drivers.

---

## CTS-983

(Warning) %s

**Description**

At least one tap driver must be inserted in each uncommitted hierarchy. Ensure that an appropriate tap configuration is used which can cover all uncommitted hierarchy boundaries.

---

## CTS-984

(Warning) Enable logic tracing of latch with or gate driver is set to true for enable logic cloning, split_enable_max_logic_levels/split_enable_max_flop_levels will be ignored.

**Description**

Tracing of OR gate will ONLY be supported with latch. If max_logic_level or max_flop_level is given, it will be ignored while enable logic tracing.

---

## CTS-985

(error) Section : '%s' is not confined in one Uncommitted Hierarchy

**Description**

There is an error in the argument list of the set_regular_multisource_clock_tree_options command, Section is not confied in one Uncommitted Hierachy. The additional information should be self explanatory.

**What Next**

Correct the error in the argument list. Every section must be confined in one Uncommitted hierarchy. See the manpage of set_regular_multisource_clock_tree_options for more information about argument syntax and semantics.

---

## CTS-986

(Warning) DRC disabled for clock nets.

**Description**

DRC is disabled for special nets through *set_auto_disable_drc_nets* command.

Feedback

**What Next**

To enable drcs on clock network do: *set_auto_disable_drc_nets -on_clock_network false* command.

---

## CTS-987

(Warning) Instance '%s' is not placed on a legal location, moving it to a legal location.

**Description**

The instance is not placed on legal location, moving the instance to a legal location..

---

## CTS-988

(Error) No load is detected for %s. Tap synthesis cannot be done for this %s.

**Description**

No load pins of the net being synthesized are inside the section boundary. Please check if the correct net is specified for synthesis or the boundary for the section is correct.

**What Next**

If the input net is correct, this section can be deleted. Rerun after correcting the input.

---

## CTS-989

(Error) Uncommitted hierarchy for %s cannot be determined.

**Description**

Some loads are not part of any uncommitted hierarchy. For tap synthesis to work correctly, loads of the root net should belong to one of the specified hierarchy.

**What Next**

See if the loads are belonging to top hierarchy. In such case, modify input such that top becomes one of the uncommitted hierarchy.

---

## CTS-990

(warning) %s%s%s%s%s

**Description**

This is a warning message for the synthesize_regular_multisource_clock_trees command. The additional information should be self explanatory.

Feedback

**What Next**

Check the warning and correct if needed. See the manpage of synthesize_regular_multisource_clock_trees for more information about argument syntax and semantics.

---

### CTS-991

(warning) Could not initialize power scenario

**Description**

Power scenario couldnt be initialized.

---

## DA

---

### DA-001

(error) Layer %s density %s for rule %s %s.

**Description**

This message is to report a layer density violation.

**What Next**

Fix it.

---

### DA-002

(error) There are %d violations of rule %s.

**Description**

This message is to report number of layer density violations of a rule.

**What Next**

Fix them.

---

### DA-003

(info) There are %d violations.

**Description**

This message is to report number of layer density violations.

Feedback

**What Next**

Fix them.

---

## DA-004

(error) Layer %s area of lib cell %s is not set.

**Description**

This message is to report an error that layer areas of lib cell are not complete. If the layer is defined by other layers. This message means at least one of these layers lack layer area setting of this lib cell. The reported lib cell may be a rpGroup if its layer areas are set but not complete.

**What Next**

Complete all layer areas then run this command again. If this is not a layer defined by other layers, please check whether its density of the reported cell is set by set_auxiliary_layer_area. If this is a layer defined by other layers, please check whether densities of all these layers of the reported cell is set by set_auxiliary_layer_area.

---

## DA-005

(error) Fail to get valid bbox of %s %s.

**Description**

bbox of the reported object is not valid. So this object cannot be supported by this command.

**What Next**

Make bbox of this object valid and run this command again.

---

## DA-006

(error) %s appears more than one time in %s

**Description**

The reported item or object appears more then one time. This is not supported.

**What Next**

Check whether this is a typo and run this command again.

Feedback

## DA-007

(error) Same %s %s cannot appears in %s and %s.

**Description**

The reported item or object appears multiple times conflictly. This is not supported.

**What Next**

Check whether this is a typo and run this command again.

## DA-008

(error) %s %s alreayd exists.

**Description**

The reported item or object to create already exists. This is not supported.

**What Next**

Check whether this is a typo and run this command again.

## DA-009

(error) Layer %s is not defined.

**Description**

When reference a layer in -layers of define_auxiliary_layer or -layer of set_auxiliary_layer_density_rule, this layer must be defined. Here defined means appearing in -name of define_auxiliary_layer or -layer_areas / -layer_densities of set_auxiliary_layer_area.

**What Next**

Run this command again with defined layer.

## DA-010

(error) Cannot set layer density of layer %s that is defined by define_auxiliary_layer.

**Description**

Density of layer defined by define_auxiliary_layer is computed from other layers. So cannot set its layer density.

Feedback

**What Next**

Set density of layers that are used to compute this layer.

---

## DA-011

(error) Cannot define layer %s by other layers. Densities of this layer are already set by set_auxiliary_layer_area

**Description**

Density of layer defined by define_auxiliary_layer is computed from other layers. So if its layer densities cannot be explicitly set.

**What Next**

Define with another layer name.

---

## DA-012

(Warning) No %s are defined %s.

**Description**

This message reports the things this command must based on are not defined.

**What Next**

Define them then run this command again.

---

## DA-013

(Error) The existing layer area and shapes information, which are set by the library, cannot be overwritten.

**Description**

This message reports the layer area and shapes information setting by -read_prf cannot be overwritten by the other options.

**What Next**

Avoid using -layer_area, -layer_shapes and -layer_density if the layer information has been set by -read_prf.

Feedback

# DB

## DB-1

(error) File is not a DB file.

**Description**

The identified file was not in the DB file format.

**What Next**

Check to see what format the file is in, and read it with the appropriate command. For example, edif files can be read into *dc_shell* with the *read -format edif <filename>* command.

## DB-3

(warning) Can't locate file '%s'.

**Description**

This warning message will be printed out the first time if we can not resolve a link to a given file. In the absense of the given file, there will be some unresolved references.

**What Next**

Check the link_library and the search_path variables and set their value accordingly.

## DB-4

(error) Open gen_state (0x%x) -- %s object '%s' (0x%x)\n attach '%s' id = %d

## DB-5

(error) Limit exceeded: Cannot create attribute %s for class %s, so program cannot continue.

**Description**

This message appears when the internal limit of 32k attributes per database object is exceeded. Once this limit is exceeded, work in progress cannot be saved and the program cannot continue.

Feedback

**What Next**

Check the scripts to see if an excessive number of *create_attribute* commands are run with unique attribute names. Try to reuse names where possible. If many scripts are run in one large session, attempt to break up the single long run into a number smaller runs, saving your work each time.

---

## DB-6

(error) Limit exceeded: Cannot create attach %s for class %s, so program cannot continue.

**Description**

This message appears when the internal limit of 32k types of attaches per database object is exceeded. Once this limit is exceeded, work in progress cannot be saved and the program cannot continue.

**What Next**

If many scripts are run in one large session, attempt to break up the single long run into a number smaller runs, saving your work each time.

---

# DBPQ

---

## DBPQ-1

(error) Failed to export library data into parquet file: '%s'. Check the disk space and run again.

**Description**

This message occurs when one or more of the following exist: 1) Data written into parquet don't meet schema requirement 2) The writing process failed

**What Next**

Check the data written from the library. Check the memory to confirm whether there is enough space to generate the corresponding parquet file.

---

## DBPQ-2

(error) Unable to find a valid db in the specific path: '%s'.

Feedback

### Description

This message occurs when the following exist: There is no valid db library under the given path.

The following is an example message:

```
Error: Unable to find a valid db in the specific path: '/.../test.db'.
 (DBPQ-2)
```

### What Next

Please check the path to the db library and library name.

---

## DBPQ-3

(error) Failed to create parquet dir: '%s'.

### Description

This message occurs when one or more of the following exist: 1) There is one existing directory with the same name 2) Fail to give written permission

The following is an example message:

```
Error: Failed to create parquet dir: './test'. (DBPQ-3)
```

### What Next

Check if the permission allows you to creat this new dir. Check if the dir already existed. If yes, create a new directory with another name, or careful clean the existing one.

---

## DBPQ-4

(error) Failed to aquire db data.

### Description

This message occurs when the following exist: 1) Failed to create db database 2) Failed to create db root

The following is an example message:

```
Error: Failed to aquire db data.(DBPQ-4)
```

### What Next

Check if the library is valid and good to use.

Feedback

## DBPQ-5

(error) Failed to read db root

**Description**

This message occurs when the following exist: the library has syntax/logic error

The following is an example message:

```
Error: Failed to read db root (DBPQ-5)
```

**What Next**

Check if the library is valid and good to use.

## DBPQ-6

(warning) No parquet generated since no relevant data is extracted from library.

**Description**

This message occurs when one or more of the following exist: 1) The library doesn't have timing group 2) The library has specific timing table format which haven't been supported yet

**What Next**

Check if the library is valid and good to use. If the library is good, please report to Library Compiler Team (Synopsys) the library has been tested with. There might be some special nldm/ocv table format which haven't been supported yet.

## DBPQ-7

(error) An unexpected error occurred while writing into parquet.

**What Next**

If this message occurs continually, please report to Library Compiler Team (Synopsys) the library has been tested with.

## DBPQ-8

(warning) Up to 2 power type voltage_maps are supported. Loaded library has %d voltage_maps.

Feedback

**Description**

This message occurs when the following exist: In the loading library there are more than two voltage_maps referenced by the cell-level pg_pin group existing. In this case only the first two voltage_maps will be extracted and exported into parquet file.

# DCFP

## DCFP-010

(Error) No floorplan exists for block %s.

**Description**

This error occurs when the most basic floorplan information, like boundary and core, are not defined for the block.

**What Next**

Check if the floorplan information has been read in correctly for the design. In case no floorplan has been read in, run the initialize_floorplan command to create a new floorplan.

## DCFP-011

(Error) Boundary bbox is not defined for the block %s.

**Description**

This error occurs when the boundary is not defined for the block or the boundary is invalid.

**What Next**

Check if the DIEAREA definition in your input DEF file is valid. Read in a DEF with the correct DIEAREA defined or run initialize_floorplan command to create a new floorplan.

## DCFP-012

(Error) Block %s has invalid core area.

**Description**

This error occurs when no core area is defined for the block or the core area defined is invalid.

Feedback

**What Next**

Check if the ROW definitions in your input DEF file are valid. Use create_site_array command to create site rows or run initialize_floorplan command to create a new floorplan.

---

## DCFP-020

(Error) Unit tile is missing in reference library.

**Description**

Unit tile is not found in the physical library. This message indicates one of three errors:

- No physical library is accessible.

- There is no site definition in any physical library.

- There are sites defined in the library, but none of them is a unit tile.

**What Next**

Add unit site definition in the technology portion of the physical library, and regenerate the library.

---

## DCFP-021

(Error) Site type %s height %s is not an integer multiple of site type %s height %s.

**Description**

This error occurs because the abnormal site height is not an integer multiple of the normal site height. Detail placement requires that the abnormal site height is an integer multiple of the normal site height.

**What Next**

Check the physical library make sure that the multiheight site is an integer multiple of the normal site height.

---

## DCFP-030

(Error) Tracks not defined for layer %s.

**Description**

This message indicates that the tracks are not defined on the layer %s. The tracks are necessary for routing on this layer.

Feedback

**What Next**

Use create_track command to create the tracks on the specific metal layers.

---

## DCFP-031

(Warning) Track %s doesn't cross core area.

**Description**

This message indicates that the track %s doesn't cross core area. These tracks will not be considered by the tool during optimization and estimation.

**What Next**

Check the track definition and make sure the tracks cover the core area of the block.

---

## DCFP-040

(Error) Macro cell %s is not fixed.

**Description**

This message indicates that the macro cell %s either doesn't have a location or has a location but is not fixed.

**What Next**

If the macro doesnt have a location, use create_placement command to place it. If the macro is placed, then fix the macros.

---

## DCFP-041

(Error) No location specified for fixed macro cell %s.

**Description**

Macro cell %s is fixed but its location is invalid.

---

## DCFP-042

(Warning) Fixed macro %s is out of the core area.

**Description**

This message indicates that the fixed macro %s is outside the core area.

Feedback

**What Next**

Move this cell into the core area manually.

---

## DCFP-043

(Warning) Fixed cell %s is overlapping with blockages at (%s, %s).

**Description**

This message is indicates that the fixed cell instance is overlapping with a blockage.

**What Next**

Manually move the fixed cell outside the blockage or run create_placement command.

---

## DCFP-044

(Error) Macro cell %s is overlapping other macro cells at (%s, %s).

**Description**

This message is indicates that this macro cell and one other neighbour macro cell are overlapping each other.

**What Next**

Manually move the cells to ensure that they don't overlap.

---

## DCFP-050

(Error) Site row %s overlaps with other site rows of same site definition at (%s, %s).

**Description**

Site rows with same site definition are not allowed to overlap.

**What Next**

Check your floorplan to find overlapping rows. Modify your DEF file to eliminate the overlap.

---

## DCFP-051

(Error) Site array has rows and columns specified at the same time.

Feedback

**Description**

You receive this error message because the site array you defined in the input DEF contains both horizontal and vertical arrays. Only one orientation of arrays can be specified in the site array, horizontal rows or vertical columns, but not both.

**What Next**

Modify the ROW definitions in the input DEF.

---

## DCFP-052

(Error) Site rows with site definition %s are misaligned.

**Description**

All the site rows with the same site site definition need to be aligned such that there is no offset between sites vertically.

**What Next**

Change the floorplan so that the rows align properly. Ensure that the distance between x-origins of the different rows is zero modulo the site width.

---

## DCFP-053

(Error) Row %s has a non-zero extra spacing of %s.

**Description**

Non-Zero extra spacing in rows is not supported.

**What Next**

Set row_extra_spacing to zero

---

## DCFP-060

(Warning) Move bound %s partially or completely overlaps with other move bound %s.

**Description**

This message indicates that two or more bounds overlap with each other. This may lead to invalid placement of cells.

**What Next**

Make sure that the bounds don't overlap each other.

Feedback

## DCFP-061

(Info) Non-exclusive movebound %s is completely covered by blockages.

**Description**

You receive this information because a movebound is completely covered by a blockage. When this occurs, the placer ignores the bound.

**What Next**

Move the movebounds to ensure that they do not conflict with the blockages.

## DCFP-062

(Warning) Placement blockage %s lie partially or completely outside the bounds of the block.

**Description**

You receive this warning message because the dimensions or locations of the specified blockages cause them to lie outside the block. Therefore, these blockages in your design are located off the chip.

**What Next**

Correct the core area to include all the blockages within the block. Or correct the locations or dimensions of the placement blockage to fit within the block.

## DCFP-063

(Error) Keepout margin for cell %s is larger than the core area.

**Description**

This error indicates that the keepout area corresponding to the specified cell to be greater than the core area. This will result in no placeable cell area in the block.

**What Next**

Ensure that the keepout value is more reasonable or increase the core area to accommodate the keepout area.

## DCFP-064

(Error) Exclusive move bounds %s and %s partially or completely overlap with each other.

Feedback

**Description**

This error occurs when two exclusive bounds overlap each other partially or completely. This may lead to insufficient space to place the cells constrained by the bounds as intersection area of two exclusive bounds is unusable.

**What Next**

Make sure that the bounds don't overlap each other.

---

## DCFP-065

(Warning) Keepout margin of cell %s lies partially or completely outside the bounds of the core.

**Description**

This message indicates that the keepout margin of the cell are not withon the core or boundary of the block.

**What Next**

Check the DEF file and ensure that the given keepout margin values are within the core area.

---

## DCFP-066

(Error) Exclusive movebound %s is completely covered by blockages.

**Description**

Exclusive movebound %s is completely covered by a blockage. This bound will be ignored.

**What Next**

Move the movebounds to ensure that they do not conflict with the blockages.

---

## DCFP-070

(Error) IO Pad %s doesn't lie between die bounding box and core bounding box.

**Description**

The placement for the specified pad or I/O is illegal.

Feedback

## DCFP-071

(Warning) IO Pad %s overlaps with other pads at (%s, %s).

## DCFP-080

(Error) No preferred routing direction defined for layer %s.

**Description**

This error indicates that there is no routing direction defined for a routing layer. The checking is performed for all routing layers if max/min routing layers are not defined.

If max/min routing layers are defined, the tool only check layers between max and min layers.

**What Next**

Please set the routing_direction attribute on the layer.

## DCFP-081

(Warning) Consecutive metal layers have the same preferred routing direction.

**Description**

This warning message occurs when two or more consecutive metal layers have the same prefferred routing direction.

**What Next**

Set the routing_direction attribute on the layer.

# DCHK

## DCHK-001

(warning) In design '%s', input pin '%s' of leaf cell '%s' is not connected to any net.

**Description**

This message appears when a leaf cell has an unconnected input pin.

Feedback

## DCHK-002

(warning) In design '%s', input pin '%s' of leaf cell '%s' is connected to undriven net '%s'.

**Description**

This message appears when leaf cell input pin has a connected net, but the net has no driver.

## DCHK-003

(warning) In design '%s', input pin '%s' of hierarchical cell '%s' has one or more internal loads, but is not being driven.

**Description**

This message appears when a hierachical cell input pin has internal load, but no driver.

## DCHK-004

(warning) In design '%s', input pin '%s' of hierarchical cell '%s' has no internal loads and is not being driven.

**Description**

This message appears when hierarchical cell input pin has no internal load and no driver.

## DCHK-005

(warning) In design '%s', the pin '%s' on submodule '%s' is connected to logic '%s'.

**Description**

This warning is issued when the *check_netlist* finds an instance of a hierarchical design (for example, a sub-module) that has an input connected to a logic constant. This warning is issued to verify that this is a desired connection on the submodule.

## DCHK-006

(warning) In design '%s', the same net is connected to more than one pin on submodule '%s'.

Feedback

**Description**

This warning is issued when the command *check_netlist* finds an instance of a hierarchical design (for example, a sub-module) that has more than one input connected to the same net. This warning is issued to verify that these are desired connections on the submodule.

---

## DCHK-007

(warning) In design '%s', cell '%s' has no output pins.

**Description**

This warning message indicates that the command *check_netlist* has found a cell with no output pins.

---

## DCHK-008

(warning) In design '%s', cell '%s' does not drive any nets.

**Description**

This warning alerts you that the output(s) of a cell is not connected to any load nets. This usually indicates that a design has not been correctly specified.

---

## DCHK-009

(warning) In design '%s', '%s' net '%s' driven by %s '%s' has no loads.

**Description**

This warning message occurs when a net is driven by an output pin (or pins) but has no load pins connected to it. This usually indicates that a design is not correctly specified.

---

## DCHK-010

(warning) In design '%s', '%s' net '%s' has no drivers.

**Description**

This warning message occurs when there is a net that is not driven by any source pins.

---

## DCHK-011

(information) In design '%s', '%s' net '%s' has multiple drivers.

Feedback

**Description**

This warning indicates that the *check_netlist* has found a net with multiple source pins.

**What Next**

Make sure that you intended to have multiple drivers on the given net. Errors in specifying a design could lead to this message in a situation where wired logic is not intended.

---

## DCHK-012

(error) In design '%s', '%s' net '%s' is driven by both logic 0 and logic 1.

**Description**

This error is issued when the *check_netlist* command encounters a shorted power ground net, which is connected to both logic 0 and logic 1.

---

## DCHK-013

(warning) In design '%s', multiply-driven '%s' net '%s' is driven by constant '%s'.

**Description**

A multiply-driven net has a constant as one of its drivers. This is likely to be a design error. If you intended to drive the net with a pullup/pulldown, instantiate a pullup/pulldown cell in your design instead.

---

## DCHK-014

(warning) In design '%s', '%s' net '%s' has a single tri-state driver '%s'.

**Description**

This warning message is printed when the *check_netlist* command detects that a net is driven by a single tri-state driver.

---

## DCHK-015

(warning) In design '%s', three-state '%s' net '%s' has non three-state driver '%s'.

**Description**

Synopsys tools classify a net as a three-state net if it is driven by at least one pin that has three-state attribute. Normally, if there are multiple drivers on such nets, it is assumed that all driving pins should be three-state drivers, for correct operation of the three-state

Feedback

bus. This warning message indicates a situation where at least one non-three-state driver appears on a three-state net.

## DCHK-016

(warning) In design '%s', port '%s' is not connected to any nets.

**Description**

This warning alerts you that a port in a design is not connected to any nets. This usually indicates that a design has not been correctly specified.

## DCHK-017

(warning) In design '%s', input port '%s' is unloaded.

**Description**

The *check_netlist* command issues this warning when it finds an unloaded input port on a design. This means that the given input port does not connect to any logic inside the design.

## DCHK-018

(warning) In design '%s', input port '%s' drives wired logic.

**Description**

This warning message occurs when the *check_netlist* command encounters an input port connected to a net that has multiple drivers. The input port (which acts as a driver on the net) is part of a wired-logic gate.

**What Next**

Make sure that you want multiple drivers on the net driven by the indicated port. Errors in specifying a design can lead to this message in a situation where wired logic is not intended. For example, if the direction of an output port is accidentally specified as input, then this message could occur.

## DCHK-019

(information) In design '%s', input port '%s' is connected directly to output port '%s'.

**Description**

This message alerts you to a situation where an input port in a design is directly connected to an output port.

Feedback

## DCHK-020

(warning) In design '%s', output port '%s' is connected directly to '%s'.

**Description**

This warning alerts you to a situation where an output port in a design is connected directly to Logic 1 or Logic 0.

## DCHK-021

(warning) In design '%s', net connected to output port '%s' is not driven.

**Description**

This warning message occurs when the *check_netlist* command finds the specified output port for the design is not driven by any signal.

## DCHK-022

(warning) In design '%s', output port '%s' is driven from the outside.

**Description**

This error message occurs when the *check_netlist* command finds the specified output port for the design is driven from the outside.

## DCHK-023

(warning) In design '%s', output port '%s' is connected directly to output port '%s'.

**Description**

This warning alerts you to a situation where an output port in a design is connected directly to another output port.

## DCHK-024

(warning) In design '%s', port '%s' is connected to a zero width bus.

**Description**

This messages indicates that the specified port is part of a zero width bus.

Feedback

## DCHK-025

(warning) In design '%s', port '%s' is not connected to any net. However the net with same name '%s' is also present in the design.

### Description

This messages indicates that the specified port is not connected to any net. However there is a net with the same name as that of port present in the design. You may want to check the connections of this port.

## DCHK-026

(warning) In design '%s', port '%s' is connected to net '%s' which does not have same name.

### Description

This messages indicates that the specified port is connected to net which does not have the same name. This is a violation of the verilog naming rules. Typically it happens when a logical hierarchy has an input port directly driving an output port, or a net that is driving multiple output ports directly. If nothing is done to resolve these warnings, then any Verilog written out will include assign statements to resolve the naming rule violations.

### What Next

To avoid assign statements in Verilog, Fusion Compiler offers the set_fix_multiple_port_nets command to resolve this early during the compile_fusion command. The -feedthroughs option enables insertion of buffers between logical hierarchy input and output ports. The -outputs option enables insertion of buffers on nets driving multiple output ports, such that each net only drives one output port after the buffers are inserted.

The Fusion Compiler and ICC II backend flow also offers the opt.port.eliminate_verilog_assign app option, which when set true, enables optimization steps in the compile_fusion, place_opt, and clock_opt commands to insert buffers to resolve these violations.

## DCHK-027

(warning) In design '%s', port '%s' is connected to net '%s' which does not have same name. However a net '%s' with same name as port exists in design.

Feedback

### Description

This messages indicates that the specified port is connected to a net with a different name. However a net with same name as the port also exists in the design. Hence, you may want to check the connections of the port as this is in violation of verilog naming rules.

---

## DCHK-028

(warning) The %s design contains an unused reference, %s.

### Description

This warning indicates that you design contains a dangling "reference" with the specified name. In Synopsys terminology, "reference" refers to the actual component for a given instantiation or cell. For example, if your cell library contains an inverter, INV, and you instanatiate that inverter in your design as cell13 and cell23, the INV library cell is the "reference" for each of these instantiations (cells). Sometimes, during the process of building or modifying a design, a reference remains, even though all cells that refer to it have been removed or changed. This should not impair the functionality of the design or the operation of Synopsys tools.

### What Next

A large number of dangling references in your design can increase the memory size of the design. Sometimes they can be removed by writing the entire design out and then reading it back in.

---

## DCHK-029

(warning) %s does not have any output ports.

### Description

This warning message indicates a design/cell without output pins. Unless such designs are protected through the use of the dont_touch command, the compile command will remove instances of such designs, since they have no functionality.

### What Next

This warning probably appeared because of an error in specifying a component in your design, or a component in your technology library. Check the design/library to find the problem, and correct the description of the given cell/design.

---

## DCHK-030

(Error) No floorplan exists for block '%s'.

Feedback

**Description**

This error occurs when the most basic floorplan information, like boundary and core, are not defined for the block.

**What Next**

Check if the floorplan information has been read in correctly for the design. In case no floorplan has been read in, run the initialize_floorplan command to create a new floorplan.

---

## DCHK-031

(Error) Boundary bbox is not defined for the block '%s'.

**Description**

This error occurs when the boundary is not defined for the block or the boundary is invalid.

**What Next**

Check if the DIEAREA definition in your input DEF file is valid. Read in a DEF with the correct DIEAREA defined or run initialize_floorplan command to create a new floorplan.

---

## DCHK-032

(Error) Block '%s' has invalid core area.

**Description**

This error occurs when no core area is defined for the block or the core area defined is invalid.

**What Next**

Check if the ROW definitions in your input DEF file are valid. Use create_site_array command to create site rows or run initialize_floorplan command to create a new floorplan.

---

## DCHK-033

(warning) In design '%s' net '%s' has a connection class violation.

**Description**

This warning message indicates that *check_netlist* has found a net that does not meet the connection class requirements described in the technology library. These connection class requirements ensure that all pins on a net can legally be connected. All pins connected together on a net must share at least one connection class in common. Each pin's class

Feedback

is defined in the technology library description for the pin, through the connection_class attribute.

**What Next**

Determine whether the design you are checking was (1) created manually as a netlist, or (2) created by Design Compiler (possibly from a high-level description) or DFT Compiler. If (1) is true, investigate the violation to be sure that you have specified the net correctly in your design. If (2) is true, examine the illegal net(s) created by the tool. It might not always be possible for the given net to be legalized. For example, a net might connect though hierarchy to pins whose connection classes cannot be matched. Or, other design rules, such as fanout restrictions or transition time restrictions might have made legalization for connection rules impossible. Also, check your technology library to determine whether there are level shifting components available to convert between the given connect classes.

---

## DCHK-034

(error) In design '%s', input port '%s' is connected to a multiply-driven net and the drivers include a hierarchical output pin.

**Description**

This error message occurs when the *check_netlist* command encounters an input port connected to a net that has multiple drivers and one or more of the drivers is a hierarchical output pin.

**What Next**

Make sure that you intend to have multiple drivers on the net driven by the indicated port.

Check that design ports are specified correctly. For example, if the direction of an output port is accidentally specified as input, then this message occurs.

Check the design to ensure that this is the functionality that you originally intended.

If you want to skip this checking, set the *da.check_netlist.allow_multiply_driven_nets_by_inputs_and_outputs* app option to true.

---

## DCHK-035

(error) In design '%s', net '%s' is a wire loop.

**Description**

This error message occurs when the *check_netlist* command encounters a wire loop, which is a timing loop with no cells in it.

Feedback

**What Next**

Make sure that you break the wire loop. Wire loops might cause further problems later.

If you want to skip this checking, set the *da.check_netlist.check_for_wire_loop* app option to false.

---

## DCHK-036

(error) In design '%s', leaf cell output pin '%s' is connected to constant net '%s'.

**Description**

This error message occurs when the *check_netlist* command encounters an cell output pin attempting to drive a constant net. This likely reflects a design error.

**What Next**

Please modify the design, so the output pin is not connected to a constant.

---

## DCHK-037

(warning) In design '%s', %s port '%s' is not being used in accordance with its stated direction.

**Description**

This warning message occurs when a port is not being used in accordance with its stated direction. An example is when a module assigns a value to an input port. These situations can cause bad logic.

**What Next**

This is only a warning message. No action is required.

However, if the result is not what you intended, search the source RTL for the offending assignment and correct it.

---

## DCHK-038

(information) In current design '%s', module '%s' is instantiated '%s' times.

**Description**

This information message indicates that a single module is instantiated more than once below the current design.

Feedback

## DCHK-039

(warning) In design '%s', cell '%s' is unmapped.

**Description**

This message appears when a cell in the design is found to be unmapped.

**What Next**

If the design has not undergone synthesis, this warning can be ignored. Otherwise, you should examine the cell that is reported to see why it is still unmapped.

## DCHK-040

(Error) Unit tile is missing in reference library.

**Description**

Unit tile is not found in the physical library. This message indicates one of three errors:

- No physical library is accessible.

- There is no site definition in any physical library.

- There are sites defined in the library, but none of them is a unit tile.

**What Next**

Add unit site definition in the technology portion of the physical library, and regenerate the library.

## DCHK-041

(Error) Site type '%s' height '%s' is not an integer multiple of site type '%s' height '%s'.

**Description**

This error occurs because the abnormal site height is not an integer multiple of the normal site height. Detail placement requires that the abnormal site height is an integer multiple of the normal site height.

**What Next**

Check the physical library make sure that the multiheight site is an integer multiple of the normal site height.

Feedback

## DCHK-042

(information) Use the related options for more information about warnings.

### Description

This message indicates that a terse version of informational messages or warnings on a design has just been displayed.

### What Next

Use the corresponding options to obtain more information about the design.

## DCHK-043

(error) In design '%s', cell '%s' does not have a reference.

### Description

This error describes a problem in the database representation for your design. The error means that a particular instantiation of a component (or "cell" in Synopsys terms) does not indicate which type of component it actually is. In Synopsys terminology "reference" describes the part of a design representation that points to the actual component for a given instantiation or cell. If you have an inverter (INV) in your technology library, and you've instantiated that inverter in your design as cell13 and cell23, then each of the instantiations (cells) should own a pointer (reference) to the actual component (in this case INV). This error indicates that, for some reason, the reference does not exist on the cell.

### What Next

Make sure that your design specifies the type of the given cell. If you specified a cell without a type, fix the problem by changing your design description. Otherwise this error could indicate that there is an internal problem in the Synopsys software that needs to be reported to the Synopsys Hotline.

## DCHK-044

(Information) Module '%s' does not contain any cells or nets.

### Description

Please double check the empty module.

## DCHK-045

(warning) In design '%s', the output pin '%s' of hierarchical cell '%s' has internal drivers, but has no loads.

Feedback

**Description**

This warning is issued when the *check_netlist* finds a floating output pin, which does not connect to any load nets.

---

## DCHK-047

(Warning) Macro cell '%s' is not placed.

**Description**

Macro cell %s location is invalid.

---

## DCHK-048

(Warning) Port '%s' is not placed.

**Description**

Port %s location is invalid.

---

## DCHK-050

(Error) Tracks not defined for layer '%s'.

**Description**

This message indicates that the tracks are not defined on the layer %s. The tracks are necessary for routing on this layer.

**What Next**

Use create_track command to create the tracks on the specific metal layers.

---

## DCHK-051

(Warning) Track '%s' on layer '%s' does not cross core area.

**Description**

This message indicates that the track %s doesn't cross core area. These tracks will not be considered by the tool during optimization and estimation.

**What Next**

Check the track definition and make sure the tracks cover the core area of the block.

Feedback

## DCHK-052

(warning) Block instance %s and %s are not aligned on cell row. There is cell row %s that orientation is %s end in location (%s, %s) at block instance %s's boundary edge %s, while there is no aligned cell row%s at block instance %s's boundary edge %s.

### Description

Cell rows in two block instances do not align. This will cause potential DRC errors in implementation.

### What Next

Check the cell rows in both block instances.

## DCHK-053

(warning) Block instance %s and current block %s are not aligned on cell row and wire track. There is cell row %s that orientation is %s end in location (%s, %s) at block instance %s's boundary edge %s in current block, while there is no aligned cell row%s at boundary edge %s in block instance %s.

### Description

Cell rows in two block instances do not align. This will cause potential DRC errors in implementation.

### What Next

Check the cell rows in both block instances.

## DCHK-054

(warning) Block instance %s and current block %s are not aligned on cell row. There is cell row %s that orientation is %s end in location (%s, %s) at boundary edge %s in block instance %s, while there is no aligned cell row%s at block instance %s's boundary edge %s in current block.

### Description

Cell rows in two block instances do not align. This will cause potential DRC errors in implementation.

### What Next

Check the cell rows in both block instances.

Feedback

## DCHK-055

(warning) Block instance %s and %s are not aligned on wire track. There is track %s%s %s on layer %s end in location (%s, %s) at block instance %s's boundary edge %s, while there is no same track%s at block instance %s's boundary edge %s.

### Description

Wire tracks in two block instances do not align. This will cause potential DRC errors in implementation.

### What Next

Check the wire tracks in both block instances.

## DCHK-056

(warning) Block instance %s and current block %s are not aligned on wire track. There is track %s%s%s on layer %s end in location (%s, %s) at boundary edge %s in block instance %s, while there is no same track%s at block instance %s's boundary edge %s in current block.

### Description

Wire tracks in two block instances do not align. This will cause potential DRC errors in implementation.

### What Next

Check the wire tracks in both block instances.

## DCHK-057

(warning) Block instance %s and current block %s are not aligned on wire track. There is track %s%s%s on layer %s end in location (%s, %s) at block instance %s's boundary edge %s in current block, while there is no same track%s at boundary edge %s in block instance %s.

### Description

Wire tracks in two block instances do not align. This will cause potential DRC errors in implementation.

### What Next

Check the wire tracks in both block instances.

Feedback

## DCHK-060

(Error) Macro cell '%s' is not fixed.

**Description**

This message indicates that the macro cell %s either doesn't have a location or has a location but is not fixed.

**What Next**

If the macro doesnt have a location, use create_placement command to place it. If the macro is placed, then fix the macros.

## DCHK-061

(Error) No location specified for fixed macro cell '%s'.

**Description**

Macro cell %s is fixed but its location is invalid.

## DCHK-062

(Warning) Fixed macro %s is out of the core area.

**Description**

This message indicates that the fixed macro %s is outside the core area.

**What Next**

Move this cell into the core area manually.

## DCHK-063

(Warning) Fixed cell %s is overlapping with blockages.

**Description**

This message is indicates that the fixed cell instance is overlapping with a blockage.

**What Next**

Manually move the fixed cell outside the blockage or run create_placement command.

Feedback

## DCHK-064

(Error) Macro cell %s is overlapping other macro cells.

**Description**

This message is indicates that this macro cell and one other neighbour macro cell are overlapping each other.

**What Next**

Manually move the cells to ensure that they don't overlap.

## DCHK-070

(Error) Site row %s overlaps with other site rows of same site definition.

**Description**

Site rows with same site definition are not allowed to overlap.

**What Next**

Check your floorplan to find overlapping rows. Modify your DEF file to eliminate the overlap.

## DCHK-071

(Error) Site array has rows and columns specified at the same time.

**Description**

You receive this error message because the site array you defined in the input DEF contains both horizontal and vertical arrays. Only one orientation of arrays can be specified in the site array, horizontal rows or vertical columns, but not both.

**What Next**

Modify the ROW definitions in the input DEF.

## DCHK-072

(Error) Site rows with site definition %s are misaligned.

**Description**

All the site rows with the same site site definition need to be aligned such that there is no offset between sites vertically.

Feedback

**What Next**

Change the floorplan so that the rows align properly. Ensure that the distance between x-origins of the different rows is zero modulo the site width.

---

## DCHK-073

(Error) Row '%s' has a non-zero extra spacing of '%s'.

**Description**

Non-Zero extra spacing in rows is not supported.

**What Next**

Set row_extra_spacing to zero

---

## DCHK-080

(Warning) Move bound '%s' overlaps with movebound '%s'.

**Description**

This message indicates that two or more bounds overlap with each other. This may lead to invalid placement of cells.

**What Next**

Make sure that the bounds don't overlap each other.

---

## DCHK-081

(Info) Non-exclusive movebound '%s' is completely covered by blockages.

**Description**

You receive this information because a movebound is completely covered by a blockage. When this occurs, the placer ignores the bound.

**What Next**

Move the movebounds to ensure that they do not conflict with the blockages.

---

## DCHK-082

(Warning) Placement blockage '%s' lie partially or completely outside the bounds of the block.

Feedback

**Description**

You receive this warning message because the dimensions or locations of the specified blockages cause them to lie outside the block. Therefore, these blockages in your design are located off the chip.

**What Next**

Correct the core area to include all the blockages within the block. Or correct the locations or dimensions of the placement blockage to fit within the block.

---

## DCHK-083

(Error) Keepout margin for cell '%s' is larger than the core area.

**Description**

This error indicates that the keepout area corresponding to the specified cell to be greater than the core area. This will result in no placeable cell area in the block.

**What Next**

Ensure that the keepout value is more reasonable or increase the core area to accommodate the keepout area.

---

## DCHK-084

(Error) Exclusive move bounds %s and %s partially or completely overlap with each other.

**Description**

This error occurs when two exclusive bounds overlap each other partially or completely. This may lead to insufficient space to place the cells constrained by the bounds as intersection area of two exclusive bounds is unusable.

**What Next**

Make sure that the bounds don't overlap each other.

---

## DCHK-085

(Warning) Keepout margin of cell %s lies partially or completely outside the bounds of the core.

**Description**

This message indicates that the keepout margin of the cell are not withon the core or boundary of the block.

Feedback

**What Next**

Check the DEF file and ensure that the given keepout margin values are within the core area.

---

## DCHK-086

(Error) Exclusive movebound %s is completely covered by blockages.

**Description**

Exclusive movebound %s is completely covered by a blockage. This bound will be ignored.

**What Next**

Move the movebounds to ensure that they do not conflict with the blockages.

---

## DCHK-090

(Error) IO Pad %s doesn't lie between die bounding box and core bounding box.

**Description**

The placement for the specified pad or I/O is illegal.

---

## DCHK-091

(Warning) IO Pad %s overlaps with other pads.

---

## DCHK-100

(Error) No preferred routing direction defined for layer %s.

**Description**

This error indicates that there is no routing direction defined for a routing layer. The checking is performed for all routing layers if max/min routing layers are not defined.

If max/min routing layers are defined, the tool only check layers between max and min layers.

**What Next**

Please set the routing_direction attribute on the layer.

Feedback

## DCHK-101

(Warning) Consecutive metal layers '%s' and '%s' have the same preferred routing direction.

**Description**

This warning message occurs when two or more consecutive metal layers have the same prefferred routing direction.

**What Next**

Set the routing_direction attribute on the layer.

## DCHK-102

(Error) Shape '%s' of port '%s' is of unexpected type '%s'.

**Description**

This message appears when a shape of port is of an unexpected type other than point, rectangle or polygon.

## DCHK-103

(Warning) The orientation of cell instance '%s' does not match any legal orientations.

**Description**

This message appears when a cell instance's orienation is not one of the legal orientation of the library cell.

## DCHK-104

(Information) The layer '%s' does not contain any PG shapes.

**Description**

This message appears when a layer doesn't have on PG shapes on it.

## DCHK-105

(Warning) The spacing of layer '%s' is greater than the difference of the pitch and width of the layer.

Feedback

**Description**

This message appears when a layer's spacing is greater than the difference of pitch and width.

---

## DCHK-106

(Error) Layer '%s' is not defined in the tech file.

**Description**

This message appears when a layer is not present in the tech file. Please check the tech file.

---

## DCHK-107

(Warning) The utilization of '%s':'%s' is above '%s'.

**Description**

This message appears when a movebound/groupbound object's utilization is above a certain value.

---

# DCX

---

## DCX-0003

(Information) Performing timing-driven clock gate split.

**Description**

The timing-driven clock gate split is being executed.

**What Next**

If that is not what you intended, set the application option *compile.clockgate.enable_timing_driven_clock_gate_split* to false.

---

# DCXS

---

## DCXS-0001

(error) Sub-Ckt build failed. No scenarios found during sub-ckt creation.

Feedback

**Description**

XForm sub-ckt build failed because no scenarios are found.

**What Next**

Client should add valid scenarios before calling XForm.

# DDB

## DDB-1

(warning) Cell %s not added to design %s because a cell with that name already exists.

## DDB-2

(warning) Net %s not added to design %s because a net with that name already exists.

**Description**

A net with the specified name already exists.

**What Next**

Reissue the command with a new net name. Use the *report_net* command to find a list of all the nets currently present in the design.

## DDB-3

(warning) Consistency problem: port %s is not owned by any design or reference.

**Description**

The specified port is not owned by any design.

**What Next**

Check the consistency of your design database.

## DDB-4

(warning) Consistency problem: a pin is not owned by any cell.

**Description**

The specified pin is not owned by any design.

Feedback

**What Next**

Check the consistency of your design database.

---

## DDB-5

(warning) Consistency problem: cell %s is not owned by any design.

---

## DDB-7

(warning) Consistency problem: net %s is not owned by any design.

---

## DDB-8

(warning) Consistency problem: a pin was found without a corresponding port.

---

## DDB-9

(warning) Consistency problem: cell %s was found without a corresponding reference.

---

## DDB-10

(warning) Consistency problem detected in design %s\n%s

---

## DDB-11

(warning) Internal error\n%s

---

## DDB-12

(warning) Removed duplicate cell '%s'.

---

## DDB-13

(warning) The name of net '%s' in design '%s' can't be changed \n\ \tto the name of both ports '%s' and '%s' to which it's connected.

---

## DDB-14

(warning) The net '%s' in design '%s' is connected to both \n \tports '%s' and '%s'.

Feedback

### Description

Two ports can only be connected to a net if they are inout ports or if they drive wired logic. Connecting two input ports to a net can limit the optimization that can be performed by Design Compiler on the net.

### What Next

Disconnect one of the ports from the net using the *disconnect_net* command.

---

## DDB-21

(error) Conflict between logic 0 and 1. Can't %s.

### Description

The two specified ports were set previously as logic 0 and 1. They might not have been directly set, but could have been implicitly set by a sequence of *set_equal* and *set_opposite* commands.

### What Next

If the ports were directly set as logic 0 and 1, the next steps are as follows:

```
Use report_attributes commands on the two ports. They will have the
driven_by_logic_zero and driven_by_logic_one attributes set.

Remove one of these two attributes, one of which is incorrect,
using the remove_attribute command

Reissue the original command.
```

If the ports were implicitly set as logic 0 and 1 through a sequesce of *set_equal* and *set_opposite* commands, the next step is as follows:

```
Use the reset_design command to remove the setting of 0 and 1 on the
ports. this command removes all other constraints on the design and
 should
be used with caution.
```

---

## DDB-22

(error) Can't set equal ports opposite in design '%s': '%s' '%s'.

### Description

The two ports were set as equal ports previously. They might not have been directly set, but could have been implicitly set by a sequence of *set_equal* and *set_opposite* commands.

Feedback

### What Next

The two specified ports were set previously as equal ports. The only way to revert back this setting is to reset the design using the *reset_design* command. This command removes all other constraints on the design and should be used with caution.

---

## DDB-23

(error) Can't set opposite ports equal in design '%s': '%s' '%s'.

### Description

The two ports were set as opposite ports previously. They might not have been directly set, but could have been implicitly set by a sequence of *set_equal* and *set_opposite* commands.

### What Next

The two specified ports were previously set as opposite ports. The only way to revert back this setting is to reset the design using the *reset_design* command. This command removes all other constraints on the design and should be used with caution.

---

## DDB-24

(warning) Overwriting design file '%s/%s'.

### Description

Overwriting the specified version of the design with more recent version.

### What Next

Warning only. No action is required.

---

## DDB-27

(error) '%s' value must be positive.

### Description

A negative value was entered. Constraint values must be positive (or 0).

### What Next

Please enter a non-negative value.

Feedback

## DDB-28

(error) '%s' cannot be set on %s pin '%s'.

**Description**

The specified constraint cannot be set on a pin of the specified direction. The constraint command will be ignored.

**What Next**

Please enter a correct constraint command.

## DDB-29

(error) '%s' cannot be set on %s port '%s'.

**Description**

The specified constraint cannot be set on a port of the specified direction. The constraint command will be ignored.

**What Next**

Please enter a correct constraint command.

## DDB-30

(error) Can't specify output port '%s' as a path startpoint.

**Description**

Output ports are not valid as path startpoints. There are no timing paths from such ports.

**What Next**

Examine the design to determine the correct startpoint for the path.

## DDB-31

(error) Can't specify input port '%s' as a path endpoint.

**Description**

Input ports are not valid as path endpoints. There are no timing paths to such ports.

**What Next**

Examine the design to determine the correct endpoint for the path.

Feedback

## DDB-32

(error) Can't specify hierarchical cell '%s' as a path '%s'.

**Description**

Hierarchical cell names are not valid as path startpoints or endpoints.

**What Next**

Use a clock, port, pin (leaf or hierarchical), or cell (leaf only) as the path startpoint or endpoint.

## DDB-33

(error) Pin '%s' does not have a library hold time.

**Description**

None.

**What Next**

Check the target library.

## DDB-34

(error) %s '%s' is in design '%s', but %s '%s' is in design '%s'.

**Description**

None.

**What Next**

None.

## DDB-35

(error) '%s' does not exist in library '%s'.

**Description**

The listed key in the error message does not exist in the library.

**What Next**

Check the key file.

Feedback

## DDB-38

(error) Can't open security file '%s' for protected library '%s'.

**Description**

Cannot open security file.

**What Next**

Check the security file.

## DDB-39

(error) Bad security key in file '%s' for library '%s'.

**Description**

You are trying to invoked *read_lib* on a protected library.

**What Next**

If a nodelocked library, check and correct these attributes: key_file, key_seed, and key_bit. If a network licensing library, check and correct these attributes: key_feature, key_version, and key_seed. Then reinvode the *read_lib* command.

## DDB-40

(error) Can't read protected library '%s'.

**Description**

You are trying to invoked *read_lib* on a protected library.

**What Next**

If a nodelocked library, check and correct these attributes: key_file, key_seed, and key_bit. If a network licensing library, check and correct these attributes: key_feature, key_version, and key_seed.

## DDB-41

(error) Incomplete library protection attributes.

## DDB-43

(warning) Could not create attribute '%s' for %s objects.

Feedback

## DDB-44

(error) Can't read unprotected library '%s'.

## DDB-45

(error) A design with name '%s' already exists in the same\n \tdesign file as design '%s'.

## DDB-46

(error) A reference with name '%s' already exists in design '%s'.

## DDB-47

(error) A cell with name '%s' already exists in design '%s'.

## DDB-48

(warning) Creating port '%s' on design '%s' with direction unknown.

## DDB-51

(warning) In the value of %s, \n \tthe characters separating the \tthose separating each

## DDB-52

(error) The value of %s \n \tmust include one

## DDB-53

(error) The value of %s \n \tmust include one

**Description**

The message is printed out when the current command found invalid value in the indicated variable.

**What Next**

Check the value of the given variable and provide the valid value.

Feedback

## DDB-54

(error) The value of %s \n \tmust include only one

**Description**

The error message is printed out when the current command found invalid value in the indicated variable.

**What Next**

Provide the valid value for this variable.

## DDB-55

(error) The value of %s \n \tmust include only one

**Description**

The error message is printed out when the current command found invalid value for the indicated variable name included in the message.

**What Next**

Provide the valid value for this variable.

## DDB-56

(error) In the value of %s, \n \tthere are no characters separating %s.

**Description**

This error message is printed out when the current command found that there are no character separators.

**What Next**

Provide the valid value for the command.

## DDB-57

(error) In the value of %s, \n \tthe %s of the characters separating \n \t%s must not be%s a digit.

**Description**

This error message is printed out when the current command found digit in the character separators.

Feedback

**What Next**

Provide the valid value for the command.

---

## DDB-58

(warning) In the value of %s, \n \tthere are no characters separating the \tbe ambiguous).

**Description**

If no characters separate the array name from the member number, the bus names will be ambiguous for arrays whose names end in a digit. For example, with *bus_naming_style* set to "%s%d", the name of the third member of array "A1" and the thirteenth element of array "A" would both have the name "A13".

**What Next**

Most likely you should change the value of the bus naming style to contain some characters between the "%s" and "%d". See the help page for *bus_naming_style* for details.

---

## DDB-60

(error) Could not find library pin for pin '%s'.

**Description**

The back-annotation failed because the pin does not have a corresponding pin in the link library.

**What Next**

Verify that the design is fully linked with the 'link' command. Verify that all link and target library search paths are valid.

---

## DDB-66

(warning) Removing group '%s'.

**Description**

The path group is being removed because the operation being performed has removed the last path from the group.

**What Next**

Be aware that any subsequent attempts to use this path group will fail because the group has been deleted. If you think the group should not have been deleted, identify at least

Feedback

one path you think should still be in the group and trace back to find which action deleted that path.

## DDB-67

(warning) Removing %s from group '%s'.

## DDB-68

(warning) Removing external delay related to clock %s.

**Description**

When a clock source is deleted from the design using the 'remove_clock' command, all input and output delay values that were specified relative to that clock are also deleted from the design. For example, consider the following script:

create_clock -name CLK -period 10 set_input_delay 2 -clock CLK all_inputs()
set_output_delay 2 -clock CLK all_outputs()

remove_clock CLK

The 'remove_clock' command will also have the effect of removing the input and output delay values that were specified relative to CLK.

**What Next**

No action is required, this is merely an informational warning.

## DDB-70

(error) None of the selected cells were grouped.

**Description**

When using the 'group' command on an hdl design that has not been compiled yet, it is possible that the cells you specified to be grouped cannot be grouped because they need to stay with thier neighboors until the design has gone through resource sharing in compile.

**What Next**

Use the 'group' command after the design has been compiled.

## DDB-71

(error) Design '%s' requires one of the following licenses: '%s'.

Feedback

**Description**

The specified design is licensed and requires one of the listed licenses to be available. An error has occurred because none of the licenses could be obtained.

**What Next**

Verify that your site has at least one of the specified licenses. If it does not, then one must be purchased. If your site does have one of the licenses, try again when the license is available.

---

## DDB-72

(information) Added key list '%s' to design '%s'.

**Description**

Indicates that the listed set of licenses have been associated with the specified design. Accessing the design will require that one of the listed licenses can be successfully checked out.

**What Next**

No action is required since this is just an information message.

---

## DDB-73

(warning) License '%s' contains the illegal character '%c'.\n\tIt was ignored.

**Description**

One of the licenses associated with a design contains an invalid character. That license will be dropped from the list of licenses which can be used to access the design.

**What Next**

If a design is associated with multiple licenses, it may be possible to access the design via a different, valid license. In any case the license name should be updated so that it does not contain any invalid characters. Invalid characters include: ',', '}', '{', '*', '\'.

---

## DDB-74

(warning) Design '%s' inherited license information from design '%s'.

Feedback

### Description

All of the licenses associated with one design have now been associated with another design. This typically happens when a design is ungrouped. In that situation, the parent design will inherit all licensing information from the ungrouped design.

### What Next

Although this is classified as a warning, it is essentially just an information message. No action is required.

---

## DDB-75

(warning) Design '%s' is being converted to a limited design.

### Description

This message indicates that the indicated design has been converted into a limited design. A limited design is a design which can be compiled and analyzed, but whose contents may not be examined or written out.

A design gets converted into a limited design in two situations. In the first case you have only an evaluation license for the design (obtained by manually setting synlib_disable_limited_licenses = "FALSE"), and the design will remain limited because the intent of an evaluation license is for the design data to be restricted. In the second case the design was derived from a DesignWare part and has not yet been run through the *compile* command. In this latter case the design remains limited only until after it has been compiled, at which point the limitation is removed. The intent of this latter limitation is to protect the technology- independent structure of the design.

### What Next

If you have only an evaluation license for the limited design, then the only way to gain access to the internals of that design is through the use of a full license for that part; if a full license is subsequently obtained then the first *compile* command will remove the 'limited design' restrictions. If the design has already been compiled, it is sufficient to run the *get_license* command to convert the limited design back to a regular, unrestricted format.

If you already have a full license for the limited design, then after the first *compile* command you can expect the design to be converted back to a regular, unrestricted format.

---

## DDB-76

(error) Cannot load design '%s'.

Feedback

**Description**

The named design cannot be loaded into Design Compiler's internal data structures. This can happen if certain synthetic parts cannot be found.

**What Next**

Attempt to link the design with the command *link -all*. If this fails, check that the software is correctly installed.

---

## DDB-77

(error) License '%s' is a Synopsys internal key and should\n \tnot have a seed associated with it.

**Description**

When license names are set on a design, third party keys must have a seed associated with them. It is an error, however, for Synopsys internal keys to have seeds.

**What Next**

When creating your own license names, make sure that they do not clash with the Synopsys internal license names.

---

## DDB-78

(error) No seed provided for the third-party license '%s'.

**Description**

When adding a third-party license, you must specify both a license name and a non-zero seed. This prevents third party vendors from creating keys for each other's licenses.

**What Next**

Specify the license name as *name/seed*. For example: "MY_LIC/1234"

---

## DDB-79

(error) The license '%s' has an invalid seed associated with it.

**Description**

This error occurs when the *set_design_license command* is used to store a third party license and a seed, and the seed that is specified is not consistent with the seed that was used to create the key.

Feedback

### What Next

Either generate a new key with the correct seed, or change the *set_design_license* command line so that the seeds are consistent.

---

## DDB-80

(error) The seed '%s' specified for license '%s' is\n\tnot a valid 32-bit integer.

### Description

Licenses can be specified in the from '<license>/<seed>' where <seed> is supposed to be a valid integer which can be represented in 32 bits. In this case the <seed> specified was either not an integer, or was too large to be represented in 32 bits.

### What Next

The <seed> associated with the license needs to be corrected such that it is a valid integer which can be stored in at most 32 bits.

---

## DDB-81

(warning) Unable to find specified driving_cell for port '%s'.

### Description

The driving_cell attributes indicate that a port should inherit its drive capability from a certain library cell. This error means that the tool was unable to locate a matching library cell or pin on that library cell. This may happen if the link_library does not contain the library for that cell, or if the cell name or pin name was incorrect. The driving cell information can be seen using *report_port -drive*. It may have been set by either *set_driving_cell* or *characterize*.

### What Next

If the driving cell requires a library that has not been identified in the *link_library*, the *link_library* should be changed to include that library. Otherwise, check the information for errors in cell_name, library name, or pin names using *report_port -drive -only port_name.*

---

## DDB-84

(error) Only ports of the same direction can be grouped.

---

## DDB-85

(error) Objects must be either all ports or all nets.

Feedback

**Description**

This error message is issued if a mixture of objects of different types is given as input to a command that requires a homogenous set of ports or nets as input.

**What Next**

Re-issue the command specifying only ports or only nets as input.

---

## DDB-86

(error) Bus name '%s' conflicts with existing names.

**Description**

This error message is issued when an attempt is made to create a bus with a name that conflicts with the name of an existing bus.

**What Next**

Re-issue the command with a non-conflicting name for the bus.

---

## DDB-87

(error) All objects must be from the same design.

**Description**

This error message is issued if a command that requires a set of objects belonging to the same design is invoked with objects that belong to different designs.

**What Next**

Re-issue the command with a set of objects that belong to the same design.

---

## DDB-88

(error) At least one of the port objects specified is already a member of a bus.

**Description**

This error message is displayed if an attempt is made to insert a port that belongs to a bus into a new bus.

**What Next**

Re-issue the command with ports that do not belong to an existing bus.

Feedback

## DDB-89

(error) Type name '%s' conflicts with existing type.

**Description**

This error message is issued if an attempt to create a type for a new bus object is made with a type name that is already used for another bus object with a different width.

**What Next**

Change the name of the new bus type.

## DDB-90

(error) specified range is different from number of objects to be bussed.

## DDB-91

(error) only designs or references can have busses created in them.

## DDB-92

(error) Cannot load design '%s' for an HDL embedded command.

**Description**

The named design cannot be loaded for the current command embedded in an HDL file. The current embedded command is not legal within an embedded script. See the HDL Compiler Manual for details.

**What Next**

Change the embedded script so that it does not use the offending command.

## DDB-95

(warning) Unable to find net instance '%s' in design '%s'.

**Description**

Back-annotation, such as a set_load or set_resistance value, was stored on a net instance within the design, but that instance can no longer be found. This can occur if a lower-level design containing the net instance was modified but the top-level design was unaware of this change. Commands which could modify lower level designs include *ungroup*, *change_names*, and *compile*.

Feedback

### What Next

Perform *ungroup* and *change_names* at the top level so that the top level design will have a chance to update its back-annotation records. Use *characterize* to move annotation to a subdesign before running *compile* or *reoptimize_design* on that subdesign.

---

## DDB-100

(warning) Unable to find minimum version of library cell '%s/%s' in library '%s'.

### Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but this library cell cannot be found in that minimum library. Design Compiler will use the maximum version of the cell for both maximum and minimum analysis in this case.

### What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if the indicated library cell was accidentally left out of the minimum analysis library.

---

## DDB-101

(warning) Unable to find minimum version of library pin '%s/%s' in library '%s'.

### Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has conflicting pin descriptions between the maximum and minimum libraries. In this case, a pin exists on the library cell in the maximum library, but that pin does not exist in the minimum library. Design Compiler will use the maximum version of the library pin for both maximum and minimum analysis in this case.

### What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if the indicated library pin was accidentally left out of the minimum analysis library.

---

## DDB-102

(warning) Conflicting timing arc descriptions between maximum library '%s' and minimum library '%s' to pin '%s/%s'.

Feedback

### Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has conflicting timing arc descriptions between the maximum and minimum libraries. In this case, a timing arc exists on the library cell in the maximum library, but a corresponding timing arc does not exist in the minimum library. Design Compiler will use the maximum version of the timing arc for both maximum and minimum analysis in this case.

In order to consider timing arcs as compatible between minimum and maximum libraries, they must have the same sense (for example, positive unate, or clear), they must have the same SDF condition, and there must be the same number of arcs of each type between a pair of pins.

### What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if timing arcs to the indicated library pin were accidentally left out of the minimum analysis library.

---

## DDB-103

(warning) Pin %s of lib cell %s exists in maximum library %s but not in minimum library %s. Assuming min delay for pin to be same as max delay.

### Description

The *set_min_library* command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has some pins in the max library which don't exist in the minimum libraries. Design Compiler will use the maximum version of the timing arc for both maximum and minimum analysis in this case.

In order to be compatible between minimum and maximum libraries, the library cells must have the same pins and same timing arcs (same sense (for example, positive unate, or clear), they must have the same SDF condition), and there must be the same number of arcs of each type between a pair of pins.

### What Next

Check that the *set_min_library* command specified the correct library for minimum analysis. See if the specified pins of the specified library cell were accidentally left out of the minimum analysis library.

---

## DDB-105

(warning) Design '%s' requires one of the following licenses: '%s'. \n\tWaiting for license to become available, press <ctrl>-C to terminate.

Feedback

### Description

The specified design is licensed and requires one of the listed licenses to be available. None of the licenses could be obtained. Design Compiler will wait for one of the licenses to become available and then continue.

### What Next

Verify that your site has at least one of the specified licenses. If it does not, then one must be purchased. If you wish to terminate the command instead of waiting for the license to become available, set synlib_wait_for_design_license = {}

---

## DDB-107

(warning) Deleted or recreated %d internal pin(s) on cell '%s'. All attributes and attaches on it(them) are lost.

### Description

The *access_internal_pins* variable controls creation and deletion of internal pins and user access to them. Because of the source of internal pins, they are created or deleted during link time, depending on the setting of this variable. You can use the *find* and *get_pins* commands to show internal pins, if such pins exist. Certain timing commands can also set constraints on internal pins.

### What Next

If this is what you intended to do, no action is necessary.

### See Also

- get_pins

---

# DDC

---

## DDC-1

(error) Unable to open DDC file '%s' for writing.

### Description

*dc_shell* encountered an I/O error when it attempted to open the specified DDC file for writing.

Feedback

**What Next**

Check that the file name is correct, that the directory exists and is writable, and that the filesystem is not full. If the target file already exists it must be writable in order for dc_shell to overwrite it.

---

## DDC-2

(error) Unable to open file '%s' for reading.

**Description**

The tool encountered an error when it attempted to open the specified DDC file for reading.

**What Next**

Check that the path to the file is correct and that the file is readable by the current user. Also verify that the file was written in DDC format.

---

## DDC-3

(error) DDC internal write error in design '%s'.

**Description**

*dc_shell* encountered an internal error while attempting to write the specified design. No DDC file was produced.

**What Next**

Please contact the Synopsys Support Center for assistance.

---

## DDC-4

(error) DDC internal read error in file '%s'.

**Description**

*dc_shell* encountered an internal error while attempting to read the specified file. No designs were read.

**What Next**

Please contact the Synopsys Support Center for assistance.

Feedback

## DDC-5

(error) Design data is corrupt in DDC file.

**Description**

The file being read has been modified or corrupted since it was originally written by *dc_shell*.

**What Next**

The DDC file must be re-created from the original design source. Note that DDC files cannot be edited by the user.

## DDC-6

(error) DDC file version is not compatible. The DDC file was written with\n dc_shell version %s dated %s.

**Description**

The file being read was written with an incompatible version of of the .ddc format that cannot be read with this release of the tool. The .ddc format is updated from time to time to support new features or functionality, and sometimes the new format cannot be read with older tool versions.

**What Next**

Use the current version of the tool to read the .ddc file.

## DDC-7

(error) File is not in DDC format.

**Description**

*dc_shell* has determined that the file being read is not a DDC format file.

**What Next**

Verify that the correct format option has been provided to the read_file command, and that the file path is correct.

## DDC-8

(error) Attempt to write duplicate design name '%s' to DDC file.

Feedback

### Description

*dc_shell* detected an attempt to write multiple designs with the same name to a DDC file, which is not allowed by the DDC format.

### What Next

Check the list of designs provided to the write command. It is possible, although unusual, for duplicate design names to have been read from different files, such as multiple .db files. If the duplicate design names must be preserved, they must be written to separate DDC files.

---

## DDC-9

(warning) The DDC format cannot be used to store physical data. Any physical\n information that is present will not be written to the DDC file.

### Description

You receive this warning message when you write out a DDC file that contains physical data. The DDC file format is not capable of representing physical data. Only the logical representation will be written to the DDC file.

### What Next

It is considered best practice to use the Milkyway storage format for designs that contain physical information. You can use the *write_milkyway* command to write the design to a Milkyway database.

---

## DDC-10

(error) Scenario '%s' does not exist.

### Description

The specified scenario, which was provided with the -scenarios option to the *write* command, does not exist.

### What Next

Check that the scenario name is correct, and that any scenarios which are to be written to the DDC file have been created.

### See Also

- create_scenario

Feedback

## DDC-11

(error) DDC file contains packed command syntax that cannot be processed by\n this version of dc_shell. Please use a current version of dc_shell\n to read this file.

### Description

The current DDC file contains embedded commands (constraints) which were written by a newer version of *dc_shell* and utilize a syntax which cannot be parsed by the current executable.

### What Next

Use the same (or newer) version of *dc_shell* to read the file as was used to write it.

## DDC-12

(warning) DDC file was written with a newer version of dc_shell.\n Some embedded commands may be ignored.

### Description

You are trying to read a DDC file which was written by a newer version of *dc_shell*, and the DDC file contains some packed commands (constraints) which are not recognized by the older version of *dc_shell*. Normally this would result in a DDC-6 error; however, if the variable ddc_allow_unknown_packed_commands is set to "true" then *dc_shell* will attempt to read the file, but any unrecognized packed commands will be ignored. (A DDC-13 warning message will be printed when each such command is first encountered.)

### What Next

To avoid losing potentially important information, always read the DDC file with the same (or newer) version of *dc_shell* as was used to write it.

### See Also

- DDC-13

## DDC-13

(warning) Ignoring unknown packed command #%d: %s

### Description

*dc_shell* attempted to unpack an embedded command which it does not recognize. This can happen when a DDC (or Milkyway) file which was written with a newer version of *dc_shell* is read with an older version of the product, while the variable

Feedback

ddc_allow_unknown_packed_commands is set to "true". The unrecognized command is simply discarded.

**What Next**

To avoid losing potentially important information, always read the DDC file with the same (or newer) version of *dc_shell* as was used to write it.

---

## DDC-14

(information) This file contains data for the following %d scenarios:\n %s

**Description**

The DDC or Milkyway reader prints this message if the file being read contains any scenario-specific constraint data. The message will report the name of each scenario for which the file contains data. If the scenario was inactive when the file was written, an asterisk (*) appears after the scenario name.

**What Next**

This is an informational message. No action is required.

**See Also**

- create_scenario
- current_scenario
- all_scenarios

---

## DDC-15

(warning) Ignoring %s attribute %s on %s object(s):\n Attribute type conflicts with existing attributes.

**Description**

An attribute contained in the DDC file conflicts in type with with an attribute that is already registered with the tool. The conflicting attribute is ignored by the DDC reader.

An attribute saved in a DDC file must have the same type as an existing attribute of the same name on the same netlist object class (e.g., string attribute on design objects).

This message is most likely seen when reading in DDC files written by the X-2005.09 release or earlier. Attribute conflicts from more-recent files are silently discarded.

Feedback

### What Next

This message could appear if there happens to be a user-defined attribute that has the same name (but different type) as a built-in attribute that was added in a later version of the tool. It is good practice to use a prefix for user-defined attributes, such as your company's name, that is unlikely to be used by Synopsys in the future.

### See Also

- set_attribute
- report_attribute

---

## DDC-16

(error) ddc file contains no scenario-specific data. Cannot specify\n -scenarios option for this file.

### Description

The *-scenarios* option to the *read_file* command can only be used to read files that contain scenario-specific constraint data.

### What Next

See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

---

## DDC-17

(error) ddc file contains no data for any of the requested scenarios

### Description

The specified ddc file does not contain any constraint data for any of the scenarios specified to the *-scenarios* option to the *read_file* command.

### What Next

Check the list of scenario names supplied to the *read_file -scenarios* option. See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

---

## DDC-18

(error) DDC file contains no data for any of the requested active scenarios

Feedback

### Description

The specified ddc file does not contain any constraint data for any of the scenarios specified to the *-active_scenarios* option to the *read_file* command.

### What Next

Check the list of scenario names supplied to the *read_file -active_scenarios* option. See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

---

## DDC-19

(warning) ddc file contains no data for the following requested scenarios:\n %s

### Description

The specified ddc file does not contain any constraint data for one or more of the scenarios specified to the *-scenarios* option to the *read_file* command. The file will be read and the list of scenarios to be read in will be restricted according to the remaining scenarios specified to the *-scenarios* option.

### What Next

Check the list of scenario names supplied to the *read_file -scenarios* option. See *read_file*(2) for more information on controlling which scenarios' constraints are read from the ddc file.

---

## DDC-20

(warning) This .ddc file contains special features and may only be read by\n\t tools that support the required features.

### Description

This warning message occurs when you write a .ddc file that is "feature locked." It is a reminder that the tool that is writing the file has flagged the file as requiring specific features in order for it to be read, and the file might not be readable by other tools or by the same tool if the required features have not been enabled.

### What Next

This is only a warning message. No action is required.

### See Also

- DDC-21

Feedback

## DDC-21

(error) The feature used to generate this .ddc file is not supported by\n\t this tool or is not enabled in the current session.

### Description

This error message occurs when you attempt to read a .ddc file that was "feature locked" by the tool that wrote it. The current session does not have, or has not enabled the specific features required to read the file. This usually happens when *dc_shell* writes the file when it is in a special mode and the resulting files cannot be read by all tools that consume the .ddc format.

### What Next

Review any other messages that were printed to understand which tool and features are required to read the file.

### See Also

- DDC-20

## DDC-22

(error) Cannot read design '%s' as a block abstraction because the file does not contain block abstraction information.

### Description

This error occurs when the *set_top_implementation_options* command has been run to specify that the design be read as a block abstraction, but no block abstraction information was saved in the .ddc file.

### What Next

Make sure you run the *create_block_abstraction* command immediately before writing the .ddc file. Also, verify that the correct design name is specified by the *set_top_implementation_options* command.

## DDC-23

(error) Cannot read design '%s' as a block abstraction because the specified interface features are not present in the file.

Feedback

### Description

This error occurs when the *set_top_implementation_options -load_logic compact_interface* command is used to specify that the named design be read as a block abstraction with a compact_interface, but the block abstraction has been generated with an older version of the tool that does not support the annotation of compact_interface logic.

### What Next

Regenerate the block abstraction with the latest version of the tool in order to obtain support for compact_interface markings. Alternatively, the block abstraction can be loaded as a block abstraction with a full_interface.

---

## DDC-24

(error) Output file %s is the source file for the block abstraction.

### Description

This error occurs when the specified output file is the source .ddc file for the block abstraction that is being written out. Design Compiler does not allow you to overwrite the original .ddc file because each design's core (non-interface) logic is retrieved from that file and merged with the block abstraction's interface logic in order to write out the complete netlist for the design.

### What Next

Specify an output file that is not the source of any block abstractions that are currently in memory.

---

## DDC-25

(error) Block abstraction source file %s appears to have been modified since the design was read.

### Description

This error occurs when the design that is being written out is a block abstraction and the .ddc file that it was originally read from has since been modified. The .ddc files containing block abstractions must not be modified until after their blocks have been written back out because the core (non-interface) logic is retrieved from the original files.

### What Next

Do not modify the source files for block abstractions if the designs are still being used.

Feedback

## DDC-26

(error) Cannot open block abstraction source file %s.

### Description

This error occurs when the design that is being written out is a block abstraction and the .ddc file that it was originally read from cannot be opened. The file might have been deleted or renamed, or there might be a permissions problem. The .ddc files containing block abstractions must remain available until their blocks have been written back out because the core (non-interface) logic is retrieved from the original files.

### What Next

Make sure the original .ddc files remain available as long as the block abstractions are being used.

## DDC-27

(information) Reading %s block abstraction for design '%s' and its hierarchy.

### Description

This message occurs when the specified design hierarchy is being loaded as a block abstraction. Only the specified type of interface logic (full or compact interface) is being loaded, not the entire design netlist. This behavior is controlled by the *set_top_implementation_options* command.

### What Next

This is an informational message. No action is required.

## DDC-28

(error) Block abstraction interface logic has been modified in an unsupported manner. Cannot write .ddc file.

### Description

This message occurs when the interface logic of a block abstraction has been modified in a way that the *write_file* command does not expect. This prevents the merging of the interface logic in memory with the core logic from the original .ddc file. This could be caused by manual modifications you have made to the netlist.

### What Next

Do not make manual modifications to block abstractions. Any such changes should be made prior to running the *create_block_abstraction* command.

Feedback

## DDC-29

(error) You must specify the output file name when writing a block abstraction.

**Description**

This message occurs if you are writing a block abstraction to a .ddc file and you have not specified the *-output* option with the *write_file* command. In this case, "block abstraction" refers to either the full design that has been processed by the *create_block_abstraction* command or the block abstraction (interface logic only) as specified by the *set_top_implementation_options* command.

Specifying the *-output* option causes Design Compiler to write all designs to a single file, which is required for block abstraction hierarchies.

**What Next**

Specify an output file when writing block abstractions to .ddc files.

## DDC-30

(warning) Forcing the -hierarchy option because a block abstraction is being written.

**Description**

This message occurs if you are writing a block abstraction to a .ddc file and you have not specified the *-hierarchy* option with the *write_file* command. In this case, "block abstraction" refers to either the full design that has been processed by the *create_block_abstraction* command or the block abstraction (interface logic only) as specified by the *set_top_implementation_options* command.

Design Compiler requires that block abstractions be written hierarchically, starting from the top design of the block abstraction. Therefore, the *-hierarchy* option is inferred if it has not been explicitly specified.

**What Next**

Specify the *-hierarchy* option when writing block abstractions to .ddc files.

## DDC-31

(error) You must specify only the top design of the block abstraction hierarchy.

**Description**

This message occurs if you are writing a block abstraction to a .ddc file and you have specified more than one design name with the *write_file* command or the specified design is not the top design of the block abstraction hierarchy. In this case,

Feedback

"block abstraction" refers to either the full design that has been processed by the *create_block_abstraction* command or the block abstraction (interface logic only) as specified by the *set_top_implementation_options* command.

A block abstraction's entire hierarchy must be written to a single .ddc file. The only design name that can be specified with the *write_file* command is the top design of the block abstraction. However, the design name can be omitted if that design is the current design. The *-hierarchy* and *-output* options are mandatory when writing block abstractions.

**What Next**

Specify only the top design of the block abstraction when writing .ddc files.

---

## DDC-32

(information) Merging block abstraction with non-interface netlist data from %s.

**Description**

This message occurs when writing out a design that was loaded as a block abstraction as specified by the *set_top_implementation_options* command. Since the block abstraction's interface logic might have been modified after it was loaded into memory, the interface logic in memory is merged with the core (non-interface) logic from the original .ddc file, and a new .ddc file is written out.

**What Next**

This is an informational message. No action is required.

---

## DDC-33

(information) Block abstraction information will not be preserved. If this\n information is required, you must run the create_block_abstraction\n command prior to writing the design.

**Description**

This message occurs when you read a .ddc file that contains block abstraction information that was created by the *create_block_abstraction* command. If the *set_top_implementation_options* command was not used to tell Design Compiler to read the file as a block abstraction (to read the interface logic only), then the design is read in its entirety. This message is a reminder that the block abstraction information is not automatically preserved if the design is written to a new .ddc file. If you want to preserve the block abstraction's information in a new file, you must run the *create_block_abstraction command immediately before writing it out.*

Feedback

**What Next**

This is an informational message. No action is required.

---

## DDC-34

(error) Cannot write IC Compiler block abstraction %s in ddc format.

**Description**

This message occurs when you attempt to write a block abstraction that was created by IC Compiler to a .ddc file. Only block abstractions created by Design Compiler can be written in the ddc format.

---

## DDC-35

(error) Reading of ILM designs is no longer supported. Cannot read %s.

**Description**

This message occurs when you try to read ILM designs in ddc format. ILM designs are no longer supported for use in Design Compiler.

**What Next**

Migrate to the use of block abstractions instead of ILMs for loading the blocks at the top level.

---

# DDCR

---

## DDCR-001

(error) Design '%s' in library '%s' is currently opened; reading DDC into an opened design is not allowed.

**Description**

The DDC file cannot be read into a design that is currently opened in memory.

**What Next**

Close the currently opened design and then run *read_ddc* again.

---

## DDCR-002

(information) Reading DDC into new design '%s' in library '%s'.

Feedback

**Description**

A new design has been created by *read_ddc*. The DDC file is read into the new design.

---

## DDCR-003

(information) Reading DDC into existing design '%s' in library '%s'; the existing design contents has been truncated.

**Description**

The DDC file is read into the specified existing design. Incremental DDC updates are not allowed. So *read_ddc* opens the design in truncate mode, discards the existing contents, and then reads the new DDC file into the design.

**What Next**

When saving truncated designs, use the *save_block -as* option to avoid overwriting your existing design on disk.

---

# DDF

---

## DDF-001

(error) Failed to start a design dash fusion server on {%s:%s}.

**Description**

You receive this error message when it failed to start a design dash fusion server on the address you set. It is very likely the address has already been used or the address cannot be assigned.

**What Next**

Please check if the address is legal at first. It the address is legal, please check if the address has already been used. Using stop() in resttcl package to shut down the old server before start a new one on the same address.

---

## DDF-002

(error) Detected invalid python.

**Description**

You receive this error message when the python binary specified by "-path" option is invalid.

Feedback

**What Next**

Please check the python binary and update the "-path" option accordingly.

---

## DDF-003

(error) Don't support the python version below 3.2.3 .

**Description**

You receive this error message when the version python binary specified by "-path" option is not supported.

**What Next**

Please check the python binary and update the "-path" option with a python binray higher than version 3.2.3 .

---

## DDF-004

(error) %s.

**Description**

You receive this error message when exception are caught during the execution of your command.

**What Next**

Please follow the exception error messgage to fix.

---

## DDF-005

(error) Fail to get the object class for object '%s'.

**Description**

The tool cannot get the object class for this object. This will stop the tool to get the feature value.

**What Next**

Double check the specified objects.

---

## DDF-006

(error) The input objects have different object classes.

Feedback

**Description**

The command cannot support the mixed objects with different object classes.

**What Next**

Correct the specified objects.

---

## DDF-007

(error) The value of option %s is empty.

**Description**

The command cannot accpet the empty option. Please double check it.

**What Next**

Correct the empty option.

---

## DDF-008

(warning) The name pair {%s %s} will be ignored since it is not included in the specified features.

**Description**

The labels will be ignored since it is not specifed by the option -features.

---

## DDF-009

(error) The specified new feature name "%s" given by -labels has conflict with -features.

**Description**

You receive this error message when the new feature name in -labels is a duplicate of one feature in -features.

**What Next**

Please provide correct name pairs.

---

## DDF-010

(error) A table named "%s" already exists.

**Description**

Cannot create two tables with the same name.

Feedback

**What Next**

Please provide another valid table name.

---

## DDF-011

(error) The table "%s" does not exist.

**Description**

Cannot update nonexistent table.

**What Next**

Please create the table before updating it.

---

## DDF-012

(error) The feature '%s' does not exist.

**Description**

You receive this error message when the object class does not have the specified feature(attribute).

**What Next**

Please check your input for -features.

---

## DDF-013

(warning) Failed to get feature "%s" for %d of %d objects. Default value will be used for the missing value.

**Description**

The tool fails to get the feature value, so the defaul value nan will be applied.

**What Next**

Check if the feature is specified correctly.

---

## DDF-014

(warning) Failed to get feature "%s" for all objects. This feature will be ignored.

**Description**

The tool cannot get the feature value for all the objects, so this feature will be skipped.

Feedback

**What Next**

Double check your feature name.

---

## DDF-015

(warning) Failed to get any feature for %d of %d objects. These objects will be ignored.

**Description**

If none of the feature value can be extracted for the object, it will be skipped.

**What Next**

Double check the specified objects.

---

## DDF-016

(error) The attribute type of feature "%s" is %s, which is not supported.

**Description**

The tool cannot support this type of attribute.

**What Next**

Consider using -function to derive this feature.

---

## DDF-017

(error) The specified data sizes of %s and %s are not equal.

**Description**

The sizes are inconsistent in these two options.

**What Next**

Please specify equal number of elements for these two options.

---

## DDF-018

(info) Feature "%s" is duplicated. It will only be extracted once.

**Description**

You receive this error message when there are duplicates in -features.

Feedback

**What Next**

Please remove duplicates in -features. If you really want to keep duplicates, you can use update_feature_table with -labels to rename a feature.

---

## DDF-019

(info) Feature %s is a duplicate of index. It will be ignored.

**Description**

You receive this error message when the feature in -features is a duplicate of index.

**What Next**

Please remove this feature from -features. If you really want to keep duplicates, you can use -labels to rename this feature.

---

## DDF-020

(error) Operation failed because: %s

**Description**

You receive this error message when the command failed for some reason.

**What Next**

Please correct your inputs according to the shown message.

---

## DDF-021

(error) Failed to get index. %s

**Description**

You receive this error message when the tool failed to extract the index.

**What Next**

Please correct your inputs according to the shown message.

---

## DDF-022

(error) Invalid objects. Make sure -objects is a valid collection.

**Description**

You receive this error message when the input for -objects is not a valid collection.

Feedback

**What Next**

Please use valid collection for -objects.

---

## DDF-023

(error) Failed to execute tcl proc %s. %s

**Description**

You receive this error message when the tool failed to execute the proc given by -function or -index_function.

**What Next**

Please correct the input for -function or -index_function according to the shown message.

---

## DDF-024

(warning) %d rows are skipped due to duplicated index. The latter duplicated row will overwrite the former. Duplicated indexes: %s

**Description**

You receive this error message when the input for -objects has duplicates.

**What Next**

You can remove duplicates from the collection of -objects.

---

## DDF-025

(error) Cannot parse feature value. %s

**Description**

You receive this error message when the tool failed to convert the feature value to expected data type.

**What Next**

Check if the type given by -type if correct.

---

## DDF-026

(error) Cannot use database. %s

Feedback

**Description**

You receive this error message when the tool failed to use database.

**What Next**

Check if the database is opened correctly.

---

## DDF-040

(error) %s

**Description**

You receive this error message when the specified database does not exist.

**What Next**

Please use an existing database.

---

## DDF-041

(error) %s

**Description**

Cannot open multiple databases.

**What Next**

Please close current open database first.

---

## DDF-042

(error) %s

**Description**

You receive this error message when you try to close database while there is no open database.

**What Next**

Use open_ml_db to open an database before closing it.

---

## DDF-043

(error) %s

Feedback

**Description**

Cannot execute the opration without an open database.

**What Next**

Please open a database first.

---

## DDF-044

(error) %s

**Description**

You receive this error message when you try to remove the current open database.

**What Next**

Please close current open database before removing it.

---

## DDF-045

(error) %s

**Description**

Cannot open different types of databases.

**What Next**

Please close previously opened database first.

---

## DDF-046

(error) %s

**Description**

You receive this error message when you try to create a record while this record already exists.

**What Next**

Please use another record name.

---

## DDF-047

(error) %s

Feedback

**Description**

You receive this error message when you specify a nonexistent record.

**What Next**

Please specify an existing record.

---

## DDF-048

(error) %s

**Description**

You receive this error message when the specified record is not a hier record.

**What Next**

Please specify a hier record.

---

## DDF-049

(error) Environment variable CERBERUS_HOME is not set. Either use this environment variable or -server option to specify the server path.

**Description**

You receive this error message when you try to use cassandra datastore without specifying server path.

**What Next**

Please set environment variable CERBERUS_HOME or use -server to specify the server path.

---

## DDF-050

(error) Database operation failed. %s

**Description**

You receive this error message when the operation failed for some reason.

**What Next**

Please correct your input according to the shown message.

Feedback

## DDF-117

(Error) Unable to create directory in %s. Please use -working_dir to specify a working directory.

**Description**

You receive this error message when directory cannot be created.

**What Next**

Please use -working_dir to change working directory.

## DDF-118

(Info) The background python process is terminating.

**Description**

Please note that the background python process will be terminated

## DDF-119

(Error) The Python screen output option can only be specified after the Python code run.

**Description**

In command run_python, the -screen_output can be specified alone without any other options, or specified with -file or -cmd option.

**What Next**

Correct the usage of -screen_output option for run_python.

## DDF-120

(error) The Python variable '%s' does not exist.

**Description**

The tool fails to get the Python vaiable, please double check.

## DDF-123

(error) Python file %s is not found.

Feedback

**Description**

You receive this error message when Python file cannot be found.

**What Next**

Provide correct path to Python file.

---

## DDF-125

(error) Host file %s is not found.

**Description**

You receive this error message when host file cannot be found.

**What Next**

Please check the path of host file.

---

## DDF-126

(error) The host name should be provided for RSH.

**Description**

For RSH protocol, the correct host name is needed.

**What Next**

Please provide the correct host name.

---

## DDF-128

(Error) Directory %s is not writable. Please use -working_dir to specify a working directory.

**Description**

You receive this error message when directory is not writable.

**What Next**

Please use -working_dir to change working directory.

---

## DDF-132

(error) There are some exceptions in python commands, except for 'SystemExit'.

Feedback

**Description**

The python commands throw out an error or exceptions, which will not include the base exceptions 'SystemExit'.

**What Next**

Please check the python commands.

---

## DDF-134

(error) Failed to start background Python process.

**Description**

Background Python process failed to start.

**What Next**

Please check if Python executable is available.

---

# DEFR

---

## DEFR-001

(error) Cannot find def file '%s'.

**Description**

The file, specified in the read_def command, cannot be read.

**What Next**

Check the existence of the file in the search_path using the *which* command.

---

## DEFR-002

(error) read def '%s' failed.

**Description**

read def file failed.

**What Next**

Check def file syntax and content.

Feedback

## DEFR-003

(error) Cannot create %s '%s'.

**Description**

The specified object cannot be created in the design.

**What Next**

Check the object definition in the DEF file. Make sure that an object with the same name does not already exist in the design.

## DEFR-004

(error) Cannot find %s '%s'.

**Description**

The specified object cannot be found in the database.

**What Next**

Check that the specified object exists in the design, if it is a design object. Or check that the specified object exists in the library, if it is a library or technology object.

## DEFR-005

(error) Port '%s' cannot be connected to net '%s', because it is already connected to net '%s'.

**Description**

The specified net cannot be reconnected to the net specified in the DEF netlist. It is already connected to another net. The DEF reader is not allowed to change port connections. It can only connect unconnected ports and reconnect ports from tie-hi/lo to power/ground nets. x

**What Next**

Check the Verilog and DEF netlists and makes sure they are consistent with each other.

## DEFR-006

(error) Pin '%s' of instance '%s' cannot be connected to net '%s', because it is already connected to net '%s'.

Feedback

**Description**

The specified net cannot be reconnected to the net specified in the DEF netlist. It is already connected to another net. The DEF reader is not allowed to change pin connections. It can only connect unconnected pins and reconnect pins from tie-hi/lo to power/ground nets. x

**What Next**

Check the Verilog and DEF netlists and makes sure they are consistent with each other.

---

## DEFR-007

(error) memory allocation error.

**Description**

There is an memory allocation or reallocation error when reading def file.

**What Next**

Check available machine memory and if memory is enough to hold the design.

---

## DEFR-008

(error) error of BUSBITCHARS '%s'.

**Description**

There is an syntax error BUSBITCHARS in the reading DEF file.

**What Next**

Check syntax BUSBITCHARS in the def file.

---

## DEFR-009

(error) unsupported or wrong UNITS.

**Description**

The UNITS in def file is wrong or not supported.

**What Next**

Check "UNITS DISTANCE MICRONS dbuPerMicron" in def file.

Feedback

## DEFR-010

(error) Failed to create net wiring for net '%s'.

**Description**

An error occurred while creating the net wiring (i.e., shapes) of the specified net.

**What Next**

Check the net wiring of the specified net in the DEF file.

## DEFR-011

(error) Pin '%s' has an invalid DIRECTION.

**Description**

The specified pin has no DIRECTION or an invalid DIRECTION.

**What Next**

Check the DIRECTION of the pin in the DEF file.

## DEFR-012

(error) Net %s has an invalid net wiring extension or STYLE.

**Description**

The specified net has an invalid wiring extension or STYLE.

**What Next**

Check the net wiring extension and STYLE of the net in the DEF file.

## DEFR-013

(error) Site '%s' does not support %s rows with site orientation '%s'.

**Description**

The specified site cannot be oriented in the direction specified by the row and site orientations.

The site symmetry must support the rotation and mirror specified by the row site orientation. Sites do not support rotations and mirrors that would swap the width and height dimensions.

Feedback

**What Next**

Check the LEF site definition and make sure the specified symmetry supports the necessary row site orientation.

---

## DEFR-014

(warning) Context design name '%s' does not match the DEF DESIGN name '%s'.

**Description**

The context design name should match the design name specified in the DEF file's DESIGN statement.

The context design is specified by the -design option. If the -design option is not specified, the current design is assumed to be the context design.

**What Next**

If the context design and DEF DESIGN names must match, specify the correct design using the -design option.

---

## DEFR-015

(warning) Ignoring unsupported %s.

**Description**

The specified DEF construct is not supported and will be ignored. When read_def is complete, a summary shows the total number of ignored constructs.

---

## DEFR-016

(information) Reading %s.

**Description**

The specified DEF construct is being read.

When read_def is complete, a summary shows the actual number of processed objects out of the total number of read constructs. Processed objects are those that are annotated or verified with the DEF information.

---

## DEFR-017

(warning) Skipping unplaced component '%s'.

Feedback

**Description**

The specified component is skipped because it has no placement information to annotate to the design.

---

## DEFR-018

(warning) Skipping physical-only pin '%s'.

**Description**

The specified pin is skipped, because it is physical-only. There is no corresponding logical pin.

---

## DEFR-019

(warning) Skipping unrouted net '%s'.

**Description**

The specified net is skipped, because it has no routing information to annotate to the design.

---

## DEFR-020

(warning) Skipping regionless group '%s'.

**Description**

The specified group is skipped, because it has no region. Only groups with physical regions are supported.

---

## DEFR-021

(error) Cannot find pin '%s' of instance '%s'.

**Description**

The specified pin cannot be found in the design. It cannot be connected to the net indicated in the DEF netlist.

**What Next**

Check that the pin exists on the specified cell instance.

Feedback

## DEFR-022

(error) Cannot find non-default rule '%s' of net '%s'.

**Description**

The specified non-default rule does not exist and cannot be assigned to the specified net. The net wiring shapes cannot be created without the non-default rule defintiion.

**What Next**

Add the non-default rule to the DEF file or create the rule using the *create_routing_rule* command, and then read the DEF file.

## DEFR-023

(warning) Cannot find net '%s' in hierarchy '%s' based on the DEF net name '%s'.

**Description**

The specified net cannot be found in the design. Its net wiring will still be created, but will be left unconnected to any net.

**What Next**

Check that the net exists in the design. Check that the DEF net name is escaped correctly. If the DEF net name contains escaped hierarchical characters, the hierarchy is extracted from the DEF net name. The DEF net name is stripped of the escape characters and looked up in the database. Sometimes a hierarchical character is mistakenly escaped or not escaped which alters the hierarchy in which the net is located.

## DEFR-024

(error) The instance '%s' of reference design '%s' is not physical.

**Description**

The specified cell instance is not physical and will be skipped. The instance exists only in the logical hierarchy. All DEF components must be physical.

**What Next**

Check the DEF file's component section and make sure the specified instance references the correct design.

## DEFR-025

(warning) %s '%s' already exists in the %s.

Feedback

**Description**

The specified object already existed and will not be created again during *read_def*.

Only one via definition, with the specified name, can exist in the design. This applies to both DEF fixed and generated vias. The name must be unique among all fixed and generated vias in the design.

Only one fixed via definition, with the specified name, can exist in the library and design. The name must be unique among all fixed vias in the library and design.

Only one pin (top-level port shape), with the specified name, can exist in the design.

**What Next**

If the existing object is correct, do nothing. If the existing object should be replaced by the DEF definition, remove the existing object or rename the DEF file's via, and then run *read_def*.

---

## DEFR-026

(error) Cannot create %s '%s'; %s.

**Description**

The specified object cannot be created in the design for the specified reason.

**What Next**

If the layer does not exist, define the layer in the technology or correct the layer name in the DEF input file.

If the geometry is invalid, correct the geometry definition in the DEF input file.

If the via cut pattern is invalid, correct the via cut pattern in the DEF input file.

---

## DEFR-027

(error) Failed to read into unsupported current design view '%s'.

**Description**

The DEF reader supports only the design and outline views.

**What Next**

Switch the current design to one of the supported views.

Feedback

## DEFR-028

(warning) Created cell '%s' has non-PG cross hierarchy net connections.

### Description

The specified cell was created by the *read_def* command. However the DEF specifies signal/clock net connections to this cell across logical hierarchy. These cross hierarchy connections are ignored, because *read_def* does not perform signal/clock port punching on hierarchical boundaries.

### What Next

These non-PG cross hierarchy net connections must be specified in the input Verilog file or manually using the *connect_net* command.

## DEFR-029

(warning) Cannot find cell '%s'.

### Description

The specified cell instance cannot be found in the design. The DEF reader does not create any cell instances. It only annotates data onto existing cell instances, which are usually created by the Verilog reader.

### What Next

Check your input Verilog file and make sure it contains the specified cell instance. Or you may force *read_def* to create the missing cell instances using the *-allow_cell_creation* option. Note that *read_def* connects cell instances to PG nets, but not to signal nets. Signal connections are expected to come through Verilog.

## DEFR-030

(error) Cannot find reference design '%s'.

### Description

The specified design cannot be found in the database, and the input DEF file contains an instance of this design. The DEF reader will skip this instance, and no data will be annotated to the design for this instance.

### What Next

Check your libraries and read the appropriate input files to create the missing reference design.

Feedback

## DEFR-031

(information) Converted site definition '%s' to '%s'.

**Description**

The indicated row site definition name was changed to the new name, as specified in the *-convert_sites* option. All rows associated with site definition will be associated with the newly named site definition.

**What Next**

Verify that you have specified the correct site definition names.

## DEFR-032

(warning) Pin '%s' is specified with direction '%s' that does not match existing direction '%s'.

**Description**

The specified pin has a DEF-specified direction that differs from the current pin direction. The pin's direction will not be changed.

**What Next**

Check your input DEF file and your current design, and make sure you are reading the correct DEF file.

## DEFR-033

(warning) Pin '%s' is specified with connection to net '%s' that does not match existing connection to net '%s'.

**Description**

The specified pin has a DEF-specified net connection that differs from the current net connection. The pin's net connection will not be changed.

**What Next**

Check your input DEF file and your current design, and make sure you are reading the correct DEF file.

## DEFR-034

(error) Scan chain '%s' has an unspecified %s.

Feedback

**Description**

The scan chain is ignored and omitted from the design for the indicated reason.

**What Next**

Check the DEF file's scan chain definition and make sure it is defined correctly.

---

## DEFR-035

(error) Library '%s' is missing technology information.

**Description**

The technology information is missing in the specified library. This information is necessary in order to read the DEF file and create physical design data.

**What Next**

Load a technology file into the library using the *read_tech_file* command.

---

## DEFR-036

(error) %s '%s' cannot be set as the %s of scan chain '%s' because it is already a part of scan chain '%s'.

**Description**

In the DEF file, the port or pin is specified as the starting or ending point of a scan chain. However it is currently either a starting point, ending point, or in the middle of another scan chain.

**What Next**

Correct the invalid scan chain data, then read the corrected DEF file.

---

## DEFR-037

(error) Scan chains are invalid; removing all scan chain data from the design.

**Description**

One or more scan chains were defined with incorrect data. This invalidates all scan chains in the design. All scan chains will be removed from the design.

**What Next**

Correct the invalid scan chain data, then read the corrected DEF file.

Feedback

## DEFR-038

(error) The instance '%s' is not in the current design.

**Description**

The specified cell instance is within a lower level of the physical hierarchy. It is in another design. This command may only annotate data to the current design.

**What Next**

Check the DEF file. The DEF file should contain data for one and only one design.

## DEFR-039

(warning) Setting sequential scan cell '%s' bit length to 1; ignoring the DEF specified bit length of %d.

**Description**

All sequential cells must have a minimum bit length of 1. The DEF specified bit length was overridden with the default bit length 1.

**What Next**

Verify that the default bit length 1 is correct for this sequential cell. If not, correct the input DEF file to reflect the correct bit length, which should be greater or equal to 1.

## DEFR-040

(warning) Setting non-sequential scan cell '%s' bit length to 0; ignoring the DEF specified bit length of %d.

**Description**

All non-sequential (i.e., combinational) cells must have a bit length of 0. The DEF specified bit length was overridden with the bit length 0.

**What Next**

Verify that the bit length 0 is correct for this combinational cell.

## DEFR-041

(warning) Via definition '%s' specifies a via rule name '%s' that references a %s technology via definition. A design via definition will be created.

Feedback

### Description

The DEF generated via definition specifies a via rule name that does not correspond to a valid technology via definition. The technology via definition must meet these requirements:

1) If the via rule name is DEFAULT, the default via definition must exist in the library technology for the specified cut layer. 2) If the via rule name is anything other than DEFAULT, the via definition must exist in the library technology having the same name as the specified via rule name. 3) The via definition must be a simple via definition, and not a custom via definition.

A new design simple via definition will be created. This via definition has design scope only, and is not visible outside of this design nor in the library technology. Instances of this new via definition will be created for all references in the DEF NETS and SPECIALNETS sections.

### What Next

If the new design via definition is not desired, verify that your design library is using the correct technology file, and that the DEF via definition specifies a valid via rule. The technology file must contain the via rule referenced by the DEF generated via definition. Reload the correct technology file and recreate your design.

---

## DEFR-042

(warning) Via definition '%s' specifies a via rule name '%s' that references a technology via definition with a different %s. A design via definition will be created.

### Description

The DEF generated via definition specifies a via rule name that corresponds to a technology via definition that has different layers, cut size, cut spacing, enclosure dimensions, or origin offset values.

A new design simple via definition will be created. This via definition has design scope only, and is not visible outside of this design nor in the library technology. Instances of this new via definition will be created for all references in the DEF NETS and SPECIALNETS sections.

### What Next

To avoid creating a new design via definition, the DEF and technology via definition must have matching layers, cut size, cut spacing, enclosure dimensions, and origin offset values. If the new design via definition is not desired, verify that your design library is using the correct technology file, and that the DEF via definition matches the technology via definition. Then reload the correct technology file and recreate your design.

Feedback

## DEFR-043

(warning) Failed to create the blockage with '+ COMPONENT %s' as cell keepout margins because %s; creating %s instead.

### Description

The indicated DEF blockage cannot be created as cell keepout margins for the indicated reason. It will be created as a placement blockage, losing its association with the specified cell.

DEF blockages defined with the "+ COMPONENT compName" statement must be created as cell keepout margins, in order to create a placement blockage around a specific cell. It may be created as a cell keepout margin if and only if the blockage is defined as a single geometry which extends out uniformly from the cell's boundary on each side (i.e., there is one margin for all boundary left-edges, one margin for all boundary bottom-edges, one margin for all boundary right-edges, and one margin for all boundary top-edges).

### What Next

Verify that the created placement blockage is the desired representation for the DEF blockage.

## DEFR-044

(warning) Fixed via definition '%s' has been converted into a generated via definition, because it has more than %d cuts.

### Description

The indicated DEF fixed via definition has too many cuts which leads to runtime degradation of downstream applications. It has been converted into a DEF generated via definition. This DEF generated via definition is either mapped to a matching library technology simple (parameterized) via definition, or it is created as a design simple via definition.

Note that once converted, it remains as a simple via definition. The write_def command does not unconvert it back into a DEF fixed via definition.

### What Next

Verify the results.

## DEFR-045

(warning) Invalid mask value %d for %s.

Feedback

**Description**

The specified shape has an invalid mask information. Following situations are checked: (1) Rect, polygon, track or via metal shape has a number of mask more than three. (2) The mask number of track is more than the number_of_masks of the routing layer used by the track. (3) The number_of_masks of the routing layer used by track is less than two when the track is specified which mask for double or triple patterning lithography to use.

**What Next**

Please fix the mask number of the shape and try command again.

---

## DEFR-046

(error) Failed to read in the layers in COMPONENTMASKSHIFT section.

**Description**

The specified layers are invalid. Following situations are checked: 1.The specified layer must be either a two or three mask layer. 2.The order of the layers must be increasing from the highest layer down to the lowest layer in the LEF layer order.

**What Next**

Please check the number_of_masks and the order of the layers and correct the invalid layer data, then read the corrected DEF file.

---

## DEFR-047

(warning) Invalid masks for '%s'.

**Description**

The specified masks are invalid because there is no layer specified in COMPONENTMASKSHIFT section, so read_def will ignore the masks.

**What Next**

Please specify the shifting layers, then read the corrected DEF file.

---

## DEFR-048

(error) Invalid mask values for the cut-shapes of via '%s'.

Feedback

**Description**

The tool issues this error when it has partially colored cuts for one via. Because the cut-shapes must all be colored or none of them colored for a fixed via made up of RECT/ POLYGON statements.

**What Next**

Reset the mask numbers for the cut-shapes of via then read the DEF file again.

---

## DEFR-049

(warning) Invalid mask values for the cut layer of via '%s'.

**Description**

The specified via has invalid mask information. Following situations are checked: (1) The mask value of via cut-shape is greater than 15. (2) The mask value of via cut-shape is greater than the number_of_masks of the cut layer. (3) The mask values of all via cut-shapes are neither alternating(e.g.123123...) nor uniform(e.g.111...). In above cases, all mask values for the specified via will be ignored.

**What Next**

Please check the number_of_masks of the cut layer and the mask values of via cut-shapes, and correct the invalid color data then read the DEF file again.

---

## DEFR-050

(error) Via definition '%s' has shapes on invalid layer '%s'.

**Description**

The indicated via definition has shapes on an invalid layer. All via shapes must be on an interconnect, local_interconnect, via_cut, or local_via_cut layer.

**What Next**

Check the layer_type attribute of the indicated layer. Correct the DEF input file and then read it again.

---

## DEFR-051

(error) Failed to delete '%s' '%s'.

**Description**

The tool was unable to delete this physical data.

Feedback

**What Next**

Check its attributes.

---

## DEFR-052

(warning) Invalid mask shift value '%d' for the compontent '%s'.

**Description**

You received this message because of the specified cell instance has invalid mask shift value. DEF shiftLayerMasks value must meet the following conditions, otherwise it will be ignored. 1.It must be 0 or 1 for two-mask layers, and 0, 1, 3, 4 or 5 for three-mask layers. 2.It must be 3, 4 or 5 when the shifted layer has fixed mask 1, 2 or 3.

**What Next**

Please check the DEF shiftLayerMasks value and the shift layer, and correct the invalid data then read the DEF file again.

---

## DEFR-053

(warning) Fail to perform the consistency check for the mask shift value '%d' of compontent '%s'.

**Description**

You received this message because the corresponding fixed mask in technology file is not 1, 2 or 3 when DEF shiftLayerMasks value is 3, 4 or 5. In this case, the mask shift value for the specified cell instance will be ignored.

**What Next**

Please correct the invalid DEF shiftLayerMasks value, and then read the DEF file again.

---

## DEFR-054

(warning) The cut layer of via '%s' is not a multi-mask layer.

**Description**

This warning message occurs when the cut layer is a single-mask layer and the mask pattern of the via definition is alternate. In this case, the mask of the cuts will be pre-defined as a uniform pattern, alternating pattern is only allowed on multi-mask layer.

Feedback

**What Next**

Please check if the attribute number_of_masks of layer is what you want, if not, please correct the attribute and read the DEF file again, otherwise, please check where the input DEF is from.

---

## DEFR-055

(warning) Invalid trim metal shape on the layer "%s".

**Description**

Trim metal shape will be ignored if it is not defined in the FILLS section.

**What Next**

Please correct the section and then read the DEF file again.

---

## DEFR-056

(warning) Layer "%s" has wrong-way default width.

**Description**

This warning occurs when layer has wrong-way default width and the DEF version is not 5.8. In this case, default width will apply to signal routing in both the preferred and non-preferred directions.

**What Next**

Please use DEF 5.8 if you want to honor wrong-way default width.

---

## DEFR-057

(warning) In the input DEF file, the geometry for STYLE %d is invalid.

**Description**

According to DEF syntax, a style polygon consists of two to eight points.

**What Next**

Fix input DEF.

---

## DEFR-058

(warning) In the input DEF file, the styleNum value '%d' in "STYLE styleNum" is invalid.

Feedback

**Description**

This warning message occurs in the following two situations. 1. The styleNum is less than 0. 2. The styleNum is only specified in NETS/SPECIALNETS section but not in STYLES section. The invalid styleNum will be ignored.

**What Next**

Fix input DEF styleNum value.

---

## DEFR-059

(warning) The reference design of instance '%s' is inconsistent between database and DEF file.

**Description**

This warning message occurs when the instance has existed in database but its reference design is inconsistent between database and DEF file. The DEF reader does not update the reference design of an existing instance.

**What Next**

Please check the attribute ref_name of the cell instance to make sure the DEF is consistent with the reference library.

---

## DEFR-060

(warning) Existing terminal '%s' of port '%s' has been replaced.

**Description**

The specified terminal (i.e., DEF pin) already exists in the design and has been replaced with the new terminal definition in the DEF PINS section. Only one terminal, with the specified name, can exist in the design.

**What Next**

Verify that the new terminal, defined in the DEF PINS section, is correct.

---

## DEFR-061

(warning) Multiple via def matches found for via ladder layer %s for via ladder at location ('%d', '%d').

**Description**

Multiple via rules are found for one via ladder, we do not restore the viaRule for this ladder.

Feedback

## DEFR-062

(warning) No via_def found for vias on via ladder layer '%s'.

**Description**

No via_def found for this via ladder. Vias in this via ladder will be created as custom vias. These vias will not have is_via_ladder bit set on them.

## DEFR-063

(warning) Via rule '%s' references undefined cut name '%s'. Hence this via rule is not a candidate to be considered as a correct match to the via ladder.

**Description**

Via rule references undefined cut name in cutNameTbl. Hence this via rule is not a candidate to be considered as a correct match to the via ladder.

## DEFR-064

(warning) Failed to set DEF %s property on %s '%s', because %s.

**Description**

The DEF property could not be set on the specified object. Either the property has not been defined, or it is defined with a different data type.

**What Next**

Make sure the property definition exists and is defined with the correct data type.

## DEFR-065

(warning) Cannot find %s '%s'.

**Description**

The specified object cannot be found in the database.

**What Next**

Check that the specified object exists in the design, if it is a design object. Or check that the specified object exists in the library, if it is a library or technology object.

Feedback

## DEFR-066

(error) Failed to create a scan clain element with scan-in pin '%s' and scan-out pin '%s' in scan chain '%s', because %s.

### Description

The specified scan chain element is invalid. A pair of scan-in and scan-out pins may appear as an element in at most one scan chain. Duplicate elements are not allowed.

### What Next

Remove the invalid element from the scan chain and then read the Scan DEF.

## DEFR-067

(error) Fail to do the consistentcy check on the attribute '%s' of the reference block for cell '%s'.

### Description

This message occurs when the mask shift information of the cell in DEF file is inconsistent with the reference block of the cell.

```
Take the following DEF file as an example, there is a cell U210 which
references NAND3X1_LVT, this message will be trigged when the reference
block meets any of the following conditions.
1. The attribute "is_mask_shiftable" is false.
2. The attribute "mask_shift_layers" does not exist or the values
   does not contain M7 or M6.

DESIGN TEST ;
COMPONENTMASKSHIFT M7 M6 M3 M2 M1 ;
COMPONENTS 1 ;
 - U210 NAND3X1_LVT + UNPLACED + MASKSHIFT 11000 ;
END COMPONENTS
END DESIGN
```

### What Next

Check the attribute of the reference block and make sure the specified instance references the correct design.

## DEFR-068

(information) Cells referencing design '%s' will use design label '%s'.

Feedback

**Description**

When searching for reference designs, read_def chooses the reference design with the label as indicated by the label switch list if any. Otherwise read_def chooses the reference design with the same label as the top design. If none is found, then read_def chooses the reference design with the default label. If no default label exists, then read_def chooses the reference design with the smallest label name and prints this information message.

---

## DEFR-069

(warning) Unable to convert RECT ( %d %d %d %d ) to a path shape, because %s.

**Description**

The application option, file.def.convert_rects_to_paths, is set true, so *read_def* attempted to create the indicated DEF RECT as a path shape. However *read_def* was unable to do so for the indicated reason. This specific DEF RECT will be created as a rectangle shape in the same manner as when the application option is false.

**What Next**

If the application option was untentionally set to true, set it back to false to avoid this warning. If the DEF RECT must be converted into a path shape, fix the problem indicated in the warning message. If the problem is a length precision limitation, try adjusting the tech length precision or library scale factor.

---

## DEFR-070

(error) TRACK statement: '%s' in PROPERTYDEFINITIONS section, DESIGN TRACKPROPERTIES statement could not be parsed.

**Description**

Parsing failed.

**What Next**

Check the DESIGN TRACKPROPERTIES statement in PROPERTYDEFINITIONS.

---

## DEFR-071

(warning) Skipping invalid scan chain %s; %s.

**Description**

The scan chain in DEF is ignored for the indicated reason.

Feedback

**What Next**

Check the specified scan chain and make sure it is defined correctly.

---

## DEFR-072

(error) DEF fill purpose map file error at line %u - %s

**Description**

The fill purpose map file has some syntax error.

**What Next**

Refer to the file.def.fill_purpose_map_per_layer man page.

**See Also**

- file.def.fill_purpose_map
- write_def

---

## DEFR-073

(error) No via_def '%s' found for via ladder on net '%s'.

**Description**

No via_def found for this via ladder. Via defs for via ladder should be defined in VIAS section of the DEF file.

---

## DEFR-079

(warning) Found mismatch on %s and layers for color check.

**Description**

This warning message occurs when there are some colored shapes/tracks on uni-pattern layers or some uncolored shapes/tracks on multi-pattern layers in the database. The check is controlled by the app option file.def.check_mask_constraints, value "loose". Colored shapes on uni-pattern layer will be converted to colorless shapes. Rest other shapes will be read as usual by read_def.

**What Next**

Please use file.def.check_mask_constraints app option with value "none" to read all these shapes.

Feedback

### DEFR-080

(error) Found mismatch on %s and layers for color check.

**Description**

This error message occurs when there is mismatch on shapes/tracks and layers for color check in the database, the check is controlled by the app option file.def.check_mask_constraints, value "strict".

**What Next**

Please use file.def.check_mask_constraints app option with value "none" to read all these shapes.

## DEFW

### DEFW-001

(warning) The specified units-per-micron value of %d is less than the database length precision of %d.

**Description**

The specified units-per-micron is specified with the *-units* option. The value should be greater or equal to the database technology length precision. If it is less, the length values may be truncated in the output DEF file.

**What Next**

Specify a larger units value or specify none to use the technology length precision.

### DEFW-002

(warning) The DEF syntax does not support multiple spacings for non-default rule %s layer %s.

**Description**

The DEF non-default rule syntax supports only one spacing per layer. The specified rule has multiple spacings, along with weights and effort levels, on the specified layer. In these cases, the output DEF file will only include the first spacing of the layer.

**What Next**

To export the complete set of non-default rules, use the *report_routing_rules -output* command to write out the rules to a script.

Feedback

## DEFW-003

(warning) Skipping invalid scan chain %s; %s.

**Description**

The scan chain is omitted from the DEF output file for the indicated reason.

**What Next**

Check the specified scan chain and make sure it is defined correctly.

## DEFW-004

(error) Failed to write from unsupported current design view '%s'.

**Description**

The DEF writer supports only the design view and outline view.

**What Next**

Switch the current design to the supported view.

## DEFW-005

(warning) Cell '%s' has multiple keepouts; only the %s keepout is written.

**Description**

The DEF writer can only output one hard or soft keepout. If there are multiple keepouts, the DEF writer will output the hard keepout only if it is defined, otherwise the soft keepout is output if it is defined.

**What Next**

Use write_floorplan to dump all the keepouts of a cell.

## DEFW-006

(information) Creating dummy net '%s' for unconnected port '%s'.

**Description**

There are unconnected ports in the design. For each unconnected port, write_def generates a dummy net and connects the port to it. The dummy net will appear in the PINS and regular NETS sections. The dummy net is not actually created and connected in the design; it is merely a placeholder in the DEF output file.

Feedback

### What Next

Verify whether the port should be connected in the netlist. Connect them to avoid seeing this message and dummy nets in the output DEF file.

---

## DEFW-007

(error) Library '%s' is missing technology information.

### Description

The technology information is missing in the specified library. This information is necessary in order to write the DEF file.

### What Next

Load a technology file into the library using the *read_tech_file* command.

---

## DEFW-008

(error) The specified %s '%s' cannot be written; %s.

### Description

The object specified in the *-objects* option cannot be written out to the DEF file for indicated reason. All objects must be in the current block and must be either a physical cell, net, or port; non-reserved routing_blockage; hard, soft, or partial placement_blockage; or move bound.

### What Next

Remove the invalid object from the *-objects* option, and call *write_def* again.

---

## DEFW-009

(information) DEF %s section is filtered by the -objects option list; %d %s written to this section.

### Description

The indicated objects, specified in the *-objects* option list, are written to the indicated section in the DEF file, but all others are omitted.

### What Next

If all objects must be written to the indicated section, do not use the *-objects* option.

Feedback

## DEFW-010

(warning) %d %s ignored in the -objects option list; %s.

### Description

The indicated number of objects, specified in the *-objects* option list, are not written out to the DEF file. Objects are omitted if the corresponding data type is not specified in the *-include* option value or is specified in the *-exclude* option value. Unrouted nets (i.e., non-PG nets having no connections or shapes) are always omitted.

### What Next

If the indicated objects must be written, explicitly include the object type in the *-include* option or do not specify the object type in the *-exclude* option.

## DEFW-011

(warning) Unsupported mask '%s' found for %s '%s'.

### Description

The mask information for specified object is not supported by DEF or is invalid. Following situations are checked:

- The value same_mask is not supported by DEF, if a mask value is same_mask, it will be treat as no_mask. - For mask pattern of track, DEF only support uniform and alternating mask pattern. The uniform mask pattern means all masks on this track are same. The alternating mask pattern means the masks on this track is alternative, for example 'mask_one:mask_two' or 'mask_two:mask_one', given that the layer of the track has number of masks as 2. - If a mask is not for a via or via definition, it shall less than or equal to 3. If the mask is great than 3, it will still be written out, however, this warning message will be printed. - If a mask is for cut layer of a via or via definition, it shall less than or equal to 9. If the mask is great than 9, the whole via mask will be ignored. - If a mask is for upper or lower layer of a via or via definition, it shall less than or equal to 3. If the mask is great than 3, but less or equal to 9, it will still be written out, however, this warning message will be printed. If the mask is great than 9, the whole via mask will be ignored.

### What Next

If the mask of the object is not correct, correct it and try the command again.

## DEFW-012

(information) Converted site definition '%s' to '%s'.

Feedback

**Description**

The indicated row site definition name was changed to the new name, as specified in the *-convert_sites* option. All rows associated with site definition will be associated with the newly named site definition.

**What Next**

Verify that you have specified the correct site definition names.

---

## DEFW-013

(warning) Design '%s' contains net fills which cannot be expressed using DEF 5.7 syntax.

**Description**

The design contain net fills which can only be expressed using DEF 5.8 or newer syntax.

**What Next**

Run write_def with the "-version 5.8" option.

---

## DEFW-014

(warning) 'routing_rules' is not in the include_list for option -include.

**Description**

There are non-default-routing rules are used in the NETS section, but the NONDEFAULTRULES section are not output. When reading the output DEF file, the width of net shapes might be changed.

**What Next**

Please check if the non-default-routing rules are needed in the DEF file, if so, please add 'routing_rules' to the include_list.

---

## DEFW-015

(warning) Technology information is missing for layer number '%d'.

**Description**

The technology information for the specified layer number is missing. If the database has the shapes on such layer, the shapes will be ignored.

Feedback

### What Next

Add the missing layer information by loading a technology file using the *read_tech_file* command if you want to write out the shapes.

---

## DEFW-016

(error) Via definition '%s' referenced by routing rule '%s' is undefined.

### Description

The specified via definition is not defined in the library technology or design. It is omitted from the DEF VIAS and NONDEFAULTRULES sections.

### What Next

Create the missing via definition or remove it from the routing rule.

---

## DEFW-018

(warning) Layer "%s" has wrong-way default width.

### Description

This warning occurs when layer has wrong-way default width and user does not use -version 5.8 for write_def. In this case, net wiring will be written out to NETS section if its width is equal to the default width, so the net wiring with wrong-way default width may be written out to the SPECIALNETS section unless the wrong-way default width is equal to the default width.

### What Next

Please use option -version 5.8 if you want to honor wrong-way default width.

---

## DEFW-019

(warning) Technology information is missing for purpose number '%d' of layer number '%d'.

### Description

The technology information for the specified layer purpose is missing; the shape is written into the DEF file on the base layer.

To exclude these shapes from the DEF file,

- Define the layerDataType for this layer and purpose in the technology file with nonMask=1.
- Use the *-exclude non_mask_purpose* option with the *write_def* command.

Feedback

### What Next

Add the missing layer purpose information to the technology file and load the modified technology file by using the *read_tech_file* command.

---

## DEFW-020

(error) DEF version 5.7 does not support '%d' units per micron.

### Description

The DEF version 5.7 file cannot be written out with the specified units per micron value.

### What Next

The valid values of units per micron for DEF version 5.7 are 100, 200, 1000, 2000, 10000 and 20000.

### See Also

- create_lib
- write_def
- write_lef
- write_gds

---

## DEFW-021

(error) Tech precision value is used as units per micron and DEF version 5.7 does not support '%d' unitsPerMicron.

### Description

The DEF version 5.7 file cannot be written out with current units per micron value.

### What Next

The valid values of units per micron for DEF version 5.7 are 100, 200, 1000, 2000, 10000 and 20000. Please use one of the above valid values with -units option or use a tech file with valid precision value.

### See Also

- create_lib
- write_def

Feedback

- write_lef
- write_gds

---

## DEFW-022

(error) Routing rules must be included when the application option 'file.def.non_default_width_wiring_to_net' is true.

### Description

Routing rules are necessary because write_def needs to generate nondefault rules in DEF, when the the application option 'file.def.non_default_width_wiring_to_net' is set to true. This application option causes write_def to output nondefault width wiring to the DEF NETS section. In order to do so correctly, write_def needs to generate dummy nondefault rules with the wiring width in the DEF NONDEFAULTRULES section. These rules are referenced by the DEF NETS section to define the nondefault width wiring. If the rules are missing, the DEF is incomplete and read_def cannot process the DEF NETS section.

### What Next

Either include routing rules when calling write_def or set the application option'file.def.non_default_width_wiring_to_net' to false.

---

## DEFW-023

(warning) Cannot output shield net for net '%s', because it is shielded by unnetted shapes.

### Description

The specified net is shielded by shapes that are not owned by any net. In order to express the net's shield net relationship with the DEF "+ SHIELDNET shieldNetName" statement in the output, the shield shapes must be owned by a net (e.g., a ground net).

### What Next

Find all unnetted shield shapes (i.e., shapes with shape_use "shield_route") and set their net owner attibute.

### See Also

- write_def

---

## DEFW-024

(warning) 'cut_metal' is not in the include_list for option -include.

Feedback

**Description**

There are cut metals in the design and 'fills' or 'specialnets' is listed in the -include, but cut metal and connect below cut metal will be not included in DEF file as you didn't specify 'cut_metal' in -include option.

**What Next**

Please check if cut metal shapes or connect below cut metal shapes are needed in DEF file, if yes, please add 'cut_metal' to the include_list.

---

## DEFW-025

(warning) The user specified view '%s' for flatten lib-cell '%s' is not available.

**Description**

The user specified view for lib-cells is not available for this lib-cell design. The flatten shapes for the current lib-cell design will not be written to the DEF file.

**What Next**

The user may need to change the view to be written to DEF file for the lib-cell design using option "-lib_cell_view".

---

## DEFW-026

(warning) Found uncolored multi-patterning shapes in the database which won't be output.

**Description**

This warning message occurs when there are some uncolored multi-patterning shapes in the database the check is controlled by the app option file.def.ignore_uncolored_shapes or the syntax forbidNoMaskConstraint in technology file. write_def will continue to write out all other shapes except the uncolored ones.

**What Next**

Please use command check_shapes -uncolored to find out all these shapes and color them, or turn off the app option mentioned above to output uncolored shapes. Note, if the syntax forbidNoMaskConstraint is 1, the value of the app option will be ignored.

---

## DEFW-027

(warning) Found viaLadder path '%s' that does not connect with any vias. This path will be written as normal path in DEF file.

Feedback

### Description

This warning message occurs when there is viaLadder path that does not connect with any vias. write_def will write out this path as as normal path in DEF file.

### What Next

Please check the missing via in this viaLadder.

---

## DEFW-028

(warning) Failed to find path(s) that overlap with leading wire of '%s' in the via ladder. This leading wire from (%d, %d) to (%d, %d) is ignored in DEF file.

### Description

Leading wire is generated on the fly during DEF writer, which should overlap with path(s) in via ladder.

This message occurs when there is no path in the via ladder that overlaps with the leading wire of this DEF NR_STACK. The leading wire of this NR_STACK is ignored in the DEF file.

### What Next

Please check why there is no path in the via ladder that overlaps with the leading wire.

---

## DEFW-029

(error) Invalid Via PCell Design named %s given in -cell_as_via option.

### Description

To be printed as via, Via PCell design must exist already and be of design_type "feedthrough". It must contain shapes in three different adjacent layers, which like in via, must be via_cut layer between two interconnect metal layers.

### What Next

Please enter valid existing Via PCell design name in -cell_as_via option.

### See Also

- get_attribute
- write_def

Feedback

## DEFW-030

(warning) Net shape '%s' shields multiple nets. Writing the first shielded net only.

### Description

The given shape shields more than one nets. The DEF SPECIALNETS wiring syntax "+ SHIELD shieldNetName" supports shielding one net only. The DEF Writer writes out this syntax, only for the first net shielded by the net shape.

### What Next

Use 'add_shield_association' and 'remove_shield_association' commands to correct the shield association between the specified net shape and shielded net.

### See Also

- remove_shield_association
- add_shield_association

## DEFW-031

(error) write_def failed because: '%s'.

### Description

This error message occurs when there is some unrecoverable error in the current design which leads to write_def failure.

### What Next

Please check the design and rectify it.

## DEFW-078

(warning) Found uncolored shapes on multi-patterning layers in the database which won't be output.

### Description

This warning message occurs when there are some uncolored shapes on multi-patterning layers in database. The check is controlled by the app option file.def.check_mask_constraints, value "loose". write_def will continue to write out all other shapes except the uncolored ones.

Feedback

**What Next**

Please use command check_shapes to find out all these shapes and color them, or turn off the app option mentioned above to output uncolored shapes.

## DEFW-079

(warning) Found mismatch on %s and layers for color check.

**Description**

This warning message occurs when there are some colored shapes/tracks on uni-pattern layers or some uncolored shapes/tracks on multi-pattern layers in the database. The check is controlled by the app option file.def.check_mask_constraints, value "loose" or "strict". When app option value is "loose", colorless shape on multi-pattern layer will be dropped. When the app option value is "strict", the colored shapes in uni-pattern layers are written out as colorless shapes. Rest other shapes are written out as usual by write_def.

**What Next**

Please use command check_shapes to find out all these shapes.

## DEFW-080

(error) Found mismatch on %s and layers for color check.

**Description**

This error message occurs when there is mismatch on shapes/tracks and layers for color check in the database, the check is controlled by the app option file.def.check_mask_constraints, value "strict".

**What Next**

Please use command check_shapes to find out all these shapes and fix them.

# DES

## DES-0001

(Warning) Register clock pin pin has no clock signal propagating to it.

**Description**

The clock pin does not have a clock signal propagating to it. The design is not fully constrained. A register clock pin is any pin that is a reference to a timing check or has a

Feedback

sequential timing arc from it. Special cases of pins that are not clocked are identified in rule DES_0003.

The design is not fully constrained. Setup or hold checks cannot be properly performed at the register, and the paths to and from the register are not constrained. As a result, timing checks for the paths related to the register cannot be performed.

**ONE POSSIBLE SCENARIO**

Consider a scenario where a scan register is clocked by either the functional clock CLK or the scan clock TCLK through a MUX. A case analysis value is specified to select the MUX input of the functional clock CLK; however, the clock specification for CLK is missing from the constraints. As a result, no clock signal reaches the clock pin of the scan register ff1/CP. Since ff1 is not clocked, a DES_0001 rule violation will be issued by the tool.

create_clock -period 30 [get_ports TCLK] set_case_analysis 0 [get_ports TE]

**What Next**

The violation message identifies the clock pin that does not have a clock reaching it.

The “Debugging Help” section provides context specific suggestions for investigating the violation to determine why the clock pin does not have a clock signal reaching it.

There are several possible causes for this violation. Some common possibilities are that the clock is blocked from reaching the pin due to a constraint blocking it, that a clock definition is missing, or that a generated clock is not expanded.

Use the potential_clocks attribute to see if the pin is in a clock network, but was blocked by a set_case_analysis, set_disable_timing, or some other constraint.

For the example scenario, the attribute can be queried as follows:

rtl_shell> get_attribute [get_pins ff1/CP] \ potential_clocks {"TCLK"}

If the potential_clocks attribute returns a clock, then use the analyze_clock_networks command with the -traverse_disabled option to find which constraint blocked the clock from reaching the pin. For the example scenario, the command can be issued as follows:

If a generated clock is not expanded, review the violations in the CLK_0003, CLK_0009, CLK_0010, or CLK_0011 rules for the reasons the generated clock is not expanded.

**FIX SUGGESTION**

For most cases, constraints might be missing for the design or contain an error if,

a clock signal is blocked from reaching the register clock pin, consider adjusting the constraints so the clock can propagate to the clock pin

the register clock pin is not in any clock’s potential clock network, evaluate whether a clock definition is missing from the constraints

Feedback

a generated clock is not being expanded, consider adjusting the constraints so that the clock can be expanded and propagate to the clock pin

For the example scenario, a clock definition for the clock, CLK, needs to be added to the constraints for the functional mode of the design:

create_clock -period 10 [get_ports CLK] create_clock -period 30 [get_ports TCLK] set_case_analysis 0 [get_ports TE]

---

## DES-001

(error) Current block is not defined.

**Description**

The current block is not defined. Many commands require that the current block is set.

**What Next**

Use *open_block* and *link_block* to open and link a block.

---

## DES-002

(error) Cannot find %s '%s' in design '%s'

**Description**

The specified object cannot be found in the given design. This is sometimes seen while reading SDF and parasitics files. In those cases, it could indicate a file which is out of sync with the design.

**What Next**

If reading SDF or parasitics, verify that the file matches the design.

---

## DES-003

(error) '%s' cannot be used on %s %s '%s'.

**Description**

Certain commands are valid only for input or output objects.

**What Next**

Enter the command with a valid list of objects.

Feedback

## DES-004

(error) Cannot find block '%s'.

**Description**

There is no block with that name is in memory.

**What Next**

Read in the block or reenter the command with a different name.

## DES-005

(error) Cannot set current instance to leaf cell '%s'.

**Description**

The current instance must be a hierarchical cell.

## DES-006

(error) Cannot find pin '%s' on cell '%s'.

**Description**

The pin does not exist on the specified cell.

**What Next**

Use *query_objects [select_pin -of_object [select_cell cell_name]] to list pin names on the cell.*

## DES-007

(warning) '%s' is not a valid object type.

**Description**

When -from or -to option is used with set_disable_timing or remove_disable_timing , the object list can only be a cell or a lib cell. This warning is generated for objects of type port and pin.

**What Next**

Don't use -from or -to option to disable pins or ports.

Feedback

## DES-008

(error) Invalid block name '%s'%s.

**Description**

Block name cannot contain ":", ".", "/", or empty spaces. The name of a block eventually becomes the directory name. So it cannot contain the "/" character or empty spaces. The ":" character is used to delimit library and block names, and the "." character is used to delimit block and view names. So they cannot be in a block name either.

**What Next**

Remove invalid characters from block name.

## DES-009

(error) Cannot find pin '%s' on library cell '%s'.

**Description**

The pin does not exist on the specified library cell.

**What Next**

Enter the command again with a valid object name.

## DES-010

(error) Cannot find %s '%s'.

**Description**

The specified object cannot be found.

**What Next**

Enter the command again with a valid object name.

## DES-011

(error) %s failed. block '%s' is in read mode.

**Description**

The specified operation failed because the block is in read mode.

Feedback

**What Next**

re-open the block in edit mode and try again.

---

## DES-012

(error) Cannot use '%s' command on %s '%s'.

**Description**

The command works only on ports of a specific direction.

---

## DES-013

(information) Creating block '%s' in library '%s'.

**Description**

This informational message shows the block.view being created in the library

**What Next**

Showing the block and library name to help understand when a block is being created.

---

## DES-014

(Error) Cannot copy block to self.

**Description**

The source and destination block are the same. Copying a block to itself is not allowed.

**What Next**

Change the destination block name and try again.

---

## DES-015

(Error) Cannot move block to self.

**Description**

The source and destination block are the same. Moving a block to itself is not allowed.

**What Next**

Change the destination block name and try again.

Feedback

## DES-016

(error) Via_def '%s' already exists in the given block or tech.

**Description**

A via_def with the specified name already exists. Two via_defs cannot have the same name in the same block or tech.

**What Next**

Specify a different name for the via_def or try the command again with the -force option to override and replace the existing via_def.

## DES-017

(Error) %s failed. Block '%s' is not open.

**Description**

The specified operation failed because the block has not been opened.

**What Next**

Open the block and try again.

## DES-018

(Error) %s failed. Block '%s' in library '%s' is modified.

**Description**

The specified operation failed because the block contains modified and un-saved data.

**What Next**

Try again with the -force option.

## DES-019

(information) Re-initializing block '%s' in library '%s'.

**Description**

This informational message shows the block.view being re-initialized in the library

Feedback

### What Next

Showing the block and library name to help understand when a block is being re-initialized.

---

## DES-020

(warning) Block '%s' is not being saved. Library '%s' is in read mode.

### Description

The specified block view is not saved because its library is open in read mode.

### What Next

Open the specific library and block in edit mode and try again.

```
prompt> open_block <block_name> -edit
```

### See Also

- open_block
- open_lib

---

## DES-021

(Information) Incrementing open_count of block '%s' to %d.

### Description

The block is already in memory. Each open_block command on a block will increase a block's open_count by one.

---

## DES-022

(Information) Decrementing open_count of block '%s' to %d.

### Description

The block is still in memory. Each close_block command will decrease a block's open_count by one. The block is removed from memory when its open_count drops to zero.

---

## DES-023

(Error) 'reopen_block %s' failed. Block '%s' in library '%s' hasn't been saved to disk.

Feedback

### Description

Using the "-read" or "-edit" option of reopen_block command discard the run-time changes and revert the block to its previously saved state. When the block hasn't been saved, there is no saved state to revert to. If what you really want is to re-initialize the block again, use the "-new" option.

### What Next

Try reopening the block in new mode if this is what you really want:

```
prompt> reopen_block <block_name> -new
```

### See Also

- save_block
- open_block

---

## DES-024

(error) Cannot create block. Block '%s' already exists in library '%s'.

### Description

create_block failed because the specified block already exists.

### What Next

Use a different block name, or use the -force option to override existing block.

---

## DES-025

(information) Overwriting block '%s' in library '%s'.

### Description

The block is being overwritten. It will be unbound from all currently opened blocks that reference it, and be replaced with a new block.

### What Next

Showing the block and library name to help understand when a block is being overwritten.

---

## DES-026

(error) Block '%s' does not have a top module.

Feedback

**Description**

This error message occurs when the command specifies a block that does not have a top module.

**What Next**

Re-create the block from verilog.

---

## DES-027

(information) Renaming '%s' to '%s' and saving.

**Description**

The block is being renamed to the specified name in memory nd saved to disk.

**What Next**

Showing the block and library name to help understand when a block is being renamed and saved.

---

## DES-028

(information) Saving '%s' to '%s'.

**Description**

The block is being saved to the named destination on disk.

**What Next**

Showing the block and library name to help understand when a block is being saved.

---

## DES-029

(error) %s failed. Block '%s' is in a read mode library.

**Description**

The specified operation failed because the block is in a read mode library.

**What Next**

re-open the library in edit mode and try again, or set the block.no_open_edit_in_read_only_libs app option to false. Then the library open_mode will be auto promoted when a block is opened in edit mode.

```
prompt> set_app_options -global { block.no_open_edit_in_read_only_libs
 false }
```

Feedback

### See Also

- get_app_option_value
- open_block
- reopen_block

---

## DES-030

(Information) Promoting open mode of the %s design library from read to edit.

### Description

The design library is already open in read mode. By default, when you open a block in the library in edit or new mode, the tool promotes the library's open mode from read to edit.

### What Next

To disable library open mode promotion, set the *design.edit_read_only_libs* application option to *false* before running the *open_block* command.

```
prompt> set_app_options -name design.edit_read_only_libs -value false
```

### See Also

- get_app_option_value
- open_block
- reopen_block
- set_app_options
- design.edit_read_only_libs

---

## DES-031

(warning) Block '%s' is not being saved because it is in read mode.

### Description

The specified block view is not saved because it is open in read mode.

### What Next

Open the block in edit mode and try again.

```
prompt> open_block <block_name> -edit
```

Feedback

**See Also**

- open_block
- open_lib

---

## DES-032

(Error) The '%s' command failed because '%s' is a library cell.

**Description**

The specified command failed because the source block is a library cell. Library cell blocks cannot be individually saved, copied, moved, or removed in icc2_shell. They can only be modified in the library manager shell, lm_shell.

**What Next**

Use the library manager shell to make changes to this library.

---

## DES-033

(Warning) Opening design '%s' in read mode because it is a library cell.

**Description**

Library cells cannot be modified in icc2_shell. They can be modified only in the library manager shell, lm_shell.

**What Next**

Use the library manager shell to make changes to this library cell.

---

## DES-034

(error) The reopen_block command failed because '%s' is a timing view library cell.

**Description**

The *reopen_block* command failed because the source block is a timing view library cell. Timing view library cells cannot be opened in icc2_shell. They can be modified only in the library manager shell, lm_shell.

**What Next**

Use the library manager shell to make changes to this library.

Feedback

## DES-035

(error) 'save_block -hierarchical -as' failed. You must specify a design label different from the source.

**Description**

save_block -hierarchical -as failed because the source and destination label are the same. When saving a hierarchy as a different name, the user must specify a design label that is different from the source design. That label will be used to save the lower-level reference blocks in the hierarchy.

## DES-036

(error) 'save_block -hierarchical -as' failed. Reference library '%s' is read-only.

**Description**

save_block -hierarchical -as requires all non-lib-cell reference libraries to be editable, so that a labeled version of the reference block can be created.

**What Next**

Open the library and its reference libraries in edit mode with

open_lib <lib_name> -edit -ref_libs_for_edit

## DES-037

(error) 'save_block -hierarchical -as' failed. Destination view is different from source.

**Description**

save_block -hierarchical -as can only be used to save a block and its sub-blocks to the same view. Saving to a different view is not allowed.

**What Next**

Remove the view specification from the -as argument and try again:

save_block -hierarchical -as <designName>/<labelName>

## DES-038

(error) 'save_block -as' failed. '%s' is a sub-block of '%s'.

Feedback

**Description**

save_block -as failed because you are trying to save a block into one of its sub-block. This will cause cyclic/self referencing and is not allowed.

---

## DES-039

(error) Both label '%s' and '%s' of sub-block '%s' are referenced.

**Description**

It is an error to save or rename a block hierarchically into a different label if the block references more than one label of of the same sub-block.

---

## DES-040

(error) 'rename_block -hierarchical' failed. You must specify a design label different from the source.

**Description**

rename_block -hierarchical failed because the source and destination label are the same. When renaming a hierarchy to a different name, the user must specify a design label that is different from the source design. That label will be used to rename the lower-level reference blocks in the hierarchy.

---

## DES-041

(error) 'rename_block -hierarchical' failed. Reference library '%s' is read-only.

**Description**

rename_block -hierarchical requires all non-lib-cell reference libraries to be editable, so that a labeled version of the reference block can be created.

**What Next**

Open the library and its reference libraries in edit mode with

open_lib <lib_name> -edit -ref_libs_for_edit

---

## DES-042

(error) 'rename_block -hierarchical' failed. Destination view is different from source.

Feedback

**Description**

rename_block -hierarchical can only be used to rename a block and its sub-blocks to the same view. Renaming to a different view is not allowed.

**What Next**

Remove the view specification from the -as argument and try again:

rename_block -hierarchical -to <designName>/<labelName>

---

## DES-043

(error) Layer '%s' is not a via cut layer.

**Description**

The specified layer is not a via cut layer. The layer must be of type VIA_CUT or LOCAL_VIA_CUT.

**What Next**

Check the technology layer information.

---

## DES-044

(warning) The x and y values of '%s' should not be less than the corresponding minimum pitch values of %d and %d specified by the given via_def.

**Description**

The specified via_def has a minimum cut pitch that is larger than the cut pitch specified for this array via. The minimum x-pitch is the sum of the via_def's *cut_width* and *min_cut_x_spacing* (or *min_cut_spacing* if *min_cut_x_spacing* is not set) attributes. The minimum y-pitch is the sum of the via_def's *cut_height* and *min_cut_y_spacing* (or *min_cut_spacing* if *min_cut_y_spacing* is not set) attributes.

**What Next**

Specify pitch values greater than or equal to the via_def's minimum pitch values as indicated in the warning message.

---

## DES-045

(error) The row and column values of '%s' cannot be less than the corresponding minimum numbers of rows and columns {%d %d} per via defined on the cut layer specified by the given via_def.

Feedback

**Description**

A via_def has been specified on which the cut layer has a minimum number of rows or columns of cuts per via that is larger than the value specified for the cuts of this array via.

**What Next**

Check the number of rows and columns of cuts of this array via and provide values greater than or equal to the corresponding values on the cut layer specified in the via_def.

---

## DES-046

(error) Min cut spacing cannot be specified for a single-cut via_def.

**Description**

A via_def for an array via is created by specifying min_rows, min_columns or both. Otherwise a via_def for a single-cut via is created, in which case min cut spacing cannot be specified.

**What Next**

To create a via_def for an array via, check the number of rows and columns of cuts. At least one of them must be greater than 1. To create a single-cut via_def, do not set the min cut spacing.

---

## DES-047

(error) create_via_def requires one of -cut_layer, -shapes, or -tsv_keepout_spacing. Specify -cut_layer to create a simple via_def, -shapes to create a custom via_def, or -tsv_keepout_spacing to create a through-silicon via_def.

**Description**

A via_def for a simple via is created by specifying -cut_layer. A via_def for a custom via is created by specifying a collection of shapes with -shapes. A via_def for a through-silicon via is created by specifying -tsv_keepout_spacing. Exactly one of these three options must be provided.

**What Next**

To create a via_def for an simple via, specify a cut layer with -cut_layer. To create a via_def for a custom via, specify a collection of shapes with -shapes. To create a via_def for a through-silicon via, specify a keepout distance with -tsv_keepout_spacing.

Feedback

## DES-048

(error) Layer '%s' is not in the specified tech or tech referenced by the specified design or library.

**Description**

A via_def cannot reference a cut layer in an unrelated tech database. For a tech via_def, the cut layer of the via_def must be in the same tech database. For a design via_def, the cut layer must be in the tech referenced by the library containing the design.

**What Next**

When referencing a layer by name, check that the layer exists in the correct tech database. When passing a layer object, set the current_lib to the correct library before getting the layer with 'get_layers' to ensure that you have a layer object from the correct tech database.

## DES-049

(Error) Cannot rename block to self.

**Description**

The source and destination block are the same. Renaming a block to itself is not allowed.

**What Next**

Change the destination block name and try again.

## DES-050

(error) Rail name '%s' does not exist.

**Description**

You tried to use a non existent rail name, for example, in trying to set the rail_name attribute on a PG pin.

**What Next**

Specify a different rail name.

## DES-051

(error) Port '%s' does not exist.

Feedback

**Description**

You tried to use a non existent port name.

**What Next**

Specify a different port name.

---

## DES-052

(error) Port '%s' is not a %s port.

**Description**

You tried to use a port of an incorrect type. For example, an attribute might require a power port, but you used a signal port.

**What Next**

Specify a different port name.

---

## DES-053

(error) Cannot attach a %s port to a %s rail

**Description**

You tried to use a port and rail combination that is incompatible. For example, if you tried to set the *rail_name* attribute for a power pin to refer to a ground rail, this message would be issued.

**What Next**

Check the port and rail selections.

---

## DES-054

(error) Can't change '%s'- %s

**Description**

You tried to change an attribute which cannot be changed for the reason given. For example, you might have tried to change a port_type attribute on a port from signal to power, but that port is used in the logic function of the cell so it cannot be changed.

---

## DES-055

(information) Renaming '%s' to '%s'.

Feedback

**Description**

The block is being renamed in memory to the named destination.

**What Next**

Showing the block and library name to help understand when a block is being renamed.

---

## DES-056

(error) Block '%s' cannot be renamed. It is referenced by '%s'.

**Description**

The block cannot be renamed because it or one of its views is referenced by another block in memory. You can rename the entire design hierarchy from the top block but renaming individual sub-blocks at the lower level is not allowed.

**What Next**

Use copy_block to make a copy of the block.

---

## DES-057

(error) 'rename_block' failed. '%s' is a sub-block of '%s'.

**Description**

rename_block failed because you are trying to rename a block into one of its sub-block. This will cause cyclic/self referencing and is not allowed.

---

## DES-058

(error) Layer '%s' does not have a metal layer %s it in the layer stack. It cannot be the cut layer of a simple via_def.

**Description**

create_via_def failed because the specified cut layer does not have a layer of type INTERCONNECT or LOCAL_INTERCONNNECT both above and below it in the layer stack. A simple via_def must have metal above and below its cut layer.

**What Next**

Choose another cut layer or modify your tech to add the missing metal layer definition.

Feedback

## DES-059

(error) 'save_block -label' failed. You must specify a design label without the characters `:', `/', or `.'.

**Description**

save_block -label failed because the label specified is not legal. Because of the syntax used for specifying a block (lib:block/userLabel.view), the lib, block, view, and userLabel names must not include the characters `:', `/', or `.'.

**What Next**

Choose a user label name that meets the criteria above and repeat the save_block command.

## DES-060

(error) Current block is a %s and is not supported by this command.

**Description**

The current block is a type that is not supported by the current command.

**What Next**

Use the *current_block* command to switch to a block that is supported by this command.

## DES-061

(error) Topology %s '%s' already exists in the plan '%s'.

**Description**

A topology object with the specified name already exists in the plan.

**What Next**

Specify a different name, or remove the existing topology object. Alternatively, you may omit the name option, and the system will automatically select a unique name.

## DES-062

(error) Topology repeater '%s' already exists on the edge '%s'.

**Description**

A topology repeater with the specified name already exists on the edge.

Feedback

**What Next**

Specify a different topology repeater name, or use the remove_topology_repeaters command to remove the existing topology repeater. Alternatively, you may omit the name option, and the system will automatically select a unique name for the topology repeater.

---

## DES-063

(error) Topology plan '%s' already exists in the block.

**Description**

A topology plan with the specified name already exists in the block.

**What Next**

Specify a different topology plan name, or use the remove_topology_plans command to remove the existing topology plan. Alternatively, you may omit the name option, and the system will automatically select a unique name for the topology plan.

---

## DES-064

(error) Topology node '%s' already exists in the plan '%s'.

**Description**

A topology node with the specified name already exists in the plan.

**What Next**

Specify a different topology node name, or use the remove_topology_nodes command to remove the existing topology node. Alternatively, you may omit the name option, and the system will automatically select a unique name for the topology node.

---

## DES-065

(error) Cell array pattern '%s' already exists.

**Description**

A cell array pattern with the specified name already exists in the specified block, or the current block if the block is unspecified.

**What Next**

Specify a different cell array pattern name, or use the remove_cell_array_patterns command to remove the existing cell array pattern. Alternatively, you may omit the name option, and the system will automatically select a unique name for the cell array pattern.

Feedback

## DES-078

(Error) Variable '%s' cannot be set after define_scaling_lib_group.

**Description**

This variable needs to be set before define_scaling_lib_group.

## DES-089

(error) Terminal '%s' already exists in block '%s'.

**Description**

A terminal with the specified name already exists in the block. In a block, each terminal must have a unique name.

**What Next**

Specify a different name that is not already used by a terminal in this block, or do not specify a name and a unique name will be automatically generated. This restriction can be controlled by the design.enforce_terminal_name_uniqueness app option.

## DES-090

(error) Block '%s' is not linked.

**Description**

This command requires that the current block is linked.

**What Next**

Use the *link_block* command to link the current block before using this command.

## DES-091

(error) Block '%s' is not opened.

**Description**

The specified block must be opened before using this command.

**What Next**

Use the *open_block* command to open the block before using this command.

Feedback

## DES-092

(error) '%s' is not the top module in current block '%s'.

**Description**

When using absolute path syntax in current_instance, the module name must be the top module name of the current block

**What Next**

Please use the top module name in the command. For example, *current_instance /top/inst1*

If the instance belongs to a different block, please use *current_block* command to change the current block before running *current_instance*

## DES-100

(error) Bound '%s' already exists in the design.

**Description**

A bound with the specified name already exists in the design.

**What Next**

Specify a different bound name, or use the remove_bounds command to remove the existing bound.

## DES-101

(error) %s '%s' cannot be assigned to the %s bound; it is already assigned to %s bound '%s'.

**Description**

The specified object is already assigned to another bound.

Ports may be assigned to at most one bound. A port cannot be reassigned to another bound without first unassigning it from its current bound.

Cells may be assigned to at most one move bound and one group bound. A cell cannot be reassigned to another move bound without first unassigning it from its current move bound. Likewise a cell cannot be reassigned to another group bound without first unassigning it from its current group bound. Cells may be

Feedback

**What Next**

Use the remove_from_bound command to unassign the object from its current bound, and then call this command again.

---

## DES-102

(error) The bound region %s is not rectilinear.

**Description**

The specified bound region is not rectilinear. Each region must be a rectilinear polygon or rectangle.

**What Next**

Correct the bound region.

---

## DES-103

(warning) %s '%s' cannot be unassigned from the bound; %s.

**Description**

The specified object cannot be unassigned from the bound. Objects may only be unassigned from bounds to which it is assigned.

Note that while a cell may be in a bound, it might not have been assigned to one.This occurs if the cell's parent hierarchical cell (or any of its ancestors in the same block) are assigned to a bound. This command only removes cells that were assigned explicitly to a bound.

**What Next**

Use the remove_from_bound command to unassign the object from its currently assigned bound if any. For a cell, unassign the cell's parent hierarchical cell from its bound if any.

---

## DES-104

(error) Ports cannot be assigned to this type of bound.

**Description**

This error comes from either create_bound or add_to_bound command. It implies that the existing or new bound being created, is limited to having only specific type of cells in it.These bounds are not allowed to have ports.

Feedback

### What Next

If the error occurs in create_bound command, you can either change the options used in creating the bound, such that it can have ports or remove the ports from the object list to the new bound. If the error occurs in add_to_bound command, you would need to choose a different bound for the port.

---

## DES-105

(error) The cell '%s' cannot be assigned to this type of bound.

### Description

This error comes from either create_bound or add_to_bound command. It implies that the existing or new bound being created is limited to having only specific types of cells in it. The specified cells cannot be added to the bound. For example, module bounds can only contain module boundary cells, which are not ancestors or descendants of any existing cell in the bound.

### What Next

If the error occurs in create_bound command, you can either change the options used in creating the bound, such that it can have cells of this type or remove the cell from the object list to the new bound. If the error occurs in add_to_bound command, you would need to choose a different bound for the cell.

---

## DES-106

(error) %s '%s' cannot be assigned to the bound; it is in a different block than the bound.

### Description

The specified object is in a different block than the bound. The bound and its containing cells and ports must be in the same physical block.

### What Next

Specify cells and ports that are in the same block as the bound.

---

## DES-110

(error) Non-default rule '%s' already exists in the design.

### Description

A non-default routing rule already exists with the specified name in the design.

Feedback

**What Next**

Remove the existing rule and then define the rule.

---

## DES-111

(error) Layer '%s' does not exist.

**Description**

The specified layer does not exist.

**What Next**

Check the technology layer information.

---

## DES-112

(error) Layer '%s' is not a routing layer.

**Description**

The specified layer is not a routing layer. The layer must be a routing layer.

**What Next**

Check the technology layer information.

---

## DES-113

(error) The number of %s values does not match the number of spacing values on layer '%s'.

**Description**

The number of spacing weight and effort values must match the number of spacing values specified for the layer in the non-default rule.

**What Next**

Check the number of spacing, weight, and effort values.

---

## DES-114

(error) Layer spacing weights must be specified on layer '%s'.

Feedback

**Description**

If multiple spacing values are specified on a layer, spacing weight values must also be specified on that layer.

**What Next**

Specify the spacing weight values.

---

## DES-115

(error) Spacing value %s is specified multiple times on layer '%s'.

**Description**

The indicated spacing value is specified more than once on the layer. Each spacing value may be specified at most once per layer per routing rule.

**What Next**

Check and correct the spacing values on the indicated layer.

---

## DES-120

(error) Io guide '%s' already exists in the design.

**Description**

An io guide with the specified name already exists in the design.

**What Next**

Specify a different io guide name, or use the remove_io_guides command to remove the existing io guide.

---

## DES-121

(error) Cell '%s' is already in io guide '%s'.

**Description**

The specified cell is already in another io guide. Cells cannot be moved from one io guide to another io guide.

**What Next**

Use the remove_from_io_guide command to remove the cell from the current io guide, and then call this command again.

Feedback

## DES-122

(error) '%s' is not a pad cell.

**Description**

The specified object is not a pad cell. Only pad cells can be in an io guide.

**What Next**

Check the get_attribute command to verify the cell is a pad cell.

## DES-123

(error) Invalid line specification: %s

**Description**

The specified line for the io_guide is invalid because of the given reason.

**What Next**

Specify a different line for the io_guide

## DES-130

(error) Io ring '%s' already exists in the design.

**Description**

An io ring with the specified name already exists in the design.

**What Next**

Specify a different io ring name, or use the remove_io_rings command to remove the existing io ring.

## DES-131

(error) Io guide '%s' is already in io ring '%s'.

**Description**

The specified io guide is already in another io ring. Io Guides cannot be moved from one io ring to another io ring.

Feedback

**What Next**

Use the remove_from_io_ring command to remove the io guide from the current io ring, and then call this command again.

---

## DES-132

(error) Invalid offset specification for io_ring

**Description**

The specified offset for the io_ring is invalid because it will create an io_ring with zero width and length.

**What Next**

Specify a different io_ring offset

---

## DES-133

(error) Invalid bbox specification for io_ring

**Description**

The specified bbox for the io_ring is invalid because it is outside the die area.

**What Next**

Specify a bbox with the die area.

---

## DES-134

(error) Cannot find pad cell '%s' in io guide '%s'.

**Description**

The specified io guide does not contain this pad cell.

**What Next**

Verify the pad cell is in the io guide and try again.

---

## DES-135

(error) Cannot find io ring '%s' in design '%s'.

**Description**

The specified io ring cannot be found in the design.

Feedback

**What Next**

Verify the io ring is valid and try again.

---

## DES-136

(error) The specified region is not rectilinear. The region must be a rectilinear polygon or rectangle.

**Description**

The specified region is not rectilinear.

**What Next**

Specify a rectilinear region and try this command again.

---

## DES-137

(error) Invalid region. Region is outside the die area.

**Description**

The specified region is outside the die area.

**What Next**

Specify a region inside the die area and try this command again.

---

## DES-138

(error) An x and y guard_band must be specified for each voltage_area_shape.

**Description**

Guard_band specifications are missing for the voltage_area_shape.

**What Next**

Specify a valid x and y guard_band and try this command again.

---

## DES-140

(error) Term '%s' is already connected to net '%s'.

**Description**

The term is already connected to the indicated net, and cannot be connected to the user-specified net unless it is disconnected first.

Feedback

**What Next**

Disconnect the term from the indicated net, and then connect it to the desired net.

---

## DES-141

(error) Cannot connect term '%s' across hierarchy to net '%s'.

**Description**

The indicated term and net are in different hierarchies and cannot be connected.

**What Next**

If the indicated term and net must be connected, create the appropriate nets and ports in the intermediate hierarchies, and then connect the term to the corresponding net in its local hierarchy.

---

## DES-142

(error) Term '%s' cannot be connected to net '%s'.

**Description**

The indicated term cannot be connected to the net.

**What Next**

Check the term and net connections.

---

## DES-143

(error) Cannot connect %s %s pin '%s' to signal net '%s'.

**Description**

The indicated PG pin has either an input or inout direction, and cannot be driven by a signal net.

**What Next**

Check the net and pin types, and check the pin direction.

---

## DES-144

(error) Cannot connect signal output pin '%s' to %s net '%s'.

Feedback

**Description**

The indicated signal pin has an output direction, and cannot drive a PG net.

**What Next**

Check the net and pin types, and check the pin direction.

---

## DES-145

(error) Term '%s' is currently connected to net '%s'.

**Description**

The term is currently connected to the indicated net, and cannot be disconnected from the user-specified net.

**What Next**

Disconnect the term from the indicated net.

---

## DES-146

(error) Cannot disconnect term '%s' across hierarchy from net '%s'.

**Description**

The indicated term and net are in different hierarchies and cannot be disconnected.

**What Next**

If the indicated term and net must be disconnected, disconnect the pin from the corresponding net in its local hierarchy.

---

## DES-147

(error) Term '%s' cannot be disconnected from net '%s'.

**Description**

The indicated term cannot be disconnected from the net.

**What Next**

Check the term and net connections.

---

## DES-149

(information) Block '%s' cannot be auto-linked.

Feedback

**Description**

A summary message indicating that the auto link process is not allowed for your block.

**What Next**

Explicitly link the block using the set_top_module command

---

## DES-150

(error) Net '%s' already exists%s.

**Description**

A net with the specified name already exists. Two nets cannot have the same name in the same cell.

**What Next**

Specify a different name for the net.

---

## DES-151

(error) Unable to create net '%s'; %s.

**Description**

The net cannot be created for the specified reason.

**What Next**

If the message indicates an invalid instance path, check the name specified in the option *net_names* and make sure the name includes the correct path to the new net.

If the message indicates that the cell instance is a leaf cell, check the name specified in the option *net_names* and make sure the name includes a path to the parent hierarchical cell of the new net. Nets cannot be added to leaf cells.

---

## DES-152

(error) Port '%s' already exists%s.

**Description**

A port with the specified name already exists. Two ports cannot have the same name on the same cell.

Feedback

**What Next**

Specify a different name for the port.

---

## DES-153

(error) Unable to create port '%s'; %s.

**Description**

The port cannot be created for the specified reason.

**What Next**

If the message indicates an invalid instance path, check the name specified in the option *port_names* and make sure the name includes the correct path to the new port.

If the message indicates that the cell instance is a leaf cell, check the name specified in the option *port_names* and make sure the name includes a path to the parent hierarchical cell of the new port. Ports cannot be added to leaf cells.

---

## DES-154

(error) Pin '%s' already exists%s.

**Description**

A pin with the specified name already exists. Two pins cannot have the same name on a cell.

**What Next**

Specify a different name for the pin.

---

## DES-155

(error) Unable to create pin '%s'; %s.

**Description**

The pin cannot be created for the specified reason.

**What Next**

If the message indicates an invalid instance path, check the name specified in the option *pin_names* and make sure the name includes the correct path to the new pin.

Feedback

If the message indicates that the cell instance is a leaf cell, check the name specified in the option *pin_names* and make sure the name includes a path to the parent hierarchical cell of the new pin. Pins cannot be added to leaf cells.

---

## DES-160

(warning) Cannot set keepout on non-physical %s '%s'.

**Description**

Keepout margins may only be set on physical designs and cells. The indicated design or cell is not physical and will be skipped.

**What Next**

Check the input object list and verify that you have specified the correct physical designs and cells.

---

## DES-161

(warning) Cannot set inner keepout on leaf cell '%s'.

**Description**

Inner keepout margins may only be set on physical designs. Inner keepout margins may not be set on leaf cells. The indicated cell is a leaf cell and will be skipped.

This has no bearing on the outer keepout. Leaf cells may have an outer keepout. If an outer keepout is specified, the cell's outer keepout will still be set.

**What Next**

Check the input object list and verify that you have specified designs rather than leaf cell instances.

---

## DES-162

(warning) Cannot derive pin-based keepout on %s '%s'.

**Description**

The pin-based outer keepout margins may only be derived for macro cells. They cannot be set on designs, partitions, or other leaf cells. The indicated cell is not a macro cell.

**What Next**

Check the input object list and verify that you have specified the correct macro cells.

Feedback

## DES-163

(error) Minimum routing layer and layer preferred routing directions are not set on the design.

**Description**

The pin-based keepout cannot be derived, because the minimum routing layer and layer preferred routing directions are not set on the design. One of these must be set in order to obtain a valid pitch value, which is used to derive the pin-based keepout margins.

**What Next**

Either set the minimum routing layer using the *set_ignored_layers* command or set the layer preferred routing directions using the *set_attribute* command on each routing layer.

## DES-164

(error) Layers are not specified for route blockage keepout.

**Description**

Layers must be specified when setting a route blockage keepout.

**What Next**

Use the option -layer to specified layers.

## DES-165

(warning) Only hard or soft type keepout margin can be set on leaf cell '%s'.

**Description**

Only hard or soft type keepout margin can be set on leaf cells.The indicated a invalid type keepout margin has been specified to set on a leaf cell and will be skipped.

**What Next**

Check the input keepout margin type and verify that you have specified the correct keepout margin type on leaf cells.

## DES-166

(warning) Layers can only be specified for route blockage keepout,layers will be ignored.

Feedback

**Description**

Layers will be ignored when keepout type is not route_blockage.

**What Next**

Do not use the option -layer to specified layers.

---

## DES-167

(warning) Can't set outer keepout for current design, setting outer keepout for current design '%s' is ignored.

**Description**

Current design will be skipped when set outer keepout for it.

**What Next**

Do not set outer keepout for current design.

---

## DES-170

(error) Pin blockage '%s' already exists in the design.

**Description**

A pin blockage with the specified name already exists in the design.

**What Next**

Specify a different pin blockage name, or use the remove_pin_blockages command to remove the existing pin blockage first.

---

## DES-171

(error) The pin blockage cannot be assigned %s; %s.

**Description**

The pin blockage cannot be assigned the specified object type for the indicated reason.

The pin blockage may only be assigned a homogeneous object list, either a list of pins, nets, or ports. If the pin blockage is already assigned an object of one type, it may not be assigned an object of another type.

**What Next**

Correct the problem with object list.

Feedback

## DES-172

(error) Pin guide '%s' already exists in the design.

**Description**

A pin guide with the specified name already exists in the design.

**What Next**

Specify a different pin guide name, or use the remove_pin_guides command to remove the existing pin guide first.

## DES-173

(error) Cell '%s' is not a macro or partition cell.

**Description**

The indicated cell is not a macro or partition cell. Only macro and partition cells may be set as the parents of a pin guide.

**What Next**

Specify a list of macro and partition cells for the parents option.

## DES-174

(error) The pin guide cannot be assigned %s; %s.

**Description**

The pin guide cannot be assigned the specified object type for the indicated reason.

The pin guide may only be assigned a homogeneous object list, either a list of pins, nets, or ports. If the pin blockage is already assigned an object of one type, it may not be assigned an object of another type.

Furthermore, if the pin guide's parent is the current design, it may only be assigned net and port objects. If the pin guide's parents are cells, it may only be assigned net and pin objects.

**What Next**

Correct the problem with object list.

Feedback

## DES-175

(error) The boundary is not rectilinear.

**Description**

The specified boundary is not rectilinear. The boundary must be a rectilinear polygon or rectangle.

**What Next**

Correct the boundary coordinate list.

## DES-176

(error) The object list is not homogeneous.

**Description**

The specified object list contains objects of different types. The object list may only contain objects of one type.

**What Next**

Specify objects of one type only.

## DES-177

(error) %s name cannot begin with the system-reserved prefix '%s'.

**Description**

A name cannot begin with a system-reserved prefix. This prefix is used by the system for unnamed objects of the indicated type.

**What Next**

Specify a different name that does not begin with the indicated system-reserved prefix.

## DES-178

(warning) %s '%s' is not physical.

**Description**

The indicated object is not physical. Only physical pins, nets, and ports may be added to a pin blockage or pin guide. This object is skipped and not added.

Feedback

**What Next**

Check that the correct physical objects are added.

---

## DES-179

(error) View '%s' of cell %s does not exist.

**Description**

The cell does not have indicated view.

**What Next**

Check that the correct view type is specified.

---

## DES-180

(error) Cannot change view to cell '%s'.

**Description**

The view of specified instance cannot be changed.

**What Next**

Check if the indicated view exists.

---

## DES-181

(error) Unable to change view on hierarchical cell '%s'.

**Description**

This command does not accept hierarchical cell.

**What Next**

Only specify leaf cells for this command.

---

## DES-182

(error) '%s' is not a legal view name.

**Description**

This command does not support the specified view type.

Feedback

**What Next**

Correct the view name.

---

## DES-183

(error) Edit group '%s' already exists in the design.

**Description**

An edit group with the specified name already exists in the design.

**What Next**

Specify a different edit group name, or use the remove_edit_groups command to remove the existing edit group. Alternatively, you may omit the name option, and the system will automatically select a unique name for the edit group.

---

## DES-184

(error) '%s' is not a valid design.

**Description**

The specified object is not a top module. A design must also be a top module.

**What Next**

Specify a top module.

---

## DES-185

(error) Addition of object '%s' to edit group '%s' forms a membership cycle.

**Description**

Adding the specified object to the specified edit group results in a membership cycle, such that the object ultimately both contains and is contained by one of its member objects, which is not permitted.

**What Next**

Use the remove_from_edit_group command to remove another object in the membership cycle, and then call this command again.

---

## DES-186

(error) Object '%s' is already in edit group '%s'.

Feedback

**Description**

The specified object is already in an edit group. Objects cannot be moved from one edit group to another edit group.

**What Next**

Use the remove_from_edit_group command to remove the object from the current edit group, and then call this command again.

---

## DES-187

(error) Object '%s' cannot be added to edit group '%s'.

**Description**

The specified object's type is not supported for inclusion in edit groups, so it cannot be added to the edit group.

**What Next**

Select a different object to add to the edit group.

---

## DES-188

(error) Unable to create pin '%s' in top module.

**Description**

A pin cannot be created in the top module of the design.

**What Next**

Only ports can be created in the top module of the design. Use the command *create_port* to create a new port in the top module of the design.

---

## DES-189

(error) Routing guide '%s' already exists in the design.

**Description**

A Routing guide with the specified name already exists in the design.

**What Next**

Specify a different Routing guide name, or use the remove_Routing_guide command to remove the existing Routing guide first.

Feedback

## DES-190

(error) Terminal '%s' already exists on port '%s'.

**Description**

A terminal with the specified name already exists on the port. On a port, each terminal must have a unique name.

**What Next**

Specify a different name that is not already used by a terminal on this port, or do not specify a name and a unique name will be automatically generated.

## DES-191

(error) At least one net name must be specified.

**Description**

One or more net names must be specified when calling the create_net command.

**What Next**

Specify one or more non-empty names.

## DES-192

(error) %s '%s' is in a different Physical hierarchy.

**Description**

The specified object to be added/removed is in a different physical hierarchy than the container object.

## DES-193

(error) Object '%s' cannot be removed from edit group '%s'.

**Description**

The specified object is not in the specified edit group, so it cannot be removed from it.

**What Next**

Select a different object to remove from the edit group.

Feedback

## DES-194

(Information) Opening sub-blocks in read-only mode.

### Description

Sub-blocks are being opened in read-only mode. The -ref_libs_for_edit option is overridden because the design.sub_blocks_for_read app option value is true.

### See Also

- open_block
- design.sub_blocks_for_read

## DES-195

(error) Topology edge '%s' already exists in the design.

### Description

An topology edge with the specified name already exists in the design.

### What Next

Specify a different topology edge name, or use the remove_topology_edges command to remove the existing topology edge. Alternatively, you may omit the name option, and the system will automatically select a unique name for the topology edge.

## DES-196

(error) Topology node '%s' already exists in the design.

### Description

An topology node with the specified name already exists in the design.

### What Next

Specify a different topology node name, or use the remove_topology_nodes command to remove the existing topology node. Alternatively, you may omit the name option, and the system will automatically select a unique name for the topology node.

## DES-197

(Information) The -ref_libs_for_edit option is overridden.

Feedback

**Description**

The -ref_libs_for_edit option is overridden because the library is in read mode and the design.edit_read_only_libs option is false. The block and its sub-blocks are opened in read mode.

**See Also**

- open_block
- design.edit_read_only_libs

---

## DES-198

(error) %s '%s' is in a different block than the %s '%s'.

**Description**

The specified object to be added/removed is in a different block than the container object.

---

## DES-199

(error) The pin guide's parent cells must be in the same physical hierarchy.

**Description**

The pin guide may only be assigned parent cells which reside in the same physical hierarchy as the pin guide itself.

**What Next**

Correct the problem with the parent cell list.

---

## DES-200

(error) Unable to create %s in leaf cell %s.

**Description**

The object cannot be created in a leaf cell.

**What Next**

Provide the correct cell for object creation.

---

## DES-201

(error) Can't save design. Design '%s' is not linked.

Feedback

**Description**

save_block requires this design to be linked.

**What Next**

Explicitly link the design prior to saving it

---

## DES-202

(warning) Not assigning %s '%s' to the %s bound because it is already assigned to %s bound '%s'.

**Description**

The specified object is already assigned to another bound.

Ports may be assigned to at most one bound. A port cannot be reassigned to another bound without first unassigning it from its current bound.

Cells may be assigned to at most one move bound and one group bound. A cell cannot be reassigned to another move bound without first unassigning it from its current move bound. Likewise a cell cannot be reassigned to another group bound without first unassigning it from its current group bound.

**What Next**

Use the remove_from_bound command to unassign the object from its current bound, and then call this command again.

---

## DES-203

(information) Block '%s' cannot be linked with link_block command, please use set_top_module.

**Description**

A summary message indicating that the auto link process is not allowed for your block, and set_top_module must be used intead of link_block.

**What Next**

Explicitly link the block using the set_top_module command

---

## DES-210

(error) Unable to create pin_bus '%s'; %s.

Feedback

**Description**

The pin_bus cannot be created for the specified reason.

**What Next**

If the message indicates an invalid instance path, check the name specified in the option cell_bus and make sure the name includes the correct path to the correct cell_bus.

---

## DES-211

(error) Cannot create pin bus on cell bus %s whose members are leaf cells.

**Description**

The pin bus cannot be created on cell bus whose members are leaf cells

**What Next**

Provide the correct cell bus for pin bus creation.

---

## DES-219

(error) cannot create net. Bus net with same name '%s' already exists%s.

**Description**

A bus net with the specified name already exists.

**What Next**

Specify a different name for the net.

---

## DES-220

(error) Block '%s' failed to properly link during 'set_top_module'.

**Description**

A message indicating that the command had problems processing your block. Please prior review output for pertinent error messages.

**What Next**

Explicitly link the block using the 'set_top_module' command after correcting the reported problems.

Feedback

## DES-221

(error) Command cannot use RTL block %s.

**Description**

A message indicating that the command cannot use an RTL block but the implicitly or explicitly-specified block is an RTL block.

**What Next**

Provide a design-type block for the command.

## DES-222

(error) Command cannot use analysis block %s.

**Description**

A message indicating that the command cannot use an analysis block, which is a block that has been created or changed using approximate techniques for the purposes of analysis and isn't suitable for use later on in the flow, and the implicitly or explicitly-specified block is an RTL block.

**What Next**

Provide a normal design block for the command.

## DES-223

(Warning) pre_extract command has not produced pre-extracted block from the original block %s.

**Description**

A message indicating that the command has not produced a new pre-extracted block from the original block, because pre-extraction proecess had not needed to producenew data different from the original.

**What Next**

Extraction tools can run on the original block.

## DES-224

(Error) Command aborted because not able to find technology in design %s.

Feedback

**Description**

A message indicating that the command has aborted because no technology is found in the given design (library).

**What Next**

Make sure the design (library) has access to technology, usually set-up during design set-up stages.

---

## DES-225

(error) Block '%s' is not linked.

**Description**

This command requires that the current block is linked. The block was not linked because auto-linking was disabled.

**What Next**

To enable auto-linking, set the app-option design.disable_auto_link to false. Alternatively use the *link_block* command to link the current block before using this command.

```
prompt> set_app_option -name design.disable_auto_link -value false
```

---

## DES-226

(error) Layer '%s' doesnot have a mask order in the tech layer stack. Mandatory to specify the lower and upper routing tech layers.

**Description**

A via_def must reference a cut layer in the tech layer stack. Othwise, please specify the lower and upper routing layers also.

**What Next**

Please specify the lower and upper routing tech layers.

---

## DES-227

(error) Command is not allowed to run on 3DIC design %s.

**Description**

The current command cannot run on the block, as 3DIC design types are not supported for this command.

Feedback

**What Next**

Check the design type and run the command on a non-3DIC design.

# DFT

## DFT-002

(Information) Scan chain %s is not in a partition. Only reordering is possible.

**Description**

A scan chain exists in the netlist without an associated partition. Such scan chains cannot be re-partitioned, only re-ordered.

## DFT-003

(Error) The design scandef is incorrect because %s.

**Description**

The design scandef is incorrect due to the described reason like buffer or inverter existence in floating list, or multiple occurence of the same scan pin, or MV related cell existence as scan cell.

**What Next**

Check the design scandef to solve the reported issue, and reload the correct scandef into the design to continue.

## DFT-004

(Error) Inconsistency exists between the design scandef and the netlist because %s.

**Description**

The design scandef is inconsistent with the design netlist due to the reported issue like missing scan pin in netlist versus scandef, or net connection inconsistency between scandef and netlist.

**What Next**

If the message is seen in check_scan_chain before place_opt or create_placement, please check the design to correct the reported issue, reload the revised scandef if necessary. If the message is seen only at the end of optimize_dft, please contact synopsys for the issue.

Feedback

## DFT-005

(warning) The scan chain %s is abnormal and may introduce logic error in later flow because %s.

**Description**

The reported scan chain is abnormal and may introduce logic error in later flow due to the described issue like buf/inv existence within OREDERED list driving both scan and data loads, or buf/inv as stop point driving both scan and data loads.

**What Next**

Check the design scandef to see whether the described issue in the reported scan chain is intended.

## DFT-006

(warning) The scan chain %s is abnormal because %s.

**Description**

The reported scan chain is abnormal due to the described issue. This abnormality may limit the dft optimization efficiency.

**What Next**

Check the design scandef to see whether the described issue in the reported scan chain is intended.

## DFT-007

(warning) The scan reordering on scan chain %s is skipped because %s.

**Description**

The scan reordering on scan chain %s is skipped due to the described reason.

**What Next**

Please check whether the described reason is caused by design issue. If yes, please correct the problem and redo dft optimization.

## DFT-008

DFT optimization is terminated due to the engine defect.

Feedback

**Description**

DFT optimization is terminated due to the engine defect.

**What Next**

Please contact synopsys engineer for the solution.

---

## DFT-009

(warning) DFT repartition is skipped on PARTITION label %s group due to the failed scan chain %s.

**Description**

DFT repartition is skipped on the named PARTITION label group due to the existence of failed scan chain.

**What Next**

Please check the displayed error message DFT-003 or DFT-004 to correct the scandef error, and reload the correct scandef to continue.

---

## DFT-010

(warning) DFT reordering is skipped for the failed scan chain %s.

**Description**

DFT reordering is skipped for the named failed scan chain.

**What Next**

Please check the displayed error message DFT-003 or DFT-004 to correct the scandef error, and reload the correct scandef to continue.

---

## DFT-011

(information) NO SCANCHAIN defined in SCANDEF.

**Description**

optimize_dft does nothinig or check_scan_chain cannot perform since there is no scan chain defined in the design.

**What Next**

use read_def to read in the SCANDEF with SCANCHAIN info

Feedback

## DFT-012

(information) scan repartition is disabled.

**Description**

scan repartition is disabled, which may impact the total scan wirelength reduction efficiency.

**What Next**

remove the app option which disables scan repartition.

## DFT-013

(Error) %s pin is set on the %s pin - %s.

**Description**

This error is shown when the scan-in pin is set on an output pin of scan cell or the scan-out pin is set on the input pin of scan cell.

Here the scan-in/out pin is the pin of scan element. Scan-in pin should be an input pin of cell and scan-out pin should be an output pin.

**What Next**

1. Checks whether the scandef is correct. Maybe a wrong pin is specified. 2. It is possible that scandef is correct but the pin direction is wrong. User has to correct the db.

## DFT-014

(warnning) optimize_dft is skipped in spg flow due to unplaced scan cell.

**Description**

optimize_dft is skipped in spg flow due to unplaced scan cell.

**What Next**

please ensure all scan cells being placed if optimize_dft is expected to be employed.

## DFT-015

optimize_dft is terminated due to unplaced scan cell.

**Description**

optimize_dft is terminated due to unplaced scan cell in the design.

Feedback

**What Next**

use legalize_placement beforehand to ensure all the scan cells being placed.

---

## DFT-016

(warnning) net %s is with timing exception constraint and will be preserved during dft optimization.

**Description**

The described net is with timing exception constraint and its connection will be preserved during dft optimization.

**What Next**

please check the net to see whether the timing exception on this net is intended.

---

## DFT-017

(warning) mv cell(s) exist in scan chain %s, this scan chain will be split to perform further optimization.

**Description**

Isolation cell or level shifter exists in the scan chain, this scan chain will be split into multiple valid ones to perform further dft optimization.

**What Next**

Check the scan def to ensure there is no mv cell inserted in newly generated scan def and go on other dft optimization steps.

---

## DFT-018

(warning) mv cell(s) locate inside an ordered list of scan chain %s, this ordered list will be break up during scan def repairment.

**Description**

Isolation cell or level shifter exists in an order list of the scan chain, this scan chain will be split into multiple valid ones so that the original ordered list will be break up.

**What Next**

Check the scan def to ensure there is no mv cell inserted in newly generated scan def and go on other dft optimization steps.

Feedback

## DFT-019

(warning) New scan chain %s is inserted into scan def.

**Description**

A new generated scan chain is inserted into scan def.

**What Next**

Check the scan def to ensure validity of new inserted scan chain and go on other dft optimization steps.

## DFT-020

(warning) Scan chain %s is deleted from scan def.

**Description**

An origianl scan chain is deleted from scan def because of mv cell inserted and this scan chain is split.

**What Next**

Check the scan def to ensure validity of new inserted scan chain and go on other dft optimization steps.

## DFT-021

(Error) Unqualified instance besides sequential cells exists in scandef as scan element, skip DFT optimization

**Description**

An non-squential cell found as scan element in scan chain, this is not an expeceted behaviour so DFT optimization will be skipped.

**What Next**

Check the location of non-squential cell inside scan chain, and re-design scan chains if necessary.

## DFT-022

(warning) new flip-flop %s replaced original flip-flop %s in scandef

Feedback

**Description**

When one flip-flop have multiple loads, this flip-flop will be cloned and assigned to each load path seprately, and a new cloned flip-flop will replace original one in as scan element in scan path.

**What Next**

Go on further DFT optimization steps.

---

## DFT-023

(warning) The start term of scan chain: %s is revised.

**Description**

Isolation cell or level shifter exists between start term and first element in scan chian, the start term of this scan chain will be reset.

**What Next**

Report this chain to see the new start term of this scan chain.

---

## DFT-024

(warning) The end term of scan chain: %s is revised.

**Description**

Isolation cell or level shifter exists between end term and last element in scan chian, the end term of this scan chain will be reset.

**What Next**

Report this chain to see the new end term of this scan chain.

---

## DFT-025

(Error) optimize_dft introduces new failed scan chain, now the failed scan chain count is %d versus the number %d before optimize_dft.

**Description**

The message occurs when optimize_dft introduces new failed scan chain.

**What Next**

Please disable optimize_dft call with the command 'set_optimize_dft_options' or contact ynopsys engineer for the solution.

Feedback

## DFT-026

(information) There exists %s in scan chain %s, and MV aware optimize_dft will be employed.

### Description

The tool found mv cell(s) or net(s) cross different voltage areas, mv aware dft will be automatically turned on to ensure no mv vialotions introduced in DFT optimization.

### What Next

check_mv_design after dft optimization ends.

## DFT-027

(information) optimize_dft is skipped in spg flow since the majority scan nets are shared by data path or the chip is too long and narrow.

### Description

optimize_dft is skipped in spg flow since the majority scan nets are shared by data path or the chip is too long and narrow. For such designs, optimize_dft call within place_opt spg flow helps little but may bring negative impact, so it is skipped.

### What Next

If the user insists on the use of dft optimization, he/she can call standalone optimize_dft command in the flow.

## DFT-028

(Warning) The timing scenario manager could not be started and optimize_dft is being skipped.

### Description

optimize_dft is being skipped because of a problem with the timing scenario manager.

### What Next

If this message is seen in the flow, check for extraction or timer messages in the log file.

### See Also

- check_timing

Feedback

## DFT-029

(Warning) Partition %s is overconstrained. It has %d bits of total stub chain capacity and %d bits of stub chain used capacity.

**Description**

The indicated partition has overfull stub chains with maxbits set so that the number of bits it contains exceeds its capacity. DFT repartitioning will be skipped.

**What Next**

If this message is seen in the flow, check for chains with maxbits on the given partition.

## DFT-1001

(Error) CTL Model could not be read

**Description**

CTL Model could not be read

**What Next**

Please Review DFT Specifications

## DFT-1002

(Error) No DFT valid partition from %s

**Description**

No DFT valid partition from %s

**What Next**

Please Review DFT Specifications

## DFT-1003

(Error) Test Mode %s is not defined

**Description**

Test Mode %s is not defined

**What Next**

Please Review DFT Specifications

Feedback

## DFT-1004

(Error) Total number of '%d' DFT signal(s) of Type '%s' required%s. '%d' DFT signal(s) of type '%s' specified.

**Description**

Total number of '%d' DFT signal(s) of Type '%s' required%s. '%d' DFT signal(s) of type '%s' specified.

**What Next**

Please Review DFT Specifications

## DFT-1005

(Error) Port %s is not defined

**Description**

Port %s is not defined

**What Next**

Please Review DFT Specifications

## DFT-1006

(Error) -Timing is specified with either -view option wrongly or -view option as spec

**Description**

-Timing is specified with either -view option wrongly or -view option as spec

**What Next**

Please Review DFT Specifications

## DFT-1007

(Error) Multiple pins cannot be specified for %s '%s'.

**Description**

Multiple pins cannot be specified for %s '%s'.

**What Next**

Please Review DFT Specifications

Feedback

## DFT-1009

(Error) Test Mode %s is not defined

**Description**

Test Mode %s is not defined

**What Next**

Please Review DFT Specifications

## DFT-1010

(Error) The '-timing' option requires two values

**Description**

The '-timing' option requires two values

**What Next**

Please Review DFT Specifications

## DFT-1011

(Error) The specified '-type' option is not supported.

**Description**

You receive this error message if you specify the wrong DFT signal type by set_dft_signal command.

Error: The specified '-type' option is not supported. (DFT-1011)

**What Next**

Define the correct DFT signal type.

## DFT-1012

(Error) Direction of '-hookup_pin' pin is incorrect.

**Description**

Tool throw this error message if it sees invalid direction of hookup_pin of signal type. Direction of hookup_pin should be input for signal type Reset, RefClock, MasterClock, ScanSlaveClock, TestMode, PllBypass, PllReset, CodecCntrl, Constant, ScanMasterClock for tck, ScanEnable, ScanDataIn, TestControl for wso.

Feedback

Direction of hookup_pin should be output for signal type ScanDataOut.

If there is any other combination defined by the user, Tool will throw error.

Error: Direction of '-hookup_pin' pin is incorrect. (DFT-1012)

**What Next**

Define the correct direction of hookup_pin of signal type.

---

## DFT-1013

(Error) Usage type of '-usage' pin is incorrect

**Description**

Usage type of '-usage' pin is incorrect

**What Next**

Please Review DFT Specifications

---

## DFT-1016

(Error) Either Internal pins flow or Clock Controller should be enabled

**Description**

Either Internal pins flow or Clock Controller should be enabled

**What Next**

Please Review DFT Specifications

---

## DFT-1018

(Error) View name of '-view' is incorrect

**Description**

View name of '-view' is incorrect

**What Next**

Please Review DFT Specifications

---

## DFT-1019

(Error) Direction of '-associated_internal_clocks' pin '%s' is incorrect

Feedback

**Description**

Direction of '-associated_internal_clocks' pin '%s' is incorrect

**What Next**

Please Review DFT Specifications

---

## DFT-1020

(Error) Could not find the specified DFT location name

**Description**

Could not find the specified DFT location name

**What Next**

Please Review DFT Specifications

---

## DFT-1022

(Error) There is no pin named %s on the instance %s.

**Description**

There is no pin named %s on the instance %s.

**What Next**

Please Review DFT Specifications

---

## DFT-1023

(Error) The %s pin on the instance %s is not an input pin.

**Description**

The %s pin on the instance %s is not an input pin.

**What Next**

Please Review DFT Specifications

---

## DFT-1024

(Error) %s is not a valid control signal; only ScanEnable and TestMode are valid.

Feedback

**Description**

%s is not a valid control signal; only ScanEnable and TestMode are valid.

**What Next**

Please Review DFT Specifications

---

## DFT-1026

(Error) '%s' is not a valid test mode for %s command.

**Description**

'%s' is not a valid test mode for %s command.

**What Next**

Please Review DFT Specifications

---

## DFT-1027

(Error) Unsuccessful DFT Insertion

**Description**

Unsuccessful DFT Insertion

**What Next**

Please Review DFT Specifications

---

## DFT-1028

(Error) The command requires -test_mode specification or current test_mode set.

**Description**

The command requires -test_mode specification or current test_mode set.

**What Next**

Please Review DFT Specifications

---

## DFT-1029

(Error) Gate level flow on designs with unmapped cells is not supported. First found unmapped cell is %s.

Feedback

**Description**

Gate level flow on designs with unmapped cells is not supported. First found unmapped cell is %s.

**What Next**

Please Review DFT Specifications

---

## DFT-1030

(Error) The -period option can only be used for signals of type RefClock

**Description**

The -period option can only be used for signals of type RefClock

**What Next**

Please Review DFT Specifications

---

## DFT-1031

(Error) The -period value should be greater than 0

**Description**

The -period value should be greater than 0

**What Next**

Please Review DFT Specifications

---

## DFT-1032

(Error) Incorrect value '%s' specified for option '-type' in command 'create_dft_netlist'.

**Description**

The Error message is shown when incorrect value is specified for option '-type' option.

**What Next**

1. Correct value for option '-type' is 'extest'.

Feedback

## DFT-1033

(Error) An integer greater than 0 should be specified for option '-debug' in command 'create_dft_netlist'.

**Description**

The Error message is shown when incorrect value is specified for option '-debug'.

**What Next**

1. Value must be greater than 0 and less than 5.

## DFT-1034

(Error) %s is not available.

**Description**

This error message is issued when neither External Test nor Internal Scan modes are found in the DFT specifications during Shell Netlist flow. Shell Netlist is aborted under such circumstances.

**What Next**

Please define either External Test or Internal Scan Mode in the script before DFT insertion and shell netlist.

## DFT-1035

(Error) "%s file can't be opened.

**Description**

This error message is issued when create_dft_netlist -debug x (x>=1) is unable to create a debug report by the name of shell_netlist.rpt. This report prints out logs of shell netlist run.

**What Next**

Please retry the command with -debug (1|2|3).

## DFT-1036

(Error) DFT has already been inserted

**Description**

DFT has already been inserted

Feedback

**What Next**

Please Review DFT Specifications

---

## DFT-1037

(Error) Name '%s' is already in use by scan skew group specification

**Description**

Name '%s' is already in use by scan skew group specification

**What Next**

Please Review DFT Specifications

## DFT-1038

(Error) Invalid element '%s'. set_scan_path -ordered/-head/-tail does not support %s.

**Description**

Invalid element '%s'. set_scan_path -ordered/-head/-tail does not support %s.

**What Next**

Please Review DFT Specifications

---

## DFT-1039

(Error) set_scan_path with %s .

**Description**

You receive this error message in the following scenario : 1) When interface option is defined with other class apart from 'bsd' | 'ieee_1838_3dcr' | 'ieee_1838_dwr'. 2) When exact_length option is defined with other class apart from 'bsd' | 'ieee_1687'. 3) When 'bsd' | 'ieee_1687' class option is defined and exact_length | ordered_elements is not defined. 4) When -init_data is defined with class bsd | ieee_1687. 5) When length of init_data and exact_length do not match. 6) When length of reset_state and exact_length do not match. 7) When class occ is defined with -input_wrapper_cells_only. 8) When class occ is defined with -output_wrapper_cells_only. 9) When class spc is defined with -input_wrapper_cells_only. 10) When class spc is defined with -output_wrapper_cells_only. 11) When class scan is defined with -input_wrapper_cells_only. 12) When class scan is defined with -output_wrapper_cells_only. 13) When class occ is defined with -cell_set. 14) When class occ is defined with -ordered_elements | -head_elements | -tail_elements 15) When

Feedback

class wrapper is defined with -input_wrapper_cells_only | -output_wrapper_cells_only and -include_elements | -ordered_elements/-head_elements | -tail_elements'. 16) When -include_elements/-head_elements/-ordered_elements/-tail_element is defined with -cell_set.

Error : set_scan_path with '-interface' is supported for '-class bsd | ieee_1838_3dcr | ieee_1838_dwr'. (DFT-1039) Error : set_scan_path with '-exact_length' is supported for '-class bsd | ieee_1687'. (DFT-1039) Error : set_scan_path with '-class bsd | ieee_1687' is supported when -exact_length is positive and order_element list is not empty. (DFT-1039) Error : set_scan_path with -init_data is supported for '-class bsd | ieee_1687'. (DFT-1039) Error : set_scan_path with -init_data is supported when length of init_data is same as exact_length. (DFT-1039) Error : set_scan_path with -reset_state is supported when length of reset_state is same as exact_length. (DFT-1039) Error : set_scan_path with '-class occ' and '-input_wrapper_cells_only' not supported. (DFT-1039) Error : set_scan_path with '-class occ' and '-output_wrapper_cells_only' not supported. (DFT-1039) Error : set_scan_path with '-class spc' and '-input_wrapper_cells_only' not supported. (DFT-1039) Error : set_scan_path with '-class spc' and '-output_wrapper_cells_only' not supported. (DFT-1039) Error : set_scan_path with '-class scan' and '-input_wrapper_cells_only' not supported. (DFT-1039) Error : set_scan_path with '-class scan' and '-output_wrapper_cells_only' not supported. (DFT-1039) Error : set_scan_path with '-class occ' and '-cell_set' not supported. (DFT-1039) Error : set_scan_path with '-class occ' and '-ordered_elements/-head_elements/-tail_elements' not supported. (DFT-1039) Error : set_scan_path with '-class wrapper', '-input_wrapper_cells_only/-output_wrapper_cells_only' and '-include_elements/-ordered_elements/-head_elements/-tail_elements'. (DFT-1039) Error : set_scan_path with '-include_elements/-head_elements/-ordered_elements/-tail_elements' and '-cell_set' not supported. (DFT-1039)

**What Next**

Define interface option when class is bsd | ieee_1838_3dcr | ieee_1838_dwr. Define exact_length option when class is bsd | ieee_1687. Define exact_length | ordered_elements when class is bsd | ieee_1687 and exact_length should be positive Define init_data for class bsd | ieee_1687. Define init_data | reset_state of same length as exact_length. Do not define class occ with input_wrapper_cells_only. Do not define class occ with output_wrapper_cells_only. Do not define class spc with output_wrapper_cells_only. Do not define class spc with output_wrapper_cells_only. Do not define class scan with input_wrapper_cells_only. Do not define class scan with output_wrapper_cells_only. Do not define class occ with -cell_set. Do not define class occ with -ordered_elements | -head_elements | -tail_elements. Do not define class wrapper with -input_wrapper_cells_only | -output_wrapper_cells_only and -include_elements | -ordered_elements | -head_elements | -tail_elements. Do not define -include_elements | -head_elements | -ordered_elements | -tail_element with -cell_set.

Feedback

## DFT-1043

(Error) Could not find '%s' in the model

**Description**

Could not find '%s' in the model

**What Next**

Please Review DFT Specifications

## DFT-1044

(Warning) The signal '%s' must be specified as '%s'

**Description**

This warning message reports that the port specified in set_scan_path -scan_enable|-scan_data_in|-scan_data_out was not declared with the correct type using the set_dft_signal command.

**What Next**

Verify the port definition in the set_dft_signal command. In set_scan_path specification, for -scan_data_in the port specified must be declared as ScanDataIn, for -scan_data_out it must be declared as ScanDataOut and for -scan_enable it must be declared as ScanEnable.

## DFT-1045

(Error) Path %s includes elements from previously defined partition

Feedback

**Description**

Path %s includes elements from previously defined partition

**What Next**

Please Review DFT Specifications

---

## DFT-1067

(Error) %s is not a valid clock. Use set_dft_signal to define it as a valid clock.

**Description**

%s is not a valid clock. Use set_dft_signal to define it as a valid clock.

**What Next**

Please Review DFT Specifications

---

## DFT-1068

(Error) Specified serilaizer IP outputs and inputs should be equal

**Description**

Specified serilaizer IP outputs and inputs should be equal

**What Next**

Please Review DFT Specifications

---

## DFT-1069

(Error) %s and %s cannot both be specified.

**Description**

This error is issued when two uncompatible options of set_scan_group are specified.

**What Next**

Please check and update set_scan_group specification.

---

## DFT-1070

(Error) -connect_to %s is not a pin/cell/hierarchy/clock and cannot be connected as specified

Feedback

**Description**

-connect_to %s is not a pin/cell/hierarchy/clock and cannot be connected as specified

**What Next**

Please Review DFT Specifications

---

## DFT-1071

(Error) Invalid specification for scan path '%s': %s is not allowed.

**Description**

This message is issued when some cells of set_scan_path specification are not compatible. For example,

Error: Invalid specification for scan path 'PATH1': rising to falling clock edge is not allowed. (DFT-1071)

**What Next**

Check set_scan_path specification.

---

## DFT-1076

(Error) %s cannot be a port or a cell in the design.

**Description**

This error is issued when incorrect name is specified.

**What Next**

Please check and update set_scan_group specification.

---

## DFT-1077

(Error) Scan synthesis cannot run because %s.

**Description**

This message is issued when scan synthesis is missing a critical prerequisite and cannot continue executing without it.

This can happen if scan enable pipelining is enabled via set_scan_configuration, but corresponding LOSPipelineEnable signals are not provided.

Feedback

**What Next**

The error message describes the exact reason why scan synthesis stopped executing. If the reason refers to the DFT specification, review it to ensure it is complete and consistent.

---

## DFT-1078

(Warning) Physical location for %s not found.

**Description**

There are cells or its pins that do not report a valid physical location on the design's layout.

This message can arise when performing DFT Scan Synthesis operations like during commands *preview_dft* or *insert_dft*.

Cells needs to be properly placed before calling DFT SCAN insertion, as the default status after *compile_fusion -to logic_opto* stage was completed before initializing DFT SCAN insertion, when coarse placement should have been applied to all elements of the design.

Lack of physical location during the DFT SCAN insertion stage might lead to sub-optimal SCAN chain architecting or excesive wire-length in SCAN connections because incomplete information of placement for elements in the design might produce bad choices for SCAN interconnection in the internal algorithms.

**What Next**

Review the design setup and run logs to identify previous errors in design setup or compile_fusion execution that prevented all cells being properly placed.

---

## DFT-1079

(Error) Could not find the specified DFT location name '%s'

**Description**

Could not find the specified DFT location name '%s'

**What Next**

Please Review DFT Specifications

---

## DFT-1080

(Error) Architecting of chains in mode '%s' failed. Please run 'set_scan_configuration -chain_count'.

Feedback

**Description**

This Error message will be displayed when chain count is not specified through set_scan_configuration command.

---

## DFT-1081

(Error) %s should be specified for %s

**Description**

%s should be specified for %s

**What Next**

Please Review DFT Specifications

---

## DFT-1083

(Error) Core Wrapping - Shared wrapper flow in netlist is enabled and number of short wrapper chains are not set.

**Description**

The Error message is shown when shared wrapper flow is enabled and number of short wrapper chains in compression mode are not specified

**What Next**

See Information DFT-3143 to fix this error.

Specify wrapper chain count of short chains mode (compression_mode|wrp_if) as following and run again set_wrapper_configuration -chain_count N -test_mode (compression_mode|wrp_if)

---

## DFT-1085

(warning) UPF check failed for the path (%s) -> (%s). Netlist connection not UPF legal.

**Description**

This message is issued when during the SCAN stitching process, where connection from ScanEnable, TestMode, ScanInput, ScanOutput or similar signals, or between SCAN cells (SCAN cell ScanOutput to next SCAN chain cell ScanInput) has been detected by MultiVoltage (MV) APIs as invalid. This means it can introuce a MV violation.

Feedback

### What Next

Use command *check_mv_design* to determine what is the MV problem in the connection reported by this message. With that information, please validate the UPF setup is valid, complete and enought for defining all UPF rules required for connecting that particular driver and load combination. If there is a UPF setup issue or deficiency, please update UPF setup.

## DFT-1086

(Information) Test DRC reports %d violating cells.

### Description

This message reports the exact amount of cells that were marked as violated by DFT DRC and TetraMAX. These are ignored by scan synthesis.

### What Next

Review your DFT specification if the number of violated cells is unexpected.

---

## DFT-1090

(Error) %s has to be specified with %s as its value.

### Description

This error is issued when specified option is not specified with proper value.

### What Next

Please check and update set_scan_group specification.

---

## DFT-1091

(Error) App options %s and %s are not compatible.

### Description

This message is issued when some app options are not compatible. For example,

Error: App options enable_general_multimode_support 'false' and occ_spc_chain_arch_flat_flow 'true' are not compatible. (DFT-1091)

Feedback

**What Next**

Check which combinations of app options are supported. Update the settings accordingly.

---

## DFT-1092

(Error) Invalid parameters: %s

**Description**

Invalid parameters: %s

**What Next**

Please Review DFT Specifications

---

## DFT-1094

(Error) %s should %s.

**Description**

This error is issued when specified option has value of inccorect type.

**What Next**

Please check and update set_scan_group specification.

---

## DFT-1095

(warning) Scan chain element %s has no power information

**Description**

This message warns user that some element in the design has incomplete, invalid or inconsistent UPF information related to Power Domains (PD) or Voltage Supply (VS) data.

DFT SCAN Synthesis requires precise PD and/or VS information for preparing DFT SCAN domains of cells that can be safely put into SCAN chains without creating UPV or MultiVoltage issues, and without requiring the insertion of unneeded MultiVoltage cells like Level Shifter, Isolation cells, etc. If the previous information is not available for a cell, SCAN architecting decisions might be hampered or erroneous regarding UPF and MV criteria, introducing MV violations.

**What Next**

Verify that libraries are properly loaded and UPF data & setup has beeing loaded successfully.

Feedback

**See Also**

- check_mv_design

---

## DFT-1096

(Error) %s is already specified as an equivalent clock

**Description**

%s is already specified as an equivalent clock

**What Next**

Please Review DFT Specifications

---

## DFT-1097

(Error) %s option is only supported with type shared_only of set_boundary_cell. Ignoring %s option.

**Description**

add_loopback_logic or add_toggle_logic is supported only with type shared_only for set_boundary_cell command.

---

## DFT-1098

(Error) -exclude option is only valid with -ports option and not -instance

**Description**

-exclude option is only valid with -ports option and not -instance

**What Next**

Please Review DFT Specifications

---

## DFT-1100

(Error) %s.

**Description**

This is a generic scan architecting error message. You receive this error message if it is not possible to build scan chains according to provided set_scan_configuration settings.

Feedback

**Messages:**

Scan partitioning trying to overflow chain %i, current chain len: %i, max_length for the given group of elements: %i.

**What Next**

Please review set_scan_configuration settings and set_scan_compression_configuration settings if scan compression is used.

---

## DFT-1101

(Error) dft.insertion_post_logic_opto disabled, cannot run insert_dft in this stage

**Description**

dft.insertion_post_logic_opto disabled, cannot run insert_dft in this stage

**What Next**

Please Review DFT Specifications

---

## DFT-1102

(Error) '%s' is not a valid Test Mode

**Description**

'%s' is not a valid Test Mode

**What Next**

Please Review DFT Specifications

---

## DFT-1106

(Warning) DFT insertion is not supported in FC extended RTL shell. Hence ignoring DFT configurations.

**Description**

DFT insertion is not supported in FC extended RTL shell.Hence DFT related configurations will be ignored.

---

## DFT-1107

(Warning) Skipping scan synthesis: %s

Feedback

**Description**

DFT SCAN insertion (*insert_dft* command) cannot be executed and will be skipped.

Usual reasons are: 1) The design was already DFT SCAN inserted.

This might happen if a previous *insert_dft* command was succesfully executed. In that case, incremental DFT SCAN insertion is both not supported and not required.

2) Unexisting or insuficient DFT setup is detected.

DFT SCAN insertion requires the definition of all required DFT signals, correct setup of SCAN chain length or SCAN chain quantity, etc. If one or more of those required setup data are not found, DFT SCAN insertion cannot proceed.

**What Next**

Check if the command *insert_dft* was not previously executed for the design, and if is not, check that DFT Specifications are complete.

---

## DFT-1108

(Warning) %s

**Description**

This is a generic warning message for preview_dft reporting.

By default, after running Scan Synthesis from compile_fusion or insert_dft commands, a 'scan_dft.rpt' file with the scan chains report from preview_dft will be created automatically in the working directory. To specify a different file name for the report, use the *dft.scan.scan_chain_report* application option. DFT-1108 message will be printed if there was an issue with the file defined for automatic reporting.

**Messages:**

"Filename %s already exists. Report will overwrite it."

"Can't open file %s for writing. Report will be skipped."

**What Next**

If the file defined for reporting could not be opened for writing, please verify whether the path specified in the file name is valid, and whether the path and the file have valid writing permissions.

---

## DFT-1109

(Error) Unable to find signal definition for %s.

Feedback

**Description**

This message is issued when ScanEnable or TestMode signals are not found. For example,

Error: Unable to find signal definition for ScanEnable or TestMode. (DFT-1109)

**What Next**

Check signals specification

---

## DFT-1112

(Error) Required OCC existing flow signal option: '%s'

**Description**

Required OCC existing flow signal option: '%s'

**What Next**

Please Review DFT Specifications

---

## DFT-1113

(Error) The clock controller bit list should be a multiple of three

**Description**

The clock controller bit list should be a multiple of three

**What Next**

Please Review DFT Specifications

---

## DFT-1114

(Error) Could not find the occ control bit pin '%s' from the current design

**Description**

Could not find the occ control bit pin '%s' from the current design

**What Next**

Please Review DFT Specifications

Feedback

## DFT-1115

(Error) The active state value of the OCC signal control bit should be either '0' or '1'

**Description**

The active state value of the OCC signal control bit should be either '0' or '1'

**What Next**

Please Review DFT Specifications

## DFT-1116

(Error) Could not find the occ control bit cycle value from '%s'

**Description**

Could not find the occ control bit cycle value from '%s'

**What Next**

**What Next**

Please Review DFT Specifications

## DFT-1121

(Error) Unknown location type '%s' specified.

**Description**

Unknown location type '%s' specified.

**What Next**

Please Review DFT Specifications

Feedback

## DFT-1122

(Error) Design '%s' has no test model

**Description**

Design '%s' has no test model

**What Next**

Please Review DFT Specifications

## DFT-1123

(Error) Could not find the specified DFT location name '%s'

**Description**

Could not find the specified DFT location name '%s'

**What Next**

Please Review DFT Specifications

## DFT-1128

(Warning) %s.

**Description**

This is a generic warning issued when set_scan_group -access_pins settings are not compatible.

**Messages:**

Sequential cell %s is connected to the access pin %s of a serially routed chain. Cell will be excluded from scan synthesis - applies to set_scan_group virtual case (without -include_elements). In such setting the cell will be automatically excluded.

Sequential cell %s is on the access pin %s of a serially routed chain. Cell will be excluded from scan synthesis. - applies to set_scan_group virtual case (without -include_elements). In such setting the cell will be automatically excluded.

BypassSe can be specified only for -class bypass. Ignoring BypassSe spec.

**What Next**

Please review set_scan_group settings.

Feedback

## DFT-1129

(Error) Other DFT Ips can not be grouped with AIT, SERVER and BSD

**Description**

Other DFT Ips can not be grouped with AIT, SERVER and BSD

**What Next**

Please Review DFT Specifications

## DFT-1130

(Error) Signal of data type 'Reset' is not valid for -connect_to option

**Description**

Signal of data type 'Reset' is not valid for -connect_to option

**What Next**

Please Review DFT Specifications

## DFT-1131

(Error) Pin %s direction is not valid for -connect_to option.

**Description**

Pin %s direction is not valid for -connect_to option.

**What Next**

Please Review DFT Specifications

## DFT-1132

(Error) Multiple signal types cannot be specified for hookup port '%s'.

**Description**

Multiple signal types cannot be specified for hookup port '%s'.

**What Next**

Feedback

## DFT-1134

(Error) For '-timing' option, rise time and fall time cannot be same

**Description**

For '-timing' option, rise time and fall time cannot be same

**What Next**

Please Review DFT Specifications

## DFT-1135

(Error) Test design rule checking reported FATAL violations.

**Description**

Message shows that dft_drc command in under the hood tetramax script has failed. The message will only be reported when enhaced dft drc reporting is enabled.

SH "SEE ALSO"

```
dft_drc
set_dft_drc_configuration
```

## DFT-1139

(Error) DFT DRC cannot performed due to too many open files.

**Description**

dft_drc command internally instantiate a process to invoke tetramax atpg tool. To perform the design rule checks on the design. This process has a maximum limit of 1024 for file descriptors. If number exeeds 1024,then dft_drc exits pre-maturely.

## DFT-1140

(Error) Cannot specify shared -%s_shared_pipeline_stages without enabling hierarchical or shared SI/SO flow.

**Description**

Cannot specify shared -%s_shared_pipeline_stages without enabling hierarchical or shared SI/SO flow.

**What Next**

Please Review DFT Specifications

Feedback

## DFT-1142

(Error) Must specify 'true' or 'false' for the %s_scan_flop option

**Description**

Must specify 'true' or 'false' for the %s_scan_flop option

**What Next**

Please Review DFT Specifications

## DFT-1143

(Error) Must specify 'true' or 'false' for the enable_bypass option

**Description**

Must specify 'true' or 'false' for the enable_bypass option

**What Next**

Please Review DFT Specifications

## DFT-1144

(Error) Since the enable_bypass option is set to true, serializer mode %s cannot be encoded to all zeros

**Description**

Since the enable_bypass option is set to true, serializer mode %s cannot be encoded to all zeros

**What Next**

Please Review DFT Specifications

## DFT-1145

(Error) A serializer clock must be provided to enable hierarchical serialization

**Description**

A serializer clock must be provided to enable hierarchical serialization

**What Next**

Please Review DFT Specifications

Feedback

## DFT-1147

(Error) DFT DRC violations cannot be reported. dft_drc was not run for %s mode.

**Description**

DFT DRC violations cannot be reported. dft_drc was not run for %s mode.

**What Next**

Please Review DFT Specifications

## DFT-1151

(Error) To group AIT, SERVER and TAP, new hierarchy should be specified insideTOP

**Description**

To group AIT, SERVER and TAP, new hierarchy should be specified insideTOP

**What Next**

Please Review DFT Specifications

## DFT-1154

(Error) The '-connect_to clock' option is not supported for '%s'.

**Description**

The '-connect_to clock' option is not supported for '%s'.

**What Next**

Please Review DFT Specifications

## DFT-1159

(Error) Design-state not compatible with requested starting point '%s'. If you are attempting to run the pre-compile flow please refer to man page of this message for further information.

**Description**

You receive this error message when tool is not able to find proper license settings.
If pre-compile flow is intended then below app option should be set after setting the current_design in the flow: set_app_options -name dft.insertion_pre_compile_fusion -value true

Feedback

If in-compile or post-compile flow is intended then 'create_test_protocol', 'preview_dft' and 'insert_dft' should be run after 'compile_fusion -to logic_opto' or 'compile' step.

---

## DFT-1169

(Error) Specify positive value for option %s.

**Description**

Option's value must be >= 1

**What Next**

Please Review DFT Specifications

---

## DFT-1188

(Error) wrp_disable option is only supported with app option dft.test_wrp_custom_wrp_cell_disable_sig_support enabled. Ignoring -wrp_disable option

**Description**

You receive this error message when you specifiy -wrp_disable option without app option 'test_wrp_custom_wrp_cell_disable_sig_support' being ON

---

## DFT-1189

(Error) %s option is only supported with type WC_Q1 | WC_Q0 ignoring %s

**Description**

You receive this error message when you do not specify -type WC_Q1 or WC_Q0 with the specified option

---

## DFT-1190

(Error) No wrp_disable signal defined for port/pin specified with '-wrp_disable' option

**Description**

You receive this error message when port/pin spcecified in -wrp_disable option does not have a dft signal of -type wrp_disable.

Feedback

## DFT-1193

(Error) Building model for design rules checking failed.

**Description**

This build error occurs when hookup pin is not available in netlist when driver/load of the hookup pin doesn't exist and when library cells are modeled incorrectly and TetraMAX cannot parse it properly due to incorrect modeling.

**What Next**

user needs to apply a restriction to prevent driver/load from being optimized away or need to check if ndm library is generated by latest version of library compiler, at least later than IC Compiler II O-2018.06-SP5.

## DFT-1196

(Error) Invalid class specified, supported values : wrapper, bsd

**Description**

Invalid class specified, supported values : wrapper, bsd

## DFT-1250

(Error) Inputs are not fully shared for shared codec SI with dedicated SO.

**Description**

Inputs are not fully shared for shared codec SI with dedicated SO.

Feedback

**What Next**

Please Review DFT Specifications

---

## DFT-1251

(Error) Incorrect polarity specified for signal '%s' acceptable polarity : '%s'

**Description**

Incorrect polarity specified for signal '%s' acceptable polarity : '%s'

**What Next**

Please Review DFT Specifications

---

## DFT-1252

(Error) Codecs outputs sizes must be identical for shared codec SI with dedicated SO.

**Description**

Codecs outputs sizes must be identical for shared codec SI with dedicated SO.

**What Next**

Please Review DFT Specifications

---

## DFT-1254

(Error) Nothing to do here. Use set_dft_configuration -mbist/-dft_access enable to use 'plan_dft' command.

**Description**

The 'plan_dft' command is used when SMS network is present. SMS network is inserted when mbist or dft_access client is enabled.

**What Next**

User need to enable either mbist or dft_access or both to insert SMS Network. For example, 'set_dft_configuration -mbist enable' OR 'set_dft_configuration -dft_access enable'

---

## DFT-1255

(Error) Invalid format specified. Valid values are ctl/icl/pdl/ict/wks/hdl/masis

Feedback

**Description**

Invalid format specified. Valid values are ctl/icl/pdl/ict/wks/hdl/masis

---

## DFT-1270

(ERROR) The interface list is parsed as key-value pair of interface name and portname <interfaceName, portName>, please provide even number of arguments in the interface list. List of mandatory interface keywords %s.

**Description**

The interface list has key-value pair of interface name and portname <interfaceName, portName>. Therefore, it cannot have odd number of arguments.

**What Next**

Please provide even number of arguments in the interface list.

---

## DFT-1276

(Error) %s is not found in the netlist.

**Description**

This message is issued when cell, pin or port from scan specification is not found in netlist. For example,

Error: SO0 is not found in the netlist. (DFT-1276)

**What Next**

Check signals specification

Feedback

## DFT-1277

(Error) Could not find valid scan group element. It should be either ndmInstance or ctl segment.

**Description**

set_scan_group has incorrect -include specification: the elements are not identified either as cells or ctl segments.

**What Next**

Please Review DFT Specifications

## DFT-1278

(Error) Please use set_dft_configuration -hsio enable option.

**Description**

Please use set_dft_configuration -hsio enable option.

**What Next**

Feedback

## DFT-1300

(Error) %s pin %s can not be a %s.

**Description**

set_scan_group -access_pin of specified type has wrong direction.

**What Next**

Please Review DFT Specifications

## DFT-1302

(Error) -occ_clock_weights option accepts only list of weights and clocks. Weights can take only positive integers or always_on or always_off.

**Description**

-occ_clock_weights option accepts only list of weights and clocks. Weights can take only positive integers or always_on or always_off.

**What Next**

Please Review DFT Specifications

## DFT-1303

(Error) -xtolerance high or -xtolerance extended is expected for XLBIST. BIST without xtolerance is not supported.

**Description**

BIST is mainly differentiated from normal logicbist by using the '-xtolerance high or -xtolerance extended' option of the "set_logicbist_configuration" command.

**What Next**

Please use '-xtolerance high or -xtolerance extended' switch in the "set_logicbist_configuration" command while using XLBIST configuration.

## DFT-1304

(ERROR) %s value is not supported for option %s. This option is ignored.

Feedback

**Description**

This error message is shown, when specified values of options do not match predefined enums. In this case the setting of the option is ignored.

**What Next**

Please review set_scan_group settings

---
